- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **WSDL** menu:

- **Go to Definition** - Takes you to the location of the definition of the current item.

  Note: You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions are available from the **Refactoring** submenu in the contextual menu of the current editor:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

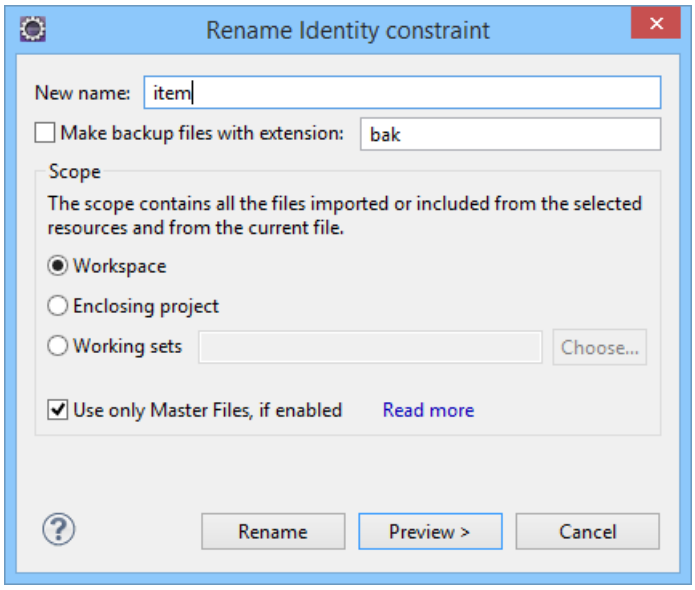

Figure 489: Rename Identity Constraint Dialog Box

Searching and Refactoring Operations Scope in WSDL Documents

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the **Change scope** operation, available in the *Quick Fix* action set or on the **Resource Hierarchy/ Dependency View** toolbar. You can restrict the scope to the current project or to one or multiple *working sets*. The **Use only Master Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Master Files** directory. Click **read more** for details about the *Master Files* support.

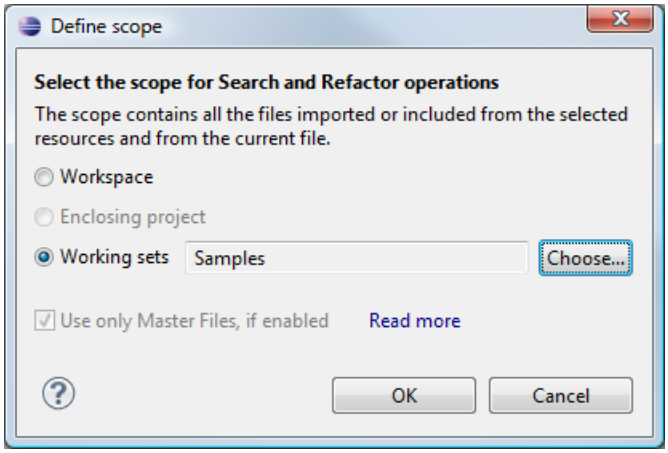

Figure 490: Change Scope Dialog Box

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the *working set* structure.

Quick Assist Support in WSDL Documents

The *Quick Assist* feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon ( ) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Ctrl + 1** (**Meta 1** on Mac OS X) keyboard shortcuts.

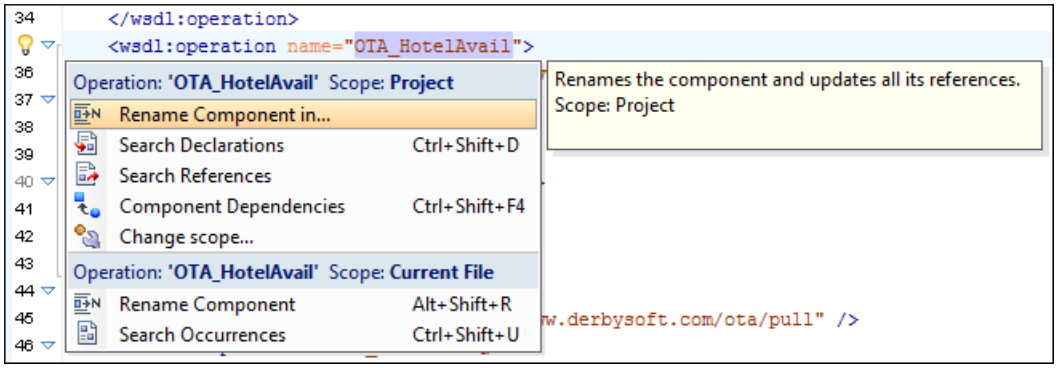

Figure 491: WSDL Quick Assist Support

The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Generating Documentation for WSDL Documents

You can use Oxygen XML Editor plugin to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a custom output format by using a custom stylesheet.

Note: The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **XML Tools** > **Generate Documentation** menu or from the **Generate WSDL Documentation** action from the contextual menu of the **Navigator** view.

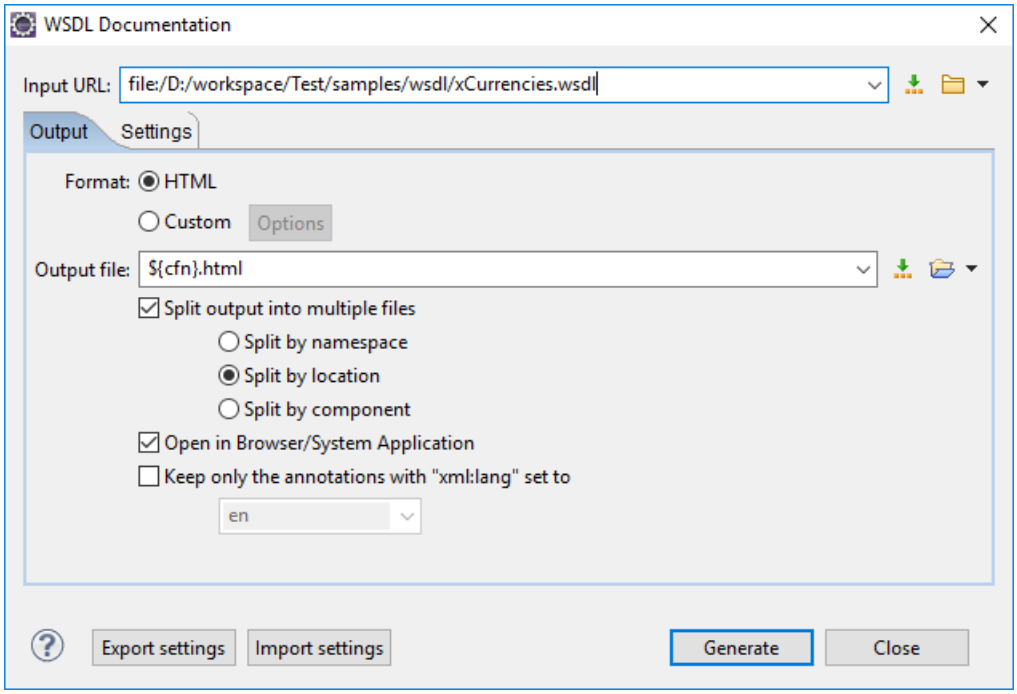

Figure 492: WSDL Documentation Dialog Box

The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:

- **HTML** - The documentation is generated in HTML output format.
- **Custom** - The documentation is generated in a custom output format, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

  Note: To set the browser or system application that will be used, go to **Window** > **Preferences** > **General** > **Web Browser** and specify it there. This will take precedence over the default system application settings.
- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `xml:lang` attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

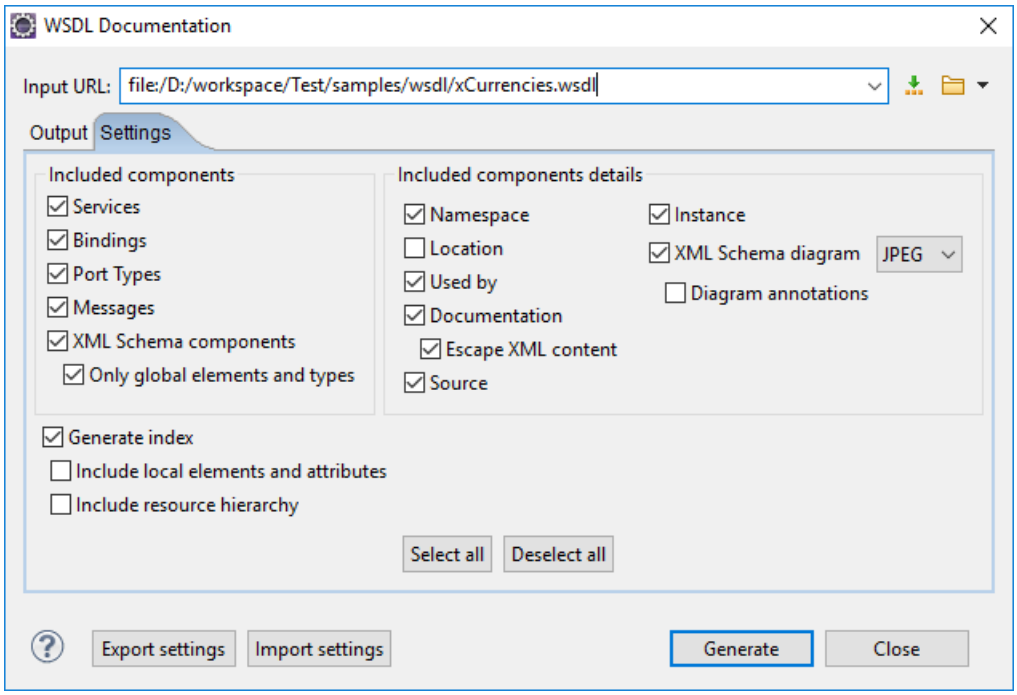

Figure 493: Settings Tab of the WSDL Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following:

- **Components**
  - **Services** - Specifies whether or not the generated documentation includes the WSDL services.
  - **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
  - **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.
  - **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.

- **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
  - **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.
- **Component Details**
  - **Namespace** - Presents the namespace information for WSDL or XML Schema components.
  - **Location** - Presents the location information for each WSDL or XML Schema component.
  - **Used by** - Presents the list of components that reference the current one.
  - **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
  - **Source** - Presents the XML fragment that defines the current component.
  - **Instance** - Generates a sample XML instance for the current component.

    Note: This option applies to the XML Schema components only.
  - **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section.
    - **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.
- **Generate index** - Displays an index with the components included in the documentation.
  - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
  - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command-line interface.)

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the WSDL documentation.

Generating WSDL Documentation in HTML Format

The WSDL documentation generated in HTML format is presented in a visual diagram style with various sections, hyperlinks, and options.

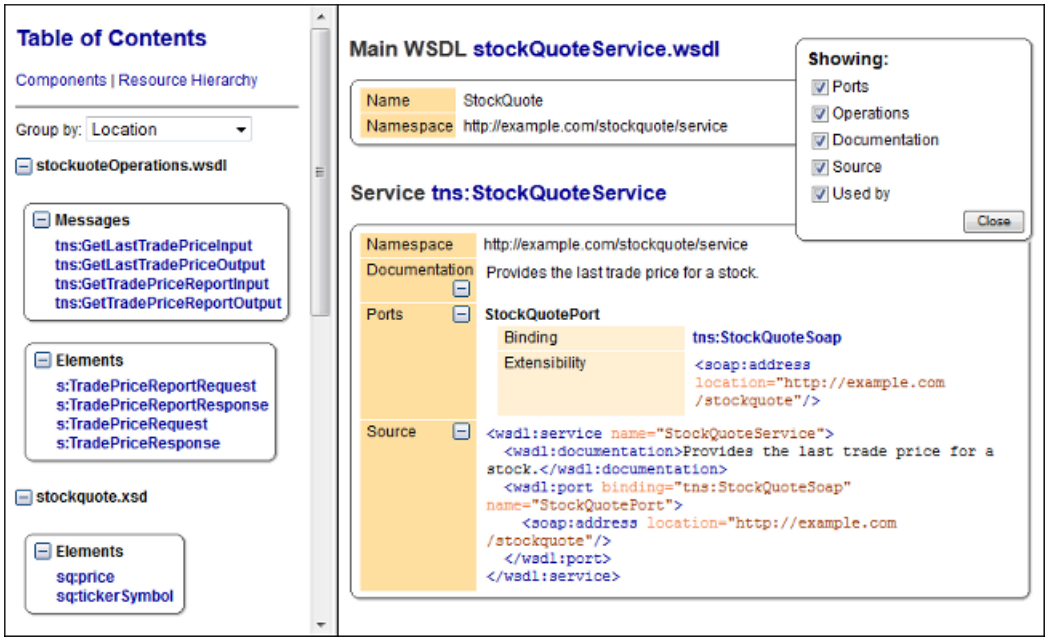

Figure 494: WSDL Documentation in HTML Format

The documentation of each component is presented in a separate section. The title of the section is composed of the component type and the component name. The component information (namespace, documentation, etc.) is presented in a tabular form.

If you choose to split the output into multiple files, the table of contents is displayed in the left frame and is divided in two tabs: **Components** and **Resource Hierarchy**.

The **Components** tab allows you to group the contents by namespace, location, or component type. The WSDL components from each group are sorted alphabetically. The **Resource Hierarchy** tab displays the dependencies between WSDL and XML Schema modules in a tree-like fashion. The root of the tree is the WSDL document that you generate documentation for.

After the documentation is generated, you can collapse or expand details for some WSDL components by using the **Showing** options or the **Collapse** or **Expand** buttons.

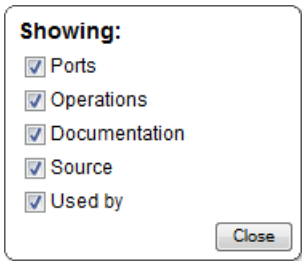

Figure 495: Showing Options

Generating WSDL Documentation in a Custom Format

To obtain the default HTML documentation output from a WSDL document, Oxygen XML Editor plugin uses an intermediary XML document to which it applies an XSLT stylesheet. To create a custom output from your WSDL document, edit the `wsdlDocHtml.xsl` XSLT stylesheet or create your own.

Note: The `wsdlDocHtml.xsl` stylesheet that is used to obtain the HTML documentation is located in the *`[OXYGEN_INSTALL_DIR]`*`/frameworks/wsdl_documentation/xsl` folder.

Note: The intermediary XML document complies with the `wsdlDocSchema.xsd` XML Schema. This schema is located in the *`[OXYGEN_INSTALL_DIR]`*`/frameworks/wsdl_documentation` folder.

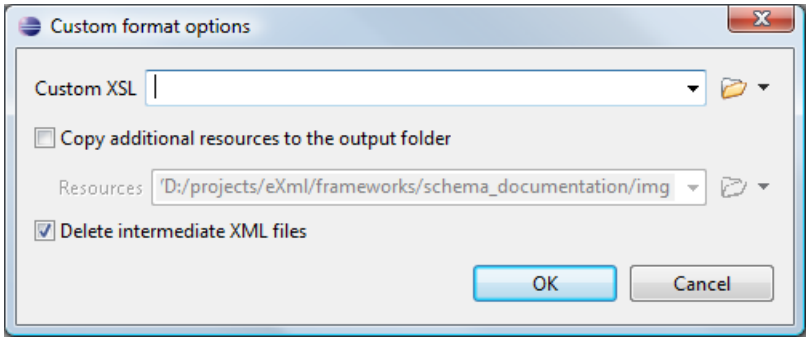

Figure 496: Custom Format Options Dialog Box

When using a custom format, you can also copy additional resources into the output folder or choose to keep the intermediate XML files created during the documentation process.

Generating WSDL Documentation from the Command-Line Interface

To generate documentation for a WSDL document from the command line, open the **WSDL Documentation** dialog box and click **Export settings**. Using the exported settings file you can generate the same documentation from the command line by running the following scripts:

- `wsdlDocumentation.bat` on Windows.
- `wsdlDocumentation.sh` on Mac OS X and Linux.

The scripts are located in the installation folder of Oxygen XML Editor plugin. You can integrate the scripts in an external batch process launched from the command-line interface.

WSDL SOAP Analyzer

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated **WSDL SOAP Analyzer** tool (available from the toolbar or **WSDL** menu).

Oxygen XML Editor plugin provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the **WSDL SOAP Analyzer** tool for the currently edited WSDL document do one of the following:

- Click the **WSDL SOAP Analyzer** toolbar button.
- Use the **WSDL SOAP Analyzer** action from the **WSDL** menu.
- Go to **Open with** > **WSDL Editor** in the contextual menu of the **Navigator** view.

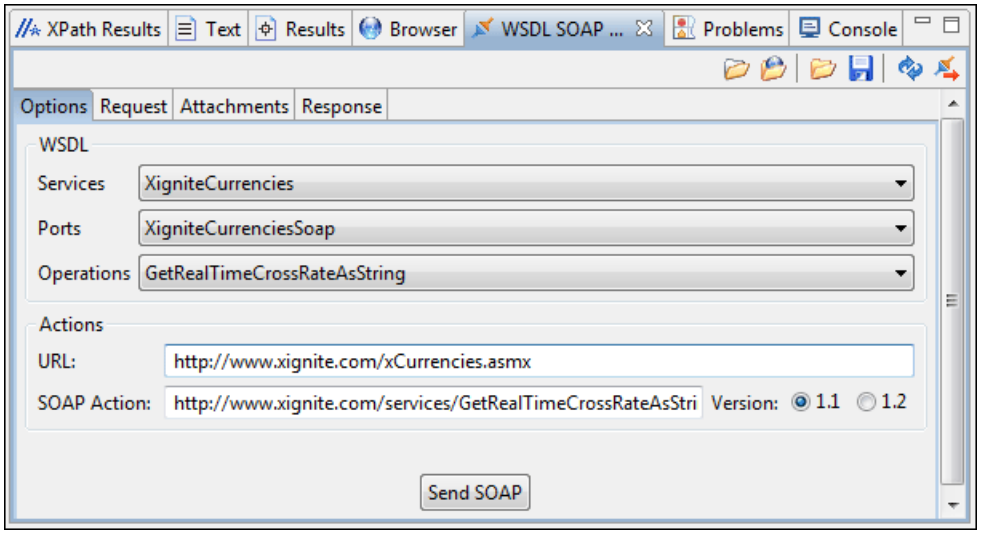

Figure 497: WSDL SOAP Analyzer View

This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.
- **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor plugin tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is *http://schemas.xmlsoap.org/soap/envelope/* for SOAP 1.1 or *http://www.w3.org/2003/05/soap-envelope* for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The *Content Completion Assistant* is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Editor plugin remembers the modified request for each one. You can press the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.
- **Attachments List** - You can define a list of file URLs to be attached to the request.

- **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Editor plugin prompts you to save them, then tries to open them with the associated system application.
- **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.
- **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor plugin is connecting to the server.

The testing of a WSDL file is straight-forward: click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the Testing Remote WSDL Files section.

Note: SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

1. Go to **Window** > **Show View** > **Other** > **Oxygen XML Editor plugin** > **WSDL SOAP Analyzer**.
2. Press the **Choose WSDL** button and enter the URL of the remote WSDL file.
   You enter the URL:
   - by typing
   - by browsing the local file system
   - by browsing a remote file system
   - by browsing a UDDI Registry
3. Press the **OK** button.
   This will open the **WSDL SOAP Analyzer** tool. In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

UDDI Registry Browser

Pressing the button in the **WSDL File Opener** dialog box (menu **Tools** > **WSDL SOAP Analyzer**) opens the **UDDI Registry Browser** dialog box.

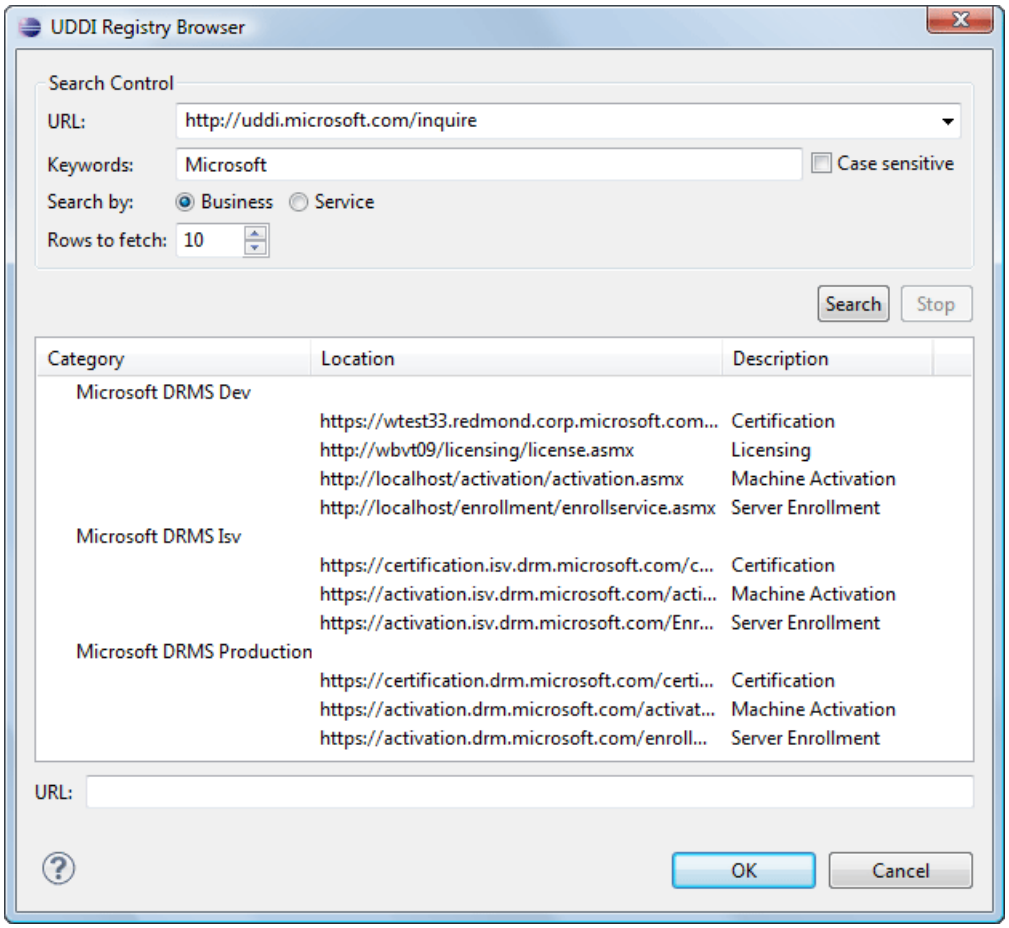

Figure 498: UDDI Registry Browser Dialog Box

The fields of the dialog box are as follows:

- **URL** - Type the URL of an UDDI registry or choose one from the default list.
- **Keywords** - Enter the string you want to be used when searching the selected UDDI registry for available Web services.
- **Rows to fetch** - The maximum number of rows to be displayed in the result list.
- **Search by** - You can choose to search either by company or by provided service.
- **Case sensitive** - When selected, the search takes into account the keyword case.
- **Search** - The WSDL files that matched the search criteria are added in the result list.

When you select a WSDL from the list and click the **OK** button, the **UDDI Registry Browser** dialog box is closed and you are returned to the **WSDL File Opener** dialog box.

Editing CSS Stylesheets

Oxygen XML Editor plugin includes a built-in editor for CSS stylesheets. This section presents the features of the CSS editor and how these features should be used. The features of the CSS editor include:

- **Create new CSS files and templates** - You can use the built-in new file wizards to create new CSS documents or templates.
- **Open and Edit CSS files** - CSS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in CSS files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Syntax highlighting** - The syntax highlighting in Oxygen XML Editor plugin makes CSS files more readable.

- **Shortcut to open resources** - You can use **Ctrl + Single-Click (Command + Single-Click on OS X)** to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

Validating CSS Stylesheets

Oxygen XML Editor plugin includes a built-in *CSS Validator*, integrated with general validation support. This makes the usual validation features for presenting errors also available for CSS stylesheets.

The CSS properties accepted by the validator are those included in the current CSS profile that is selected in the CSS validation preferences. The **CSS 3 with Oxygen extensions** profile includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen that can be used in Author mode. That means all Oxygen specific extensions are accepted in a CSS stylesheet by the built-in CSS validator when this profile is selected.

Specify Custom CSS Properties

To specify custom CSS properties, follow these steps:

1. Create a file named `CustomProperties.xml` that has the following structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<css_keywords
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:schemaLocation="http://www.oxygenxml.com/ns/css
 http://www.oxygenxml.com/ns/css/CssProperties.xsd"
      xmlns="http://www.oxygenxml.com/ns/css">
      <property name="custom">
      <summary>Description for custom property.</summary>
        <value name="customValue"/>
        <value name="anotherCustomValue"/>
      </property>
</css_keywords>
```

2. Go to your desktop and create the `builtin/css-validator/` folder structure.
3. Press and hold **Shift** and right-click anywhere on your desktop. From the contextual menu, select **Open Command Window Here**.
4. In the command line, run the `jar cvf custom_props.jar builtin/` command.
   The `custom_props.jar` file is created.
5. Go to *[OXYGEN_INSTALL_DIR]*`/lib` and create the `endorsed` folder. Copy the `custom_props.jar` file to *[OXYGEN_INSTALL_DIR]*`/lib/endorsed`.

Content Completion in CSS Stylesheets

A *Content Completion Assistant*, similar to the one available for XML documents offers the CSS properties and the values available for each property. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut and is context-sensitive when invoked for the value of a property. The *Content Completion Assistant* also includes code templates that can be used to quickly insert code fragments into CSS stylesheets. The code templates that are proposed include form controls, actions, and **Author** mode operations.

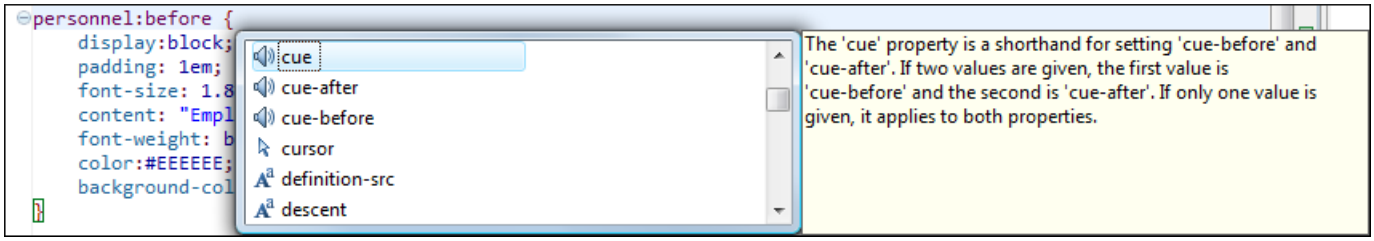

Figure 499: Content Completion in CSS Stylesheets

The properties and values available are dependent on the CSS Profile selected in the **CSS** preferences. The CSS 2.1 set of properties and property values is used for most of the profiles. However, with CSS 1 and CSS 3 specific proposal sets are used.

The profile *CSS 3 with Oxygen extensions* includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen XML Editor plugin that can be used in **Author** mode.

Proposals for CSS Selectors - After inserting a *CSS selector*, the content completion assistance will propose a list of pseudo-elements and pseudo-classes that are available for the selected CSS profile.

Proposals for `@media` and `@import` Rules - After inserting `@media` or `@import <url>` rules, the content completion assistance will propose a list of supported media types.

Related Information:

Specify Custom CSS Properties on page 754

Syntax Highlighting in CSS Files

Oxygen XML Editor plugin supports syntax highlighting in CSS files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for CSS files, follow these steps:

1. Open the **Preferences** dialog box .
2. Go to **Editor** > **Syntax Highlight**.
3. Select and expand the **CSS** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

Syntax Highlight Preferences on page 92

CSS Outline View

The **Outline** view for CSS stylesheets presents the import declarations for other CSS stylesheet files and all the selectors defined in the current CSS document. The selector entries can be presented as follows:

- In the order they appear in the document.
- Sorted by the element name used in the selector.
- Sorted by the entire selector string representation.

You can synchronize the selection in the **Outline** view with the cursor moves or changes you make in the stylesheet document. When you select an entry from the **Outline** view, Oxygen XML Editor plugin highlights the corresponding import or selector in the CSS editor.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

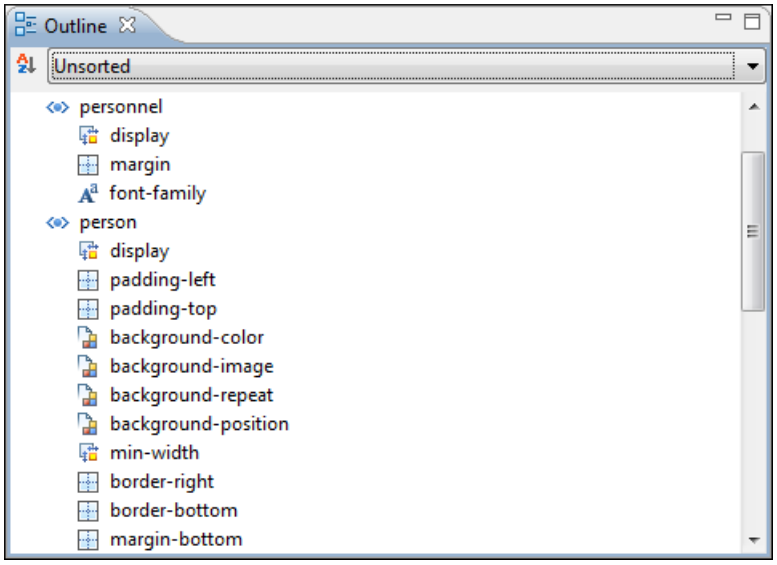

Figure 500: CSS Outline View

The selectors presented in this view can be found quickly using the key search field. When you press a sequence of character keys while the focus is in the view, the first selector that starts with that sequence is selected automatically.

Folding in CSS Stylesheets

In a large CSS stylesheet document, some styles can be collapsed so that only the styles that are needed remain in focus. The same folding features available for XML documents are also available in CSS stylesheets.

Note: To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

Formatting and Indenting CSS Stylesheets (Pretty Print)

If the edited CSS stylesheet becomes unreadable because of the bad alignment of the text lines, the format and indent operation available for XML documents is also available for CSS stylesheets. It works in the same way as for XML documents and is available as the same menu and toolbar action.

Minifying CSS Stylesheets

Minification (or *compression*) of a CSS document is the practice of removing unnecessary code without affecting the functionality of the stylesheet.

To minify a CSS, invoke the contextual menu anywhere in the edited document and choose the **Minify CSS** action. Oxygen XML Editor plugin opens a dialog box that allows you to:

- Set the location of the resulting CSS.
- Place each style rule on a new line.

After pressing **OK**, Oxygen XML Editor plugin performs the following actions:

- All spaces are normalized (all leading and trailing spaces are removed, while sequences of white spaces are replaced with single space characters).
- All comments are removed.

Note: The CSS minifier relies heavily upon the W3C CSS specification. If the content of the CSS file you are trying to minify does not conform with the specifications, an error dialog box will be displayed, listing all errors encountered during the processing.

The resulting CSS stylesheet gains a lot in terms of execution performance, but loses in terms of readability. The source CSS document is left unaffected.

Note: To restore the readability of a minified CSS, invoke the **Format and Indent** action from the **XML** menu, the **Source** submenu from the contextual menu, or **Source** toolbar. However, this action will not recover any of the deleted comments.

Editing Relax NG Schemas

An XML Schema describes the structure of an XML document and is used to validate XML document instances against it, to check that the XML instances conform to the specified requirements. If an XML instance conforms to the schema then it is said to be valid. Otherwise, it is invalid.

Oxygen XML Editor plugin offers support for editing Relax NG schema files in the following editing modes:

- **Text editing mode** - Allows you to edit Relax NG schema files in a source editing mode, along with a schema design pane with two tabs that offer a **Full Model View** and **Logical Model View**.
- **Grid editing mode** - Displays Relax NG schema files in a structured spreadsheet-like grid.
- **Author editing mode** - The visual **Author** mode is also available for Relax NG schema files, presenting the schema similar to the Relax NG compact syntax. It links to imported schemas and external references. Embedded Schematron is also supported in Relax NG schemas with XML syntax.

For information about applying and detecting schemas, see Associating a Schema to XML Documents on page 579.

Related Information:

Associating a Schema to XML Documents on page 579

Editing Relax NG Schema in the Master Files Context

Smaller interrelated modules that define a complex Relax NG Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor plugin provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You cat set a main Relax NG document either using the *master files* support from the **Navigator** view, or using a validation scenario.

To set a *master file* using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor plugin warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The main advantage of editing in the context of a *master file* is that it provides correct validation of a module in the context of a larger schema structure.

Creating a New Validation Scenario on page 568
XML Schema Outline View on page 327

Relax NG Schema Diagram Editor

This section explains how to use the graphical diagram editor for Relax NG schemas.

Introduction to Relax NG Schema Diagram Editor

Oxygen XML Editor plugin provides a simple, expressive, and easy-to-read schema diagram editor for Relax NG schemas.

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, or BMP images. It helps both schema authors in developing the schema and content authors who are using the schema to understand it.

Oxygen XML Editor plugin is the only XML editor to provide a side by side source and diagram presentation and have them real-time synchronized:

- The changes you make in the Editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram selects the underlying code in the source editor.

Full Model View

When you create a new schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The schema diagram editor has two tabs that offer a **Full Model View** and **Logical Model View**.

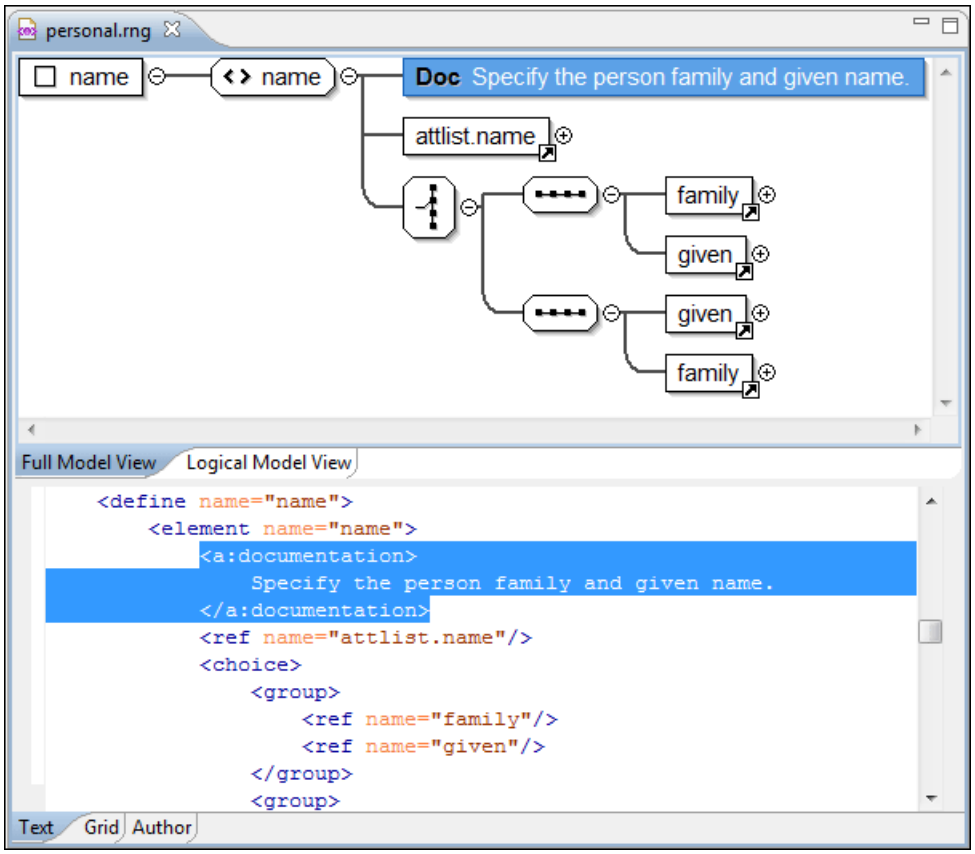

Figure 501: Relax NG Schema Editor - Full Model View

The following references can be expanded in place: patterns, includes, and external references. This expansion mechanism, coupled with the synchronization support, makes the schema navigation easy.

All the element and attribute names are editable by double-clicking the names.

Logical Model View

The **Logical Model View** presents the compiled schema in the form of a single pattern. The patterns that form the element content are defined as top level patterns with generated names. These names are generated depending of the elements name class.

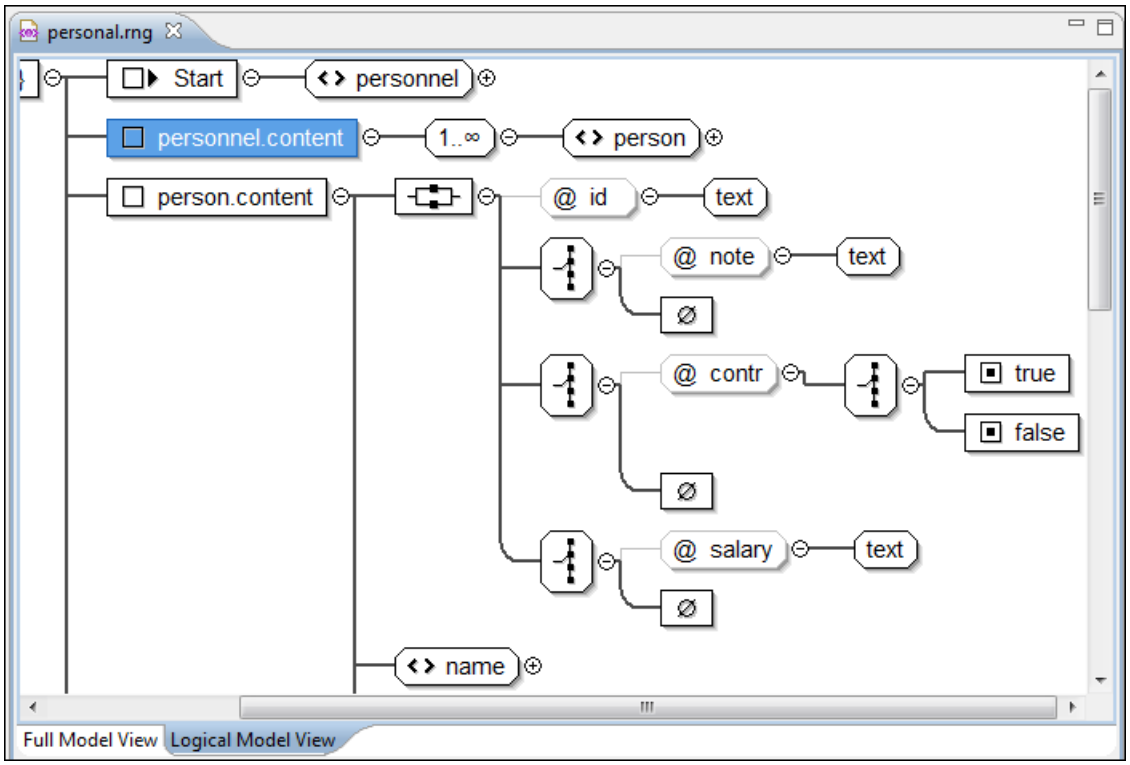

Figure 502: Logical Model View for a Relax NG Schema

Symbols Used in the Schema Diagram

The views in the schema diagram editor renders all the Relax NG schema patterns with the following intuitive symbols:

-  - `define` pattern with the `name` attribute set to the value shown inside the rectangle (in this example `name`).
- - `define` pattern with the `combine` attribute set to `interleave` and the `name` attribute set to the value shown inside the rectangle (in this example `attlist.person`).
- - `define` pattern with the `combine` attribute set to `choice` and the `name` attribute set to the value shown inside the rectangle (in this example `attlist.person`).
-  - `element` pattern with the `name` attribute set to the value shown inside the rectangle (in this example `name`).
-  - `attribute` pattern with the `name` attribute set to the value shown inside de rectangle (in this case `note`).
-  - `ref` pattern with the `name` attribute set to the value shown inside the rectangle (in this case `family`).
- - `oneOrMore` pattern.
- - `zeroOrMore` pattern.
- - `optional` pattern.

- - `choice` pattern.
- - `value` pattern (for example, used inside a `choice` pattern).
- - `group` pattern.
-  - A pattern from the Relax NG Annotations namespace (http://relaxng.org/ns/compatibility/annotations/1.0) that is treated as a documentation element in a Relax NG schema.
- - `text` pattern.
- - `empty` pattern.

Actions Available in the Schema Diagram Editor

When editing Relax NG schemas in **Full Model View**, the contextual menu offers the following actions:

Append child
Appends a child to the selected component.

Insert Before
Inserts a component before the selected component.

Insert After
Inserts a component after the selected component.

Edit attributes
Edits the attributes of the selected component.

Remove
Removes the selected component.

Show only the selected component
Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

Show Annotations
Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

Auto expand to references
This option controls how the schema diagram is automatically expanded. If you select it and then edit a top-level element or you make a refresh, the diagram is expanded until it reaches referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

Collapse Children
Collapses the children of the selected view.

Expand Children
Expands the children of the selected view.

Print Selection
Prints the selected view.

Save as Image
Saves the current selection as JPEG, BMP, SVG or PNG image.

Refresh
Refreshes the schema diagram according to the changes in your code. They represent changes in your imported documents or changes that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the **Logical Model View** instead of the diagram.

Validating Relax NG Schema Documents

By default, Relax NG schema files are validated as you type. To change this, open the **Preferences** dialog box , go to **Editor** > **Document Checking**, and deselect the **Enable automatic validation** option.

To validate a Relax NG schema document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **XML** menu. When Oxygen XML Editor plugin validates a Relax NG schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Presenting Validation Errors in Text Mode on page 169

Content Completion in Relax NG Schemas

The intelligent *Content Completion Assistant* allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box , go to **Editor** > **Content Completion**, and deselect the **Enable content completion** option.

When active, the *Content Completion Assistant* displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on OS X)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

If you are using the concept of *master files* to import/include modules, the *Content Completion Assistant* collects its components starting from the *master files*. The *master files* can be defined in the project or in the associated validation scenario. For more information about the *Master Files* support in Oxygen XML Editor plugin, see Defining Master Files at Project Level.

The *Content Completion Assistant* also offers additional information for the element and attribute proposals in the form of schema annotations that is displayed in a tooltip.

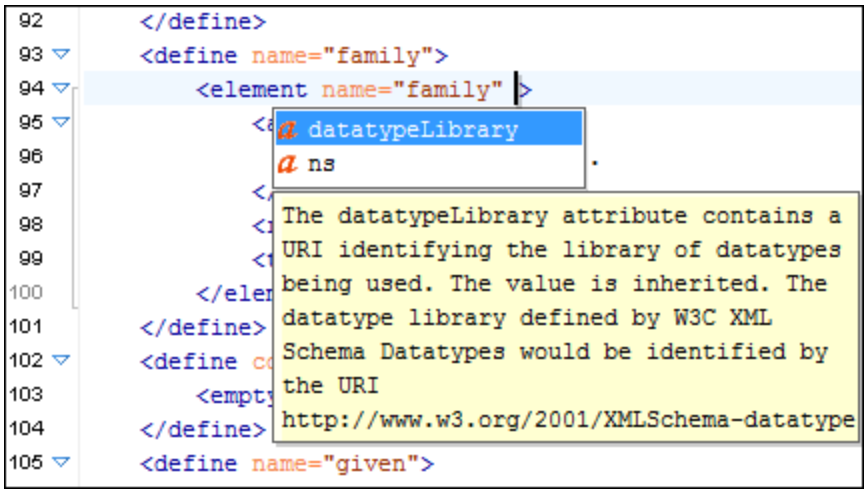

Figure 503: Relax NG Content Completion Assistant

Syntax Highlighting in Relax NG Schemas

Oxygen XML Editor plugin supports syntax highlighting in Relax NG schemas to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for Relax NG schemas, follow these steps:

1. Open the **Preferences** dialog box .
2. Go to **Editor** > **Syntax Highlight**.
3. Select and expand the **XML** section in the top pane (for RELAX NG Compact Syntax schemas, select and expand the **RNC** section).
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes (for RELAX NG Compact Syntax schemas, the tab is **RNC**).

Tip: Oxygen XML Editor plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor** > **Syntax Highlight** > **Elements/ Attributes by Prefix** preferences page.

Related Information:

Syntax Highlight Preferences on page 92

Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor plugin offers *Quick Fixes* for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

Note: For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

Quick Fixes are available in **Text** mode and **Author** mode.

Oxygen XML Editor plugin provides *Quick Fixes* for numerous types of problems, including the following:

Problem Type	Available Quick Fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content

Problem Type	Available Quick Fixes
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

Related Information:

Schematron Quick Fixes (SQF) on page 579

Relax NG Outline View

The **Outline** view for Relax NG schemas presents a list with the patterns that appear in the diagram in both the **Full Model View** and **Logical Model View** cases and it allows for quick access to a component by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

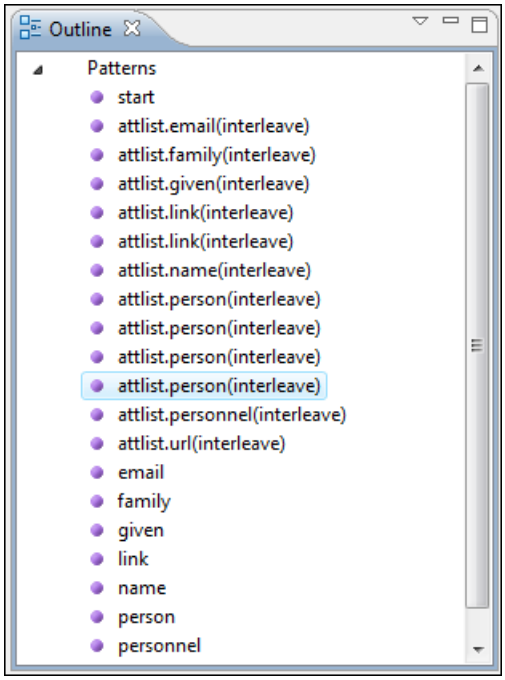

Figure 504: Relax NG Outline View

This view has two modes, with the tree showing either the XML structure or the defined pattern (components) collected from the current document. By default, the **Outline** view presents the components.

When the **Show components** option is selected in the **View menu** on the **Outline** view action bar, the following option is available:

Show XML structure

Shows the XML structure of the current document in a tree-like manner.

The following actions are available in the **View menu** on the **Outline** view action bar when the **Show XML structure** option is selected:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram will be also selected in the **Outline** view.

Show components

Shows the defined pattern collected from the current document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel.

Configure displayed attributes

Displays the **XML Structured Outline** preferences page.

The following contextual menu actions are also available in the **Outline** view when the **Show XML structure** option is selected in the **View menu**:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

Toggle Comment

Comments/uncomments the currently selected element.

Search references

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Opens the **Component Dependencies** view that displays the dependencies of the currently selected component.

Rename Component in

Renames the currently selected component in the context of a scope that you define.

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Delete

Deletes the currently selected component.

Expand All

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

RNG Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a schema. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

If you want to see the hierarchy of a schema, select the desired schema in the **Navigator** view and choose **Resource Hierarchy** from the contextual menu.

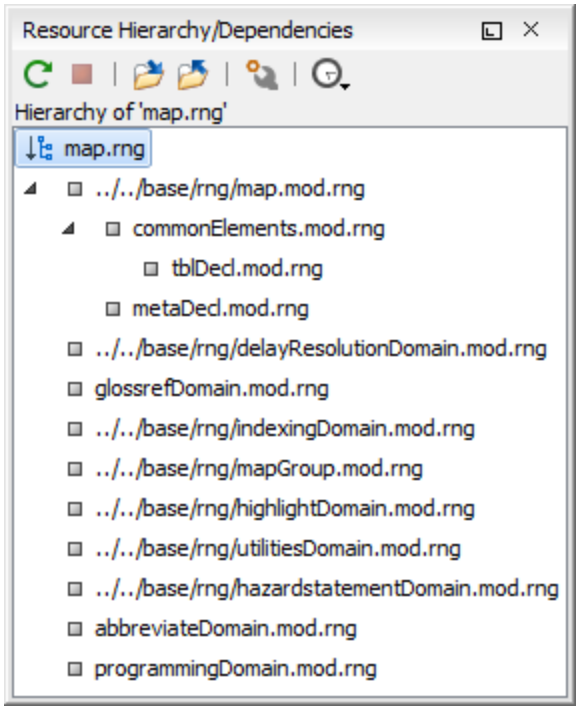

Figure 505: Resource Hierarchy/Dependencies View - hierarchy for `map.rng`

If you want to see the dependencies of a schema, select the desired schema in the **Navigator** view and choose **Resource Dependencies** from the contextual menu.

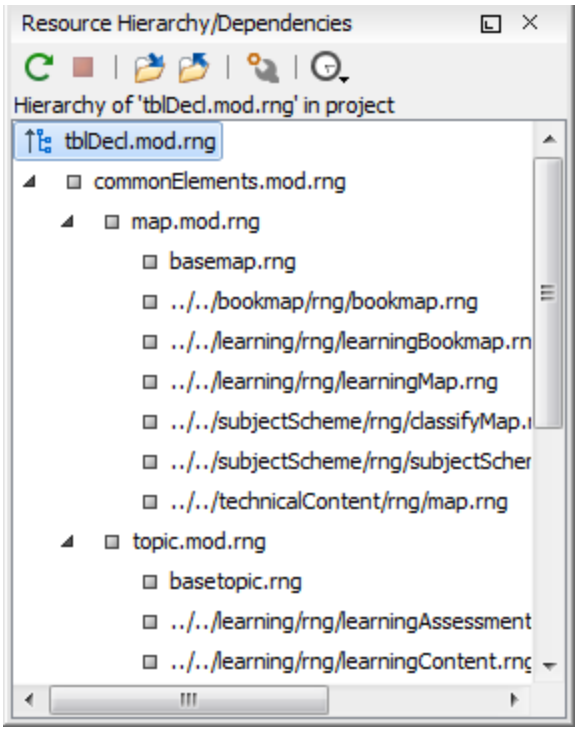

Figure 506: Resource Hierarchy/Dependencies View - Dependencies for `tblDecl.mod.rng`

The following actions are available in the **Resource Hierarchy/Dependencies** view:

Refresh

Refreshes the Hierarchy/Dependencies structure.

Stop

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the **Master Files** directory.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

Note: The **Move resource** or **Rename resource** actions give you the option to update the references to the resource.

Related Information:

Search and Refactor Operations Scope on page 588

Moving/Renaming RNG Resources

You can move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Select this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is selected, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

Note: Updating the references of a resource that is resolved through a catalog is not supported. Also, the update references operation is not supported if the path to the renamed or moved resource contains entities.

Relax NG Schema Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

To see the dependencies of a RelaxNG component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named defines.

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

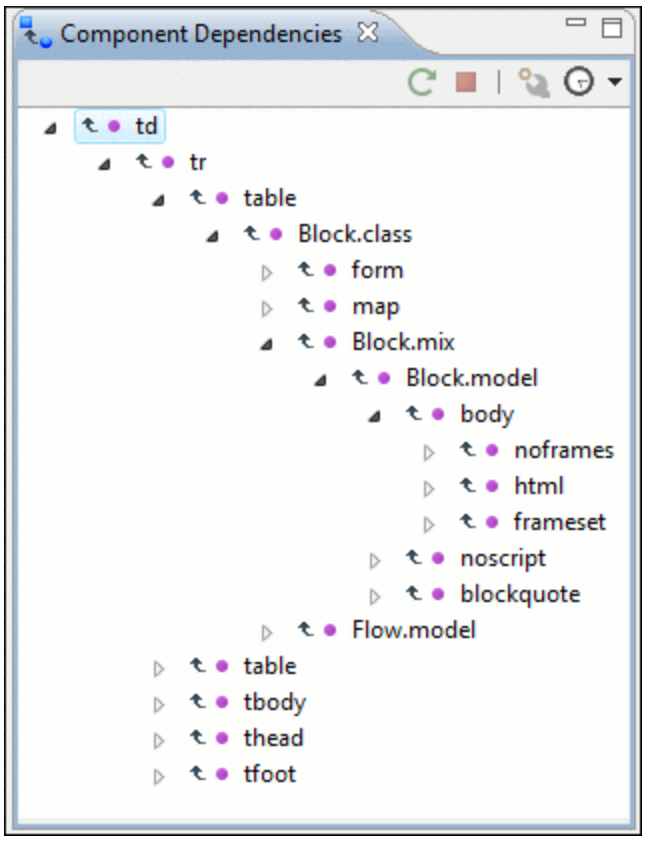

Figure 507: Component Dependencies View - Hierarchy for `xhtml.rng`

The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:

Search and Refactor Operations Scope on page 588

Searching and Refactoring Actions in RNG Schemas

Search Actions

The following search actions can be applied on named *defines* and are available from the **Search** submenu in the contextual menu of the current editor:

- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **XSL** menu:

- **Go to Definition** - Moves the cursor to the definition of the current element in the Relax NG (full syntax) schema.

  Note: You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on named *defines* and are available from the **Refactoring** submenu in the contextual menu of the current editor:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

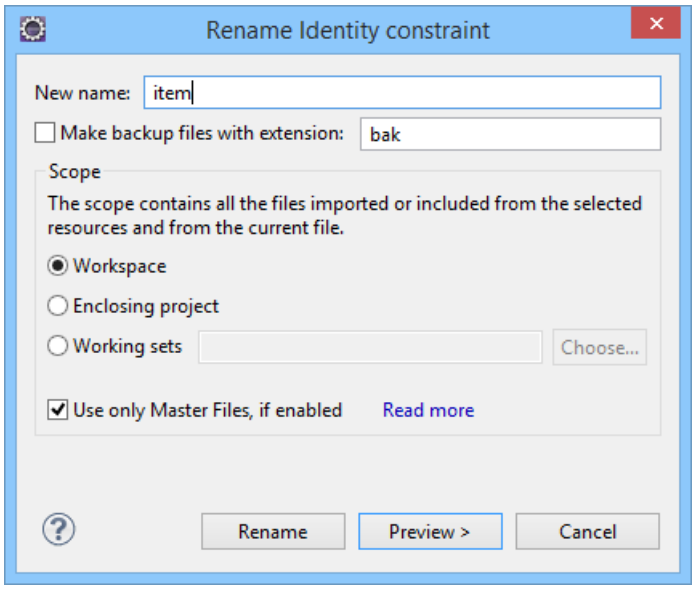

Figure 508: Rename Identity Constraint Dialog Box

RNG Quick Assist Support

The *Quick Assist* support improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist* feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon ( ) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Ctrl + 1** (**Meta 1** on Mac OS X) keyboard shortcuts.

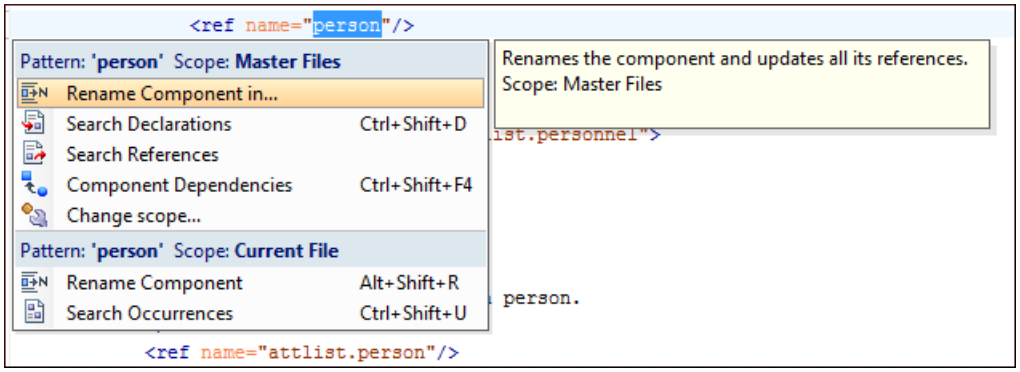

Figure 509: RNG Quick Assist Support

The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Configuring a Custom Datatype Library for a RELAX NG Schema

A RELAX NG schema can declare a custom datatype library for the values of elements found in XML document instances. The datatype library must be developed in Java and it must implement the interface specified on the www.thaiopensource.com website.

The *JAR* file containing the custom library and any other dependent *JAR* file must be added to the classpath of the application, that is the *JAR* files must be added to the folder *[ECLIPSE-INSTALL-DIR]*`/lib` and a line `<library name="lib/custom-library.jar"/>` must be added for each *JAR* file to the file *[ECLIPSE-INSTALL-DIR]*`/plugin.xml` in the <runtime> element.

To load the custom library, restart the Eclipse platform.

Editing NVDL Schemas

Some complex XML documents are composed by combining elements and attributes from namespaces. Furthermore, the schemas that define these namespaces are not even developed in the same schema language. In such cases, it is difficult to specify in the document all the schemas that must be taken into account for validation of the XML document or for content completion. An NVDL (Namespace Validation Definition Language) schema can be used. This schema allows the application to combine and interleave multiple schemas of different types (W3C XML Schema, RELAX NG schema, Schematron schema) in the same XML document.

Oxygen XML Editor plugin offers support for editing NVDL schema files in the following editing modes:

- **Text editing mode** - Allows you to edit NVDL schema files in a source editing mode, along with a schema design pane with two tabs that offer a **Full Model View** and **Logical Model View**.
- **Grid editing mode** - Displays NVDL schema files in a structured spreadsheet-like grid.
- **Author editing mode** - The visual **Author** mode is also available for Relax NG schema files, presenting them in a compact and easy to understand representation.

For information about applying and detecting schemas, see Associating a Schema to XML Documents on page 579.

Related Information:

Associating a Schema to XML Documents on page 579

NVDL Schema Diagram

This section explains how to use the graphical diagram of a NVDL schema.

Introduction to NVDL Schema Diagram Editor

Oxygen XML Editor plugin provides a simple, expressive, and easy-to-read schema diagram editor for NVDL schemas.

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, and BMP images. It helps both schema authors in developing the schema and content authors that are using the schema to understand it.

Oxygen XML Editor plugin is the only XML Editor to provide a side by side source and diagram presentation and have them real-time synchronized:

- The changes you make in the Editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram, selects the underlying code in the source editor.

Full Model View

When you create a schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The diagram view has two tabbed panes offering a **Full Model View** and a **Logical Model View**.

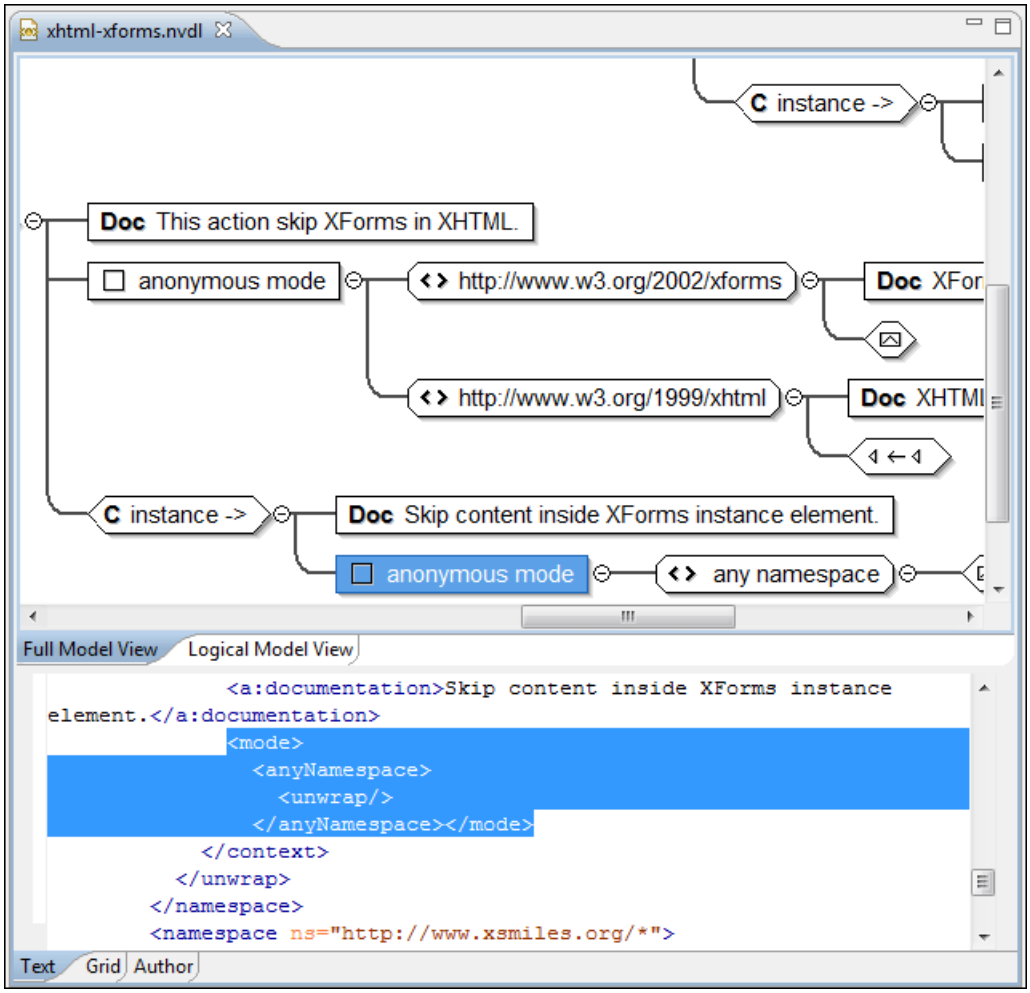

Figure 510: NVDL Schema Editor - Full Model View

The **Full Model View** renders all the NVDL elements with intuitive icons. This representation coupled with the synchronization support makes the schema navigation easy.

Double-click any diagram component to edit its properties.

Logical Model View

The **Logical Model View** presents the compiled schema in the form of a single pattern. The patterns that form the element content are defined as top level patterns with generated names. These names are generated depending of the elements name class.

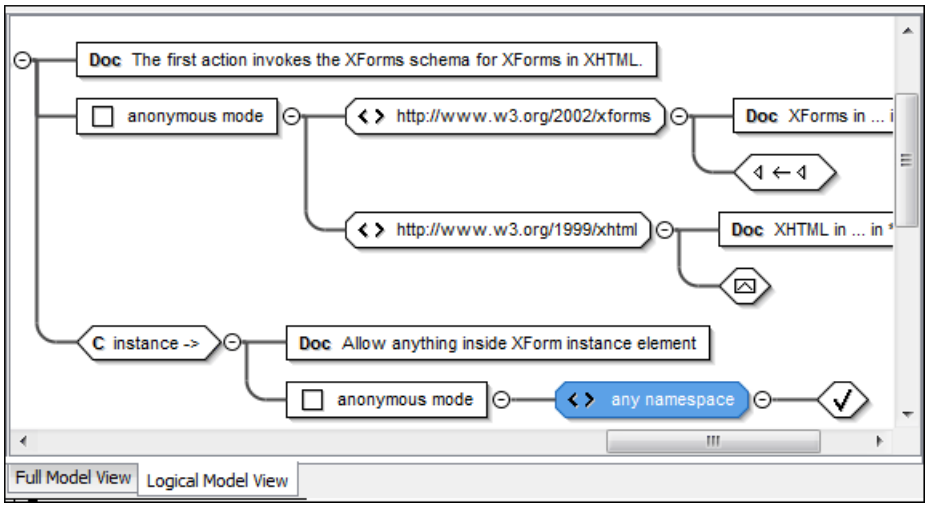

Figure 511: Logical Model View for an NVDL Schema

Actions Available in the Diagram Editor

The contextual menu offers the following actions:

Show only the selected component

Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

Show Annotations

Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

Auto expand to references

This option controls how the schema diagram is automatically expanded. For instance, if you select it and then edit a top-level element or you trigger a diagram refresh, the diagram will be expanded until it reaches the referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

Collapse Children

Collapses the children of the selected view.

Expand Children

Expands the children of the selected view.

Print Selection

Prints the selected view.

Save as Image

Saves the current selection as image, in JPEG, BMP, SVG or PNG format.

Refresh

Refreshes the schema diagram according to the changes in your code (changes in your imported documents or those that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the **Logical Model View** instead of the diagram.

Validating NVDL Schema Documents

By default, NVDL schema files are validated as you type. To change this, open the **Preferences** dialog box , go to **Editor** > **Document Checking**, and deselect the **Enable automatic validation** option.

To validate an NVDL schema document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **XML** menu. When Oxygen XML Editor plugin validates an NVDL schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Related Information:
Validating XML Documents Against a Schema on page 561

Content Completion in NVDL Schemas

The intelligent *Content Completion Assistant* allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box , go to **Editor** > **Content Completion**, and deselect the **Enable content completion** option.

When active, the *Content Completion Assistant* displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on OS X)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

If you are using the concept of *master files* to import/include modules, the *Content Completion Assistant* collects its components starting from the *master files*. The *master files* can be defined in the project or in the associated validation scenario. For more information about the *Master Files* support in Oxygen XML Editor plugin, see Defining Master Files at Project Level.

The *Content Completion Assistant* also offers additional information for the element and attribute proposals in the form of schema annotations that is displayed in a tooltip.

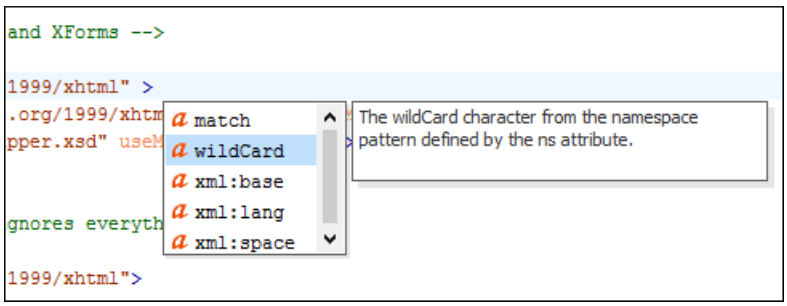

Figure 512: NVDL Content Completion Assistant

Syntax Highlighting in NVDL Schemas

Oxygen XML Editor plugin supports syntax highlighting in NVDL schemas to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for NVDL schemas, follow these steps:

1. Open the **Preferences** dialog box .
2. Go to **Editor** > **Syntax Highlight**.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

Tip: Oxygen XML Editor plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor** > **Syntax Highlight** > **Elements/Attributes by Prefix** preferences page.

Related Information:

Syntax Highlight Preferences on page 92

NVDL Outline View

The **Outline** view for NVDL schemas presents a list with the named or anonymous rules that appear in the diagram and it allows for quick access to a rule by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

NVDL Schema Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

To see the dependencies of an NVDL component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named modes.

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

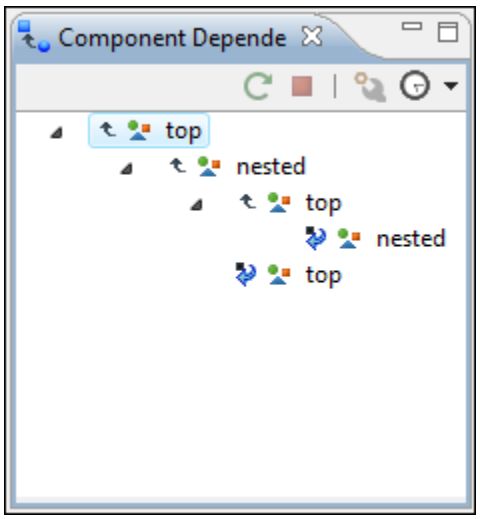

Figure 513: Component Dependencies View - Hierarchy for `test.nvdl`

The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Searching and Refactoring Actions in NVDL Schemas

Search Actions

The following search actions can be applied on `name`, `useMode`, and `startMode` attributes and are available from the **Search** submenu in the contextual menu of the current editor:

- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **XSL** menu:

- **Go to Definition** - Moves the cursor to its definition in the schema used by the NVDL to validate it.

  Note: You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on `name`, `useMode`, and `startMode` attributes and are available from the **Refactoring** submenu in the contextual menu of the current editor:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

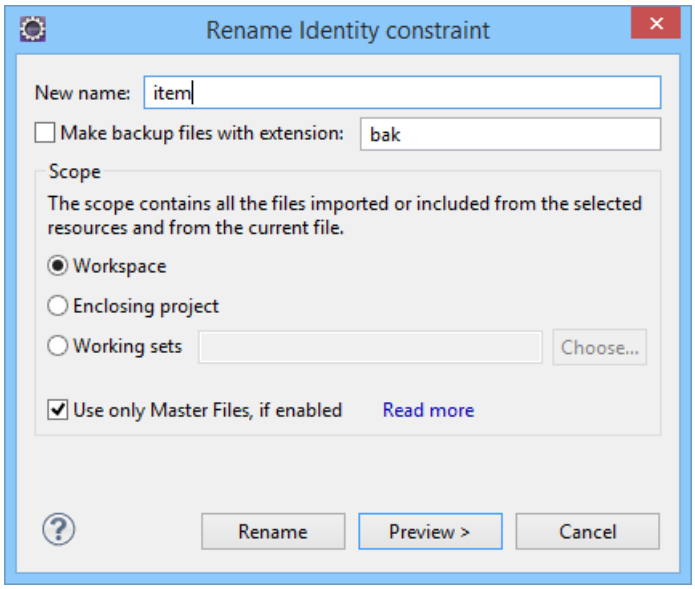

Figure 514: Rename Identity Constraint Dialog Box

Editing JSON Documents

This section explains the features of the Oxygen XML Editor plugin JSON Editor and how to use them.

Editing JSON Documents in Text Mode

When editing JSON documents in the **Text** editing mode, the usual text editing actions are available, along with other editor specific actions, including:

- Find / Replace
- Drag and Drop
- Validation
- Format and Indent (Pretty Print)

Note: You can run XPath expressions on opened JSON documents, but in **Text** mode the XPath results cannot be mapped in the document. However, they can be mapped in the **Grid** editing mode. You can use the **Grid** button at the bottom of the editor panel to switch to that editing mode.

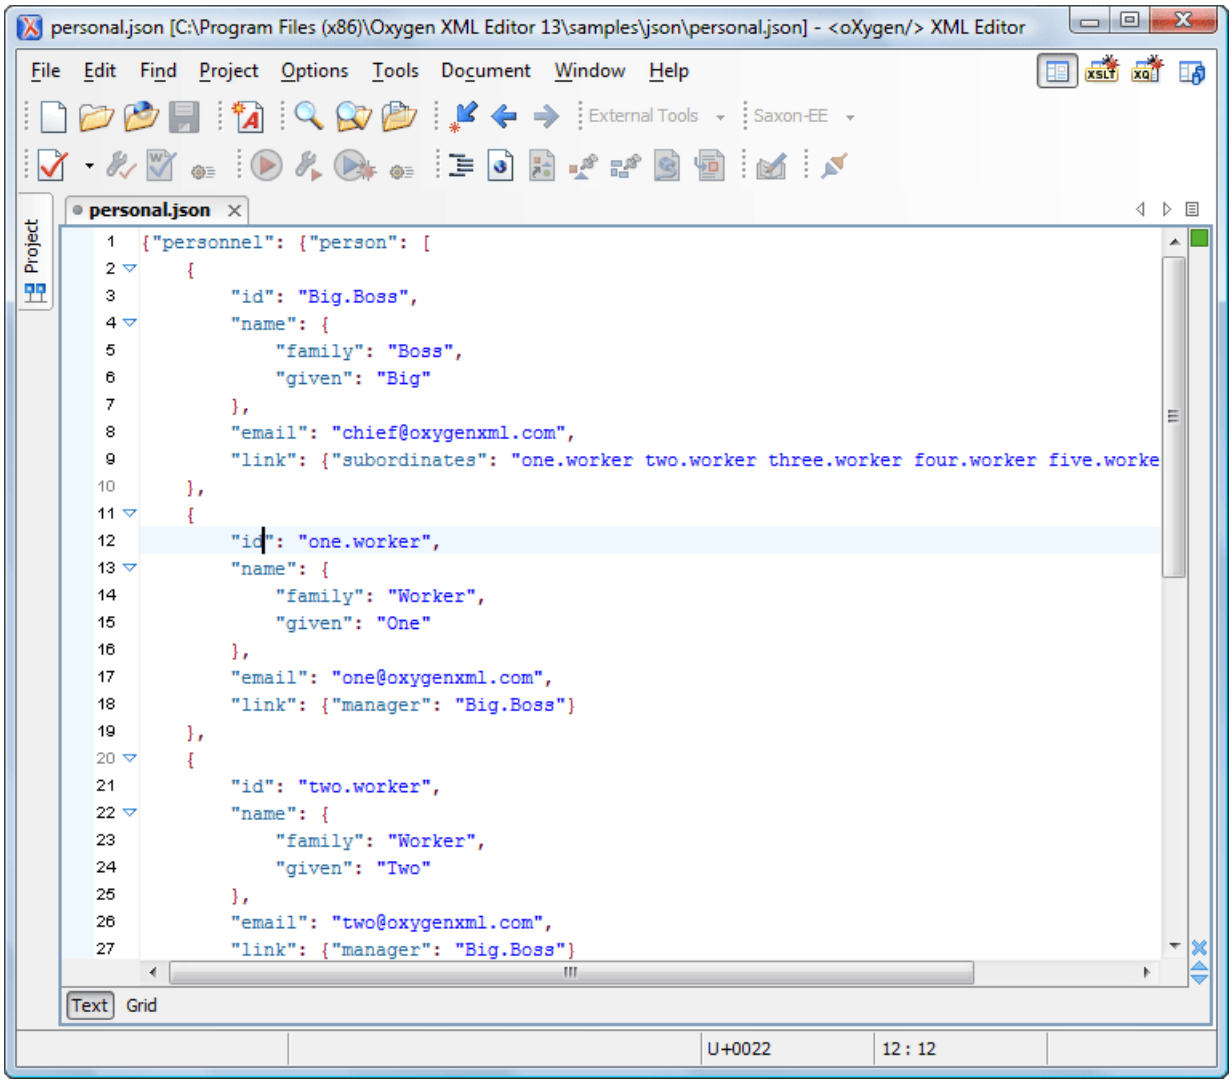

Figure 515: JSON Editor Text Mode

Related Information:

Editing JSON Documents in Grid Mode on page 779

Editing JSON Documents in Grid Mode

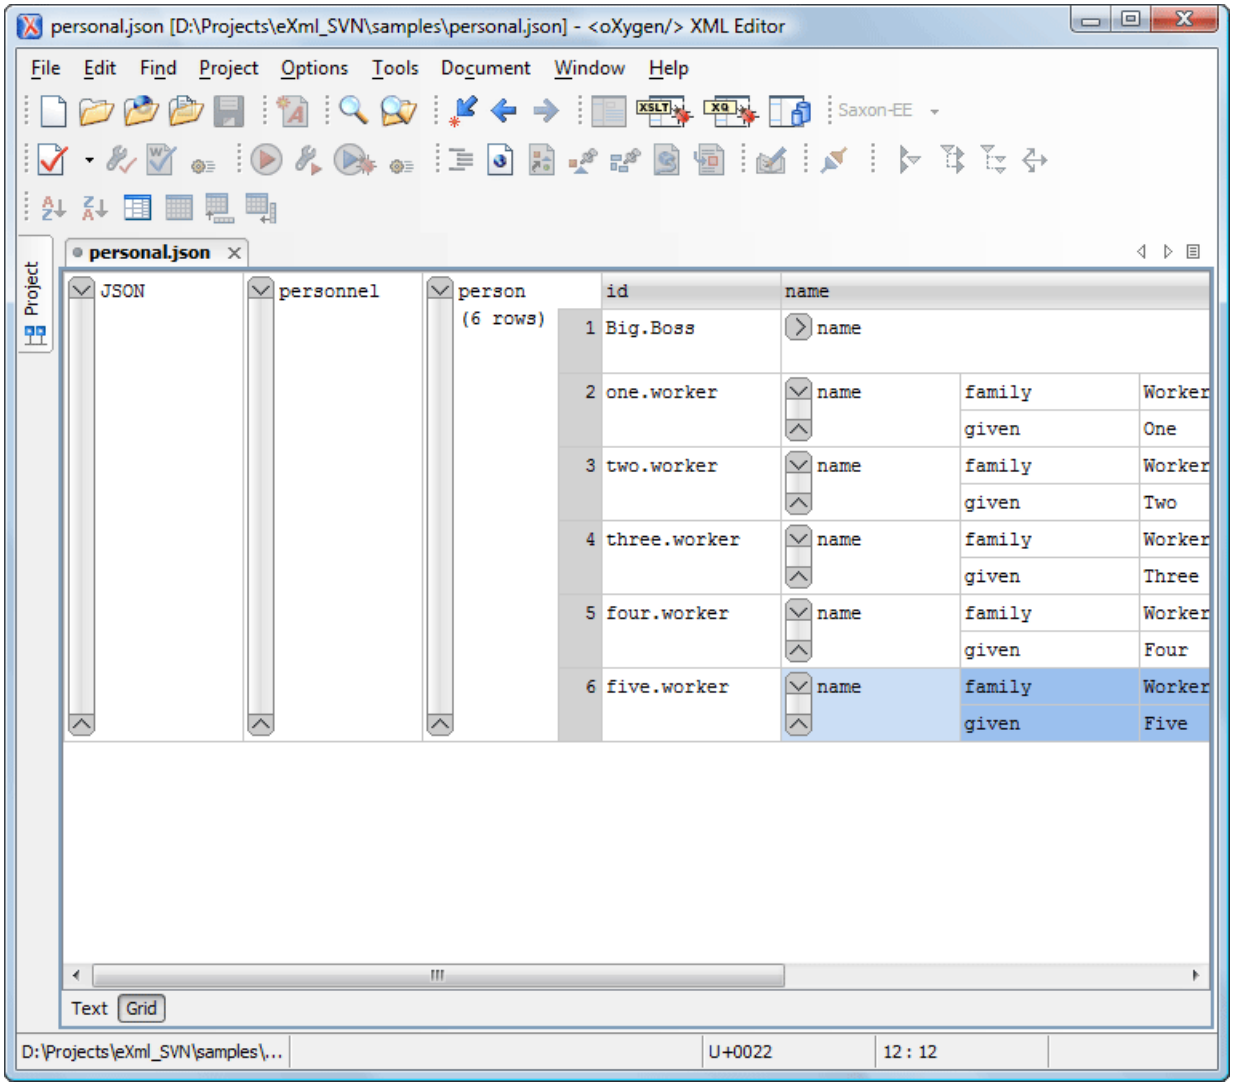

Figure 516: JSON Editor Grid Mode

Oxygen XML Editor plugin allows you to view and edit the JSON documents in the **Grid** mode. The JSON is represented in **Grid** mode as a compound layout of nested tables in which the JSON data and structure can be easily manipulated with table-specific operations or drag and drop operations on the grid components. You can also use the following JSON-specific contextual actions:

Array

Useful when you want to convert a JSON *value* to *array*.

Insert value before

Inserts a value before the currently selected one.

Insert value after

Inserts a value after the currently selected one.

Append value as child

Appends a value as a child of the currently selected value.

You can customize the JSON grid appearance according to your needs. For instance, you can change the font, the cell background, foreground, or even the colors from the table header gradients. The default width of the columns can also be changed.

Related Information:

Grid Editing Mode on page 184

Grid Preferences on page 82

Validating JSON Documents

Oxygen XML Editor plugin includes a built-in JSON validator (based on the free JAVA source code available on www.json.org), integrated with the general validation support.

Related Information:

Presenting Validation Errors in Text Mode on page 169
Document Checking Preferences on page 69

Syntax Highlighting in JSON Documents

Oxygen XML Editor plugin supports syntax highlighting in JSON files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for JSON files, follow these steps:

1. Open the **Preferences** dialog box .
2. Go to **Editor** > **Syntax Highlight**.
3. Select and expand the **JSON** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

Syntax Highlight Preferences on page 92

Folding in JSON

In a large JSON document, the data enclosed in the '{' and '}' characters can be collapsed so that only the needed data remain in focus. The folding features available for XML documents are available in JSON documents.

JSON Outline View

The **Outline** view for JSON documents displays the list of all the components of the JSON document you are editing. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

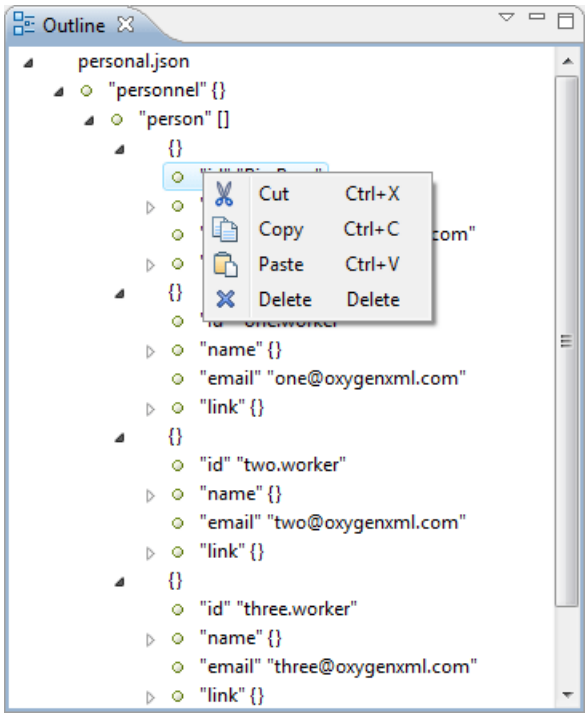

Figure 517: JSON Outline View

The following actions are available in the contextual menu of the JSON **Outline** view:

- **Cut**
- **Copy**
- **Paste**
- **Delete**

The **View menu** on the JSON **Outline** view action bar includes a **Selection update on cursor move** option that allows you to control the synchronization between the **Outline** view and source the document. Oxygen XML Editor plugin synchronizes the selection in the **Outline** view with the cursor moves or the changes you make in the JSON editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

JSON to XML Converter

Oxygen XML Editor plugin includes a useful and simple tool for converting JSON files to XML. It can be found in the **XML Tools** menu.

To convert a JSON document to XML, follow these steps:

1. Select the **JSON to XML** action from the **XML Tools** menu.
   The **JSON to XML** dialog box is displayed:

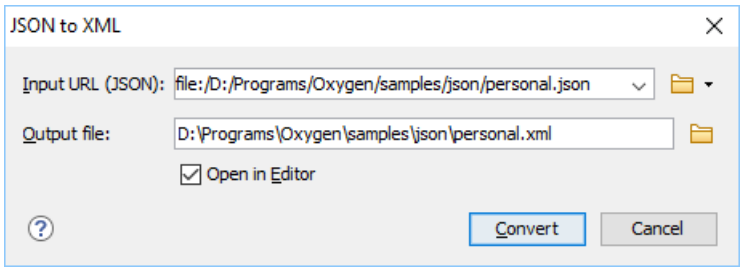

Figure 518: JSON to XML Dialog Box

2. Choose or enter the **Input URL** of the JSON document.

3. Choose the path of the **Output file** that will contain the resulting XML document.
4. Select the **Open in Editor** option to open the resulting XML document in the main editing pane.
5. Click the **Convert** button.

The original JSON document is now converted to an XML document.

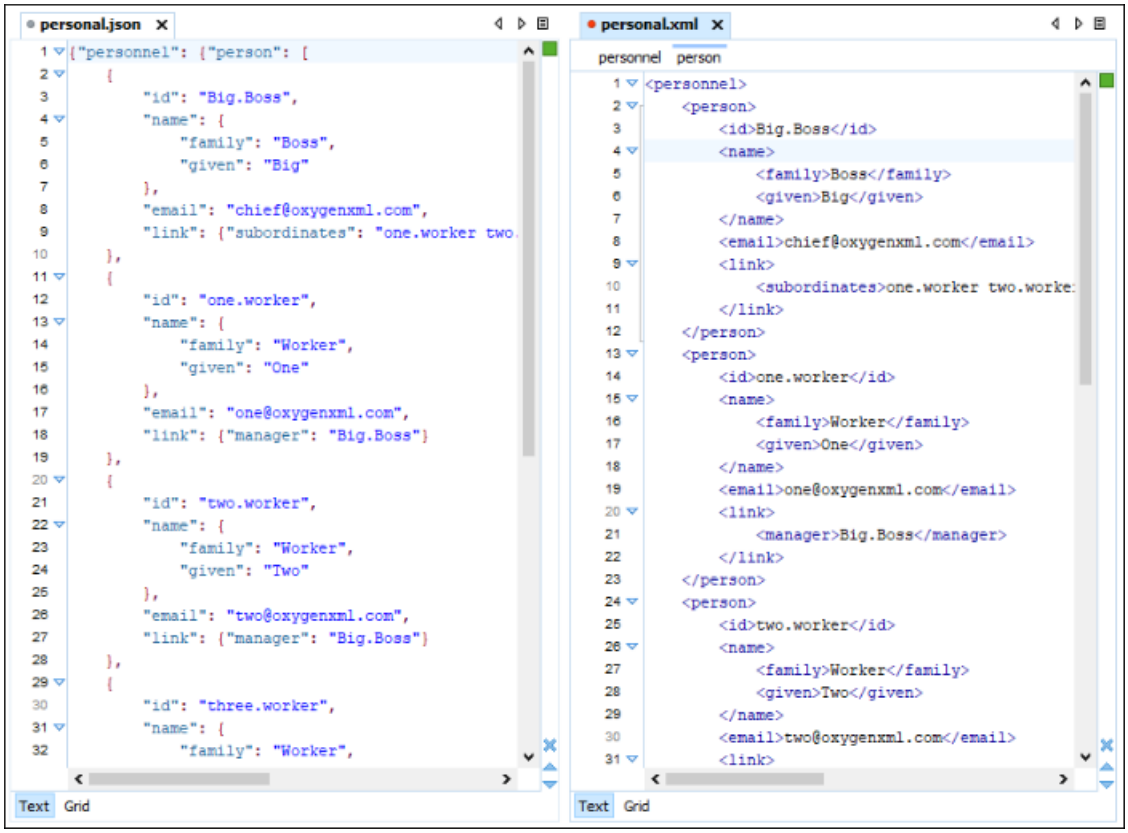

Figure 519: Example: XML to JSON Operation Result

XML to JSON Converter

Oxygen XML Editor plugin includes a useful and simple tool for converting XML files to JSON. It can be found in the **XML Tools** menu.

To convert an XML document to JSON, follow these steps:

1. Select the **XML to JSON** action from the **XML Tools** menu.

   The **XML to JSON** dialog box is displayed:

   Figure 520: XML to JSON Dialog Box
2. Choose or enter the **Input URL** of the XML document.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
5. Click the **Convert** button.

The original XML document is now converted to a JSON document.

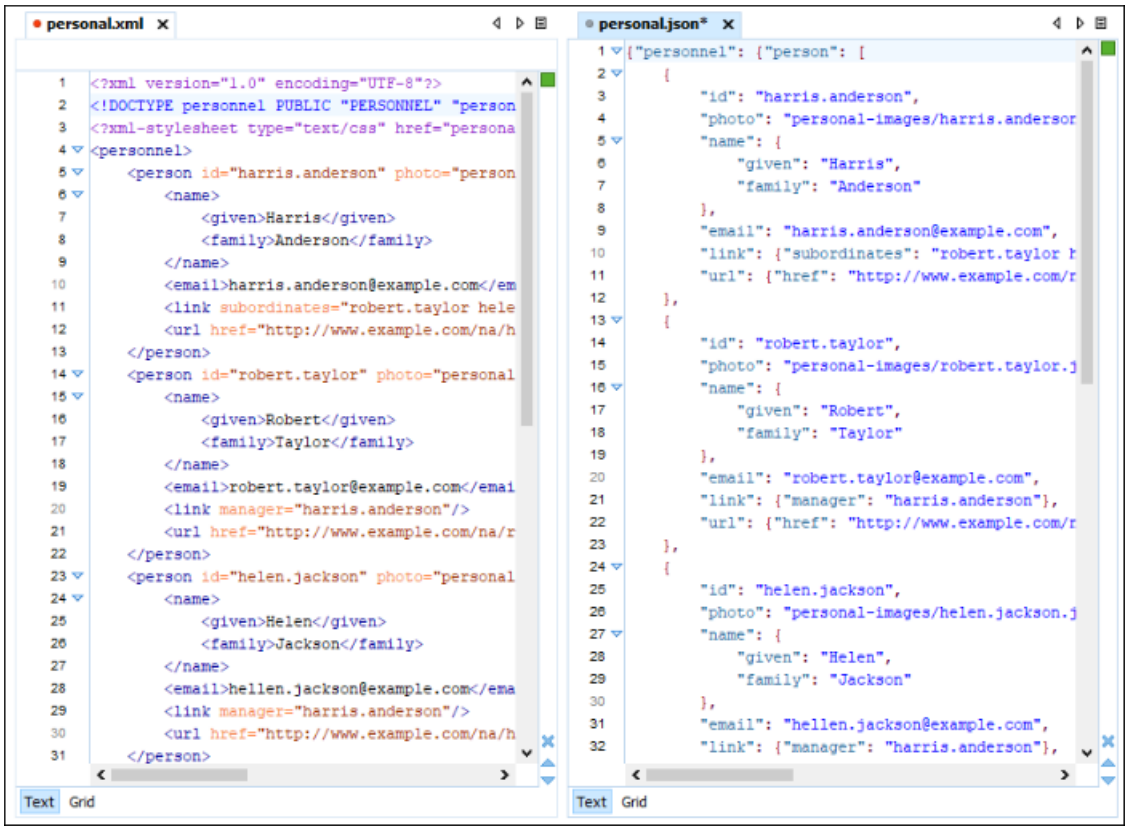

Figure 521: Example: XML to JSON Operation Result

Editing StratML Documents

Strategy Markup Language (StratML) is an XML vocabulary and schema for strategic plans. Oxygen XML Editor plugin supports StratML Part 1 (Strategic Plan) and StratML Part 2 (Performance Plans and Reports) and provides templates for the following documents:

- **Strategic Plan** (StratML Part 1)
- **Performance Plan** (StratML Part 2)
- **Performance Report** - (StratML Part 2)
- **Strategic Plan** - (StratML Part 2)

You can view the components of a StratML document in the **Outline** view. Oxygen XML Editor plugin implements a default XML with XSLT transformation scenario for this document type, called StratML to HTML.

Editing XLIFF Documents

XLIFF (*XML Localization Interchange File Format*) is an XML-based format that was designed to standardize the way multilingual data is passed between tools during a localization process. Oxygen XML Editor plugin provides the following support for editing XLIFF documents:

XLIFF Version 1.2 and 2.0 Support:

- New document templates for XLIFF documents.
- A default CSS file (`xliff.css`) used for rendering XLIFF content in **Author** mode is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/xliff/css/`.
- Validation and content completion support using local catalogs. The default catalog (`catalog.xml`) for version 1.2 is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/xliff/xsd/1.2`, and for version 2.0 in *[OXYGEN_INSTALL_DIR]*`/frameworks/xliff/xsd/2.0`.

XLIFF Version 2.0 Enhanced Support:

- Support for validating XLIFF 2.0 documents using modules. The default modules are stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/xliff/xsd/2.0/modules`.

Editing XLIFF Documents in Author Mode

By default, when you create a new XLIFF document from a template, Oxygen XML Editor plugin opens it in **Text** mode. Aside from the normal editing features found in **Text** mode, you can also switch to **Author** mode where Oxygen XML Editor plugin offers some special form controls specifically for XLIFF documents. These form controls simply allow you to add or edit XLIFF attribute values and content in a visual mode.

For XLIFF version 2.0 documents, you can also change the style of the visual editing mode. The **Styles** drop-down menu on the toolbar offers the following styles that are specifically designed to render XLIFF 2.0 documents in **Author** mode:

- **Default**
- **Classic**
- **Translate**

Editing JavaScript Documents

This section explains the features of the Oxygen XML Editor plugin JavaScript Editor and how you can use them.

JavaScript Editing Actions

Oxygen XML Editor plugin allows you to create and edit JavaScript files and assists you with useful features such as syntax highlight, content completion, and outline view. To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

```
90    function change_sides(front) {
91      switch ($('#version-switch').text()) {
92        case 'Original':
93          $('#holder').html($('div .original[id]').html());
94          make_clickable();
95          $('#version-switch').text('Translation 1');
96          break;
97        case 'Translation 1':
98          $('#holder').html($('div .translation[id]').filter(':first').html());
99          $('#version-switch').text('Translation 2');
100         break;
101       case 'Translation 2':
102         $('#holder').html($('div .translation[id]').filter(':last').html());
103         $('#version-switch').text('Original');
104         break;
105       }
106     }
```

Figure 522: JavaScript Editor Text Mode

The contextual menu of the **JavaScript** editor offers the following actions:

Cut

Allows you to cut fragments of text from the editing area.

Copy

Allows you to copy fragments of text from the editing area.

Paste

Allows you to paste fragments of text in the editing area.

Toggle Comment

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a single comment for the entire fragment you want to comment.

Toggle Line Comment

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a comment for each line of the fragment you want to comment.

Go to Matching Bracket

Use this option to find the closing, or opening bracket, matching the bracket at the cursor position. When you select this option, Oxygen XML Editor plugin moves the cursor to the matching bracket, highlights its row, and decorates the initial bracket with a rectangle.

Note: A rectangle decorates the opening or closing bracket that matches the current one, at all times.

Source

Allows you to select one of the following actions:

To Lower Case

Converts the selection content to lower case characters.

To Upper Case

Converts the selection content to upper case characters.

Capitalize Lines

Converts to upper case the first character of every selected line.

Join and Normalize Lines

Joins all the rows you select to one row and normalizes the content.

Insert new line after

Inserts a new line after the line at the cursor position.

Modify all matches

Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Open

Allows you to select one of the following actions:

- **Open File at Cursor** - select this action to open the source of the file located at the cursor position
- **Open File at Cursor in System Application** - select this action to open the source of the file located at the cursor position with the application that the system associates with the file

Compare

Select this option to open the **Compare Files** tool to compare the file you are editing with a file you choose in the dialog box.

Validating JavaScript Files

You have the possibility to validate the JavaScript document you are editing. Oxygen XML Editor plugin uses the Mozilla Rhino library for validation. For more information about this library, go to http://www.mozilla.org/rhino/doc.html. The JavaScript validation process checks for errors in the syntax. Calling a function that is not defined is not treated as an error by the validation process. The interpreter discovers this error when executing the faulted line. Oxygen XML Editor plugin can validate a JavaScript document both on-request and automatically.

Content Completion in JavaScript Documents

When you edit a JavaScript document, the *Content Completion Assistant* presents you a list of the elements you can insert at the cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut.

For an enhanced assistance, JQuery methods are also presented. The following icons decorate the elements in the content completion list of proposals depending on their type:

- f - function

- V - variable
- ▢ - object
- ● - property
- $f_{()}$ - method

Note: These icons decorate both the elements from the content completion list of proposals and from the **Outline** view.

Figure 523: JavaScript Content Completion Assistant

The *Content Completion Assistant* collects:

- Method names from the current file and from the library files.
- Functions and variables defined in the current file.

If you edit the content of a function, the content completion list of proposals contains all the local variables defined in the current function, or in the functions that contain the current one.

Syntax Highlighting in JavaScript Documents

Oxygen XML Editor plugin supports syntax highlighting in JavaScript files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for JavaScript files, follow these steps:

1. Open the **Preferences** dialog box .
2. Go to **Editor** > **Syntax Highlight**.
3. Select and expand the **JavaScript** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

Syntax Highlight Preferences on page 92

JavaScript Outline View

Oxygen XML Editor plugin present a list of all the components of the JavaScript document you are editing in the **Outline** view. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

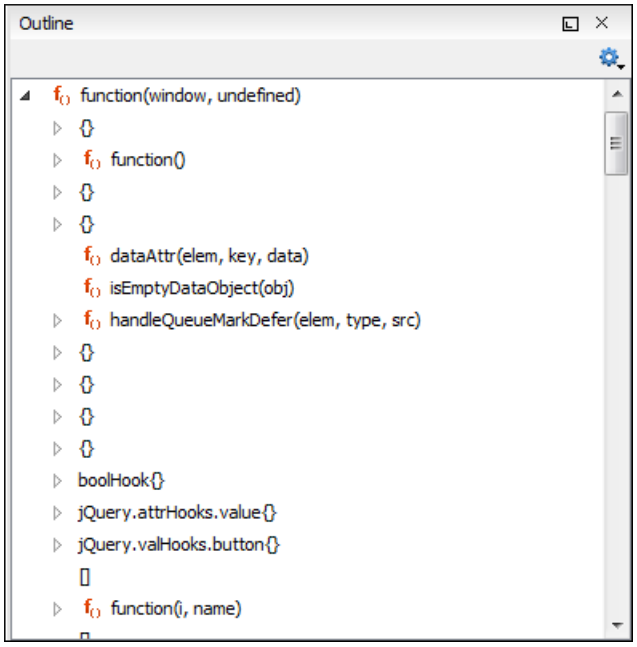

Figure 524: JavaScript Outline View

The following icons decorate the elements in the **Outline** view depending on their type:

- - function
- - variable
- - object
- - property
- - method

The contextual menu of the JavaScript **Outline** view contains the usual **Cut**, **Copy**, **Paste**, and **Delete** actions. From the **Settings** menu, you can select the **Update selection on cursor move** option to synchronize the **Outline** view with the editing area.

Editing XProc Scripts

An XProc script is edited as an XML document that is validated against a RELAX NG schema. If the script has an associated transformation scenario, then the XProc engine from the scenario is invoked as validating engine. The default engine for XProc scenarios is the Calabash engine that comes bundled with Oxygen XML Editor plugin version 20.0.

XProc Content Completion

Oxygen XML Editor plugin helps you edit a XProc scripts through the *Content Completion Assistant*, offering proposals that are valid at the cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut.

The content completion inside the element `input/inline` from the XProc namespace *http://www.w3.org/ns/xproc* offers elements from the following schemas depending both on the `port` attribute and the parent of the `input` element. When invoking the content completion inside the XProc element `inline`, the list of content completion proposals is populated as follows:

- If the value of the `port` attribute is `stylesheet` and the `xslt` element is the parent of the `input` elements, the *Content Completion Assistant* offers XSLT elements.
- If the value of the `port` attribute is `schema` and the `validate-with-relax-ng` element is the parent of the `input` element, the *Content Completion Assistant* offers RELAX NG schema elements.
- If the value of the `port` attribute is `schema` and the `validate-with-xml-schema` element is the parent of the `input` element, the *Content Completion Assistant* offers XML Schema schema elements.
- If the value of the `port` attribute is `schema` and the `validate-with-schematron` element is the parent of the `input` element , the *Content Completion Assistant* offers either ISO Schematron elements or Schematron 1.5 schema elements.
- If the above cases do not apply, then the *Content Completion Assistant* offers elements from all the schemas from the above cases.

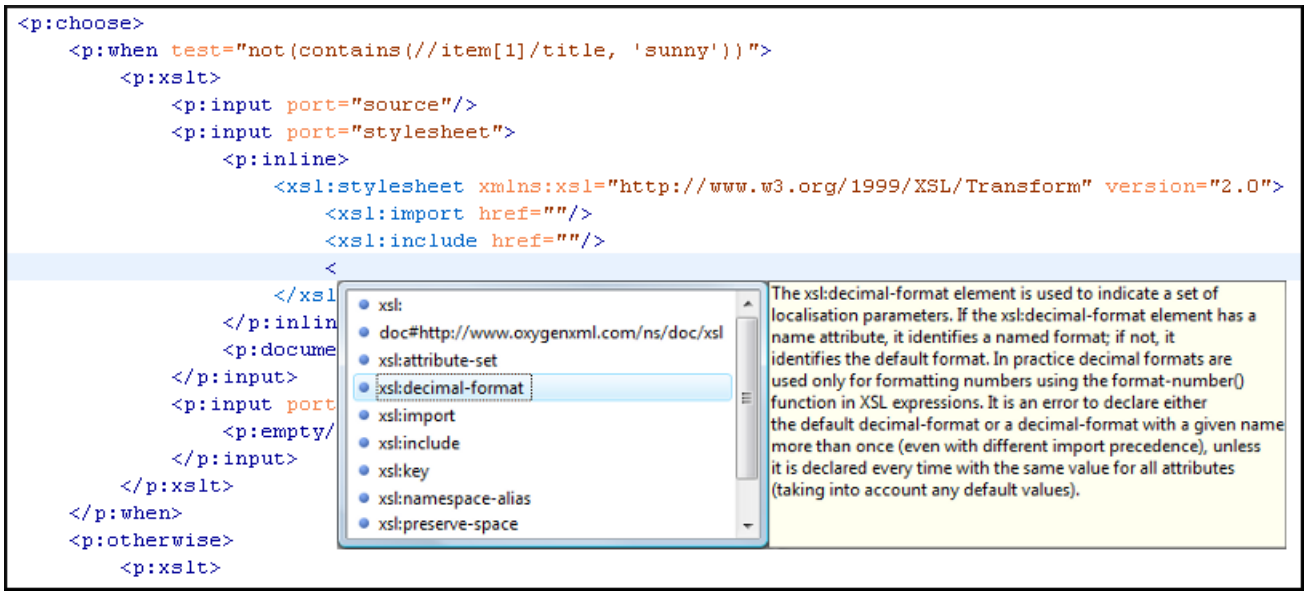

Figure 525: XProc Content Completion

XProc Syntax Highlighting

The XProc editor assists you in writing XPath expressions by offering dedicated coloring schemes for syntax highlighting.

To customize the colors or styles used for the syntax highlighting colors for XProc, follow these steps:

1. Open the **Preferences** dialog box .
2. Go to **Editor** > **Syntax Highlight**.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

Enabling Extensions in Calabash

If you are using the default Calabash engine, it is possible to configure extensions (for a list of the valid extensions, see http://xmlcalabash.com/docs/reference/cfg.extension.html).

To configure an extension:

1. Edit the following file: `OXYGEN_INSTALL_DIR/lib/xproc/calabash/engine.xml`.
2. Add the extension and its value as a `system-property`, as in the following example:

```
<system-property name="com.xmlcalabash.allow-text-results" value="true"/>
```

Related Information:

This type of transformation specifies the parameters and location of an XProc script.

Integrating an External XProc Engine on page 974

Editing Schematron Schemas

Schematron is a simple and powerful Structural Schema Language for making assertions about patterns found in XML documents. It relies almost entirely on XPath query patterns for defining rules and checks. Schematron validation rules allow you to specify a meaningful error message. This error message is provided to you if an error is encountered during the validation stage.

Oxygen XML Editor plugin assists you in editing Schematron documents with schema-based content completion, syntax highlight, search and refactor actions, and dedicated icons for the **Outline** view. You can create a new Schematron schema using one of the Schematron templates available in the **New from Templates** wizard.

For information about applying and detecting Schematron schemas, see Associating a Schema to XML Documents on page 579.

Validating XML Documents Against Schematron

The Skeleton XSLT processor is used for validation and conforms with ISO Schematron or Schematron 1.5. It allows you to validate XML documents against Schematron schemas or against combined RELAX NG / W3C XML Schema and Schematron.

How to Specify the Query Language Binding

You can specify the query language binding to be used in the Schematron schema by doing the following:

- For embedded ISO schematron, open the **Preferences** dialog box , go to **XML** > **XML Parser** > **Schematron**, and select it in the **Embedded rules query language binding** option.
- For standalone ISO Schematron, specify the version by setting the query language to be used in a `queryBinding` attribute on the schema root element. For more information, see the Query Language Binding section of the Schematron specifications.
- For Schematron 1.5 (standalone and embedded), open the **Preferences** dialog box , go to **XML** > **XML Parser** > **Schematron**, and select the version in the **XPath Version** option.

Multi-Lingual Support in Schematron Messages

You can specify the desired language for the validation messages in the **Schematron Preferences** page. The Schematron validation messages can be presented in multiple languages by defining the language for each message using the Schematron `diagnostics`. For more information, see the Use of Schematron for Multi-Lingual Schemas specification.

How to Customize Color Schemes in Schematron

The Schematron editor renders the XPath expressions with dedicated coloring schemes . To customize the coloring schemes, open the **Preferences** dialog box and go to **Editor** > **Syntax Highlight**.

Schematron Transformation Scenario

When you create a Schematron document, Oxygen XML Editor plugin provides a built-in transformation scenario. You can use this scenario to obtain the XSLT style-sheet corresponding to the Schematron schema. You can apply this XSLT stylesheet to XML documents to obtain the Schematron validation results.

For more information about the Schematron support in Oxygen XML Editor plugin, watch our video demonstrations:

https://www.youtube.com/embed/HdcZA3DJi7E

https://www.youtube.com/embed/y3u3wlO92e4

Editing XML Documents in Text Mode on page 403

Associating a Schema to XML Documents on page 579

Editing Schematron Schema in the Master Files Context

Smaller interrelated modules that define a complex Schematron cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a diagnostic defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor plugin provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You cat set a main Schematron document either using the *master files* support from the **Navigator** view, or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor plugin warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger schema structure.
- *Content Completion Assistant* displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.

Validating Schematron Documents

By default, a Schematron schema is validated as you type. To change this, open the **Preferences** dialog box , go to **Editor** > **Document Checking**, and deselect the **Enable automatic validation** option.

To validate a Schematron document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **XML** menu. When Oxygen XML Editor plugin validates a Schematron schema, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Oxygen XML Editor plugin offers an error management mechanism capable of pinpointing errors in XPath expressions and in the included schema modules.

Related Information:

Presenting Schematron Validation Issues

Presenting Schematron Validation Issues

The possible issues that might occur during the validation process when validating XML documents against Schematron are presented with colored underlines in the editing pane, colored markers in the right vertical stripe, and details about the issues are presented in the **Problems** tab at the bottom area of the Oxygen XML Editor plugin window. Each error is flagged with a severity level that can be: *warning*, *error*, *fatal* or *info*.

To set a severity level, Oxygen XML Editor plugin looks for the following information:

- The **role** attribute, which can have one of the following values:
  - **warn** or **warning** - Sets the severity level to *warning*. By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
  - **error** - Sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
  - **fatal** - Sets the severity level to *fatal*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
  - **info** or **information** - Sets the severity level to *info*. By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.

- The start of the message, after trimming leading white-spaces. Oxygen XML Editor plugin looks to match the following exact string of characters (case sensitive):
  - **Warning:** - Sets the severity level to *warning*. By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
  - **Error:** - Sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
  - **Fatal:** - Sets the severity level to *fatal*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
  - **Info:** - Sets the severity level to *info*. By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.
- If none of the previous rules match, Oxygen XML Editor plugin sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.

Content Completion in Schematron Documents

Oxygen XML Editor plugin helps you edit a Schematron schema through the *Content Completion Assistant*, offering proposals that are valid at the cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut.

When you edit the value of an attribute that refers a component, the proposed components are collected from the entire schema hierarchy. For example, if the editing context is `phase/active/@pattern`, the *Content Completion Assistant* proposes all the defined patterns.

Note: For Schematron resources, the *Content Completion Assistant* collects its components starting from the *master files*. The *master files* can be defined in the project or in the associated validation scenario. For further details about the *Master Files* support go to Defining Master Files at Project Level.

If the editing context is an attribute value that is an XPath expression (such as `assert/@test` or `report/@test`), the *Content Completion Assistant* offers the names of XPath functions, the XPath axes, and user-defined variables.

The *Content Completion Assistant* displays XSLT 1.0 functions and optionally XSLT 2.0 / 3.0 functions in the attributes *path*, *select*, *context*, *subject*, *test* depending on the Schematron options that are set in Preferences pages. If the Saxon 6.5.5 namespace (`xmlns:saxon="http://icl.com/saxon"`) or the Saxon 9.8.0.8 namespace is declared in the Schematron schema (`xmlns:saxon="http://saxon.sf.net/"`) the content completion also displays the XSLT Saxon extension functions as in the following figure:

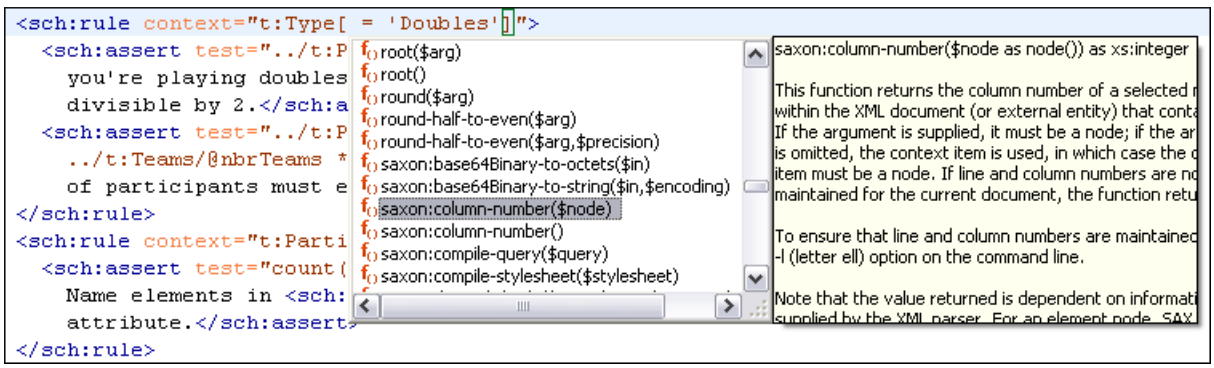

Figure 526: XSLT Extension Functions in Schematron Schema Content Completion

The *Content Completion Assistant* also includes code templates that can be used to quickly insert code fragments into Schematron documents.

Syntax Highlighting in Schematron

Oxygen XML Editor plugin supports syntax highlighting in Schematron schemas to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for Schematron schemas, follow these steps:

1. Open the **Preferences** dialog box .
2. Go to **Editor** > **Syntax Highlight**.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

Tip: Oxygen XML Editor plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor** > **Syntax Highlight** > **Elements/Attributes by Prefix** preferences page.

Related Information:

Syntax Highlight Preferences on page 92

XML Schema or RELAX NG with Embedded Schematron Rules

Schematron rules can be embedded into an XML Schema through annotations (using the `appinfo` element), or in any element on any level of a RELAX NG Schema (taking into account that the RELAX NG validator ignores all elements that are not in the RELAX NG namespace).

Oxygen XML Editor plugin accepts such documents as Schematron validation schemas and it is able to extract and use the embedded rules.

Validating XML Documents with XML Schema and Embedded Schematron

To validate an XML document with XML Schema and its embedded Schematron, you can associate the document like this:

```
<?xml-model href="percent.xsd" type="application/xml"
            schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

Validating XML Documents with Relax NG and Embedded Schematron

To validate an XML document with RELAX NG schema and its embedded Schematron rules, you need to associate the document with both schemas like this:

```
<?xml-model href="percent.rng" type="application/xml"
            schematypens="http://relaxng.org/ns/structure/1.0"?>
<?xml-model href="percent.rng" type="application/xml"
            schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

The second association validates your document with Schematron rules extracted from the RELAX NG Schema.

Note: When you work with XML Schema or Relax NG documents that have embedded Schematron rules Oxygen XML Editor plugin provides two built-in validation scenarios: **Validate XML Schema with embedded Schematron** for XML schema , and **Validate Relax NG with embedded Schematron** for Relax NG. You can use one of these scenarios to validate the embedded Schematron rules.

Example: Embedded Schematron in XML Schema

```
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="...">
 <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
  </sch:pattern>
</xsd:appinfo>
```

Example: Embedded Schematron in Relax NG Schema

```
<grammar
    xmlns="http://relaxng.org/ns/structure/1.0"
    xmlns:sch="http://purl.oclc.org/dsdl/schematron" >
    <sch:pattern>
      <sch:rule context="...">
        <sch:assert test="...">Message.</sch:assert>
      </sch:rule>
    </sch:pattern>
    <start>
     ..............
    </start>
</grammar>
```

Embed Schematron Quick Fixes in Relax NG or XML Schema on page 808

Schematron Outline View

The **Outline** view for Schematron schemas presents a list of components in a tree-like structure and it allows for quick access to a component by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

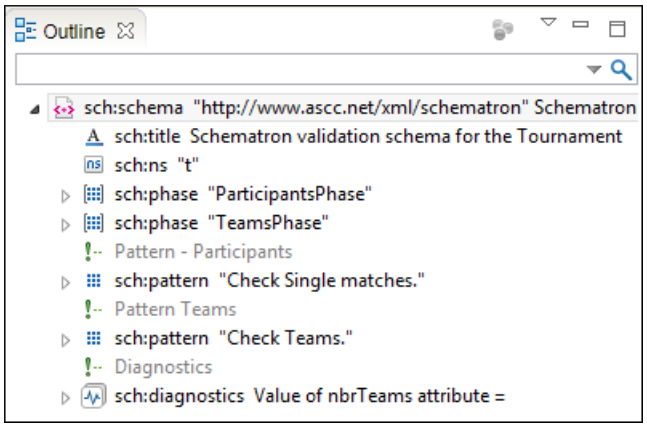

Figure 527: Schematron Outline View

The following actions are available in the **View menu** on the **Outline** view action bar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel.

Configure displayed attributes

Displays the XML Structured Outline preferences page.

The following contextual menu actions are also available in the **Outline** view:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

Toggle Comment

Comments/uncomments the currently selected element.

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Delete

Deletes the currently selected component.

Expand All

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

Schematron Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a Schematron schema. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

If you want to see the hierarchy of a schema, select the desired schema in the **Navigator** view and choose **Resource Hierarchy** from the contextual menu.

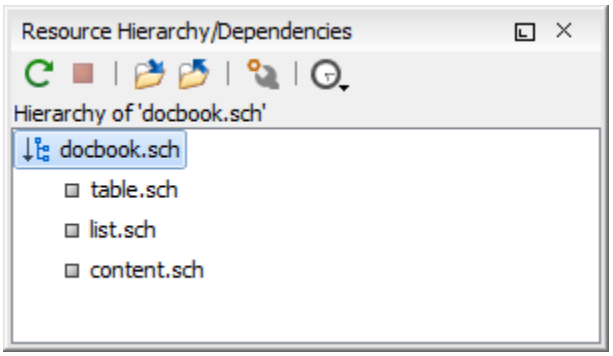

Figure 528: Resource Hierarchy/Dependencies View

If you want to see the dependencies of a schema, select the desired schema in the **Navigator** view and choose **Resource Dependencies** from the contextual menu.

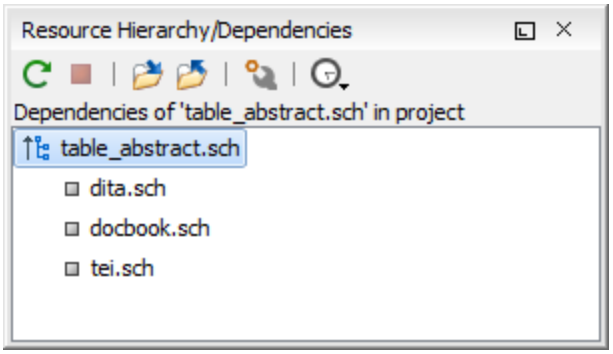

Figure 529: Resource Hierarchy/Dependencies View - Dependencies for `table_abstract.sch`

The following actions are available in the **Resource Hierarchy/Dependencies** view:

Refresh

Refreshes the Hierarchy/Dependencies structure.

Stop

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the **Master Files** directory.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

Note: The **Move resource** or **Rename resource** actions give you the option to update the references to the resource.

Moving/Renaming Schematron Resources

You can move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Select this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is selected, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

Highlight Component Occurrences in Schematron Documents

When you position your mouse cursor over a component in a Schematron document, Oxygen XML Editor plugin searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of **Highlight Component Occurrences**, open the **Preferences** dialog box and go to **Editor** > **Mark Occurrences**. You can also trigger a search using the **Search** > **Search Occurrences in File Ctrl + Shift + U (Command + Shift + U on OS X)** action from contextual menu. Matches are displayed in separate tabs of the **Results** view.

Searching and Refactoring Operations in Schematron Documents

Search Actions

The following search actions can be applied on `pattern`, `phase`, or `diagnostic` types and are available from the **Search** submenu in the contextual menu of the current editor:

- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

Refactoring Actions

The following refactoring actions can be applied on `pattern`, `phase`, or `diagnostic` types and are available from the **Refactoring** submenu in the contextual menu of the current editor:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

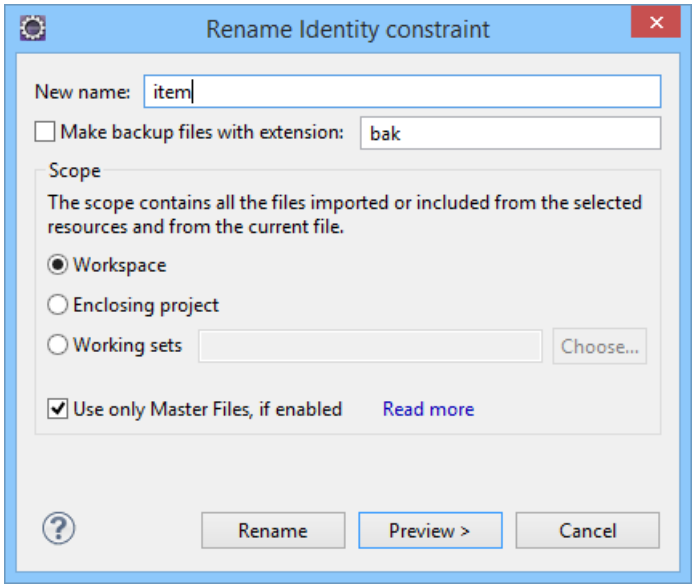

Figure 530: Rename Identity Constraint Dialog Box

Searching and Refactoring Operations Scope in Schematron Documents

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the **Change scope** operation, available in the *Quick Fix* action set or on the **Resource Hierarchy/ Dependency View** toolbar. You can restrict the scope to the current project or to one or multiple *working sets*. The **Use only Master Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Master Files** directory. Click **read more** for details about the *Master Files* support.

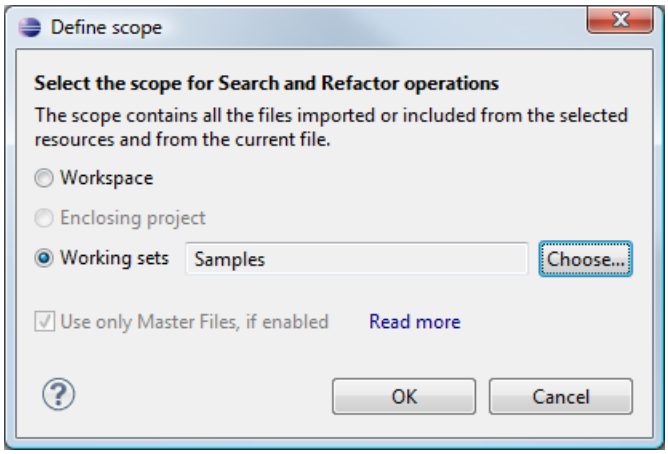

Figure 531: Define Scope Dialog Box

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the *working set* structure.

Quick Assist Support in Schematron Documents

The *Quick Assist* support improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist* feature is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon ( ) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Ctrl + 1** (**Meta 1** on Mac OS X) keyboard shortcuts.

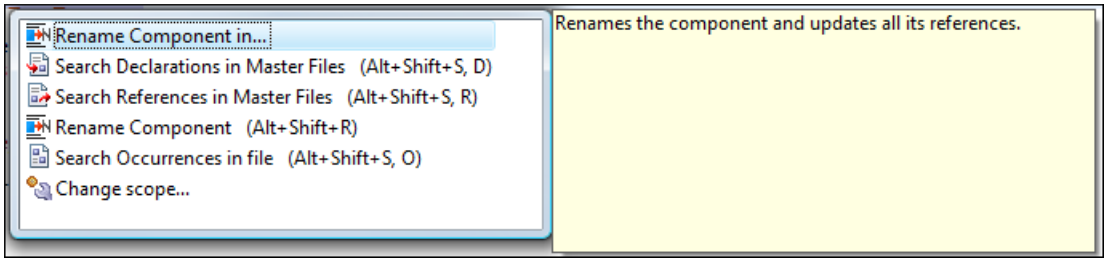

Figure 532: Schematron Quick Assist Support

The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Schematron Unit Test (XSpec)

XSpec is a behavior driven development (BDD) *framework* for XSLT, XQuery, and Schematron. XSpec consists of a syntax for describing the behavior of your XSLT, XQuery, or Schematron code, and some code that enables you to test your code against those descriptions.

Creating a Schematron Unit Test

To create a Schematron Unit Test, go to **File** > **New** > **Schematron Unit Test**. This is simple document template to help you get started.

Running a Schematron Unit Test

To run a Schematron Unit Test, open the XSpec file in an editor and click **Apply Transformation Scenario(s)** on the main toolbar. This will run the built-in **Run XSpec Test** transformation scenario that is defined in the XSpec *framework*.

Testing a Stylesheet

An XSpec file contains one or more test scenarios.

Example

Suppose you have this Schematron rule that says sections should have a title:

```
  <sch:pattern>
    <sch:rule context="section">
      <sch:assert test="title" id="a002">
        section should have a title
      </sch:assert>
    </sch:rule>
  </sch:pattern>
```

The XSpec test could look like this:

```
<x:description xmlns:x="http://www.jenitennison.com/xslt/xspec" schematron="demo-01.sch">
    <x:scenario label="section should have a title">
      <x:context>
        <article>
          <section>
            <title>Introduction</title>
            <p>This is an example.</p>
          </section>
          <section>
            <p>This is an example.</p>
          </section>
        </article>
      </x:context>

      <x:expect-not-assert id="a002" location="/article[1]/section[1]"/>
      <x:expect-assert id="a002" location="/article[1]/section[2]"/>
    </x:scenario>
</x:description>
```

The `sch:assert` with the `id="a002"` is not expected to be triggered on the first section since it includes a title. This requirement is expressed with the `x:expect-not-assert` element.

Since the second section does not have a title, you would expect the Schematron rule to be triggered and this requirement is expressed with the `x:expect-assert` element.

For more details about how to write Schematron tests and various samples, see https://github.com/xspec/xspec/wiki/Writing-Scenarios-for-Schematron#writing-tests.

Adding a Catalog to an XSpec Transformation

If your Schematron needs a catalog, you can add one to the XSpec transformation by doing one of the following:

- If you are using a project in Oxygen XML Editor plugin, create a `catalog.xml` file in the project directory. This catalog will then be loaded automatically.
- Edit the **Run XSpec Test** transformation scenario, go to the **Parameters** tab, and set the value of the `catalog` parameter to the location of your catalog file.

Editing Schematron Quick Fixes

Oxygen XML Editor plugin provides support for editing the Schematron *Quick Fixes*. You can define a library of *Quick Fixes* by editing them directly in the current Schematron file or in a separate file. Oxygen XML Editor plugin assists you in editing Schematron *Quick Fixes* with schema-based content completion, syntax highlighting, and validation as you type.

For information about applying and detecting the Schematron schemas that include SQF, see Associating a Schema to XML Documents on page 579.

Oxygen XML Blog: Schematron Checks to Help Technical Writing

Schematron Quick Fixes (SQF)

Oxygen XML Editor plugin provides support for Schematron *Quick Fixes* (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron *Quick Fixes* are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with *assert* or *report* messages.

A typical use case is using Schematron *Quick Fixes* to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, please see the following blog post: http://blog.oxygenxml.com/2015/05/schematron-checks-to-help-technical.html.

Displaying the Schematron Quick Fix Proposals

The defined Schematron *Quick Fixes* are displayed on validation errors in **Text** mode and **Author** mode.

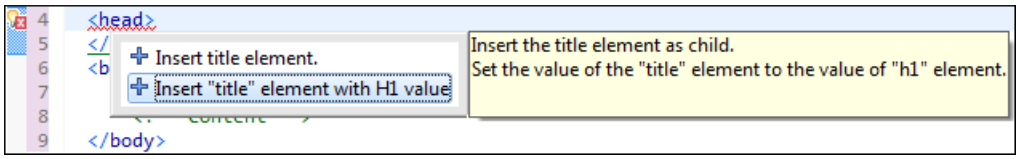

Figure 533: Example of a Schematron Quick Fix

Schematron Quick Fix Specifications

Presenting Schematron Validation Issues

Defining Schematron Quick Fixes

You can define and customize Schematron *Quick Fixes* directly in the current Schematron file or in a separate Schematron file. The Schematron *Quick Fixes* are an extension of the Schematron language and they allow you to define fixes for Schematron error messages. You can refer the *Quick Fixes* from the `assert` or `report` elements in the values of the `sqf:fix` attributes.

Defining a Schematron Quick Fix

The basics of a Schematron *Quick Fix* is defined by an ID, name, description, and the operations to be executed.

- **ID** - Defined by the `id` attribute from the `fix` element and must be unique in the current context. It is used to refer the *Quick Fix* from a `report` or `assert` element.
- **Name** - The name of the *Quick Fix* is defined by the `title` element.
- **Description** - Defined by the text in the paragraphs (p) of the `description` element.
- **Operations** - The following basic types of operations (elements) are supported:
  - `<sqf:add>` Element - To add a new node or fragment in the document.
  - `<sqf:delete>` Element - To remove a node from the document.
  - `<sqf:replace>` Element - To replace a node with another node or fragment.
  - `<sqf:stringReplace>` Element - To replace text content with other text or a fragment.

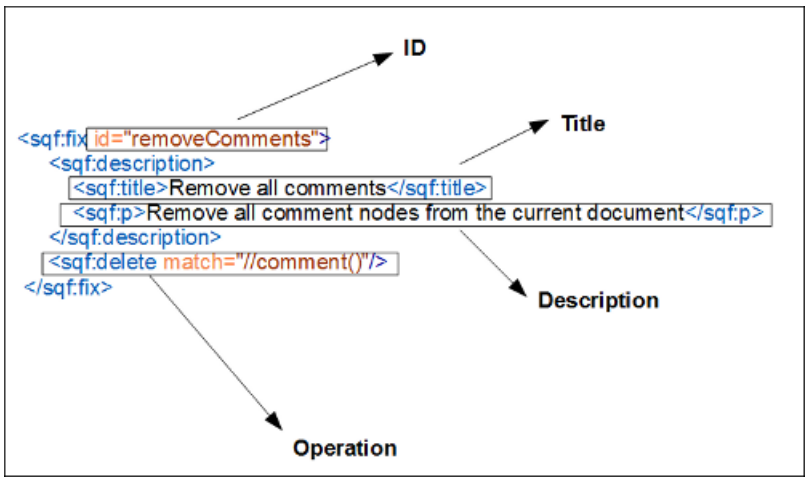

Figure 534: Schematron Quick Fix Components

The assertion message that generates the *Quick Fix* is added as the `description` of the problem to be fixed. The `title` is presented as the name of the *Quick Fix*. The content of the paragraphs (p) within the `description` element are presented in the tooltip message when the *Quick Fix* is selected.

Additional Elements Supported in the Schematron Quick Fixes

`<sqf:user-entry>`

This element defines a value that must be set manually by the user. For more information, see User Entry SQF Operation on page 804.

`<sqf:call-fix>`

This element calls another *Quick Fix* within a *Quick Fix*. The called *Quick Fix* must be defined globally or in the same Schematron rule as the calling *Quick Fix*. A calling *Quick Fix* adopts the activity elements of the called *Quick Fix* and should not include other activity elements. You can also specify which parameters are sent by using the `<sqf:with-param>` child element.

`<sqf:group>`

Allows you to group multiple *Quick Fixes* and refer them from an `assert` or `report` element.

`<sqf:fixes>`

Is defined globally and contains global fixes and groups of fixes.

<sqf:copy-of>

Used to copy the selected nodes that are specified by the `select` attribute. The element with its attribute is treated as an `xsl:copy-of` with a `select` attribute, as defined in the XSLT specification.

<sqf:param>

Defines a parameter for a *Quick Fix*. If the parameter is defined as `abstract` then the `type` and default value should not be specified and the fix can be called from an abstract pattern that defines this parameter.

Other SQF Notes

Note: The `sqf:default-fix` attribute is ignored in Oxygen XML Editor plugin.

For more details on editing Schematron *Quick Fixes*, go to: Schematron Quick Fix Specifications

Basic Schematron Quick Fix Operations

There are four basic operations that can be executed in a Schematron *Quick Fix*: **Add**, **Delete**, **Replace**, and **String Replace**.

Add

The <sqf:add> element allows you to add a node to the instance. An *anchor* node is required to select the position for the new node. The *anchor* node can be selected by the `match` attribute. Otherwise, it is selected by the `context` attribute of the rule.

The `target` attribute defines the name of the node to be added. It is required if the value of the `node-type` attribute is set to anything other than "comment".

The <sqf:add> element has a `position` attribute and it determines the position relative to the *anchor* node. The new node could be specified as the first child of the *anchor* node, the last child of the *anchor* node, before the *anchor* node, or after the *anchor* node (`first-child` is the default value). If you want to add an attribute to the *anchor* node, do not use the `position` attribute.

Note: If you insert an element and its content is empty, Oxygen XML Editor plugin will insert the required element content.

An Example of the <sqf:add> Element:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
   xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
 queryBinding="xslt2">
   <pattern>
     <rule context="head">
        <assert test="title" sqf:fix="addTitle">title element missing.</assert>
        <sqf:fix id="addTitle">
            <sqf:description>
                <sqf:title>Insert title element.</sqf:title>
            </sqf:description>
           <sqf:add target="title" node-type="element">Title text</sqf:add>
        </sqf:fix>
     </rule>
   </pattern>
</schema>
```

Specific Add Operations:

- **Insert Element** - To insert an element, use the <sqf:add> element, set the value of the `node-type` to "element", and specify the element *QName* with the `target` attribute. If the element has a prefix, it must be defined in the Schematron using a namespace declaration (`<ns uri="namespace" prefix="prefix"/>`).
- **Insert Attribute** - To insert an attribute, use the <sqf:add> element, set the value of the `node-type` to "attribute", and specify the attribute *QName* with the `target` attribute. If the attribute has a prefix, it must be defined in the Schematron using a namespace declaration (`<ns uri="namespace" prefix="prefix"/>`).
- **Insert Fragment** - If the `node-type` is not specified, the <sqf:add> element will insert an XML fragment. The XML fragment must be well formed. You can specify the fragment in the `add` element or by using the `select` attribute.
- **Insert Comment** - To insert a comment, use the <sqf:add> element and set the value of the `node-type` to "comment".

- **Insert Processing Instruction** - To insert a processing instruction, use the `<sqf:add>` element, set the value of the `node-type` to "pi" or "processing-instruction", and specify the name of the processing instruction in the `target` attribute.

Delete

The `<sqf:delete>` element allows you to remove any type of node (such as elements, attributes, text, comments, or processing instructions). To specify nodes for deletion the `<sqf:delete>` element can include a `match` attribute that is an XPath expression (the default value is `.`). If the `match` attribute is not included, it deletes the context node of the Schematron rule.

An Example of the `<sqf:delete>` Element:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
    xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
    <pattern>
        <rule context="*[@xml:lang]">
            <report test="@xml:lang" sqf:fix="remove_lang">
                The attribute "xml:lang" is forbidden.</report>
            <sqf:fix id="remove_lang">
                <sqf:description>
                    <sqf:title>Remove "xml:lang" attribute</sqf:title>
                </sqf:description>
                <sqf:delete match="@xml:lang"/>
            </sqf:fix>
        </rule>
    </pattern>
</schema>
```

Replace

The `<sqf:replace>` element allows you to replace nodes. Similar to the `<sqf:delete>` element, it can include a `match` attribute. Otherwise, it replaces the context node of the rule. The `<sqf:replace>` element has three tasks. It identifies the nodes to be replaced, defines the replacing nodes, and defines their content.

An Example of the `<sqf:replace>` Element:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
    xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
 queryBinding="xslt2">
    <pattern>
        <rule context="title">
            <report test="exists(ph)" sqf:fix="resolvePh" role="warn">
                ph element is not allowed in title.</report>
            <sqf:fix id="resolvePh">
                <sqf:description>
                    <sqf:title>Change the ph element into text</sqf:title>
                </sqf:description>
                <sqf:replace match="ph">
                    <value-of select="."/>
                </sqf:replace>
            </sqf:fix>
        </rule>
    </pattern>
</schema>
```

Other Attributes for Replace Operations:

- **`node-type`** - Determines the type of the replacing node. The permitted values include:
  - `keep` - Keeps the node type of the node to be replaced.
  - `element` - Replaces the node with an element.
  - `attribute` - Replaces the node with an attribute.
  - `pi` - Replaces the node with a processing instruction.
  - `comment` - Replaces the node with a comment.
- **`target`** - By using a *QName* it gives the replacing node a name. This is necessary when the value of the `node-type` attribute is anything other than "comment".
- **`select`** - Allows you to choose the content of the replacing nodes. You can use XPath expressions with the `select` attribute. If the `select` attribute is not specified then the content of the `<sqf:replace>` element is used instead.

String Replace

The `<sqf:stringReplace>` element is different from the others. It can be used to find a sub-string of text content and replace it with nodes or other strings.

Attributes for the String Replace Operation:

- **`match`** - Allows you to select text nodes that contain the sub-strings you want to replace.
- **`select`** - Allows you to select the replacing fragment, in case you do not want to set it in the content of the `stringReplace` element.
- **`regex`** - Matches the sub-strings using a regular expression.

  Note: Consider the following information about using regular expressions in the `stringReplace` element:

  - The regular expressions from this operation are compiled as Java regular expressions. For more information, see https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html.
  - The ***j flag*** allows you to use the standard Java regular expression engine, which allows native Java regular expression syntax. This allows, for example, the use of **`\b`** in a regular expression to match word boundaries. For more information, see http://www.saxonica.com/html/documentation/functions/fn/matches.html.
  - Regular expressions in the `<sqf:stringReplace>` element always have the *dot matches all* flag set to "true". Therefore, the line terminator will also be matched by the regular expression.
- **`flags`** - Specifies flags to control the interpretation of the regular expression (given in the `regex` attribute).

Attention: The context of the content within the `<sqf:stringReplace>` element is set to the whole text node, rather than the current sub-string.

An Example of the `<sqf:stringReplace>` Element:

```
<?xml version="1.0" encoding="UTF-8"?>
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
    xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
 queryBinding="xslt2">
    <sch:pattern>
        <sch:rule context="text()">
            <sch:report test="matches(., 'Oxygen', 'i')"
 sqf:fix="changeWord">The oXygen word is not allowed</sch:report>
            <sqf:fix id="changeWord">
                <sqf:description>
                    <sqf:title>Replace word with product</sqf:title>
                </sqf:description>
                <sqf:stringReplace regex="Oxygen" flags="i"><ph keyref="product"/>
                </sqf:stringReplace>
            </sqf:fix>
        </sch:rule>
    </sch:pattern>
</sch:schema>
```

Related Information:

User Entry SQF Operation on page 804
Restricting Quick Fix Operations on page 805

User Entry SQF Operation

The `<sqf:user-entry>` element defines a value that must be set manually by the user. If multiple `user-entry` elements are defined, Oxygen XML Editor plugin will display a dialog box for each one, in which the user can specify values. Also, the `<user-entry>` element can be used as an XPath variable where the XPath variable is the name of the `user-entry`. Note that the `default` attribute defines a default value for the operation by using an XPath expression (as in the example below) and its value will be presented in the user entry dialog box.

An Example of the `<sqf:user-entry>` Element:

```
<sqf:fix id="editTitle">
    <sqf:description>
        <sqf:title>Edit the jurnal title</sqf:title>
    </sqf:description>
    <sqf:user-entry name="newTitle" default="@title">
        <sqf:description>
            <sqf:title>Edit the title:</sqf:title>
        </sqf:description>
    </sqf:user-entry>
    <sqf:replace match="@title" target="title" node-type="keep" select="$newTitle"/>
</sqf:fix>
```

Related Information:

Basic Schematron Quick Fix Operations on page 802

Restricting Quick Fix Operations

To restrict a *Quick Fix* or a specific operation to only be available if certain conditions are met, the `use-when` attribute can be included in the `<sqf:fix>` element or any of the SQF operation elements. The condition of the `use-when` attribute is an XPath expression and the fix or operation will be performed only if the condition is satisfied. In the following example, the `use-when` condition is applied to the `<sqf:fix>` element:

```
<sqf:fix id="last" use-when="$colWidthSummarized - 100 lt $lastWidth"
 role="replace">
   <sqf:description>
       <sqf:title>Subtract excessive width from the last element.</sqf:title>
   </sqf:description>
   <let name="delta" value="$colWidthSummarized - 100"/>
   <sqf:add match="html:col[last()]" target="width" node-type="attribute">
    <let name="newWidth" value="number(substring-before(@width,'%')) - $delta"/>
       <value-of select="concat($newWidth,'%')"/>
   </sqf:add>
</sqf:fix>
```

Related Information:

Basic Schematron Quick Fix Operations on page 802

Formatting/Indenting Content Inserted by SQF Operations

Content that is inserted by the **Add**, **Replace**, or **String Replace** Schematron *Quick Fix* operations is automatically indented unless you set the value of the `xml:space` attribute to `preserve` on the operation element. There are several methods available to format the content that is inserted:

- **`xsl:text`** - You can use an `xsl:text` element to format the inserted content and keep the automatic indentation, as in the following example:

  ```
  <sqf:add position="last-child">
      <row><xsl:text>
      </xsl:text>
          <entry>First column</entry><xsl:text>
          </xsl:text>
          <entry>Second column</entry><xsl:text>
          </xsl:text>
      </row><xsl:text>
      </xsl:text>
  </sqf:add>
  ```

- **`xml:space`** - Use the `xml:space` attribute and set its value to `preserve` to format the content and specify the spacing between elements, as in the following example:

  ```
  <sqf:add node-type="element" target="codeblock" xml:space="preserve">
      /* a long sample program */
      Do forever
       Say "Hello, World"
      End</sqf:add>
  ```

Related Information:

Basic Schematron Quick Fix Operations on page 802

Executing Schematron Quick Fixes in Other Documents

You can apply Schematron *Quick Fixes* over nodes from referenced documents (using XInclude or external entities), and you can access them as nodes in your current document.

Also, you can apply the *Quick Fixes* over other documents using the `doc()` function in the value of the `match` attribute. For example, you can add a new key in the `keylist.xml` file using the following operation:

```
<sqf:add match="doc('keylist.xml')/KeyList" target="Key"
 node-type="element" select="Key2">
```

Generate Multiple Similar Quick Fixes

You can generate the same Schematron *Quick Fix* for multiple matches. To do this, you can add the `use-for-each` attribute inside the `sqf:fix` element and for each match of the XPath expression in the value of the `use-for-each` attribute, a Quick Fix will be presented to the user. The XPath expression does not change the

context of the Quick Fix. If you want to access the current match from the XPath expression, you can use the `$sqf:current` variable.

Example:

Suppose you want to restrict the user from entering more than 4 list items in a list. The following example presents an error on any list that has more than 4 list items and offers a Quick Fix with multiple proposals where the user would specify which list item to remove.

```
<sch:rule context="ul">
    <sch:report test="count(li) gt 4" sqf:fix="removeAnyItem">
        The list cannot contain more than 4 entries.
    </sch:report>
    <sqf:fix id="removeAnyItem" use-for-each="1 to count(li)">
        <sqf:description>
            <sqf:title>Remove item #<sch:value-of select="$sqf:current"/></sqf:title>
        </sqf:description>
        <sqf:delete match="li[$sqf:current]"/>
    </sqf:fix>
</sch:rule>
```

Localizing SQF Messages

Oxygen XML Editor plugin provides support for presenting Schematron Quick Fix messages in multiple languages. The language used for the SQF messages is the language specified in the '**Message Language** option in the **Schematron** preferences page. If you want to provide an alternative message for a specific language, you can reference IDs or key values for the specific alternate text phrase. In Oxygen XML Editor plugin, the alternate text phrase is defined in a `sch:diagnostic` element.

Example:

The following example presents a quick fix with a different message depending on whether the user's language is English or German.

```
<sch:rule context="dog">
  <sch:assert test="bone" diagnostics="d_en d_de" sqf:fix="addBone" >
    A dog should have a bone.</sch:assert>

  <sqf:fix id="addBone">
    <sqf:description>
      <sqf:title ref="fix_en fix_de" xml:lang="en">Add a bone</sqf:title>
      <sqf:p ref="fix_desc_en fix_desc_de" xml:lang="en">Add bone element as child</sqf:p>
    </sqf:description>
    <sqf:add node-type="element" target="bone"/>
  </sqf:fix>
</sch:rule>
....
<sch:diagnostics xml:lang="en">
  <sch:diagnostic id="d_en"> A dog should have a bone. </sch:diagnostic>
  <sch:diagnostic id="fix_en"> Add a bone </sch:diagnostic>
  <sch:diagnostic id="fix_desc_en">Add a bone element as child</sch:diagnostic>
</sch:diagnostics>
<sch:diagnostics xml:lang="de">
  <sch:diagnostic id="d_de"> Ein Hund sollte ein Bein haben. </sch:diagnostic>
  <sch:diagnostic id="fix_de"> FÃ¼gen Sie einen Knochen hinzu </sch:diagnostic>
  <sch:diagnostic id="fix_desc_de"> FÃ¼gen Sie ein Knochenelement als
    untergeordnetes Element hinzu </sch:diagnostic>
</sch:diagnostics>
```

Validating Schematron Quick Fixes

By default, Schematron *Quick Fixes* are validated as you edit them within the Schematron file or while editing them in a separate file. To change this, open the **Preferences** dialog box , go to **Editor** > **Document Checking**, and deselect the **Enable automatic validation** option.

To validate Schematron *Quick Fixes* manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **XML** menu. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Related Information:

Validating XML Documents Against a Schema on page 561
Validation Scenario on page 568
Presenting Validation Errors in Author Mode on page 213
Presenting Validation Errors in Text Mode on page 169

Content Completion in SQF

Oxygen XML Editor plugin helps you edit Schematron *Quick Fixes* embedded in a Schematron document by offering proposals that are valid at the cursor position in a *Content Completion Assistant*. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut.

When you edit the value of an attribute that references a *Quick Fix ID*, the ids are collected from the entire definition scope. For example, if the editing context is `assert/@sqf:fix`, the *Content Completion Assistant* proposes all fixes defined locally and globally.

If the editing context is an attribute value that is an XPath expression (such as `sqf:add/@match` or `replace/@select`), the *Content Completion Assistant* offers the names of XPath functions, the XPath axes, and user-defined variables and parameters.

The *Content Completion Assistant* displays XSLT 1.0 functions (and optionally XSLT 2.0 / 3.0 functions) in the attributes *path*, *select*, *context*, *subject*, and *test*, depending on the Schematron options that are set in Preferences pages. If the Saxon 6.5.5 namespace (`xmlns:saxon="http://icl.com/saxon"`) or the Saxon 9.8.0.8 namespace is declared in the Schematron schema (`xmlns:saxon="http://saxon.sf.net/"`) the content completion also displays the XSLT Saxon extension functions.

Highlight Quick Fix Occurrences in SQF

When you position your mouse cursor over a *Quick Fix* ID in a Schematron document, Oxygen XML Editor plugin searches for the *Quick Fix* declaration and all its references and highlights them automatically.

Customizable colors are used: one for the *Quick Fix* definition and another one for its references. Occurrences are displayed until another *Quick Fix* is selected.

To change the default behavior of **Highlight Component Occurrences**, open the **Preferences** dialog box and go to **Editor** > **Mark Occurrences**. You can also trigger a search using the **Search** > **Search Occurrences in File (Ctrl + Shift + U (Command + Shift + U on OS X))** action from contextual menu. Matches are displayed in separate tabs of the **Results** view.

Searching and Refactoring Operations in SQF

Search Actions

The following search actions can be applied on *Quick Fix* IDs and are available from the **Search** submenu in the contextual menu of the current editor:

- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

Refactoring Actions

The following refactoring actions can be applied on *Quick Fix* IDs and are available from the **Refactoring** submenu in the contextual menu of the current editor:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

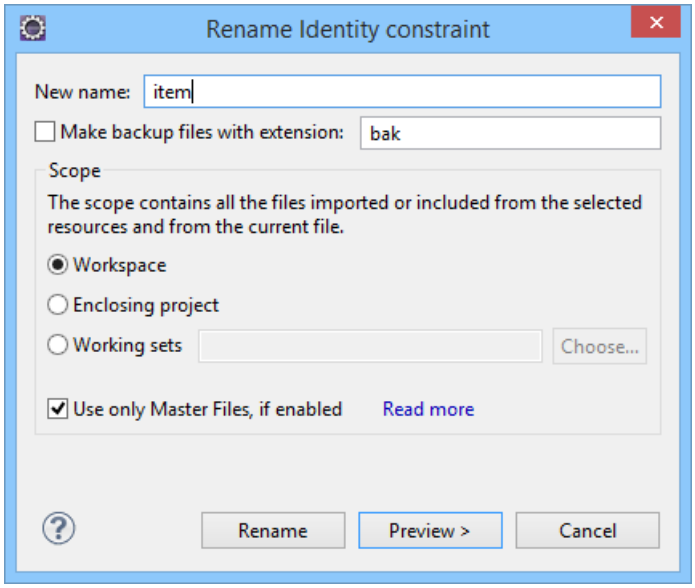

Figure 535: Rename Identity Constraint Dialog Box

Embed Schematron Quick Fixes in Relax NG or XML Schema

Schematron *Quick Fixes* can be embedded into an XML Schema through annotations (using the `appinfo` element), or in a schematron rule embedded in the RELAX NG Schema. For more information about embedding schematron in XML Schema or Relax NG, see XML Schema or RELAX NG with Embedded Schematron Rules on page 792.

Oxygen XML Editor plugin is able to extract and use the embedded Schematron *Quick Fixes*. To make the embedded Schematron *Quick Fixes* available, follow these steps:

1. Define a validation against a schema.
2. For the **Schema type**, choose `XML Schema` or `Relax NG`.
3. Select the **Embedded schematron rules** option.

Example: Embedded Schematron Quick Fix in XML Schema

```
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="...">
 <sch:assert test="..." sqf:fix="fixId">Message.</sch:assert>
   <sqf:fix id="fixId">
     ......
   </sqf:fix>
    </sch:rule>
  </sch:pattern>
</xsd:appinfo>
```

Example: Embedded Schematron Quick Fix in Relax NG

```
<grammar
    xmlns="http://relaxng.org/ns/structure/1.0"
    xmlns:sch="http://purl.oclc.org/dsdl/schematron" >
    <sch:pattern>
      <sch:rule context="...">
        <sch:assert test="..." sqf:fix="fixId">Message.</sch:assert>
     <sqf:fix id="fixId">
       .....
     </sqf:fix>
      </sch:rule>
```

```
      </sch:pattern>
      <start>
       ..............
      </start>
</grammar>
```

Tip: For more extensive examples, see our samples in the *[OXYGEN_INSTALL_DIR]*`/samples/schematron` folder.

Related Information:

XML Schema or RELAX NG with Embedded Schematron Rules on page 792
Defining Schematron Quick Fixes on page 801

Integrating SQF in a Framework

You can use Schematron *Quick Fixes* to assist your content authors by imposing rules for an entire *framework* (document type) and offering fixes when a rule violation is detected.

For example, if you are using DITA, you may want your contributors to avoid inserting a figure (`fig` element) inside a paragraph (p element) that contains other content since it may result in undesirable placement or spacing in the output. The Schematron rule and its *Quick Fix* for this particular use-case could look like this:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
    xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
 queryBinding="xslt2">
   <pattern id="check.figure.location">
     <rule context="p/fig">
         <report test="true()" role="warn" sqf:fix="moveAfter">
         A figure inside a paragraph doesn't transform well into PDF. </report>
         <sqf:fix id="moveAfter">
             <sqf:description>
                 <sqf:title>Move after the paragraph.</sqf:title>
             </sqf:description>
             <let name="figToMove" value="."/>
             <sqf:add match="parent::p" select="$figToMove" position="after"/>
             <sqf:delete match="."/>
         </sqf:fix>
     </rule>
   </pattern>
</schema>
```

The result of this example would be that the user will see a warning if they insert a `fig` element inside a p element and they are presented with the option of selecting the *Quick Fix* that would move the figure outside the paragraph.

How to Integrate SQF in a Framework

To integrate a Schematron *Quick Fix* in a *framework*, follow these steps:

1. Define a Schematron *Quick Fix* for a rule in an existing or new Schematron file.
2. Save it somewhere in your *framework* directory. For example, the default *framework* directory for DITA is located in: *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/`.
3. Add a reference to the Schematron file that includes the SQF in your *framework* by following the procedure in Associating a Schema in Validation Scenarios Defined in the Document Type on page 582.
4. Open a document in your *framework* and test the new rule and *Quick Fix*.
5. You can continue to refine the rule and develop additional rules as needed.

Editing XHTML Documents

Oxygen XML Editor plugin provides support for editing XHTML files. Oxygen XML Editor plugin includes XHTML catalogs and document templates to help you get started. You can also find a sample file in the *[OXYGEN_INSTALL_DIR]*`/samples/xhtml` folder.

The XHTML editing features include:

- **Source Editing** - You can edit XHTML files in the **Text** editing mode (XML source editor) using all of its useful features.
- **Visual Editing** - You can edit XHTML files in the visual **Author** editing mode using all of its authoring features.
- **Validation** - Easily identify errors and their location with the Oxygen XML Editor plugin XML validation features.
- **Content Completion** - The *Content Completion Assistant* displays a list of context-sensitive proposals that are valid at the current cursor position. In **Text** mode, it can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut, while in **Author** mode, it is activated by simply pressing **Enter**.
- **Import HTML as XHTML** - Oxygen XML Editor plugin includes support for importing HTML files as an XML document.
- **Remote Editing** - Oxygen XML Editor plugin has built-in support for editing documents that are stored on remote servers through FTP, SFTP, and WebDAV protocols, allowing you to edit XHTML pages from your web server.
- **Syntax Highlighting** - XHTML documents with embedded CSS, JS, PHP, and JSP scripts are rendered with dedicated coloring schemes. To customize them, open the **Preferences** dialog box and go to **Editor** > **Syntax Highlight**. Select and expand the **XHTML** section in the top pane and you can see the effects of your changes in the **Preview** pane.

Editing Markdown Documents

Markdown was created as a lightweight markup language with plain text formatting syntax designed to provide a syntax that is very easy to read and write, and to convert it to HTML and other formats. It is often used by content contributors who want a quick and easy way to write content without having to take their fingers off the keyboard and without having to learn numerous codes or shortcuts, and it can easily be shared interchangeably between virtually any types of contributor and system.

Oxygen XML Editor plugin provides a built-in Markdown editor that allows you to convert Markdown syntax to HTML or DITA and it includes a preview panel to help you visualize the final output. Aside from the plain text syntax that is common amongst most Markdown applications, the editor in Oxygen XML Editor plugin also integrates many other powerful features that content authors are accustomed to using for other types of documents. Some of these additional unique features include:

- Additional toolbar and contextual menu actions.
- Automatic validation to help keep the syntax valid.
- Dedicated syntax highlighting to make Markdown documents even easier to read and write.
- Unique features for creating Markdown documents directly in *DITA maps* and converting Markdown documents to DITA topics.
- Specialized syntax rules to combine popular syntax features from several specifications.

Markdown Editor

Oxygen XML Editor plugin provides an intuitive, dynamic, and easy-to-use Markdown editor for writing and converting Markdown documents. It is a split-screen editor with two panels that are synchronized in real-time. The left side is a simple text editor that is specially designed for writing Markdown syntax. The right side is a WYSIWYG style preview of how changes will look in the output.

Markdown Text Editor Pane (Left Side)

The left pane is a simple text editor that is refined to accept Markdown syntax. At the same time, you still have many of the actions, options, and features that you are used to when editing any other type of document in Oxygen XML Editor plugin.

The features of this special editor that are unique for Markdown documents include:

- **Unique Markdown Syntax Rules** - The Markdown editor in Oxygen XML Editor plugin uses an integration of rules that combine rules from common default Markdown syntax along with many of the rules used in the GitHub Flavored Markdown syntax.
- **Syntax Highlighting** - The Oxygen XML Editor plugin syntax highlighting feature is integrated into the Markdown text editor to make it easier to read and write Markdown syntax. You can even customize the colors and styles for the syntax highlighting.
- **Automatic Spell Checking** - The Markdown editor supports the Oxygen XML Editor plugin automatic spell checking feature that reports possible misspelled words as you type. You simply need to select the **Automatic spell check** option in the **Spell Check** preferences page, then click the **Select editors** button and select **Markdown Editor**.
- **Helpful Toolbar and Contextual Menu Actions** - A variety of unique actions are available from the toolbar to help you insert proper Markdown syntax. The contextual menu also includes some common editing actions, as well as unique actions to export (convert) Markdown documents to HTML or DITA.

WYSIWYG Preview Pane (Right Side)

The right pane is a WYSIWYG *Preview* pane that shows a visual representation of how changes made in the left-side text editor will be converted to HTML or DITA output. The changes you make in the text editor are parsed continually and they are immediately visible in the *Preview* pane. There are two tabs available in the *Preview* pane, one for visualizing DITA output and one for visualizing HTML output. You can switch between the two tabs at the bottom of the pane.

The *Preview* pane includes the following unique features:

- **WYSIWYG Visualization** - This pane presents the Markdown syntax from the left-side text editor in a visual WYSIWYG style interface that is automatically synchronized as you type.
- **Export Options** - The **DITA** tab includes a contextual menu action to export (convert) the current Markdown document to a DITA topic. Similarly, the **HTML** tab includes a contextual menu action to export (convert) it to an XHTML document.
- **Automatic Validation** - As you edit Markdown documents, they are validated automatically. The conversion engine constantly tries to parse your changes and if a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the *Preview* pane or **Results** view at the bottom of the editor.
- **Print Feature** - The Markdown editor includes a **Print** action that is available in the contextual menu and it allows you to configure options for printing the current document as you see it in the *Preview* pane.
- **Preview Markup** - The Markdown editor includes a **Tags Display Mode** drop-down menu that is available on the toolbar and it allows you to control the amount of markup that is displayed in the *Preview* pane.
- **Specialized DITA Features** - The Markdown editor includes some unique, specialized features to integrate it with the powerful DITA support in Oxygen XML Editor plugin.

Creating New Markdown Documents on page 812

Creating New Markdown Documents

To create a new Markdown document in Oxygen XML Editor plugin, follow these steps:

1. Click the **New** button on the toolbar or select **File** > **New**.
2. Select the **Markdown** document template.
3. Click **Next**.
4. Choose the storage path and a file name for the new document.
5. Click the **Finish** button.

   Result: A new Markdown document is created and it is opened in the specialized Markdown Editor.

Related Information:

Markdown Editor on page 810

Actions Available in the Markdown Editor

Aside from the actions that are available in Oxygen XML Editor plugin for any type of document (such as the actions in the various menus and the common sections of the toolbar), a variety of unique actions are also available in the Markdown editor, from the toolbar and contextual menu.

Toolbar Actions

The following default actions are readily available on the toolbar when editing Markdown documents:

Header (1st Level)

Inserts an *atx-style* first level header at the cursor position.

Header (2st Level)

Inserts an *atx-style* second level header at the cursor position.

Header (3rd Level)

Inserts an *atx-style* third level header at the cursor position.

Horizontal Rule

Inserts a horizontal rule at the cursor position.

Bold (Strong)

Marks the selected text with bold.

Italic (Emphasis)

Marks the selected text with italics.

Strikethrough

Marks the selected text with a strikethrough.

Code Block

Inserts (or surrounds selected text in) a codeblock.

Blockquote

Inserts a blockquote at the cursor position.

Insert Link

Opens the **Insert Link** dialog box that allows you to define a link to insert at the cursor position.

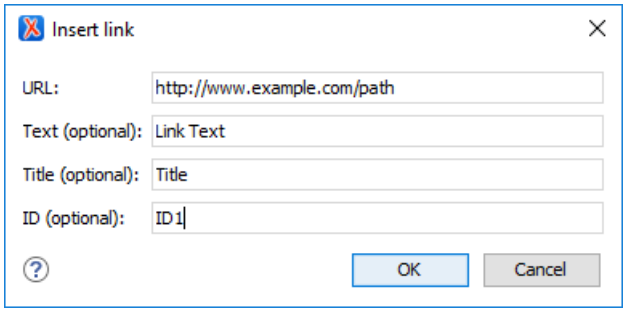

Figure 537: Insert Link Dialog Box

Insert Image

Opens the **Insert Image** dialog box that allows you to define an image to insert at the cursor position. You can type the URL of the image you want to insert or use browsing tools in the **Browse** drop-down menu.

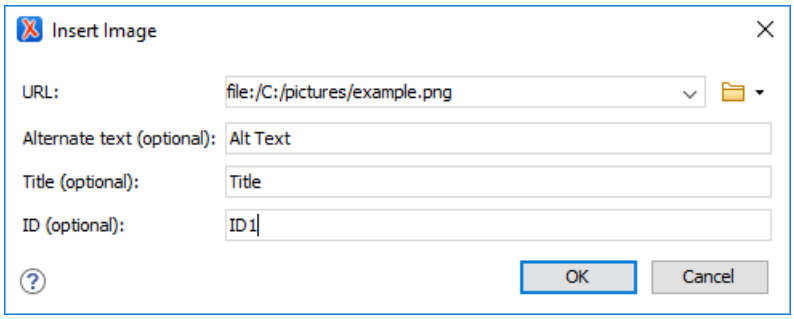

Figure 538: Insert Link Dialog Box

Insert Ordered List

Inserts an ordered list at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an ordered list.

Insert Unordered List

Inserts an unordered list at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an unordered list.

Insert Task List

Inserts a task list at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to a task list.

Insert Table

Inserts a table at the cursor position.

Tags Display Mode drop-down menu

Allows you to control the amount of markup that is displayed in the *Preview* pane and offers the following choices:

Full Tags with Attributes

Displays full tag names with attributes for both *block* and *inline* elements.

Full Tags

Displays full tag names without attributes for both *block* and *inline* elements.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Opens the **Author** preferences page where you can configure options in regards to *tags*, such as the default **Tags Display Mode**, **Tags Background Color**, **Tags Foreground Color**, and **Tags Font**.

Contextual Menu Actions

The following default actions are available in the contextual menu when editing Markdown documents:

Cut, Copy, Paste

Use these actions to execute the typical editing actions on the currently selected content.

Show/Hide Preview

A toggle action that shows or hides the *Preview* pane.

Export as DITA Topic

Converts the current Markdown document into a DITA topic.

Export as HTML

Converts the current Markdown document into an XHTML document.

Print (Available in the *Preview* pane)

Opens a page setup dialog box that allows you to configure printing options for the current document.

Related Information:

Markdown Editor on page 810

Working with Markdown Documents in DITA on page 815
Markdown Editor Syntax Rules and Specifications on page 817

Syntax Highlighting in the Markdown Editor

Oxygen XML Editor plugin supports syntax highlighting in the Markdown editor to improve the readability of the content and make it easier to internalize the semantics of the content.

To customize the colors or styles used for the syntax highlighting colors for Markdown documents, follow these steps:

1. Open the **Preferences** dialog box .
2. Go to **Editor** > **Syntax Highlight**.
3. Select and expand the **Markdown** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

Syntax Highlight Preferences on page 92
Markdown Editor on page 810

Automatic Validation in Markdown Documents

Markdown documents are validated automatically as you type. The conversion engine constantly tries to parse your changes to display the results in the *Preview* pane. If a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the **DITA** tab or in the **Results** view at the bottom of the editor.

The types of errors that will be reported include the following:

- Improper order of headers.
- The syntax in a documents begins with something other than a 1st level header.
- Tags are not closed properly if XHTML markup is used in the document.
- Invalid tag names if XHTML markup is used in the document.
- Markup is not well formed if XHTML markup is used in the document.

Related Information:

Markdown Editor on page 810

Working with Markdown Documents in DITA

Oxygen XML Editor plugin includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics and the **DITA** tab in the *Preview* pane provides a visualization of how the topic will look after conversion.

Export Markdown as a DITA Topic

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The **Export as DITA Topic** action is available in the contextual menu of the left-side text editor and the right-side *Preview* pane when the **DITA** tab selected.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the **Text** editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Editor plugin has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the **DITA Maps Manager**. The following features are available for Markdown documents in the **DITA Maps Manager** view:

- **Insert Reference to Markdown Document** - You can use the **New**, **Reference**, and **Reference to the currently edited file** actions from the **Append Child**, **Insert Before**, or **Insert After** submenu when invoking the contextual menu in the **DITA Maps Manager** to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (`topicref` element) with the `format` attribute set to `markdown`.
- **Validate Markdown Documents in DITA Maps** - When you use the **Validate and Check for Completeness** action from the **DITA Maps Manager** toolbar to check the integrity of the structure of a *DITA map*, Markdown documents that are referenced in the *DITA map* will be converted to DITA topics in the background and validated the same as any other DITA topic.
- **Transforming DITA Maps with Markdown Documents** - When transforming *DITA maps* that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.
- **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the **DITA Maps Manager** and select **Refactoring** > **Convert Markdown to DITA Topic**. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

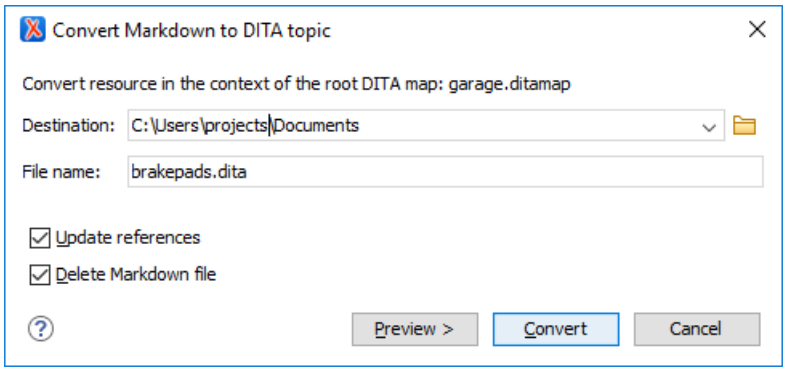

Figure 539: Convert Markdown to DITA Topic Dialog Box

This dialog box includes the following options:

Destination

The destination path for the new DITA topic.

File Name

Presents the current name and allows you to change it.

Update references

Select this option to update all references of the file in the *DITA map* and in the files referenced from the *DITA map*.

Delete Markdown file

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

Preview

Select this button to display a preview of the changes Oxygen XML Editor plugin is about to make.

Convert

Select this button to perform the conversion.

Tip: Oxygen XML Editor plugin comes with a sample ditamap project for converting Markdown to DITA. Go to the **Navigator** view, open the `sample.xpr` project, and navigate to the `dita/markdown-dita` folder.

Automatic Validation in Markdown Documents on page 815

Markdown Editor Syntax Rules and Specifications

The Markdown editor in Oxygen XML Editor plugin uses rules that were integrated from the most common set of default Markdown syntax rules along with many of the GitHub Flavored Markdown rules.

The Oxygen XML Editor plugin implementation of the most commonly used syntax rules are as follows:

Headers

The Markdown editor supports two styles of headers, *Setext* and *Atx*.

- **Setext Style**

  Setext-style headers are underlined using equal signs (for first-level headers) and dashes (for second-level headers). Any number of equal signs or dashes will result in the same output.

  Example: Setext Style Headers

```
First-Level Header (H1)
========

Second-Level Header (H2)
------------
```

- **Atx Style**

  Atx-style headers use 1-6 hash characters at the start of the line, corresponding to header levels 1-6. Optionally, you may close atx-style headers. This is purely cosmetic and the closing hashes do not need to match the number of hashes used to open the header. It is the number of opening hashes that determines the header level.

  Example: Atx Style Headers

```
# H1 text #
## H2 text
### H3 text ######
#### H4 text
##### H5 text ###
###### H6 text
```

Horizontal Rules (for HMTL output only)

You can produce a horizontal rule tag (`<hr />`) by placing three or more hyphens, asterisks, or underscores on a line by themselves (they also need to be preceded and followed by a blank line). Optionally, they can be separated by spaces.

- **Example: Horizontal Rules**

```
* * *

*****

---------------------------------------

- - - -
```

Paragraphs and Line Breaks

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines. The text at the beginning of a paragraph should not be indented with spaces or tabs. To create a new paragraph, simply insert a blank line in between them.

Important: When converting to HTML, if you break a paragraph on multiple lines (without a blank line in between them), it will create a break tag (`<br />`). When converting to DITA, the text is kept in a single paragraph in this case and a blank line is required to break a paragraph. This behavior differs slightly from the default Markdown rules.

- **Example: Paragraphs**

```
This is a paragraph that contains
two lines of text. (In HTML, a break tag is created in between the two lines)

This is a new paragraph.
```

Styling Text

The Markdown editor supports some syntax rules for styling text (such as bold, italic, or strikethrough).

- **Italic (Emphasis)** - Text wrapped with one asterisk or underscore produces an italic (emphasis) tag.

```
*italic*
_italic_
```

- **Bold (Strong)** - Text wrapped with two asterisks or underscores produces a bold (strong) tag.

```
**bold**
__bold__
```

- **Strikethrough** - In HTML only, text wrapped with two tildes (~~) produces a strikethrough tag.

```
~~strikethrough~~
```

Tip: You can also combine these styling rules. For example, `**BoldText _ItalicText_ BoldText**` would produce italicized text within bold text. Also, if you surround an asterisk or underscore with spaces, it will be treated as a literal asterisk or underscore. To produce a literal asterisk or underscore at a position where it would otherwise be used as an styling delimiter, you can escape it with a backslash (for example, `\*literal asterisks\*`.

Links

The Markdown editor supports two types of links, *inline* and *reference*. In both cases, it begins with link text that is delimited by [square brackets].

- **Inline Links**

  To create an inline link, use a set of regular parentheses immediately after the closing square bracket for the link text. Inside the parentheses, put the URL where you want the link to point, and optionally a title surrounded in quotes. Also, if you referencing a local resource on the same server, you can use relative paths.

  Examples: Inline Link

  With a title:

```
Text with [example link text](http://www.example.com/path "Title") inline link and title.
```

  Without a title:

```
Text with [example link text](http://www.example.com/path) inline link without a title.
```

  Relative path:

```
Text with [example link text](/relative_path/) inline link with relative path.
```

- **Reference Links**

Reference-type links use a second set of square brackets that include a label (link identifier) to identify the link (it may consist of letters, numbers, spaces, and punctuation and it is not case sensitive). You can optionally use a space to separate the sets of brackets. The labels (link identifiers) are only used for creating the links and do not appear in the output.

```
Text with [link text1][id 1] a reference-type link and [link text2][id_2] another one.
```

Then, somewhere in the document, you need to define your link label on a line by itself. The link identifier must be within square brackets followed by a colon, then after one or more spaces the URL for the link. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses. Also, the link may optionally be enclosed in angle brackets (< >).

```
[id 1]: http://example1.com/ "Optional Title"
[id_2]: <http://example2.com/> "Optional Title2"
```

Other notes about Reference Links:

- You can put the title on a second line and use extra spaces or tabs for padding. This is useful for aesthetics when the URL is long.

  ```
  [id]: http://example.com/long/path/to/resource/here
      "Optional Title Here"
  ```

- The label (link identifier) can be missing, in which case the link text (in square brackets) is used as the name.

  ```
  [My Link][]
  ```

  and then defined as:

  ```
  [My Link]: http://example.com/
  ```

Automatic Links

The Markdown editor supports a shortcut style for creating automatic links for URLs and email addresses. You simply surround the URL or email address with angle brackets.

Note: These automatic links only work properly in HTML conversions. The *Preview* pane may display them properly in the DITA tab, but the DITA output will not properly recognize the format.

- **URLs**

  By surrounding a URL with angle brackets, you can show the actual text of the URL while also making it clickable in the output.

  ```
  <http://example.com/>
  ```

  For example, in HTML it is converted to:

  ```
  <a href="http://example.com/">http://example.com/</a>
  ```

- **Email Addresses**

  Automatic links for email addresses work similarly, except that Markdown will also perform a bit of randomized decimal and hex entity-encoding to help obscure your address from address-harvesting *spambots*.

  ```
  <address@example.com>
  ```

  In HTML, it is converted to something like:

  ```
  <a href="&#x6D;&#x61;i&#x6C;&#x74;&#x6F;:&#x61;&#x64;&#x64;&#x72;&#x65;
  &#115;&#115;&#64;&#101;&#120;&#x61;&#109;&#x70;&#x6C;e&#x2E;&#99;&#111;
  &#109;">&#x61;&#x64;&#x64;&#x72;&#x65;&#115;&#115;&#64;&#101;&#120;&#x61;
  &#109;&#x70;&#x6C;e&#x2E;&#99;&#111;&#109;</a>
  ```

Images

The Markdown editor uses an image syntax that is intended to resemble the syntax for links, allowing for the same two types: *inline* and *reference*. In both cases, the syntax for images begin with an exclamation mark, followed by `alt` attribute text surrounded by square brackets., and then followed by a set of parentheses that contain the URL or path to the image.

- **Inline Images**

  For inline images, use a set of regular parentheses immediately after the closing square bracket for the `alt` attribute text. Inside the parentheses, put the URL or path of the image, and optionally a title surrounded in quotes.

  Examples: Inline Images

  With a title:

  ```
  Text with ![Alt text](/path/to/img.jpg "Optional title") inline image and a title.
  ```

  Without a title:

  ```
  Text with ![Alt text](/path/to/img.jpg) inline link without a title.
  ```

- **Reference Images**

  For reference-type images, use a second set of square brackets that include a label (image identifier) to identify the image (it may consist of letters, numbers, spaces, and punctuation and it is not case sensitive). You can optionally use a space to separate the sets of brackets. The labels (image identifiers) do not appear in the output.

  ```
  Text with ![Alt text1][id] a reference-type image.
  ```

  Then, somewhere in the document, you need to define your image label on a line by itself. The image identifier must be within square brackets followed by a colon, then after one or more spaces the URL or path of the image. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses.

  ```
  [id]: url/to/image "Optional Title"
  ```

Blockquotes

The Markdown editor uses email-style greater than characters (>) for *blockquotes*. You only need to put the > before the first line of a hard-wrapped paragraph, but it looks better (and is more clear) if you put a > before every line.

- **Example: Blockquotes**

  ```
  > This is a blockquote with two paragraphs. Lorem ipsum dolor sit amet,
  > consectetuer adipiscing elit. Aliquam hendrerit mi posuere lectus.
  > Vestibulum enim wisi, viverra nec, fringilla in, laoreet vitae, risus.
  >
  > Donec sit amet nisl. Aliquam semper ipsum sit amet velit. Suspendisse
  > id sem consectetuer libero luctus adipiscing.
  ```

- *Blockquotes* can be nested by adding additional levels of > characters.

  Example: Nested Blockquotes

  ```
  > This is the first level of quoting.
  >
  > > This is nested blockquote.
  >
  > Back to the first level.
  ```

- *Blockquotes* can also contain other Markdown elements (such as headers, lists, and code blocks).

  Example: Blockquotes with Other Markdown Elements

  ```
  > ## This is a header.
  >
  > 1.   This is the first list item.
  > 2.   This is the second list item.
  >
  > Here's some example code:
  ```

```
>
>     return shell_exec("echo $input | $markdown_script")
```

Quoting Code (Inline and Code Blocks)

The Markdown editor supports quoting code or commands inline within a sentence or in distinct blocks.

- **Inline**

  You can quote or emphasize code within a sentence (inline) with single backticks (`). The text within the backticks will not be formatted.

  Example: Inline Code Emphasis

  ```
  This is a normal sentence with a `code` in the middle.
  ```

- **Code Blocks**

  You can format code or text into its own distinct block by inserting a blank line before and after the content and using at least 4 spaces (or 1 tab), or by using opening and closing triple backticks (```) on separate lines.

  Example: Code Block

  ```
  This is a normal paragraph:

      This is a code block

  This is a normal paragraph:

  ```
  This is a code block
  ```
  ```

  One level of indentation is removed from each line of a codeblock and it continues until it reaches a line that is not indented (or until the closing backticks).

  Example: Code Block with Indentation

  ```
      tell application "something"
          beep
      end tell
  ```

  For example, in HTML the result would look like this:

  ```
  <pre><code>tell application "Foo"
      beep
  end tell
  </code></pre>
  ```

  You can also add an optional language identifier to enable syntax highlighting in your code blocks. The Oxygen XML Editor plugin Markdown editor supports the following languages: *Java*, *JavaScript*, *CSS*, and *Python*.

  Example: Syntax Highlighting in Code Block

  ```
  ```css
  input[type="submit"] {
      color: white;
      font-weight: bold;
  ```
  ```

Inline XHTML (for HMTL output only)

The Markdown editor supports writing inline XHTML. Since Markdown is just a writing format, it requires a conversion for publishing purposes. If you are using the HTML conversion, for any markup that is not covered by Markdown syntax, you can simply use XHTML syntax.

- **Example: Inline XHTML**

  ```
  This is a regular paragraph.

  <table>
      <tr>
          <td>Col 1</td>
          <td>Col 2</td>
      </tr>
  ```

```
</table>

This is another regular paragraph.
```

Lists

The Markdown editor supports ordered and unordered lists. You can also insert *blockquotes* and *code blocks* inside list items. List markers typically start at the left margin, but may be indented by up to three spaces.

- **Unordered Lists**

  For unordered lists, you can use asterisks (*), plus signs (+), and hyphens (-) interchangeably.

```
* List item 1
+ List item 2
- List item 3
```

- **Ordered Lists**

  For ordered lists, use numbers followed by periods. The actual numbers you use have no effect on the output. It simply converts them to list items within an ordered list an the actual number of list items will determine the numbers in the output.

```
1. List item 1
8. List item 2
5. List item 3
```

- **Nested Lists**

  You can create nested lists by indenting lines by two spaces.

```
1. Ordered list item 1
  1. Nested ordered list item 1
  2. Nested ordered list item 2
    * 2nd level nested unordered list item 1
    * 2nd level nested unordered list item 2
      * 3rd level nested unordered list item 1
2. Ordered list item 2
```

- **Paragraphs Inside Lists**

  If list items are separated by blank lines, Markdown will wrap the items in a paragraph in the output.

```
* List item 1

* List item 2
```

  For both DITA and HTML output, this would result in:

```
<ul>
<li><p>List item 1</p></li>
<li><p>List item 2</p></li>
</ul>
```

- **Multiple Paragraphs Inside Lists**

  List items may consist of multiple paragraphs. Each subsequent paragraph in a list item must be indented by either 4 spaces or one tab. Optionally, you can also indent each line of a paragraph to make it look nicer.

```
1.  This is a list item with two paragraphs. Lorem ipsum dolor
    sit amet, consectetuer adipiscing elit. Aliquam hendrerit
    mi posuere lectus.

    Vestibulum enim wisi, viverra nec, fringilla in, laoreet
    vitae, risus. Donec sit amet nisl. Aliquam semper ipsum
    sit amet velit.

2.  Suspendisse id sem consectetuer libero luctus adipiscing.
```

- **Blockquotes Inside Lists**

  To put a *blockquote* within a list item, the blockquote delimiters (>) need to be indented so that it is under the first letter of the text after the list item marker.

```
*   A list item with a blockquote:
    > This is a blockquote
    > inside a list item.
```

- **Code Blocks Inside Lists**

  To put a code block within a list item, insert an empty line in between the list item and the code block, and the code block needs to be indented twice (with 8 spaces or 2 tabs), or if you are using the triple backticks method, the opening triple backtick needs to be indented with 4 spaces or 1 tab.

```
*   A list item with a code block:

        This is a code block inside a list item

    ```
    This is a code block inside a list item using the backticks method
    ```
```

Task Lists

You can create task lists by prefacing list items with a hyphen followed by a space followed by square brackets (`- [ ]`). To mark a task as complete, use `- [x]`.

- **Example: Task Lists**

```
- [ ] Unfinished task 1
- [x] Finished task 2
```

Definition Lists

You can create definition lists by using a colon plus a space for each list item.

- **Example: Definition Lists**

```
Term 1
: Definition A
: Definition B
```

Tables

You can create tables in the Markdown editor by using pipes (`|`) and hyphens (`-`).

- **Creating a Table**

  Pipes are used to separate each column, while hyphens are used to create column headers. The pipes on either end of the table are optional. Cells can vary in width and do not need to be perfectly aligned within columns, but there must be at least three hyphens in each column of the header row.

```
| First Header  | Second Header |
| ------------- | ------------- |
| Column 1 Row 1 Cell  | Column 2 Row 1 Cell  |
| Column 1 Row 2 Cell  | Column 2 Row 2 Cell  |
```

- **Formatting Rules in Table Cells**

  You can use formatting rules inside the cells of the table (such as links, inline code blocks, and text styling).

```
| First Header  | Second Header |
| --- | --- |
| `inline code`  | Content with **bold text** inside cell  |
```

- **Aligning Text in Tables**

  You can align text to the left, right, or center of a column by including colons (`:`) to the left, right, or on both sides of the hyphens within the header row.

```
| Left-aligned | Center-aligned | Right-aligned |
| :---         |     :---:      |          ---: |
| Content Cell | Content Cell   | Content Cell  |
```

- **Joining Cells (Span a Cell Over Multiple Columns)**

You can join cells horizontally (span a cell over multiple columns) by using multiple consecutive pipe characters (`|`) to the right of the particular cell. The number of consecutive pipes indicate the number of columns the cell will span (`||` for two, `|||` for three, and so on).

```
| First Header | Second Header | Third Header | Fourth Header |
| ------------ | ------------- | ------------ | ------------- |
| Content Cell | *Cell Span Over 3 Columns* |||
```

Emoji

You can add *emoji* in the Markdown editor by surrounding the EMOJICODE with colons (`:EMOJICODE:`).

- **Example: Emoji**

```
:smile:
:laughing:
```

The resulting emoticons will appear in the output, but they are not displayed in the *Preview* pane.

For a full list of available emoji codes, see Emoji Cheat Sheet.

Backslash Escapes

You can ignore Markdown formatting by using backslash escapes (`\`) to generate literal characters that would otherwise have special meaning in the Markdown syntax. For example, if you want to surround a word with literal asterisks (instead of an italic or emphasis tag), you can use backslashes to escape the asterisks.

```
\*literal asterisks\*
```

The Markdown editor provides backslash escapes for the following characters:

```
\   backslash
`   backtick
*   asterisk
_   underscore
{}  curly braces
[]  square brackets
()  parentheses
#   hash mark
+   plus sign
-   minus sign (hyphen)
.   dot
!   exclamation mark
```

Automatic Escaping for Special Characters

The Markdown editor includes support for automatically escaping special characters such as angle brackets (< >) and ampersands (&). If you want to use them as literal characters, you must escape them as entities, as in the table below. The exception to this is in HTML output, if the special characters for a valid tag (for example, <b>), they are treated as literal characters and escaping is not necessary.

Literal Character	Escaping Code
<	<
>	>
&	&

Footnotes

The Markdown editor in Oxygen XML Editor plugin supports normal and inline footnotes. The following examples show the required syntax.

- **Example: Normal Footnote**

```
Here is a footnote reference,[^1]

[^1]: Here is the footnote.
```

- **Example: Normal Footnote with Multiple Blocks**

```
Here is a footnote reference,[^longnote]

[^longnote]: Here is the footnote with multiple blocks.

    Subsequent paragraphs are indented with 4 spaces or 1 tab to show that they
belong to the previous footnote.
```

- **Example: Inline Footnote**

```
Here is an inline note.^[Inlines notes are easier to write, since
you don't have to pick an identifier and move down to type the
note.]
```

Built-in XML Frameworks

9

Topics:

- Predefined Document Types (Frameworks)
- Other Supported Document Types

A *framework* is associated to an XML document type according to a set of rules. It also includes a variety of settings that improve editing capabilities in the **Author** mode for its particular file type. These settings include:

- A default grammar used for validation and content completion in both **Author** mode and **Text** mode.
- CSS stylesheets for rendering XML documents in **Author** mode.
- User actions invoked from toolbars or menus in **Author** mode.
- Predefined scenarios used for transformations for the class of XML documents defined by the document type.
- *XML Catalogs*.
- Directories with document templates.
- User-defined extensions for customizing the interaction with the content author in **Author** mode.

Oxygen XML Editor plugin includes built-in support for many common document types. Each document type is defined in a *framework*. You can create new *frameworks* or make changes to existing *frameworks* to suit your individual requirements.

For more information about configuring a *framework* in Oxygen XML Editor plugin, watch our video:

https://www.youtube.com/embed/Q91lU4qqzpk

Related Information:

Advanced Framework Customization on page 1230
Document Type Configuration Dialog Box on page 48

Predefined Document Types (Frameworks)

Oxygen XML Editor plugin includes a variety of specialized editors, views, and features that are dynamic according to the type of document that you open or create. The type of documents that are supported include the most popular predefined XML *frameworks* that include a full set of features as well as other document types that include more generic or common features.

Predefined Frameworks

The following predefined document types (*frameworks*) are fully supported in Oxygen XML Editor plugin and each of these document types include built-in transformation scenarios, validation, content completion, document templates , default CSS files for rendering content in **Author** mode, and default actions for editing in **Author** mode:

- DocBook 4 - A document type standard for books, articles, and other prose documents (particularly technical documentation).
- DocBook 5 - An enhanced (version 5) document type standard designed for a variety of documents (particularly technical documentation).
- DITA - An XML-based architecture designed for authoring, producing, and delivering technical information.
- DITA Map - A document type that collects and organizes references to DITA topics or other maps.
- XHTML - Extensible HyperText Markup Language includes the same depth of expression as HTML, but also conforms to XML syntax.

- TEI ODD - Text Encoding Initiative One Document Does it all is an XML-conformant specification that allows you to create TEI P5 schema in a literate programming style.
- TEI P5 - The Text Encoding Initiative guidelines is a standard for the academic community that collectively define an XML format for text that is primarily semantic rather than presentational.
- JATS - The NISO Journal Article Tag Suite is a technical standard that defines an XML format for scientific literature.

Document Type Association Preferences on page 46

DocBook 4 Document Type (Framework)

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, *block-level*, and *inline*. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

File Definition

A file is considered to be a *DocBook 4* document when one of the following conditions are true:

- The root element name is book or `article`.
- The PUBLIC ID of the document contains the string `-//OASIS//DTD DocBook XML`.

Default Document Templates

There are a variety of default *DocBook 4* templates available when creating new documents from templates and they can be found in: **Framework Templates** > **DocBook 4**.

The default templates for DocBook 4 documents are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/templates/Docbook 4` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the DocBook 4 file is `docbookxi.dtd` and it is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/4.5/dtd/`.

Default CSS

The default CSS files used for rendering DocBook content in **Author** mode are stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles on page 1315.

Default XML Catalog

The default *XML Catalog*, `catalog.xml`, is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/`.

Transformation Scenarios

Oxygen XML Editor plugin includes numerous built-in DocBook transformation scenarios that allow you to transform DocBook 4 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. All of them are listed in the **DocBook 4** section in the **Configure Transformation Scenario(s)** dialog box.

For more information, see the DocBook Transformation Scenarios on page 885 section.

DocBook 4 Author Mode Actions

A variety of actions are available in the DocBook 4 *framework* that can be added to the **DocBook4** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant*.

DocBook 4 Toolbar Actions

The following default actions are readily available on the **DocBook (Author Custom Actions)** toolbar when editing in **Author** mode (by default, most of them are also available in the **DocBook4** menu and in various submenus of the contextual menu):

Bold

Emphasizes the selected text by surrounding it with `<emphasis role="bold">` tag. You can use this action on multiple non-contiguous selections.

Italic

Emphasizes the selected text by surrounding it with `<emphasis role="italic">` tag. You can use this action on multiple non-contiguous selections.

Underline

Emphasizes the selected text by surrounding it with `<emphasis role="underline">` tag. You can use this action on multiple non-contiguous selections.

Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross reference (link)

Opens a dialog box that allows you to select a target to insert as a hypertext link.

Cross reference (xref)

Inserts a cross reference to other parts of the document.

Web Link (ulink)

Inserts a link that addresses its target with a URL (Universal Resource Locator).

Insert OLink

Opens an **OLink** dialog box that allows you to insert a link that addresses its target indirectly, using the `targetdoc` and `targetptr` values that are present in a **Targetset** file.

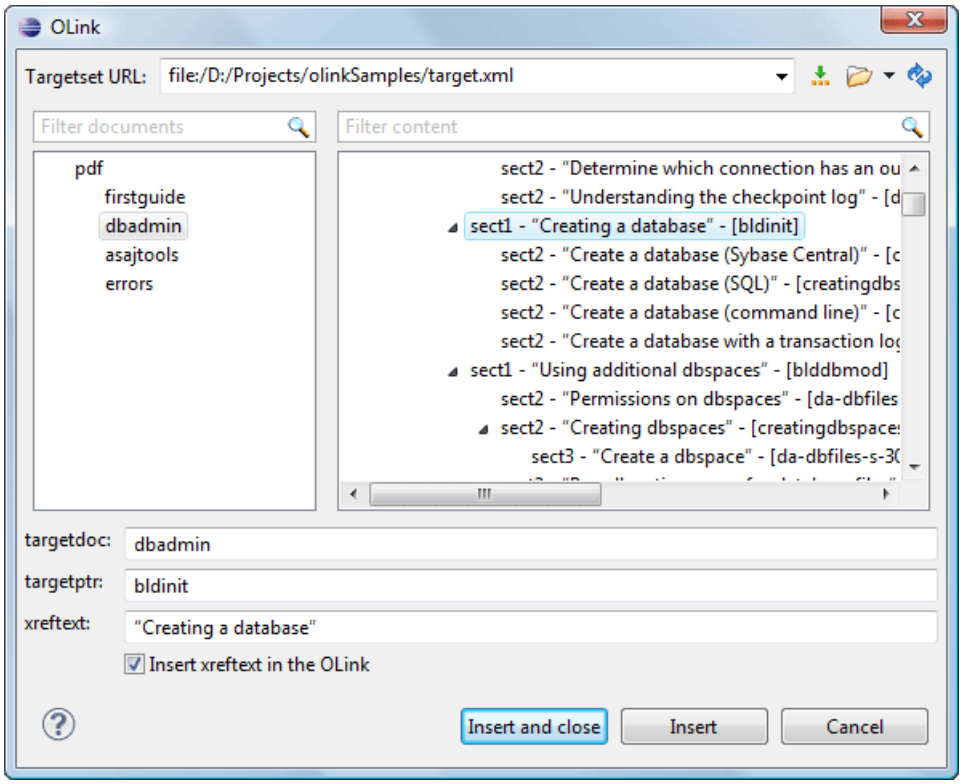

Figure 540: Insert OLink Dialog Box

After you choose the **Targetset URL**, the structure of the target documents is presented. For each target document (`targetdoc`), its content is displayed allowing you to easily identify the `targetptr` for the `olink` element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for **targetdoc** and **targetptr**, you can insert them directly in the corresponding fields. You can also edit an `olink` using the **Edit OLink** action that is available on the contextual menu. The last used **Targetset** URL will be used to identify the edited target.

To insert XREF text into the `olink`, enter the text in the **xreftext** field and make sure the **Insert xreftext in the OLink** option is selected.

Insert URI

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

Insert Image

Opens a dialog box that allows you to select the path of an image to insert at the cursor position. Depending on the current location, an image-type element is inserted. If the action is invoked between two block elements (such as paragraphs), the dialog box also allows you to provide a title.

Insert Media Resource

Opens a **Choose Media** dialog box that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

Section Drop-Down Menu

The following actions are available from this menu:

Insert Section

Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is `sect1`, then a `sect2` is inserted. By default, this action also inserts a `para` element as a child node. The `para` element can be deleted if it is not needed.

Promote Section (Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X))

Promotes the current node as a sibling of the parent node.

Demote Section (Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X))

Demotes the current node a child of the previous node.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations.

Insert List Item

Inserts a list item in the current list type.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Insert Variable List

Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

Insert Procedure List

Inserts a DocBook `procedure` element. A step `child` item is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a *block element*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DocBook4 Menu Actions

The following additional actions can be found in the **DocBook4** menu when editing in **Author** mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 4 *framework*:

Paste As XInclude

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Subscript

Surrounds the selected text with a *subscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

Superscript

Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor plugin a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin Editor Variables.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block* and *inline elements*.

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

Profiling Settings

Opens the profiling options preferences page, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

DocBook 4 Contextual Menu Actions

In addition to many of the DocBook 4 toolbar actions and the *general* **Author** mode contextual menu actions, the following DocBook 4 *framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 4 *framework*:

Paste As XInclude

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link > Edit OLink

Opens a dialog box that allows you edit an existing OLink. See the **Insert OLink** action for more information.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

DocBook 4 Drag/Drop (or Copy/Paste) Actions

Dragging a file from the **Navigator** view or **DITA Maps Manager** view and dropping it into a DocBook 4 document that is edited in **Author** mode, creates a link to the dragged file (the `ulink` DocBook element) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Navigator** view and drop them into a DocBook 4 document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the `inlinegraphic` DocBook element with a `fileref` attribute).

Inserting an `olink` in DocBook Documents

The `olink` element is used for linking to resources outside the current DocBook document. The `targetdoc` attribute is used for the document ID that contains the target element and the `targetptr` attribute for the ID of the target element (the value of an `id` or `xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
```

You can form a cross reference to that chapter by adding an `olink`, as in the following example:

```
You may need to update your
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>
when you get a new machine.
```

To use an `olink` to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.

   A unique ID must be assigned to each document that will be referenced with an `olink`. It is usually added as an `id` (or `xml:id` for DocBook5) attribute to the root element of the document.
2. Decide on your output hierarchy.

   For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: `<dir name="directory_name">`, in the target database document.
3. Create the target database document.

   Each collection of documents has a master target database document that is used to resolve all `olinks` from that collection. The target database document is an XML file that is created once. It provides a means for pulling in the target data for each document. The database document is static and all the document data is pulled in dynamically.

   Example: The following is an example of a target database document. It structures a collection of documents in a `sitemap` element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

   ```
   <?xml version="1.0" encoding="utf-8"?>
   <!DOCTYPE targetset [
   <!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
   <!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db">
   <!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
   ]>
   <targetset>
     <targetsetinfo>
       Description of this target database document,
       which is for the examples in olink doc.
     </targetsetinfo>

     <!-- Site map for generating relative paths between documents -->
     <sitemap>
       <dir name="documentation">
         <dir name="guides">
           <dir name="mailuser">
             <document targetdoc="MailUserGuide"
                       baseuri="userguide.html">
               &ugtargets;
             </document>
           </dir>
           <dir name="mailadmin">
             <document targetdoc="MailAdminGuide">
               &agtargets;
             </document>
           </dir>
         </dir>
         <dir name="reference">
           <dir name="mailref">
             <document targetdoc="MailReference">
               &reftargets;
             </document>
           </dir>
         </dir>
       </dir>
     </sitemap>
   </targetset>
   ```
4. Generate the target data files by executing a DocBook transformation scenario.

   Before applying the transformation, you need to edit the transformation scenario, go to the **Parameters** tab, and make sure the value of the `collect.xref.targets` parameter is set to `yes`. The default name of a target data file is `target.db`, but it can be changed by setting an absolute file path in the `targets.filename` parameter.

Example: An example of a `target.db` file:

```
<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
 <ttl>Administering User Accounts</ttl>
 <xreftext>How to administer user accounts</xreftext>
 <div element="part" href="#d5e4" number="I">
  <ttl>First Part</ttl>
  <xreftext>Part I, “First Part”</xreftext>
  <div element="chapter" href="#d5e6" number="1">
    <ttl>Chapter Title</ttl>
    <xreftext>Chapter 1, Chapter Title</xreftext>
    <div element="sect1" href="#src_chapter" number="1" targetptr="src_chapter">
      <ttl>Section1 Title</ttl>
      <xreftext>xreflabel_here</xreftext>
    </div>
  </div>
 </div>
</div>
```

5. Insert `olink` elements in the DocBook documents.

   When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the **Link** drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an `olink` from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (`targetdoc`), its content is displayed, allowing you to easily identify the appropriate `targetptr`. You can also use the search fields to quickly identify a target. If you already know the values for the `targetdoc` and `targetptr` attributes, you can insert them directly in the corresponding fields.

   Example: In the following image, the target database document is called `target.xml`, *dbadmin* is selected for the target document (`targetdoc`), and *bldinit* is selected as the value for the `targetptr` attribute. Notice that you can also add XREF text into the `olink` by using the `xreftext` field.

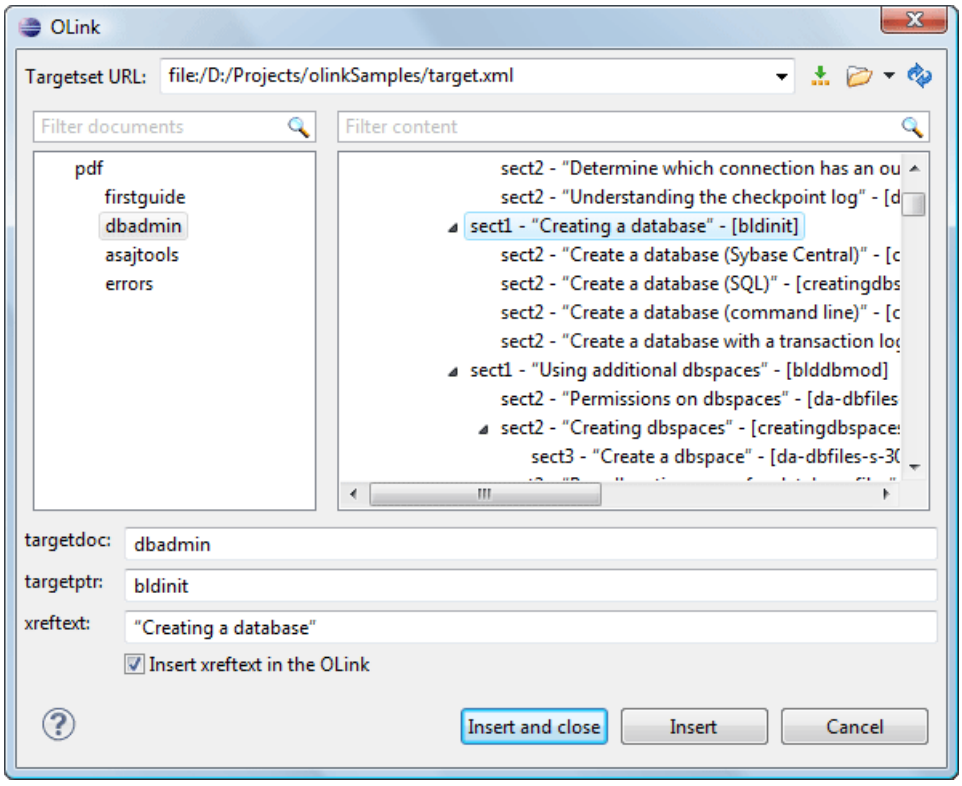

Figure 541: Insert OLink Dialog Box

6. Process a DocBook transformation for each document to generate the output.
   a) Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
   b) Apply the transformation scenario.

DocBook 5 Document Type (Framework)

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, *block-level*, and *inline*. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

File Definition

A file is considered to be a DocBook 5 document when the namespace is *http://docbook.org/ns/docbook*.

Default Document Templates

There are a variety of default *DocBook 5* templates available when creating new documents from templates and they can be found in: **Framework Templates** > **DocBook 5** > **DocBook 5.0** and **Framework Templates** > **DocBook 5** > **DocBook 5.1**.

New document templates for both DocBook 5 documents are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/templates/Docbook5.0` folder.

New document templates for both DocBook 5.1 documents are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/templates/Docbook5.1` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/5.0/rng/` (or for DocBook 5.1 in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/5.1/rng/`). Other types of schemas for various DocBook versions are also located in various folders inside the *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/` directory.

Default CSS

The default CSS files used for rendering DocBook content in **Author** mode is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles on page 1315.

Transformation Scenarios

Oxygen XML Editor plugin includes numerous built-in DocBook transformation scenarios that allow you to transform DocBook 5 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Editor plugin also includes a DocBook 5.1 transformation scenario for *Assembly* documents. All of them are listed in the **DocBook 5** section in the **Configure Transformation Scenario(s)** dialog box.

For more information, see the DocBook Transformation Scenarios on page 885 section.

DocBook 5 Author Mode Actions

A variety of actions are available in the DocBook 5 *framework* that can be added to the **DocBook5** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant*.

DocBook 5 Toolbar Actions

The following default actions are readily available on the **DocBook (Author Custom Actions)** toolbar when editing in **Author** mode (by default, most of them are also available in the **DocBook5** menu and in various submenus of the contextual menu):

Bold

Emphasizes the selected text by surrounding it with `<emphasis role="bold">` tag. You can use this action on multiple non-contiguous selections.

Italic

Emphasizes the selected text by surrounding it with `<emphasis role="italic">` tag. You can use this action on multiple non-contiguous selections.

Underline

Emphasizes the selected text by surrounding it with `<emphasis role="underline">` tag. You can use this action on multiple non-contiguous selections.

Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross reference (link)

Opens a dialog box that allows you to select a target to insert as a hypertext link.

Cross reference (xref)

Inserts a cross reference to other parts of the document.

Web Link (ulink)

Inserts a link that addresses its target with a URL (Universal Resource Locator).

Insert OLink

Opens an **OLink** dialog box that allows you to insert a link that addresses its target indirectly, using the `targetdoc` and `targetptr` values that are present in a **Targetset** file.

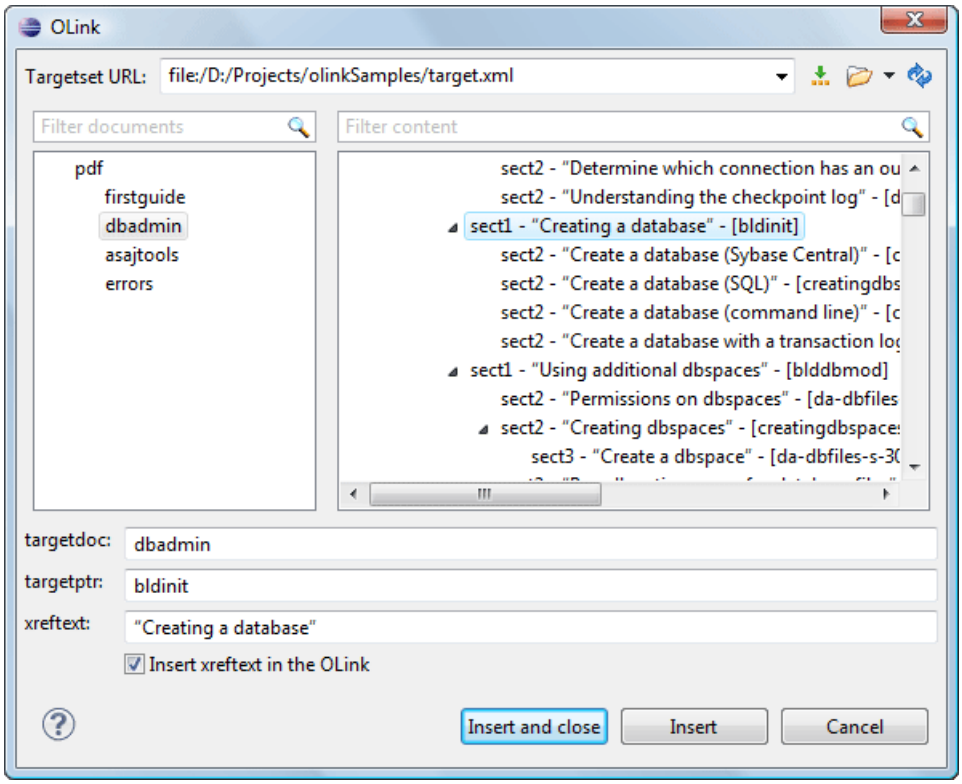

Figure 542: Insert OLink Dialog Box

After you choose the **Targetset URL**, the structure of the target documents is presented. For each target document (`targetdoc`), its content is displayed allowing you to easily identify the `targetptr` for the `olink` element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for **targetdoc** and **targetptr**, you can insert them directly in the corresponding fields. You can also edit an `olink` using the **Edit OLink** action that is available on the contextual menu. The last used **Targetset** URL will be used to identify the edited target.

To insert XREF text into the `olink`, enter the text in the **xreftext** field and make sure the **Insert xreftext in the OLink** option is selected.

Insert URI

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

Insert Image

Opens a dialog box that allows you to select the path of an image to insert at the cursor position. Depending on the current location, an image-type element is inserted. If the action is invoked between two block elements (such as paragraphs), the dialog box also allows you to provide a title.

Insert Media Resource

Opens a **Choose Media** dialog box that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

Section Drop-Down Menu

The following actions are available from this menu:

Insert Section

Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is `sect1`, then a `sect2` is inserted. By default, this action also inserts a `para` element as a child node. The `para` element can be deleted if it is not needed.

Promote Section (Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X))

Promotes the current node as a sibling of the parent node.

Demote Section (Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X))

Demotes the current node a child of the previous node.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations.

Insert List Item

Inserts a list item in the current list type.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Insert Variable List

Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

Insert Procedure List

Inserts a DocBook `procedure` element. A step `child` item is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a *block element*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DocBook5 Menu Actions

The following additional actions can be found in the **DocBook5** menu when editing in **Author** mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 5 *framework*:

Paste As XInclude

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Subscript

Surrounds the selected text with a *subscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

Superscript

Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor plugin a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin Editor Variables.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block* and *inline elements*.

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

Profiling Settings

Opens the profiling options preferences page, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

DocBook 5 Contextual Menu Actions

In addition to many of the DocBook 5 toolbar actions and the *general* **Author** mode contextual menu actions, the following DocBook 5 *framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 5 *framework*:

Paste As XInclude

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link > Edit OLink

Opens a dialog box that allows you edit an existing OLink. See the **Insert OLink** action for more information.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

DocBook 5 Drag/Drop (or Copy/Paste) Actions

Dragging a file from the **Navigator** view or **DITA Maps Manager** view and dropping it into a DocBook 5 document that is edited in **Author** mode, creates a link to the dragged file (the `link` DocBook element) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Navigator** view and drop them into a DocBook 5 document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the `imageobject` DocBook element with an `imagedata` child element and a `fileref` attribute).

Inserting an `olink` in DocBook Documents

The `olink` element is used for linking to resources outside the current DocBook document. The `targetdoc` attribute is used for the document ID that contains the target element and the `targetptr` attribute for the ID of the target element (the value of an `id` or `xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
```

You can form a cross reference to that chapter by adding an `olink`, as in the following example:

```
You may need to update your
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>
when you get a new machine.
```

To use an `olink` to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.

   A unique ID must be assigned to each document that will be referenced with an `olink`. It is usually added as an `id` (or `xml:id` for DocBook5) attribute to the root element of the document.
2. Decide on your output hierarchy.

   For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: `<dir name="directory_name">`, in the target database document.
3. Create the target database document.

   Each collection of documents has a master target database document that is used to resolve all `olinks` from that collection. The target database document is an XML file that is created once. It provides a means for pulling in the target data for each document. The database document is static and all the document data is pulled in dynamically.

   Example: The following is an example of a target database document. It structures a collection of documents in a `sitemap` element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

   ```
   <?xml version="1.0" encoding="utf-8"?>
   <!DOCTYPE targetset [
   <!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
   <!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db">
   <!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
   ]>
   <targetset>
     <targetsetinfo>
       Description of this target database document,
       which is for the examples in olink doc.
     </targetsetinfo>

     <!-- Site map for generating relative paths between documents -->
     <sitemap>
       <dir name="documentation">
         <dir name="guides">
           <dir name="mailuser">
             <document targetdoc="MailUserGuide"
                       baseuri="userguide.html">
               &ugtargets;
             </document>
           </dir>
           <dir name="mailadmin">
             <document targetdoc="MailAdminGuide">
               &agtargets;
             </document>
           </dir>
         </dir>
         <dir name="reference">
           <dir name="mailref">
             <document targetdoc="MailReference">
               &reftargets;
             </document>
           </dir>
         </dir>
       </dir>
     </sitemap>
   </targetset>
   ```
4. Generate the target data files by executing a DocBook transformation scenario.

   Before applying the transformation, you need to edit the transformation scenario, go to the **Parameters** tab, and make sure the value of the `collect.xref.targets` parameter is set to `yes`. The default name of a target data file is `target.db`, but it can be changed by setting an absolute file path in the `targets.filename` parameter.

Example: An example of a `target.db` file:

```
<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
 <ttl>Administering User Accounts</ttl>
 <xreftext>How to administer user accounts</xreftext>
 <div element="part" href="#d5e4" number="I">
  <ttl>First Part</ttl>
  <xreftext>Part I, “First Part”</xreftext>
  <div element="chapter" href="#d5e6" number="1">
    <ttl>Chapter Title</ttl>
    <xreftext>Chapter 1, Chapter Title</xreftext>
    <div element="sect1" href="#src_chapter" number="1" targetptr="src_chapter">
      <ttl>Section1 Title</ttl>
      <xreftext>xreflabel_here</xreftext>
    </div>
  </div>
 </div>
</div>
```

5. Insert `olink` elements in the DocBook documents.

   When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the **Link** drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an `olink` from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (`targetdoc`), its content is displayed, allowing you to easily identify the appropriate `targetptr`. You can also use the search fields to quickly identify a target. If you already know the values for the `targetdoc` and `targetptr` attributes, you can insert them directly in the corresponding fields.

   Example: In the following image, the target database document is called `target.xml`, *dbadmin* is selected for the target document (`targetdoc`), and *bldinit* is selected as the value for the `targetptr` attribute. Notice that you can also add XREF text into the `olink` by using the `xreftext` field.

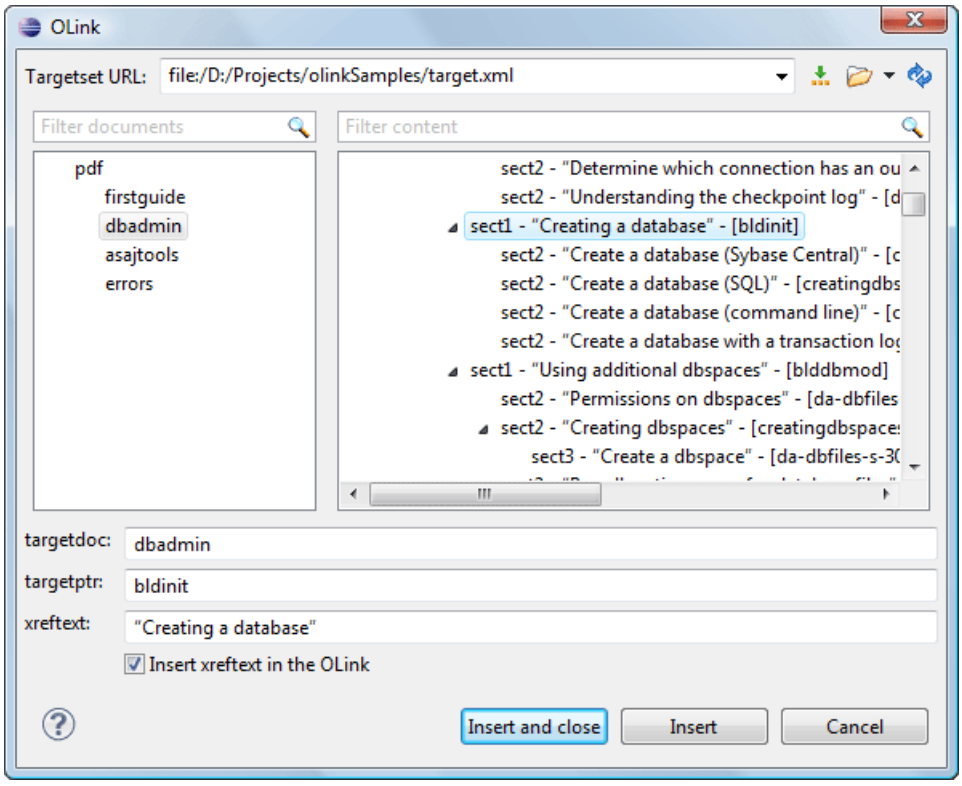

Figure 543: Insert OLink Dialog Box

6. Process a DocBook transformation for each document to generate the output.
   a) Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
   b) Apply the transformation scenario.

DocBook 5.1 Assembly

The DocBook *Assembly* document type was introduced with DocBook 5.1 and it is used to define the hierarchy and relationships for a collection of resources. It is especially helpful for topic-oriented authoring scenarios since it assembles a set of resources (such as DocBook 5.1 *topics*) to form a hierarchical structure for a larger publication.

An *Assembly* document usually has four major parts:

- **Resources** - Identifies a collection of resources (such as topics). An *Assembly* may identify one or more collections.
- **Structure** - Identifies an artifact to be assembled. A document in this case is the particular collection of resources (such as topics) that forms the documentation. Within the `structure` element, an `output` element can be used to identify the type of output to be generated and `module` elements can be used to identify the resources to be included. An *Assembly* may identify one or more *structures*.
- **Relationships** - Identifies relationships between resources. These relationships may be manifested in any number of *structures* during assembly. An *Assembly* may identify any number of relationships.
- **Transformations** - Identifies transformations that can be applied during assembly. An *Assembly* may identify any number of transformations.

For detailed information about the DocBook *Assembly* document type, see DocBook 5.1: The Definitive Guide - DocBook Assemblies.

File Definition

A file is considered to be an *Assembly* when the root name is `assembly`.

Default Document Templates

A default **Assembly** document template is available when creating new documents from templates and it can be found in: **Framework Templates** > **DocBook 5** > **DocBook 5.1**.

The default template for DocBook Assembly documents is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/templates/Docbook5.1` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/5.1/rng/`.

Transformation Scenarios

Oxygen XML Editor plugin includes a built-in transformation scenario that can be applied on an *Assembly* file to generate an *assembled* (merged) DocBook file. The scenarios is called **DocBook Assembly** and is found in the **DocBook 5** section in the **Configure Transformation Scenario(s)** dialog box.

Resources

- DocBook 5.1: The Definitive Guide - DocBook Assemblies
- Docbook 5.1 Specifications
- Sample files: *[OXYGEN_INSTALL_DIR]*`/samples/docbook/v5/assembly/`

DocBook 5.1 Topic

The DocBook *Topic* document type was introduced with DocBook 5.1 and it is used as a modular unit of documentation. It is similar to the concept of the DITA *Topic* and can be used as modular resources in conjunction with DocBook 5.1 *Assembly* documents.

For detailed information about the DocBook *Topic* document type, see DocBook 5.1: The Definitive Guide - Topic.

File Definition

A DocBook file is considered to be a *Topic* when the root name is `topic`.

Default Document Templates

A default **Topic** document template is available when creating new documents from templates and it can be found in: **Framework Templates** > **DocBook 5** > **DocBook 5.1**.

The default template for DocBook Assembly documents is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/templates/Docbook5.1` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/5.1/rng/`.

Transformation Scenarios

Since DocBook *Topics* are modular resources, they are *assembled* and transformed in the **DocBook Assembly** transformation process. You can also use any of the built-in DocBook transformation scenarios to transform individual DocBook Topics to a variety of outputs, such as PDF, HTML, EPUB, and more. They are found in the **DocBook 5** section in the **Configure Transformation Scenario(s)** dialog box.

DocBook 5.1 Assembly on page 847

DocBook Targetset Document Type (Framework)

DocBook *Targetset* documents are used to resolve cross references with the DocBook `olink`.

File Definition

A file is considered to be a *Targetset* when the root name is `targetset`.

Default Document Templates

A default **Map** document template is available when creating new documents from templates and it can be found in: **Framework Templates** > **DocBook Targetset**.

The default template for DocBook Targetset documents is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/templates/Targetset` folder.

Default Schema for Validation and Content Completion

The default schema, `targetdatabase.dtd`, for this type of document is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/xsl/common/`.

DITA Topics Document Type (Framework)

The Darwin Information Typing Architecture (DITA) is an XML-based architecture for authoring, producing, and delivering technical information. It divides content into small, self-contained topics that you can reuse in various deliverables. The extensibility of DITA permits organizations to define specific information structures while still

using standard tools to work with them. DITA content is created as topics, each an individual XML file. Typically, each topic has a defined primary objective and structure, and DITA also includes several specialized topic types (*task*, *concept*, *reference*, *glossary entry*).

For much more detailed information, resources, and instructions, see the DITA Authoring on page 1458 chapter.

File Definition

A file is considered to be a DITA topic document when one of the following conditions are true:

- The root element name is one of the following: `concept`, `task`, `reference`, `dita`, or `topic`.
- The PUBLIC ID of the document is a PUBLIC ID for the elements listed above.
- The root element of the file has an attribute named `DITAArchVersion` for the "http://dita.oasis-open.org/architecture/2005/" namespace. This enhanced case of matching is only applied when the **Enable DTD/XML Schema processing in document type detection** option is selected from the **Document Type Association** preferences page.

Default Document Templates

There are a variety of default *DITA topic* templates available when creating new documents from templates and they can be found in various folders inside: **Framework Templates** > **DITA**.

The default templates for DITA topic documents are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/templates/topic` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the DITA documents are stored in the various folders inside *DITA-OT-DIR*`/dtd/` or *DITA-OT-DIR*`/schema/`.

Default CSS

The default CSS files used for rendering DITA content in **Author** mode are stored in the various folders inside: *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles on page 1315.

Default XML Catalogs

The default *XML Catalogs* for the DITA topic document type are as follows:

- *DITA-OT-DIR*`/catalog-dita.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/catalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/plugin/catalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/styleguide/catalog.xml`

Transformation Scenarios

Oxygen XML Editor plugin includes built-in transformation scenarios that allow you to transform individual DITA Topics to a XHTML or PDF output. They can be found in the **DITA** section in the **Configure Transformation Scenario(s)** dialog box.

DITA Author Mode Actions

A variety of actions are available in the DITA *framework* that can be added to the **DITA** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant*.

DITA Toolbar Actions

The following default actions are readily available on the **DITA (Author Custom Actions)** toolbar when editing in **Author** mode (by default, most of them are also available in the **DITA** menu and in various submenus of the contextual menu):

Bold

Surrounds the selected text with a b tag. You can use this action on multiple non-contiguous selections.

Italic

Surrounds the selected text with an `i` tag. You can use this action on multiple non-contiguous selections.

Underline

Surrounds the selected text with a u tag. You can use this action on multiple non-contiguous selections.

Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross Reference

Opens the **Cross Reference (xref)** dialog box that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics on page 1563.

File Reference

Opens the **File Reference** dialog box that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. For more information, see Linking in DITA Topics on page 1563.

Web Link

Opens the **Web Link** dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. For more information, see Linking in DITA Topics on page 1563.

Related Link to Topic

Opens the **Cross Reference (xref)** dialog box that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics on page 1563.

Related Link to File

Opens the **File Reference** dialog box that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics on page 1563.

Related Link to Web Page

Opens the **Web Link** dialog box that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics on page 1563.

Insert Image

Opens the **Insert Image** dialog box that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

Insert Media Resource

Opens the **Insert Media** dialog box that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an `object` element and it is rendered in **Author** mode so that it can be played directly from there.

Insert Section Drop-Down Menu

The following insert actions are available from this menu:

Insert Section

Inserts a new `section` element in the document, depending on the current context.

Insert Concept

Inserts a new `concept` element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

Insert Task

Inserts a new `task` element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

Insert Topic

Inserts a new `topic` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Reference

Inserts a new `reference` element, depending on the current context. A reference is a top-level container for a reference topic.

Insert Paragraph

Inserts a new paragraph at current cursor position.

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the **Reuse Content** dialog box that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (*conref*), content key references (*conkeyref*), or key references to metadata (*keyref*).

Insert step or list item

Inserts a new list or step item in the current list type.

Insert Unordered List

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is

rendered inside a *block element*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DITA Menu Actions

The following additional actions can be found in the **DITA** menu when editing in **Author** mode:

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the **Reuse Content** dialog box that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (*conref*), content key references (*conkeyref*), or key references to metadata (*keyref*).

Push Current Element

Opens the **Push current element** dialog box that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

Edit Content Reference

This action is available for elements with a `conref` or `conkeyref` attribute. it opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`conref`/`conkeyref` and `conrefend` attributes). For more information, see Reuse Content Dialog Box on page 1545.

Replace Reference with content

Replaces the referenced fragment (`conref` or `conkeyref`) at the cursor position with its content. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location.

Remove Content Reference

Removes the content reference (`conref` or `conkeyref`) inside the element at the cursor position.

Create Reusable Component

Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component on page 1554.

Insert Reusable Component

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component on page 1555.

Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA *framework*:

Paste as content reference

Inserts a content reference (a DITA element with a `conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the `conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from *DITA maps*. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an `xref` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Subscript

Surrounds the selected text with a *subscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

Superscript

Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor plugin a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Insert > Σ Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations.

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin Editor Variables.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note: This option does not have an effect on content that is *cut* and *pasted*.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Browse DITA Style Guide

Opens the **DITA Style Guide Best Practices for Authors** in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the **About Element** sub-menu), in the **DITA** menu, and in some of the documentation tips that are displayed by the *Content Completion Assistant*.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block* and *inline elements*.

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

Profiling Settings

Opens the profiling options preferences page, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

DITA Contextual Menu Actions

In addition to many of the DITA toolbar actions and the *general* **Author** mode contextual menu actions, the following DITA *framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA *framework*:

Paste as content reference

Inserts a content reference (a DITA element with a `conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the `conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from *DITA maps*. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.

2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an `xref` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Insert > Σ Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Reuse submenu

This submenu includes the following actions in regards to reusing content in DITA:

Push Current Element

Opens the **Push current element** dialog box that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

Edit Content Reference

This action is available for elements with a `conref` or `conkeyref` attribute. it opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`conref`/`conkeyref` and `conrefend` attributes). For more information, see Reuse Content Dialog Box on page 1545.

Replace Reference with content

Replaces the referenced fragment (`conref` or `conkeyref`) at the cursor position with its content. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location.

Remove Content Reference

Removes the content reference (`conref` or `conkeyref`) inside the element at the cursor position.

Create Reusable Component

Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component on page 1554.

Insert Reusable Component

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component on page 1555.

Search References (Ctrl + Shift + G)

Finds the references to the `id` attribute value for the element at the current cursor position, in all the topics contained in the current *DITA map* (opened in the **DITA Maps Manager** view). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

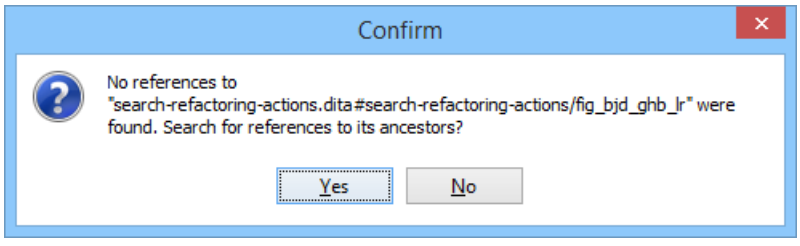

Figure 544: Search References to Ancestors Dialog Box

Show Key Definition

Available for elements that have a `conkeyref` or `keyref` attribute set (or elements with an ancestor element that has a `conkeyref` or `keyref` attribute). It computes the key name and opens the *DITA map* that contains the definition of the key with the element that defines that key selected.

About Element submenu

This submenu includes the following actions:

Style Guide

Opens the **DITA Style Guide Best Practices for Authors** in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the **About Element** sub-menu), in the **DITA** menu, and in some of the documentation tips that are displayed by the *Content Completion Assistant*.

Browse reference manual

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

Go to Definition

Moves the cursor to the definition of the current element.

DITA Drag/Drop (or Copy/Paste) Actions

Dragging a file from the **Navigator** view or **DITA Maps Manager** view and dropping it into a DITA document that is edited in **Author** mode, creates a link to the dragged file (the `xref` DITA element with the `href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Navigator** view and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA `image` element with an `href` attribute).

DITA Map Document Type (Framework)

DITA maps are documents that collect and organize references to DITA topics to indicate the relationships between the topics. They can be used as a container for topics used to transform a collection of content into a publication and they offer a sequence and structure to the topics. They can also serve as outlines or tables of contents for DITA deliverables and as build manifests for DITA projects. *DITA maps* allow scalable reuse of content across multiple contexts. Maps can reference topics or other maps, and can contain a variety of content types and metadata.

For much more detailed information, resources, and instructions, see the DITA Authoring on page 1458 chapter.

File Definition

A file is considered to be a *DITA map* document when one of the following conditions are true:

- The root element name is one of the following: `map`, `bookmap`.
- The public ID of the document is `-//OASIS//DTD DITA Map` or `-//OASIS//DTD DITA BookMap`.
- The root element of the file has an attribute named `class` that contains the value `map/map` and a `DITAArchVersion` attribute from the *http://dita.oasis-open.org/architecture/2005/* namespace. This enhanced case of matching is only applied when the **Enable DTD/XML Schema processing in document type detection** option from the **Document Type Association** preferences page is selected.

Default Document Templates

There are a variety of default *DITA map* templates available when creating new documents from templates and they can be found in various folders inside: **Framework Templates** > **DITA Map**.

The default templates for *DITA map* documents are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/sita/templates/map` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the *DITA map* document are stored in the various folders inside *DITA-OT-DIR*`/dtd/` or *DITA-OT-DIR*`/schema/`.

Default CSS

The default CSS files used for rendering DITA content in **Author** mode are stored in the various folders inside: *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles on page 1315.

Default XML Catalogs

The default *XML Catalogs* for the *DITA map* document type are as follows:

- *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/catalog.xml`
- *DITA-OT-DIR*`/catalog-dita.xml`

Transformation Scenarios

Oxygen XML Editor plugin includes numerous built-in transformation scenarios that allow you to transform *DITA maps* to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, and CHM. All of them are listed in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.

For more information, see the DITA Map Transformation Scenarios on page 889 section.

DITA Map Author Mode Actions

A variety of actions are available in the *DITA map framework* that can be added to the **DITA** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant*.

DITA Map Toolbar and Menu Actions

When a *DITA map* is opened in **Author** mode, the following default actions are available on the **DITA Map Author Custom Actions** toolbar (by default, they are also available in the **DITA** menu and in various submenus of the contextual menu):

Insert New Topic

Opens a **New** DITA topic dialog box that allows you to create a new topic and inserts a reference to it at the cursor position.

Insert Topic Reference

Opens the **Insert Reference** dialog box that allows you to insert and configure a reference to a topic at the cursor position.

Reuse Content

Opens the **Reuse Content** dialog box that allows you to insert and configure a content reference (`conref`), or a content key reference (`conkeyref`) at the cursor position.

Insert Topic Heading

Opens the **Insert Reference** dialog box that allows you to insert a topic heading at the cursor position.

Insert Topic Group

Opens the **Insert Reference** dialog box that allows you to insert a topic group at the cursor position.

Insert Relationship Table

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

Relationship Table Properties

Allows you to change the properties of rows in relationship tables.

Insert Relationship Row

Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

Insert Relationship Column

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

Delete Relationship Column

Deletes the table column where the cursor is located.

Delete Relationship Row

Deletes the table row where the cursor is located.

Move Up

Moves the selected node up one position on its same level.

Move Down

Moves the selected node down one position on its same level.

Promote

Moves the selected node up one level to the level of its parent node.

Demote

Moves the selected node down one level to the level of its child nodes.

DITA Menu Actions

The following additional actions can be found in the **DITA** menu when editing a *DITA map* in **Author** mode:

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block* and *inline elements*.

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

Profiling Settings

Opens the profiling options preferences page, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin Editor Variables.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note: This option does not have an effect on content that is *cut* and *pasted*.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

DITA Map Contextual Menu Actions

In addition to many of the **DITA Map** toolbar actions and the *general* **Author** mode contextual menu actions, the following *DITA map framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box on page 1487.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Search References

Finds the references to the `href` or `keys` attribute value of the topic/map reference element at the current cursor position, in all the topics from the current *DITA map* (opened in the **DITA Maps Manager** view). The current topic/map reference element must have an `href` or `keys` attribute defined to complete the search.

Show Key Definition

Available for elements that have a `conkeyref` or `keyref` attribute set (or elements with an ancestor element that has a `conkeyref` or `keyref` attribute). It computes the key name and opens the *DITA map* that contains the definition of the key with the element that defines that key selected.

DITA Map Drag/Drop Actions

Dragging a file from the **Navigator** view or **DITA Maps Manager** view and dropping it into a *DITA map* document that is edited in **Author** mode creates a link to the dragged file (a `topicref` element, `chapter`, `part`, etc.) at the drop location.

Open Topic from DITA Map in Author Mode

When a *DITA map* is opened in **Author** mode, you can click the icon to the left of a topic to open that particular topic in the editor.

XHTML Document Type (Framework)

The Extensible HyperText Markup Language (XHTML), is a markup language that has the same depth of expression as HTML, but also conforms to XML syntax.

File Definition

A file is considered to be an XHTML document when the root element name is `html`.

Default Document Templates

There are a variety of default *XHTML* templates available when creating new documents from templates and they can be found in: **Framework Templates** > **XHTML**.

The default templates for XHTML documents are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml/templates/` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the XHTML file are stored in the following locations:

- XHTML 1.0 - *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml/dtd/` or *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml/nvdl/`.
- XHTML 1.1 - *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml11/dtd/` or *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml11/schema/`.
- XHTML 5 - *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml/xhtml5 (epub3)/`.

Default CSS

The default CSS files used for rendering XHTML content in **Author** mode are stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles on page 1315.

Default XML Catalogs

The default *XML Catalogs* for the XHTML document type are as follows:

- *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml/dtd/xhtmlcatalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/relaxng/catalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/nvdl/catalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml11/dtd/xhtmlcatalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml11/schema/xhtmlcatalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/xhtml5 (epub3)/catalog-compat.xml`

Transformation Scenarios

Oxygen XML Editor plugin includes built-in transformation scenarios that allow you to transform XHTML documents to several types of DITA document types (topic, task, concept, reference). They can be found in the **XHTML** section in the **Configure Transformation Scenario(s)** dialog box.

XHTML Author Mode Actions

A variety of actions are available in the XHTML *framework* that can be added to the **XHTML** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant*.

XHTML Toolbar Actions

The following default actions are readily available on the **XHTML (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **XHTML** menu and some of them are in various submenus of the contextual menu):

Bold

Changes the style of the selected text to `bold` by surrounding it with b tag. You can use this action on multiple non-contiguous selections.

Italic

Changes the style of the selected text to `italic` by surrounding it with `i` tag. You can use this action on multiple non-contiguous selections.

Underline

Changes the style of the selected text to `underline` by surrounding it with u tag. You can use this action on multiple non-contiguous selections.

Link

Inserts an a element with an `href` attribute at the cursor position. You can type the URL of the reference you want to insert or use the browsing tools in the **Browse** drop-down menu.

Insert Image

Inserts a graphic object at the cursor position. This is done by inserting an `img` element regardless of the current context. The following graphical formats are supported: GIF, JPG, JPEG, BMP, PNG, SVG.

Insert Media Resource

Opens a **Choose Media** dialog box that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

Headings Drop-down Menu

A drop-down menu that includes actions for inserting h1, h2, h3, h4, h5, h6 elements.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations.

Insert List Item

Inserts a list item in the current list type.

Insert Unordered List

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert a definition list at the cursor position

Inserts a definition list (`dl` element) with one list item (a `dt` child element and a `dd` child element). You can also use this action to convert selected paragraphs or other types of lists to a definition list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a *block element*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor plugin a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

XHTML Menu Actions

The following additional actions can be found in the **XHTML** menu when editing in **Author** mode (some of them are also available in the contextual menu):

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block* and *inline elements*.

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

Profiling Settings

Opens the profiling options preferences page, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

XHTML Contextual Menu Actions

In addition to many of the XHTML toolbar actions and the *general* **Author** mode contextual menu actions, the following XHTML *framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

XHTML Drag/Drop (or Copy/Paste) Actions

Dragging a file from the **Navigator** view or **DITA Maps Manager** view and dropping it into an XHTML document that is edited in **Author** mode, creates a link to the dragged file (the a element with the `href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Navigator** view and drop them into an XHTML document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the `img` element with the `src` attribute).

TEI P5 Document Type (Framework)

The *TEI (Text Encoding Initiative)* document type is an international and interdisciplinary standard that enables libraries, museums, publishers, and individual scholars to represent a variety of literary and linguistic texts for online research, teaching, and preservation.

File Definition

A file is considered to be a TEI P5 document when one of the following conditions are true:

- The document namespace is *http://www.tei-c.org/ns/1.0*.
- The public ID of the document is *-//TEI P5*.

Default Document Templates

There are a variety of default *TEI P5* templates available when creating new documents from templates and they can be found in: **Framework Templates** > **TEI P5**.

The default templates for TEI P5 documents are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/templates/TEI P5` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the TEI P5 document is `tei_all.rng` and it is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/xml/tei/custom/schema/relaxng/`.

Default CSS

The default CSS files used for rendering TEI content in **Author** mode are stored in *[OXYGEN_INSTALL_DIR]*/frameworks/tei/xml/tei/css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles on page 1315.

Default XML Catalogs

The default *XML Catalogs* for the TEI P5 document type are as follows:

- *[OXYGEN_INSTALL_DIR]*/frameworks/tei/xml/tei/schema/dtd/catalog.xml
- *[OXYGEN_INSTALL_DIR]*/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml
- *[OXYGEN_INSTALL_DIR]*/frameworks/tei/xml/tei/stylesheet/catalog.xml

Transformation Scenarios

Oxygen XML Editor plugin includes built-in transformation scenarios that allow you to transform TEI P5 documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, and ODT. They can be found in the **TEI P5** section in the **Configure Transformation Scenario(s)** dialog box.

- TEI: P5 Guidelines

Related Information:

Editing XML Documents in Author Mode on page 441
Editing XML Documents in Text Mode on page 403
Adding Tables in TEI Documents on page 521

TEI P5 Author Mode Actions

A variety of actions are available in the TEI P5 *framework* that can be added to the **TEI P5** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant*.

TEI P5 Toolbar Actions

The following default actions are readily available on the **TEI P5 (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **TEI P5** menu and some of them are in various submenus of the contextual menu):

Bold

Changes the style of the selected text to `bold` by surrounding it with `hi` tag and setting the `rend` attribute to `bold`. You can use this action on multiple non-contiguous selections.

Italic

Changes the style of the selected text to `italic` by surrounding it with `hi` tag and setting the `rend` attribute to `italic`. You can use this action on multiple non-contiguous selections.

Underline

Changes the style of the selected text to `underline` by surrounding it with `hi` tag and setting the `rend` attribute to `ul`. You can use this action on multiple non-contiguous selections.

Insert Section

Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Image

Inserts an image reference at the cursor position. Depending on the current location, an image-type element is inserted.

Insert List Item

Inserts a list item in the current list type.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a *block element*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor plugin a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

TEI P5 Menu Actions

The following additional actions can be found in the **TEI P5** menu when editing in **Author** mode (some of them are also available in the contextual menu):

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin Editor Variables.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note: This option does not have an effect on content that is *cut* and *pasted*.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block* and *inline elements*.

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

Profiling Settings

Opens the profiling options preferences page, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

TEI Contextual Menu Actions

In addition to many of the TEI toolbar actions and the *general* **Author** mode contextual menu actions, the following TEI *framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

TEI P5 Drag/Drop Actions

Dragging a file from the **Navigator** view or **DITA Maps Manager** view and dropping it into a TEI P5 document that is edited in **Author** mode, creates a link to the dragged file (the `ptr` element with the `target` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a TEI P5 document inserts a graphic element (the `graphic` element with the `url` attribute) at the drop location, similar to the **Insert Image** toolbar action.

Customization of TEI Frameworks Using the Latest Sources

The TEI P5 *framework* is available as a public project at the following SVN repository: https://github.com/TEIC/oxygen-tei. This project is the base for customizing a TEI *framework*.

To customize a TEI *framework*, follow this procedure:

1. Check out the project on a local computer from the SVN repository.

   This action is done with an SVN client application that creates a working copy of the SVN repository on a local computer.
2. Customize the TEI *framework* in Oxygen XML Editor plugin.
   a) Set the Oxygen XML Editor plugin `frameworks` folder to the `oxygen/frameworks` subfolder of the folder of the SVN working copy.

      Open the **Preferences** dialog box , go to **Global**, and set the path of the SVN working copy in the **Use custom frameworks** option.
   b) Open the **Preferences** dialog box , go to **Document Type Association** > **Locations**, and select **Custom**.
3. Build a *JAR* file with the TEI *framework*.

   The SVN project includes a `build.xml` file that can be used for building a *JAR* file using the Ant tool. The command that should be used:

   ```
   ant -f build.xml
   ```
4. Distribute the *JAR* file to the users that need the customized TEI *framework*.

   The command from the above step creates a file `tei.zip` in the `dist` subfolder of the SVN project. Each user that needs the customized TEI *framework* will receive the `tei.zip` file and will unzip it in the `frameworks` folder of the Oxygen XML Editor plugin install folder.

Customization of TEI Frameworks Using the Compiled Sources

The following procedure describes how to update to the latest stable version of TEI Schema and TEI XSL, already integrated in the TEI *framework* for Oxygen XML Editor plugin.

1. Go to https://code.google.com/p/oxygen-tei/;
2. Go to **Downloads**;
3. Download the latest uploaded `.zip` file;
4. Unpack the `.zip` file and copy its content in the Oxygen XML Editor plugin `frameworks` folder.

TEI ODD Document Type (Framework)

The *TEI ODD (Text Encoding Initiative - One Document Does it all)* document type is a TEI XML-conformant specification format that allows you to create a custom TEI P5 schema in a literate programming fashion. A system of XSLT stylesheets called Roma was created by the TEI Consortium for manipulating the ODD files.

File Definition

A file is considered to be a TEI ODD document when the following conditions are true:

- The file extension is `.odd`.
- The document namespace is *http://www.tei-c.org/ns/1.0*.

Default Document Templates

There is a default *TEI ODD* document template available when creating new documents from templates and they can be found in: **Framework Templates** > **TEI ODD**.

The default template is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/templates/TEI ODD` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the TEI ODD document is `tei_odds.rng` and it is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/xml/tei/custom/schema/relaxng/`.

Default CSS

The default CSS files used for rendering TEI ODD content in **Author** mode are stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles on page 1315.

Default XML Catalogs

The default *XML Catalogs* for the TEI ODD document type are as follows:

- *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/xml/tei/custom/schema/catalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/xml/tei/schema/catalog.xml`

Transformation Scenarios

Oxygen XML Editor plugin includes built-in transformation scenarios that allow you to transform TEI ODD documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, ODT, RNG, DTD, and XML Schema. They can be found in the **TEI ODD** section in the **Configure Transformation Scenario(s)** dialog box.

TEI ODD Author Mode Actions

A variety of actions are available in the TEI ODD *framework* that can be added to the **TEI ODD** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant*.

TEI ODD Toolbar Actions

The following default actions are readily available on the **TEI ODD (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **TEI ODD** menu and some of them are in various submenus of the contextual menu):

Bold

Changes the style of the selected text to `bold` by surrounding it with `hi` tag and setting the `rend` attribute to `bold`. You can use this action on multiple non-contiguous selections.

Italic

Changes the style of the selected text to `italic` by surrounding it with `hi` tag and setting the `rend` attribute to `italic`. You can use this action on multiple non-contiguous selections.

Underline

Changes the style of the selected text to `underline` by surrounding it with `hi` tag and setting the `rend` attribute to `ul`. You can use this action on multiple non-contiguous selections.

Insert Section

Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Image

Inserts an image reference at the cursor position. Depending on the current location, an image-type element is inserted.

Insert List Item

Inserts a list item in the current list type.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a *block element*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor plugin a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

TEI ODD Menu Actions

The following additional actions can be found in the **TEI ODD** menu when editing in **Author** mode (some of them are also available in the contextual menu):

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin Editor Variables.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note: This option does not have an effect on content that is *cut* and *pasted*.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block* and *inline elements*.

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

Profiling Settings

Opens the profiling options preferences page, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

TEI Contextual Menu Actions

In addition to many of the TEI toolbar actions and the *general* **Author** mode contextual menu actions, the following TEI *framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

TEI ODD Drag/Drop Actions

Dragging a file from the **Navigator** view or **DITA Maps Manager** view and dropping it into a TEI ODD document that is edited in **Author** mode, creates a link to the dragged file (the `ptr` element with the `target` attribute) at the drop location.

jTEI Document Type (Framework)

The *jTEI (Journal of the Text Encoding Initiative)* document type is a highly restrictive customization (only about 80 elements are included) of the TEI P5 *framework*.

File Definition

A file is considered to be a *jTEI* document when the root element is named *TEI*, it is in the namespace *http://www.tei-c.org/ns/1.0*, and the `@rend` attribute is set to *"jTEI"*.

Default Document Templates

There is a default **jTEI Article** template available when creating new documents from templates and they can be found in: **Framework Templates** > **TEI JTEI**.

The default template is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/templates/TEI jTEI` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `tei_jtei.rng` and it is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/xml/tei/custom/schema/relaxng/`.

Default CSS

The default CSS file (`jtei.css`) that is used for rendering jTEI in **Author** mode is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles on page 1315.

Default XML Catalogs

The default *XML Catalogs* for jTEI are as follows:

- *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/xml/tei/schema/dtd/catalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/xml/tei/stylesheet/catalog.xml`

Transformation Scenarios

Oxygen XML Editor plugin includes built-in transformation scenarios that allow you to transform jTEI documents to PDF and ODT. They can be found in the **TEI JTEI** section in the **Configure Transformation Scenario(s)** dialog box.

Adding Tables in TEI Documents on page 521

JATS Document Type (Framework)

The *JATS (NISO Journal Article Tag Suite)* document type is a technical standard that defines an XML format for scientific literature.

File Definition

A file is considered to be a JATS document when the PUBLIC ID of the document contains the string `-//NLM//DTD`.

Default Document Templates

There are some default *JATS* templates available when creating new documents from templates and they can be found in: **Framework Templates** > **JATSKit - NISO JATS and NLM BITS**

The default templates for JATS documents are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/jats/templates/` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the JATS document are stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/jats/lib/schemas/`.

Default CSS

The default CSS files used for rendering JATS content in **Author** mode are stored in *[OXYGEN_INSTALL_DIR]*/frameworks/jats/lib/author-css/.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles on page 1315.

Default XML Catalog

The default *XML Catalog*, jatskit-catalog.xml, is stored in *[OXYGEN_INSTALL_DIR]*/frameworks/jats/lib/schemas/.

Transformation Scenarios

Oxygen XML Editor plugin includes built-in transformation scenarios that allow you to transform JATS documents to a variety of outputs, such as PDF, HTML, and EPUB. They can be found in the **JATSKit** section in the **Configure Transformation Scenario(s)** dialog box.

JATS Author Mode Actions

A variety of actions are available in the JATS *framework* that can be added to the **JATS** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant*.

JATS Toolbar Actions

The following default actions are readily available on the **JATS (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **JATS** menu and in various submenus of the contextual menu):

Paragraph Level Drop-Down Menu

Insert Paragraph
Insert a new paragraph element at current cursor position.

Insert Unordered List
Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

Insert Ordered List
Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Boxed Text
Inserts or wraps content in a box with a shaded background.

Code
Inserts or wraps content in a code element.

Display Quote
Inserts or wraps content in a disp-quote element.

Figure

Inserts a `fig` element with a `title` (inside a `caption` element). This action opens a dialog box that allows you to enter the text for the title for the figure.

Graphic Figure

Inserts a `fig` element with a `title` (inside a `caption` element), and a `graphic` element. A dialog box is displayed that allows you to enter the title for the figure, followed by a dialog box that allows you to select the URL of the graphic to be inserted.

Bold

Surrounds the selected text with a `bold` tag. You can use this action on multiple non-contiguous selections.

Italic

Surrounds the selected text with an `italic` tag. You can use this action on multiple non-contiguous selections.

Underline

Surrounds the selected text with an `underline` tag. You can use this action on multiple non-contiguous selections.

Monospace

Inserts or wraps content with a `monospace` element.

Insert Image

Inserts an image reference at the cursor position. Depending on the current location, an image-type element is inserted.

Insert List Item

Inserts a list item in the current list type.

Insert MathML

Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations.

Subscript

Surrounds the selected text with a *subscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

Superscript

Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

JATS Menu Actions

The following additional actions can be found in the **JATS** menu when editing in **Author** mode:

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block* and *inline elements*.

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

Profiling Settings

Opens the profiling options preferences page, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

JATS Drag/Drop Actions

Dragging a file from the **Navigator** view or **DITA Maps Manager** view and dropping it into a JATS document that is edited in **Author** mode, creates a link to the dragged file (the `ext-link` element with the `xlink:href` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a JATS document inserts an image element (the `inline-graphic` element with the `xlink:href` attribute) at the drop location, similar to the **Insert Image** toolbar action.

EPUB Document Type (Framework)

EPUB is an e-book file format that is a ZIP archive and can be downloaded and read on devices such as phones, tablets, computers, or e-readers. You can view the contents and structure of this type of file in the **Navigator** view or main editing pane.

Three distinct *frameworks* are supported for the EPUB document type:

- **NCX** - A declarative global navigation definition.
- **OCF** - The Open Container Format (OCF) defines a mechanism by which all components of an Open Publication Structure (OPS) can be combined into a single file system entity.
- **OPF** - The Open Packaging Format (OPF) defines the mechanism by which all components of a published work that conforms to the Open Publication Structure (OPS) standard (including metadata, reading order, and navigational information) are packaged in an OPS Publication.

  Note: Oxygen XML Editor plugin supports OPF 2.0, OPF 3.0, and OPF 3.1.

File Definition

A file is considered to be an *EPUB* document if it has a file extension of `.epub`.

Default Document Templates

There are a variety of default *EPUB* templates available when creating new documents from templates and they can be found the following folders in **Framework Templates**: **NCX**, **OCF**, **OPF 2.0**, **OPF 3.0**, and **OPF 3.1**.

- The default templates for the **NCX** document types are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/ncx/templates` folder.
- The default templates for the **OCF** document types are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/ocf/templates` folder.
- The default template for the **OPF 2.0** document type is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/opf/templates/2.0` folder.
- The default template for the **OPF 3.0** document type is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/opf/templates/3.0` folder.
- The default template for the **OPF 3.1** document type is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/opf/templates/3.1` folder.

Default Schema

The default schema files for the various types of EPUB document types are located in the following directories:

- The default schema files for the **NCX** document types are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/ncx/schemas` folder.
- The default schema files for the **OCF** document types are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/ocf/schemas` folder.
- The default schema files for the **OPF 2.0** document type is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/opf/schemas/2.0` folder.
- The default schema files for the **OPF 3.0** document type is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/opf/schemas/3.0` folder.
- The default schema files for the **OPF 3.1** document type is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/opf/schemas/3.1` folder.

Related Information:

Working with Archive Files on page 1136

Other Supported Document Types

Along with the fully supported predefined *frameworks* (document types), Oxygen XML Editor plugin also provides limited support (including document templates) for editing a variety of other document types. All the specialized views, editors, actions, and options are dynamic according to the type of file that is opened or created. Other document types that are supported in Oxygen XML Editor plugin include:

- EPUB (NCX, OCF, OPF 2.0, 3.0, & 3.1) - A standard for e-book files.
- OOXML - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
- ODF - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.
- DocBook Targetset - For resolving cross-references when using *olinks*.
- XSLT Stylesheets - A document type that provides a visual mode for editing XSLT stylesheets.
- WSDL - Web Services Description Language is an XML language for describing the functionality offered by a web service.
- Schematron - For making assertions about the presence or absence of patterns in XML documents. This document type applies to the ISO Schematron version.
- Schematron Quick Fixes (SQF) - An extension of the ISO standard Schematron, allows developers to define *Quick Fixes* for Schematron errors.

- StratML (Part 1 & 2) - Part 1 and 2 of the Strategy Markup Language specification.
- XProc - A document type for processing XProc script files.
- XML Schema - Documents that provide support for editing annotations.
- MathML - Mathematical Markup Language (2.0 and 3.0) is an application of XML for describing mathematical notations.
- XLIFF (1.2 & 2.0) - XML Localization Interchange File Format is a standard for passing data between tools during a localization process.
- XQuery - The common query language for XML.
- CSS - Cascading Style Sheets is a language used for describing the look and formatting of a document.
- Relax NG Schema - A schema language that specifies a pattern for the structure and content of an XML document.
- NVDL Schema - Namespace Validation Dispatching Language allows you to specify sections of XML documents to be validated against various schemas.
- JSON - JavaScript Object Notation is a lightweight data-interchange format.
- Markdown - A lightweight markup language with plain text formatting syntax that can be converted to HTML or DITA.
- JavaScript - Programming language of HTML and the Web.
- XMLSpec - A markup language for W3C specifications and other technical reports.
- DITAVAL - DITA conditional processing profile to identify the values you want to conditionally process for a particular output, build, or other purpose.
- Daisy - A technical standard for digital audio books, periodicals, and computerized text. It is designed to be an audio substitute for print material.
- EAD - Encoded Archival Description is an XML standard for encoding archival finding aids.
- KML - Keyhole Markup Language is an XML notation for expressing geographic visualization in maps and browsers.
- Maven Project & Settings - Project or settings file for Maven build automation tool that is primarily used for Java projects.
- Oasis *XML Catalog* - An *XML Catalog* document that describes a mapping between external entity references and locally-cached equivalents.
- Other Non-XML Files- Oxygen XML Editor plugin also includes a simple text editor and a variety of helpful features for creating and editing non-XML files.

Transforming Documents

10

Topics:

- Transformation Scenarios
- WebHelp Output
- PDF Output

XML documents can be transformed into a variety of user-friendly output formats that can be viewed by end users. This process is known as a *transformation*.

Oxygen XML Editor plugin includes numerous built-in transformation possibilities to publish XML content in various output formats (such as WebHelp, PDF, CHM, EPUB, JavaHelp, Eclipse Help, XHTML, etc.)

For transformations that are not included in your installed version of Oxygen XML Editor plugin, simply install the tool chain required to perform the specific transformation and process the files in accordance with the processor instructions. A multitude of target formats are possible. The basic condition for a transformation to any format is that your source document is well-formed.

Transformation Scenarios

A transformation scenario is a set of complex operations and settings that gives you the possibility to obtain outputs of multiple types (XML, HTML, PDF, EPUB, etc.) from the same source of XML files and stylesheets.

Note: You need to use the appropriate stylesheet according to the source definition and the desired output. For example, if you want to transform into an HTML format using a DocBook stylesheet, your source XML document should conform with the DocBook DTD.

Executing a transformation scenario implies multiple actions, such as:

- Validating the input file.
- Obtaining intermediate output files (for example, formatting objects for the XML to PDF transformation).
- Using transformation engines to produce the output.

Before transforming an XML document in Oxygen XML Editor plugin, you need to define a transformation scenario to apply to that document. A scenario is a set of values for various parameters that define a transformation. It is not related to a particular document, but rather to a document type. Oxygen XML Editor plugin included preconfigured built-in transformation scenarios, but you can also create new transformation scenarios.

When creating new transformation scenarios, the types that are available include:

- **Scenarios that Apply to XML Files** - This type of scenario contains the location of an XSLT stylesheet that is applied on the edited XML document, as well as other transformation parameters. For more information, see XML Transformation with XSLT on page 936 and XML Transformation with XQuery on page 946.
- **Scenarios that Apply to XSLT Files** - This type of scenario contains the location of an XML document that the edited XSLT stylesheet is applied to, as well as other transform parameters. For more information, see XSLT Transformation on page 963.
- **Scenarios that Apply to XQuery Files** - This type of scenario contains the location of an XML source, that the edited XQuery file is applied to, as well as other transform parameters. When the XML source is a native XML database, the XML source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the XML input field of the scenario. For more information, see XQuery Transformation on page 974.

- **Scenarios that Apply to SQL Files** - This type of scenario specifies a database connection for the database server that runs the SQL file that is associated with the scenario. The data processed by the SQL script is located in the database.
- **Scenarios that Apply to XProc Files** - This type of scenario contains the location of an XProc script, as well as other transform parameters. For more information, see SQL Transformation on page 979.
- **DITA-OT Scenarios** - This type of scenario provides the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Editor plugin includes a built-in version of Ant and a built-in version of DITA-OT, although you can also set other versions in the scenario. For more information, see DITA OT Transformation on page 950.
- **ANT Scenarios** - This type of scenario contains the location of an Ant build script, as well as other transform parameters. For more information, see Ant Transformation on page 961.

Note:

Status messages generated during the transformation process are displayed in the **Console** view (the **Enable Oxygen consoles** option must be selected in the **View** preferences page).

Built-in Transformation Scenarios

Oxygen XML Editor plugin includes preconfigured built-in transformation scenarios that are used for common transformations. They can be found in the various sections in the **Configure Transformation Scenario(s)** dialog box or **Transformation Scenarios** view. All the predefined *document types (frameworks)* that are included in Oxygen XML Editor plugin have various transformation scenarios in their specific sections, including the most popular *frameworks*, such as DITA, DocBook, TEI, XHTML, JATS, OOXML, and more.

To obtain the desired output, use one of the following actions from the toolbar or **Transform** submenu in the contextual menu of the **Navigator** view:

- **Apply Transformation Scenario(s) (Alt + Shift + T, T (Command + Alt + T, T on OS X))** - If you have associated transformation scenarios for the current document, this action will simply apply the association and begin the transformation process. If an association is not detected, this action will open the **Configure Transformation Scenario(s)** dialog box where you can choose the scenarios you want to apply.
- **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** - This action will open the **Configure Transformation Scenario(s)** dialog box where you can choose the scenarios you want to apply.

Note:

- You can apply a transformation even if the current document is not associated with a transformation scenario.
- If the document contains an `xml-stylesheet` processing instruction that references an XSLT stylesheet (commonly used to display the document in web browsers), Oxygen XML Editor plugin prompts you to associate the document with a built-in transformation scenario.
- The default transformation scenario is suggested based on the processing instruction from the edited document.

Editing a Transformation Scenario on page 980
Configure Transformation Scenario(s) Dialog Box on page 982
Applying Associated Transformation Scenarios on page 982
Transformation Scenarios View on page 986

DocBook Transformation Scenarios

Built-in transformation scenarios allow you to transform DocBook documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Editor plugin also includes a DocBook 5.1 transformation scenario for *Assembly* documents. All of them are listed in the **DocBook 4** and **DocBook 5** sections in the **Configure Transformation Scenario(s)** dialog box.

DocBook to WebHelp Classic Transformation

DocBook documents can be transformed into several types of WebHelp systems.

WebHelp Classic Output

To publish a DocBook document as a **WebHelp Classic** system, follow these steps:

1. Click the **Configure Transformation Scenario(s)** action from the toolbar.
2. Select the **DocBook WebHelp Classic** scenario from the **DocBook 4** or **DocBook 5** section.
3. Click **Apply associated**.

   When the **DocBook WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Output

To publish a DocBook document as a **WebHelp Classic with Feedback** system, follow these steps:

1. Click **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic with Feedback** scenario from the **DocBook 4** or **DocBook 5** section.
3. Click **Apply associated**.
4. Enter the documentation product ID and the documentation version.

   When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see Deploying a Feedback-Enabled System on page 1050.

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

https://www.youtube.com/embed/eoQ2uxHvppE

Customizing DocBook WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

l10n.gentext.default.language

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.copyright

Adds a small copyright text that appears at the end of the **Table of Contents** pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); }
       (document, 'script', 'facebook-jssdk')); -->
  </script>
  <div data-share="true" data-show-faces="true" data-action="like"
     data-layout="standard" class="fb-like"/>
</div>
```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, `no`. If set to `no`, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then a default **Oxygen** footer is inserted in each WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, `mobile-phone-user-guide`, `hvac-installation-guide`).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

webhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.skin.css

Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the predefined skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\predefined-skins` directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

For more information about all the DocBook transformation parameters, go to http://docbook.sourceforge.net/release/xsl/current/doc/fo/index.html.

Customizing WebHelp Classic Output on page 1009

DocBook to DITA Transformation

Oxygen XML Editor plugin includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at sourceforge.net.

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:
   - To apply the transformation scenario to a newly opened file, use the **Apply Transformation Scenario(s) (Alt + Shift + T, T (Command + Alt + T, T on OS X))** action from the toolbar or the **XML** menu.
   - To customize the transformation or change the scenario that is associated with the document, use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the toolbar or the **XML** menu.
2. Select the **DocBook to DITA** transformation scenario in the **DocBook 4** or **DocBook 5** section.
3. Click the **Apply associated** button to run the transformation.

   Step Result: The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.
4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

Related Information:

Editing a Transformation Scenario on page 980
Configure Transformation Scenario(s) Dialog Box on page 982

DocBook to PDF Transformation

Oxygen XML Editor plugin includes a built-in transformation scenario that is designed to convert DocBook content to PDF.

To convert a DocBook document to PDF, follow these steps:

1. Use one of the following two methods to begin the transformation process:
   - To apply the transformation scenario to a newly opened file, use the **Apply Transformation Scenario(s) (Alt + Shift + T, T (Command + Alt + T, T on OS X))** action from the toolbar or the **XML** menu.
   - To customize the transformation or change the scenario that is associated with the document, use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the toolbar or the **XML** menu.
2. Select the **DocBook PDF** transformation scenario in the **DocBook 4** or **DocBook 5** section.
3. Click the **Apply associated** button to run the transformation.

For information about customizing the PDF output for DocBook content, see DocBook to PDF Output Customization on page 1122.

Related Information:

Editing a Transformation Scenario on page 980
Configure Transformation Scenario(s) Dialog Box on page 982
DocBook to PDF Output Customization on page 1122

DocBook to EPUB Transformation

Oxygen XML Editor plugin includes a built-in transformation scenario that is designed to convert DocBook content to EPUB. The EPUB specification recommends the use of *OpenType* fonts (recognized by their `.otf` file extension) whenever possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```
@font-face {
font-family: "MyFont";
font-weight: bold;
font-style: normal;
src: url(fonts/MyFont.otf);
}
```

2. In the CSS, specify where this font is used. To set it as default for h1 elements, use the `font-family` rule, as in the following example:

```
h1 {
font-size:20pt;
margin-bottom:20px;
font-weight: bold;
font-family: "MyFont";
text-align: center;
}
```

3. Open the **Configure Transformation Scenario(s)** dialog box, select the **DocBook EPUB** transformation scenario in the **DocBook 4** or **DocBook 5** section, and click **Edit**.
4. In the **Parameters** tab, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

   Note: The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.
5. Run the transformation scenario.

DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform *DITA maps* to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Editor plugin also includes a special **Run DITA-OT Integrator** that can be used to integrate a DITA-OT plugin and a **DITA Map Metrics Report** transformation that generates a statistics report for your DITA map. All of them are listed in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.

A variety of transformations scenarios are available for *DITA maps*:

- Predefined transformation scenarios allow you to transform a *DITA map* to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word.
- **Run DITA-OT Integrator** - Use this transformation scenario if you want to integrate a DITA-OT plugin. This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- **DITA Map Metrics Report** - Use this type of transformation scenario if you want to generate a *DITA map* statistics report. They contain information such as the number of processed maps and topics, content reuse percentage, number of elements, attributes, words, and characters used in the entire *DITA map* structure, DITA conditional processing attributes used in the *DITA maps*, and more.

Applying Associated Transformation Scenarios on page 982

DITA Map to WebHelp Responsive Transformation

DITA content can be transformed into several types of WebHelp Responsive systems.

WebHelp Responsive Output

To publish a *DITA map* as **WebHelp Responsive** output, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- Templates Tab - This tab contains a set of predefined publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones.
- Parameters Tab - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section below for details about the most commonly used parameters for WebHelp Responsive transformations.
- Filters Tab - This tab allows you to filter certain content elements from the generated output.
- Advanced Tab - This tab allows you to specify some advanced options for the transformation scenario.
- Output Tab - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

   When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

WebHelp Responsive with Feedback Output

To publish a *DITA map* as a **WebHelp Responsive with Feedback** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

   - Templates Tab - This tab contains a set of predefined publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones.
   - Parameters Tab - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section below for details about the most commonly used parameters for WebHelp Responsive transformations.
   - Filters Tab - This tab allows you to filter certain content elements from the generated output.
   - Advanced Tab - This tab allows you to specify some advanced options for the transformation scenario.
   - Output Tab - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.
5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

   When the **DITA Map WebHelp Responsive with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment.

Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

editlink.remote.ditamap.url

Use this parameter in conjunction with `editlink.web.author.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of

the *main DITA map*. For example, a GitHub custom URL might look like this: `https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap`.

editlink.web.author.url

This parameter needs to be used in conjunction with `editlink.remote.ditamap.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: `https://www.oxygenxml.com/oxygen-xml-web-author/`.

editlink.present.only.path.to.topic

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the **editlink.remote.ditamap.url** and **editlink.web.author.url** parameters are ignored.

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor plugin)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed *DITA map*. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

force.unique

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.reload.stylesheet

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

webhelp.search.custom.excludes.file

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `'*'` (matches zero or more characters) or `'?'` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages.

webhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

webhelp.search.page.numberOfItems

Specifies the number of search results items displayed on each page. This parameter is only used when the **webhelp.search.enable.pagination** parameter is enabled.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.show.changes.and.comments

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

webhelp.sitemap.base.url

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the *DITA map*, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

webhelp.sitemap.change.frequency

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

webhelp.sitemap.priority

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

Parameters Specific to WebHelp Responsive Output

webhelp.default.collection.type.sequence

Specifies if the **sequence** value will be used by default when the `collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.

webhelp.enable.search.autocomplete

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is `yes`.

webhelp.fragment.after.body

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.logo_and_title

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.main.page.search

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.toc_or_tiles

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.top_menu

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.logo_and_title

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.page.search

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.toc_or_tiles

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.top_menu

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head

In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is `yes`.

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is `yes`.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is `no`.

webhelp.show.indexterms.link

Specifies if an icon that links to the index will be presented in the output. The default value is `yes`.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a *tree* style layout, this parameter should be set to `no`.

webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is `yes`.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is `yes`.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is `yes`.

webhelp.show.related.links

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is `yes`. The `webhelp.merge.nested.topics.related.links` parameter can used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is `yes`.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. The default value is `yes`.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is `yes`.

webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for *chunked* topics. The default value is `yes`.

webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

webhelp.publication.toc.tooltip.position

By default, if a topic contains a `shortdesc` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left** (default)
- **right**
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is `3`. A value of `0` means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are `collapsed` or `expanded` (default value).

DITA Map to WebHelp Classic Transformation

DITA content can be transformed into several types of WebHelp Classic systems.

WebHelp Classic Output

To publish a *DITA map* as a **WebHelp Classic** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

   - Skins Tab - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
   - Parameters Tab - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section below for details about the most commonly used parameters for WebHelp Responsive transformations.
   - Filters Tab - This tab allows you to filter certain content elements from the generated output.
   - Advanced Tab - This tab allows you to specify some advanced options for the transformation scenario.
   - Output Tab - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to process the transformation.

When the **DITA Map WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Output

To publish a *DITA map* as a **WebHelp Classic with Feedback** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

   - Skins Tab - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
   - Parameters Tab - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section below for details about the most commonly used parameters for WebHelp Responsive transformations.
   - Filters Tab - This tab allows you to filter certain content elements from the generated output.
   - Advanced Tab - This tab allows you to specify some advanced options for the transformation scenario.
   - Output Tab - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to begin the transformation.
5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

   When the **DITA Map WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment.

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

https://www.youtube.com/embed/eoQ2uxHvppE

Parameters for Customizing WebHelp Classic Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor plugin)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed *DITA map*. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

force.unique

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.body.script

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<body>` section of every WebHelp page.

webhelp.copyright

Adds a small copyright text that appears at the end of the **Table of Contents** pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); }
       (document, 'script', 'facebook-jssdk')); -->
    </script>
    <div data-share="true" data-show-faces="true" data-action="like"
       data-layout="standard" class="fb-like"/>
</div>
```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, no. If set to no, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then a default **Oxygen** footer is inserted in each WebHelp page.

webhelp.google.search.results

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommend to set the `linkTarget` attribute to `frm` for frameless (*iframe*) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`

webhelp.google.search.script

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

webhelp.head.script

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<head>` section of every WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.reload.stylesheet

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

webhelp.search.custom.excludes.file

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `'*'` (matches zero or more characters) or `'?'` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.show.changes.and.comments

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

webhelp.sitemap.base.url

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the *DITA map*, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

webhelp.sitemap.change.frequency

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

webhelp.sitemap.priority

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

DITA Map to PDF Transformation

Oxygen XML Editor plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting *DITA maps* to PDF output.

Creating a DITA Map to PDF Transformation Scenario

To create a *DITA Map to PDF* transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** toolbar.
2. Select **DITA Map PDF** and click the **Edit** button (or use the **Duplicate** button if your *framework* is read-only).
3. Use the various tabs to configure the transformation scenario. In the **Parameters** tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
   - `show.changes.and.comments` - If set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output.
   - `customization.dir` - Specifies the path to a customization directory.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

Related Information:
DITA Map to PDF Output Customization on page 1117

DITA Map to PDF WYSIWYG Transformation

Oxygen XML Editor plugin comes bundled with a **DITA-OT CSS Publishing to PDF plugin** that allows you to convert *DITA maps* to PDF using a CSS layout processor. Oxygen XML Editor plugin also comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xsl:fo* customizations. Oxygen XML Editor plugin also supports a few third-party processors.

The following processors are supported:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Editor plugin. For more information, see the Oxygen PDF Chemistry User Guide.
- **Prince Print with CSS** (not included in the Oxygen XML Editor plugin installation kit) - A third-party component that needs to be purchased from http://www.princexml.com.
- **Antenna House Formatter** (not included in the Oxygen XML Editor plugin installation kit) - A third-party component that needs to be purchased from http://www.antennahouse.com/antenna1/formatter/.

The **DITA-OT CSS Publishing to PDF plugin** is located in the following directory: *`DITA-OT-DIR`*`/plugins/com.oxygenxml.pdf.css`. Although it includes a set of CSS files in its `css` subfolder, when this plugin is used in Oxygen XML Editor plugin, the CSS files located in the `${frameworks}` directory take precedence.

Creating the Transformation Scenario

To create an **DITA Map to PDF WYSIWYG** transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** toolbar.
2. Select **DITA Map PDF - WYSIWYG**.
3. In the **CSS Processor** tab, choose the processor type. You can select between **Oxygen PDF Chemistry**, **Prince XML**, or **Antenna House**.
4. In the **Parameters** tab, configure any of the following parameters (if applicable):
   - **css.processor.path.chemistry** (if you are using the **Oxygen PDF Chemistry** processor) - Specifies the path to the **Oxygen PDF Chemistry** executable file that will be run to generate the PDF. If this parameter is not set, your system's PATH environment variable will be used to find and start the **Oxygen PDF Chemistry** processor.
   - **css.processor.path.prince** (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
   - **css.processor.path.antenna-house** (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
   - **show.changes.and.comments** - When set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output. The default value is no.
   - **dita.css.list** - Allows you to specify a list of CSS URLs to be used by the PDF processor (instead of the default CSS files). The files must have URL syntax and be separated using semicolons. If the value is empty, the CSS associated with the current selection from the **Styles** drop-down menu is used.
   - **args.css** - Allows you to specify a path to a custom CSS to be used in addition to those specified in the `dita.css.list` parameter OR in addition to the CSS that is currently selected in the **Styles** drop-down menu. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.
5. Click **OK** and run the transformation scenario.

Customizing the Output

The **DITA-OT CSS Publishing to PDF plugin** makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xsl:fo* customizations. You can style the PDF output by simply using a custom CSS to change the styling and then re-running the transformation scenario until you get the desired result.

For more information, see the Customization CSS section. It offers numerous tips and examples for customizing the CSS for the PDF output.

Changing the Style of an Element

To change the style of a particular element, you need to create an additional CSS file that will store the customization rules. Once you have created this file, you need to instruct the editor how to use this additional CSS. This can be done in two ways:

- Specify the path to your custom CSS using the `args.css` parameter:
  1. Edit a **DITA map to PDF WYSIWYG** transformation scenario.
  2. In the **Parameters** tab, specify the path to your custom CSS files in the `args.css` parameter.
  3. Click **OK** and run the transformation scenario.

  This method is appropriate if you just want to apply the styling customization to the output.
- Create an alternate CSS for the DITA document type:
  1. Follow the procedure for adding an alternate CSS file in Customizing the Main CSS of a Framework on page 1297.
  2. Once you have configured your CSS as an additional layer, you can select it from the **Styles** drop-down menu (on the toolbar).
  3. Run the **DITA Map PDF - WYSIWYG** transformation scenario and the customization rules from the additional CSS will be visible in the produced PDF.

  This method allows you to have many customization CSS files and simply select the one that you need at any time for both the output and the rendering in **Author** mode.

Using the CSS Inspector to See the Style Associated with an Element

To find the styles associated with an element, follow this procedure:

1. Open a document in the editor and select **Inspect Styles** from the contextual menu. This opens the **CSS Inspector** view that shows all the CSS rules that apply to the selected element.
2. Click the particular link for the CSS selector that you need to change and Oxygen XML Editor plugin will open the CSS file and position the cursor at that selector.
3. After you identify the source of the styles you want to modify, copy the CSS rule in your customization CSS file and modify it according to your needs.

   To see the changes in **Author** mode, press **F5** to reload the document.

CSS Inspector View on page 209
Oxygen PDF Chemistry User Guide
Customization CSS on page 899

Customization CSS

The publishing process of the **DITA Map PDF - WYSIWYG** transformation scenario is driven by a customization CSS.

To change the styling of the output:

1. Create a custom CSS file that will contain all your customizations. It is recommended to create this file in your project directory.

   Important: Always use CSS rules that match the DITA class attribute values. Avoid using CSS selectors containing element names, because they have a weaker specificity and will not override the styles defined in the built-in CSS files. For instance, to match the p element, use its class attribute:

   ```
   *[class ~= "topic/p"] {
   ```

```
  color: gray;
}
```

Instead of:

```
p {
  color: gray;
}
```

Tip: You can organize the CSS rules in separate files, but they all need to be imported from a single master CSS file. For simplicity, this manual provides instructions based upon a single CSS file.

Note: LESS files are supported (LESS is a CSS pre-processor with a CSS-like syntax, but has a lot of features designed to speed up development).

2. Add the custom CSS rules. See the topics in this section for assistance with specific types of customizations.
3. In the **DITA Map PDF - WYSIWYG** transformation scenario, set the full path to the custom CSS file as the value of the `args.css` parameter.

Debugging the CSS

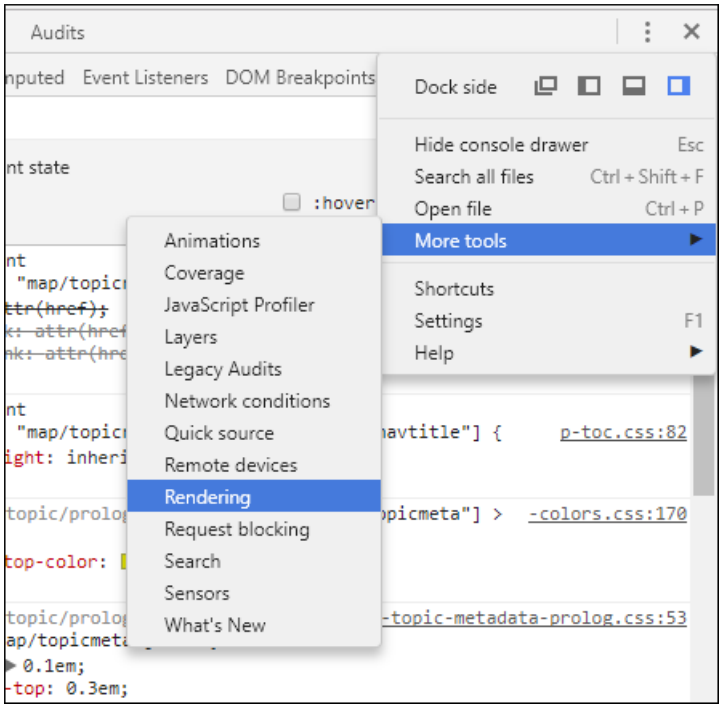
If you notice that some of the CSS properties were not applied, some typical debugging steps might include the following:

1. The first thing you should try is to check the file structure of the **merged map**. This can be found in the `out/pdf-css` directory and it has the `.merged.xml` file extension. You can open this file in **Oxygen XML Editor/Author** to examine the XML structure. Optionally, you can pretty print it (**Format and Indent**) to make the structure easier to read.
2. Then check that the CSS selector is written correctly.
3. If you still cannot identify the problem, then inspect how the styles are applied (you can try one of the methods listed below).

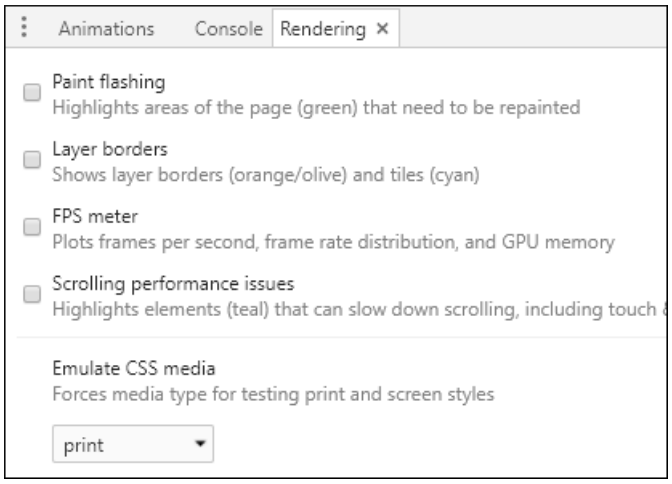
Inspecting the Applied Styles Using the Chrome Browser

To inspect the applied CSS styles using Chrome:

1. Open the `.merged.xml` file in Chrome.
2. Click on the element you want to inspect.
3. Activate the **Chrome Developer Tools** by using ⋮ > **More Tools** > **Developer Tools**, or press **CTRL+SHIFT+I**.
4. Activate the **Rendering** pane by using ⋮ > **More Tools** > **Rendering**:



5. In the **Rendering** pane, select **print** from the **Emulate CSS media** section. This will activate the CSS selectors enclosed in `@media print {..}`.



Note: This allows you to the debug styling of elements, table of contents, and index, but not the styles of the page margin boxes (headers, footers) or page breaks.

Tip: In the left pane of the **Developer Tools** interface, you can inspect elements and their styles in the **Elements** tab. You can click on any of the links to display the applied CSS files in the **Styles** tab in the right pane. Editing the styles in that pane results in a live preview of how the change will affect the output.

CAUTION: Do not modify the built-in rules directly in the CSS files from the **Oxygen XML Editor/Author** installation. Instead, copy the rules to your own customization CSS.

Inspecting the Applied Styles Using Oxygen XML Editor/Author

To inspect styles:

1. Open the file ending in `.merged.xml` file in **Oxygen XML Editor/Author**
2. From the **Styles** toolbar, choose the **+ Print Ready** entry. This will activate the CSS selectors enclosed in `@media print {..}`.
3. Click on the element you want to style. Use the **Inspect Styles** action from the Contextual Menu. A specialized view will show the built-in CSS rules.

Note: This allows you to debug styling of elements, but not of the page margin boxes (headers, footers) or page breaks.

CAUTION: Do not modify the built-in rules directly in the CSS files from the **Oxygen XML Editor/Author** installation. Instead, copy the rules to your own customization CSS.

Other techniques

These are some other techniques you may find useful:

- Add background and borders properties to the specific CSS rule. If they do not appear in the output then there is a problem with the rule selector.
- Try to use the `!important` notation to the property that is not applied, or make the selector more specific (you can add more parent selectors).
- To figure out how the elements are mapped into PDF, you can use this fragment in the customization CSS:

```
* {
   border: 1pt solid blue !important;
}

*:before(1000) {
   content:  oxy_name() !important;
   color: orange;
}

*:before(999) {
   content: "[ class= '" attr(class) "'] " !important;
   color: orange;
}
```

This will show the element name, its class attribute, and will paint a blue border around each of the elements in the output. It will not show the page margin boxes or some content elements that were hidden.

Page Size

This is where you can find information on how the page sizes are defined.

Page Size - Built-in CSS rules

The `[PLUGIN_DIR]/css/p-page-size.css` file contains the default page rules. It uses the US-LETTER size (8.5in by 11in). The content of this file is:

```
@page {
    padding-top:0.2em;
    padding-bottom:0.2em;
    size: us-letter;
    margin: 1in;
}
```

Note: This is listed solely for illustration purposes, as the plugin might use something different.

How to Change the Page Size

Suppose you want to publish using the standard A4 page size, with a margin of 2cm.

In your customization css, use:

```
@page {
    size: A4;
    margin: 2cm;
}
```

If you need different margins depending on the page side:

```
@page {
    size: A4;
    margin: 2cm;
}
@page :left{
    margin-right:4cm;
}
@page :right{
    margin-left:4cm;
}
```

This would only increase the gutter margins or the inside margins needed for binding of the final book. The other margins would remain 2cm.

How to Change the Page Orientation

Suppose you want to publish on a landscape page. The default is portrait, so you need to change it by using the size property. This will contain both the physical measurements and the orientation. In your customization css, use:

```
@page {
    size: us-letter landscape;
}
```

How to Change the Page Settings for a Specific Element

Suppose your publication is mainly using a portrait page orientation, but there are some topics that have wide images. To avoid having the images bleeding outside of the page, you could use a wider page setting (landscape).

1. Mark the topic with an `@outputclass` attribute and give it a distinct value (for example, **wide**).
2. In your customization css, match the topic from the CSS and associate it with a named page. This page has landscape orientation and small margins.

```
*[class ~= "topic/topic"][outputclass = 'wide'] {
    page: wide-page;
}

@page wide-page {
    size: letter landscape;
    margin: 0.5in;
```

```
}
```

Note: You can extend the example on any DITA element that should be displayed on wider page. Change the CSS selector to:

```
*[outputclass = 'wide'] {
    page: wide-page;
}
```

Metadata

DITA has a solid vocabulary for specifying metadata. There are `<prolog>` elements in the topics, and `<topicmeta>`, `<bookmeta>` elements in the bookmaps. They can be used to define authors, dates, audiences, organizations, etc. See: https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/metadata-in-maps-and-topics.html

It is up to you to decide where this information should be presented, in the PDF content or in the PDF document properties.

Metadata - Input XML fragment

In the merged map, the metadata section is placed inside the `<oxy:front-page>` element. This is different from the original placement in the map or bookmap - after the title, but allows usage of information from it in the title page.

Bookmaps

This is an example of a section taken from a merged bookmap where the CSS processor is applied to obtain the PDF. It only contains some of the possible metadata elements. The `bookmeta` metadata section is inherited from `topicmeta`:

```
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
    xmlns:opentopic-index="http://www.idiominc.com/opentopic/index" cascade="merge" class="- map/map bookmap/bookmap
 "
    ditaarch:DITAArchVersion="1.3" >

      <oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">

        <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
            class="- map/topicmeta bookmap/bookmeta ">
            <author class="- topic/author ">Howe Tuduit</author>
            <bookid class="- topic/data bookmap/bookid ">
                <isbn class="- topic/data bookmap/isbn ">071271271X</isbn>
                <booknumber class="- topic/data bookmap/booknumber ">SG99-9999-00</booknumber>
                <maintainer class="- topic/data bookmap/maintainer ">
                    <organization class="- topic/data bookmap/organization ">Retro Tools</organization>
                    <person class="- topic/data bookmap/person "/>
                </maintainer>
            </bookid>
            <bookrights class="- topic/data bookmap/bookrights ">
                ...
                <bookowner class="- topic/data bookmap/bookowner ">
                    <organization class="- topic/data bookmap/organization ">Retro Tools, Inc.</organization>
                </bookowner>
            </bookrights>
        </bookmeta>

        <oxy:front-page-title>
            ...
...
```

Maps

The maps have a more simple structure, they use the `<topicmeta>` element for metadata sections. This is also a simplified example, as there may be many more elements in the metadata section:

```
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
    xmlns:opentopic-index="http://www.idiominc.com/opentopic/index" cascade="merge" class="- map/map "
    ditaarch:DITAArchVersion="1.3">
    ...

      <oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">

        <topicmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot" is-chapter="true"
            class="- map/topicmeta ">
            <author class="- topic/author ">Dan Caprioara</author>
            <metadata class="- topic/metadata ">
                <prodinfo class="- topic/prodinfo ">
```

```
                    <prodname class="- topic/prodname ">oXygen PDF CSS DITA Plugin</prodname>
                </prodinfo>
            </metadata>
            <audience class="- topic/audience "/>
        </topicmeta>
...
```

Metadata - Built-in CSS rules

The `[PLUGIN_DIR]/css/p-meta.css` file contains the rules that extract metadata. The `<topicmeta>` can be used as a child of `map`, or a `topicref`. The map `<topicmeta>` is moved into the `<oxy:front-page>` element, so its local name is used to differentiate between the two cases and the CSS selectors will start with it.

```
/*
 * ================================================
 *
 * PDF metadata
 *
 * ================================================
 */
@media oxygen-chemistry {

/*
 * Titles (maps).
 */
*[class ~= "map/map"] > *[class ~= "topic/title"] {
    -oxy-pdf-meta-title: content();
}
*[class ~= "map/map"][title] {
    -oxy-pdf-meta-title: attr(title);
}

/*
 * Titles (bookmaps).
 */
front-page *[class ~= "bookmap/booktitle"] > *[class ~= "bookmap/mainbooktitle"] {
    -oxy-pdf-meta-title: content();
}

/*
 * Subject (bookmaps), using the alternate title.
 */
front-page *[class ~= "bookmap/booktitle"] > *[class ~= "bookmap/booktitlealt"] {
    -oxy-pdf-meta-description: content();
}

/*
 * Author (maps and bookmaps)
 *
 * Bookmeta is a specialization of topicmeta.
 */
front-page *[class ~= "map/topicmeta"] > *[class ~= "topic/author"] {
    -oxy-pdf-meta-author: content();
}

/*
 * Created (maps and bookmaps)
 */
front-page  *[class ~= "map/topicmeta"] > *[class ~= "topic/critdates"] > *[class ~= "topic/created"] {
    -oxy-pdf-meta-custom: "Created" attr(date);
}

/*
 * Revised (maps and bookmaps) - can have multiple occurences, so we aggregate them.
 */
front-page *[class ~= "map/topicmeta"] > *[class ~= "topic/critdates"]:has(*[class ~= "topic/revised"]) {
    -oxy-pdf-meta-custom: "Revised" oxy_xpath('string-join(*[contains(@class, " topic/revised ")]/@modified, ", " )');
}

/*
 * Keywords (maps and bookmaps).
 */
front-page *[class ~= "map/topicmeta"] > *[class ~= "topic/keywords"] > *[class ~= "topic/keyword"] {
    -oxy-pdf-meta-keyword: content();
}

/*
 * Organizaton holding the  book rights. (bookmaps)
 */
front-page *[class ~= "bookmap/bookmeta"] > *[class ~= "bookmap/bookrights"] > *[class ~= "bookmap/bookowner"] {
    -oxy-pdf-meta-custom: "Book rights owner" content();
}

/*
 * ISBN (bookmaps)
 */
front-page *[class ~= "bookmap/bookmeta"] > *[class ~= "bookmap/bookid"] > *[class ~= "bookmap/isbn"] {
    -oxy-pdf-meta-custom: "ISBN" content();
}
```

```
/*
 * Maintainer (bookmaps)
 */
front-page *[class ~= "bookmap/bookmeta"] > *[class ~= "bookmap/bookid"] > *[class ~= "bookmap/maintainer"] {
    -oxy-pdf-meta-custom: "Maintainer" content();
}

}

/*
 * Reset the topicmeta styles, in editor are used uses colors.
 * The topicmeta is used in the metadata section of the map, but
 * also in each topicref from the TOC.
 * The metadata section from the map is hidden.
 */
*[class~="map/topicmeta"] {
 border-color: transparent;
 color:inherit;
 background-color: inherit;
    border:none;
    margin:0;
    padding:0;
}
*[class~="map/topicmeta"]:before {
 content: none;
}
```

Note: This is listed solely for illustration purposes, as the plugin might use something different.

How to Add the Publication Audience to the Custom PDF Metadata

The audience element indicates the users the publication is addressing. This can be placed inside a `<topicmeta>` element in a `<map>` as in the following example:

```
<map>
    ...
    <topicmeta>
        ...
        <audience type="programmer" job="programming" experiencelevel="expert"/>
```

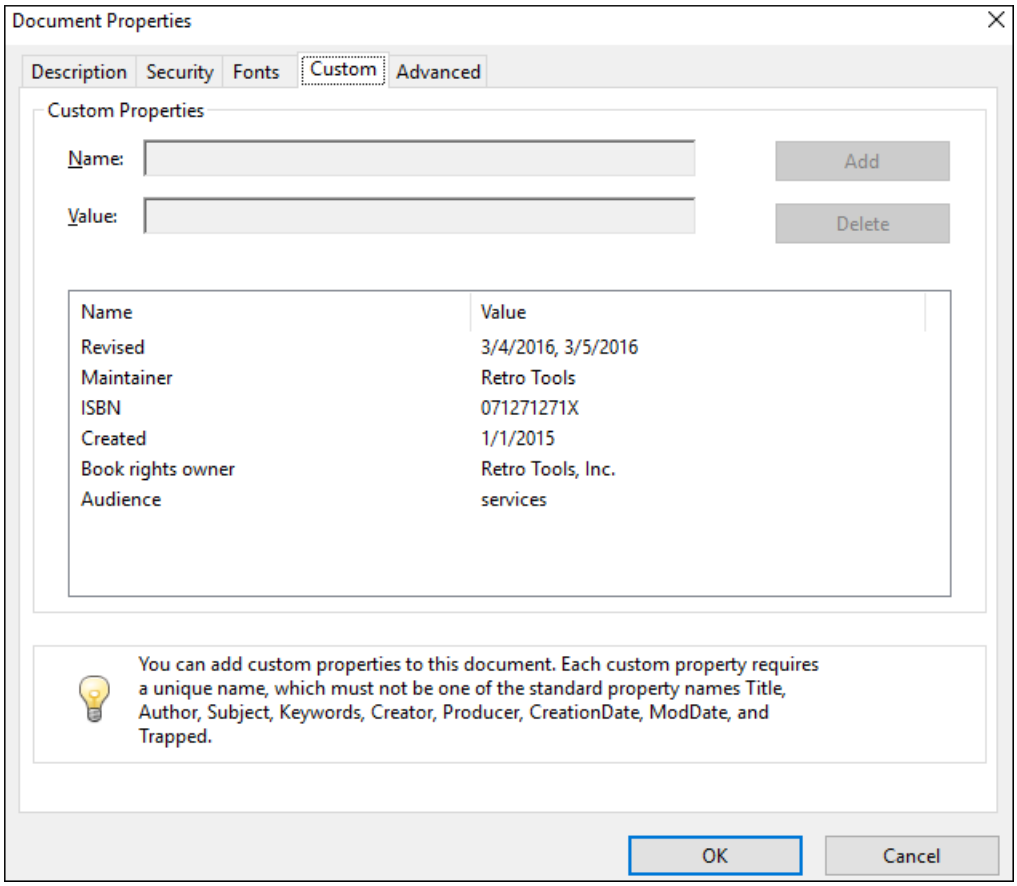
To collect the `@type` attribute, add the following in your customization css:

```
map > *[class ~= "map/topicmeta"] > *[class ~= "topic/audience"] {
    -oxy-pdf-meta-custom: "Audience" attr(type);
}
```

Note: It is best to use the class selector (such as `*[class ~= "map/topicmeta"]`) instead of `topicmeta` to cover cases where the elements are specialized (for instance, in a bookmap the `bookmeta` is a `topicmeta`, so your selector will also function for bookmaps, not only simple maps.

Note: The selector begins with `map >` to choose the `<topicmeta>` that is a direct child of the map, not other `<topicmeta>` elements from other `<topicref>` elements.

The metadata is displayed in the **Custom** tab of the **Document Properties** dialog box from Acrobat Reader:



How to Show Metadata in the Cover Page

Suppose you need to present the **author** and the **ISBN** just under the publication title. Your bookmap contains:

```
<bookmap id="taskbook">
    <booktitle>
        <booklibrary>Retro Tools</booklibrary>
        <mainbooktitle>Product tasks</mainbooktitle>
        <booktitlealt>Tasks and what they can do</booktitlealt>
    </booktitle>
    <bookmeta>
        <author>Howe Tuduit</author>
        <critdates>
            <created date="1/1/2015"/>
            <revised modified="3/4/2016"/>
            <revised modified="3/5/2016"/>
        </critdates>
        <bookid>
            <isbn>071271271X</isbn>
            <booknumber>SG99-9999-00</booknumber>
...
```

The entire <booktitle> element content is displayed on the first page of the PDF, so suppose you need to add the information after it.

In your customization css, add the following CSS rules:

```
*[class ~= "bookmap/booktitle"]:after {
    display:block;
    content: "by " oxy_xpath('//*[contains(@class, " bookmap/bookmeta ")]/*[contains(@class, " topic/author ")]/
text()');
    margin-top: 4em;
    text-align: center;
    color: gray;
}
*[class ~= "bookmap/booktitle"]:after(2) {
    display:block;
    content: "ISBN "oxy_xpath('//*[contains(@class, " bookmap/isbn ")]/text()');
    text-align: center;
    color: gray;
}
```

The following CSS extensions were used in this example:

- **oxy_xpath** - Executes an XPath expression and returns a string content.
- **`:after(N)`** - Creates more than one *after* pseudo element. The argument value represents how far the generated content is from the real content. In the example above, the content of the `:after` is closer to the title (upper) than the content of the `:after(2)`.

Generating Synthetic Pages for Metadata.

Suppose you need to show this information on a page that follows the title page, instead of on the title page. In this case, you need to prepare a named page and place the content on it. In your customization css, add the following CSS rules:

```
@page page-for-meta {
    background-color: yellow; /* Just to see it better*/
    @top-left-corner {
        content:""; /* Remove the default header */
    }
    @top-right-corner {
        content:""; /* Remove the default header */
    }
}

*[class ~= "bookmap/booktitle"]:after {
    page: page-for-meta;
}
*[class ~= "bookmap/booktitle"]:after(2) {
    page: page-for-meta;
}
```

How to Show Metadata in the Header or Footer

If you need to add some of the map metadata to the header of the front page (for example, the **creation date**), add the following CSS rules in your customization css:

```
front-page > *[class ~= "map/topicmeta"] > *[class ~= "topic/critdates"] > *[class ~= "topic/created"]{
    string-set: mapcreated attr(date);
}

@page front-page {
     @top-center {
          content: "Created: " string(mapcreated);
     }
}
```

Note: The *front-page* is the name of a page that used to present the `<oxygen:front-page>` element. The above page rule is combined with the default styles.

How to Show Arbitrary/Computed Data in the Header or Footer

The header and footer are compose of page margin boxes that can be populated with static text, by using *string-sets*.

You can extract and process data from any location in your document by executing XPath expressions. You can bind the evaluation result to a CSS *string-set* and then use it in the page margin boxes.

The following example counts the words from the publication and shows it in the front page footer.

In your customization css, add the following CSS rules:

```
*[class ~= "map/map"]{
    string-set: number-of-words oxy_xpath("string-length(normalize-space(.)) - string-length(translate(normalize-
space(.),' ',')) +1");
}

@page front-page {
     @bottom-center {
          content: "Number of words: " string(number-of-words);
     }
}
```

Note: This example counts all the words, including the ones from the TOC, but does not take into account the static labels.

Note: Preferably define the string set directly on the root element if you intend to use it in the front page.

Note: The context node for the XPath execution is(are) the one(s) matched by the CSS selector.

Cover (Title) Page

Customizing the cover page is one of the most requested customization requests.

Cover Page - Input XML fragment

The merged map contains a `<oxy:front-page>` element, child of the root element. This contains the metadata and an `<oxy:front-page-title>` element with the title structure.

```
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
    <oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">
        <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
            ...
        </bookmeta>
        <oxy:front-page-title>
            <booktitle xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
                class="- topic/title bookmap/booktitle ">
                <booklibrary class="- topic/ph bookmap/booklibrary ">Retro Tools</booklibrary>
                <mainbooktitle class="- topic/ph bookmap/mainbooktitle ">Product tasks</mainbooktitle>
                <booktitlealt class="- topic/ph bookmap/booktitlealt ">Tasks and what they can do</booktitlealt>
            </booktitle>
        </oxy:front-page-title>
    </oxy:front-page>
```

Cover Page - Built-in CSS rules

The `<oxy:front-page>` element is associated with a page named *front-page* with no headers or footers. The `<oxy:front-page-title>` is styled with a bigger font. The built-in CSS rules are in `[PLUGIN_DIR]/css/p-front-page.css`.

```
@media print {

    front-page {
        page: front-page;
    }

    front-page-title {
        display:block;
        text-align:center;
        margin-top:3in;
        font-size:2em;
        font-family:arial, helvetica, sans-serif;
        font-weight:bold;
    }

    @page front-page {
        @top-left-corner    {          content:none }
        @top-left           {          content:none }
        @top-center         {          content:none }
        @top-right          {          content:none }
        @top-right-corner   {          content:none }
        @bottom-left-corner {          content:none }
        @bottom-left        {          content:none }
        @bottom-center      {          content:none }
        @bottom-right       {          content:none }
        @bottom-right-corner{          content:none }
    }
}
```

Note: This is listed solely for illustration purposes, as the plugin might use something different.

How to Add a Background Image for the Cover

The simplest way is to create an SVG image as large as the entire physical page and set it as the background for the *front-page*.

Consider the following SVG document (`cover.svg`).

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE svg PUBLIC "-//W3C//DTD SVG 1.1//EN" "http://www.w3.org/Graphics/SVG/1.1/DTD/svg11.dtd">
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in">
    <desc>A gradient as big as a page.</desc>
    <defs>
        <linearGradient id="lc"
            x1="0%" y1="0%"
            x2="0%" y2="100%"
            spreadMethod="pad">
            <stop offset="0%"   stop-color="#00DD00" stop-opacity="1"/>
            <stop offset="100%" stop-color="#00AA00" stop-opacity="1"/>
        </linearGradient>
    </defs>
```

```
    <rect x="0" y="0" width="100%" height="100%" rx="10" ry="10"
        style="fill:url(#lc);
        stroke: #005000;
        stroke-width: 3;"/>
    <text x="45%" y="95%"  color="#FFFFAA" font-size="0.7cm"> Sample </text>
</svg>
```

It shows a gradient (but it can be anything, created with any tool) and the "Sample" text. It is as large as a US-LETTER page and can be used in a publication using this page size.

Note: You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They can be scaled and produce better results when printed.

In your customization css, add the following:

```
@page front-page {
    background-image: url("us-letter.svg");
    background-position:center;
}
```

Note: For smaller artworks, you can use background-position with percentage values.

Note: The text from the SVG or PDF background images are searchable in the PDF reader.

How to Change Styling of the Cover Page Title

Match the `<front-page-title>` in your customization css:

```
front-page-title {
  margin-top: 1in;
  font-size: 3em;
}
```

How to Add Text to the Cover Page

If you need to add arbitrary text to the cover page, you can use the `<oxy:front-page-title>` element as an anchor and add as many blocks of text as you need after it, and style them differently.

In your customization css, add the following:

```
front-page-title:after(1) {
    display:block;
    content: "DRAFT VERSION";
    font-size: large;
    color: red;
    text-align:center;
}

front-page-title:after(2) {
    display:block;
    content: "DO NOT DISTRIBUTE WITHOUT PERMISSION";
    font-size: large;
    color: red;
    text-align:center;
    font-style: italic;
}
```

The result is:

To use content from the document, you can use the `oxy_xpath` function in the `content` property. For a more complex example, including the generation of a new page for the synthetic `:after` elements, see: How to Show Metadata in the Cover Page on page 906.

How to Show Metadata in the Cover Page on page 906

How to Place Cover on the Right or Left Side

The merged map contains a `<oxy:front-page>` element that is displayed as the cover.

In your customization css, add the following CSS rules:

```
front-page{
    page-break-before:left;
}
```

Note: This will create an empty page at the beginning of the publication, moving the cover content on the needed side.

For more information, see: Oxygen PDF Chemistry: Controlling Page Breaks.

Related Information:

Double Side Pagination on page 917

How to Add a Specific Number of Empty Pages After the Cover Page

In your customization css, add the following CSS rules:

```
@page my-blank-page {
    /* Hide the page numbers */
    @top-left {content: none};
    @top-right {content: none};
}

front-page:after(1){
    page:my-blank-page;
    display:block;
    content: "\2002";
    color:transparent;
    page-break-after:always;
}

front-page:after(2){
    page:my-blank-page;
    display:block;
    content: "\2002";
    page-break-after:always;
}

front-page:after(3){
    page:my-blank-page;
    display:block;
    content: "\2002";
    page-break-after:always;
}
```

Note: The *"\2002"* character is a space that is not shown on the pages, but gives a value for the content property.

How to Force an Odd or Even Number of Pages in a Chapter on page 918

Front Matter and Back Matter

The *front matter* is a series of topics that are usually placed after the cover page and before the TOC or the content.

The *back matter* is a series of topics that are usually placed after the content of the book.

Front Matter and Back Matter - Input XML fragment

The frontmatter topics are wrapped in an `<oxy:front-matter>` element, that has the class `bookmap/frontmatter` (it is a clone of the original `<frontmatter>` element from the map):

Front Matter and Back Matter - Built-in CSS

The built-in CSS rules are in `[PLUGIN_DIR]/css/p-bookmap-frontmatter-backmatter.css`. By default, it associates the `<oxy:front-matter>` and `<oxy:back-matter>` elements with the *matter* page, that has no headers or other page margin boxes. Each of the child topics start on a new page.

The content of this file is:

```
@media print {

    front-matter,
    back-matter {
        page: matter-page;
    }

    /* Put the sections on a separate page. */
    front-matter > *[class ~= "topic/topic"],
    back-matter > *[class ~= "topic/topic"]{
      page-break-before: always;
    }
}
```

Note: This is listed solely for illustration purposes, as the plugin might use something different.

Related Information:

Page Headers and Footers on page 921

How to Remove Page Breaks Between Front Matter Child Topics

If you do not like the fact that all the topics that enter a bookmap `<frontmatter>` start on a new page, you can disable this by using the following rules in your customization css:

```
front-matter > *[class ~= "topic/topic"],
back-matter > *[class ~= "topic/topic"]{
      page-break-before: auto;
}
```

How to Style the Front Matter and Back Matter Topics

Suppose you want the topics from the *front matter* and *back matter* to start at the middle of the page and use a smaller fine print.

In your customization css, add the following:

```
front-matter > *[class ~= "topic/topic"] {
    margin-top: 50%;
    border-top: 5pt solid silver;
    font-size: 0.5em;
}
```

Numbering

The default numbering system is to only number the chapters in the TOC and in the content (shallow numbering).

Note: For a plain DITA map, the chapters are the `<topicref>` elements that are placed on the first level. For bookmaps, the chapters are the topics referenced by a `<chapter>` element.

Numbering - Input XML Fragments

The numbering affects three parts of your publication, the table of contents, headers/footers, and chapter titles:

The Table of Contents

The table of contents is a tree of `<topicref>` elements.

```
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
    <oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">
        ...
    </oxy:front-page>
    <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">
        <title class="- topic/title ">Publication Title</title>

        <topicref is-chapter="true" class="- map/topicref " ... >
            <topicmeta class="- map/topicmeta " ... >
                <navtitle href="#unique_1" class="- topic/navtitle ">Overview</navtitle>
                ...
            </topicmeta>
            <topicref class="- map/topicref " ...>
                <topicmeta class="- map/topicmeta " data-topic-id="dcpp_resources">
```

```
                    <navtitle href="#unique_2" class="- topic/navtitle ">Resources</navtitle>
                    ...
                </topicmeta>
            </topicref>
        ...
    </opentopic:map>
...
</map>
```

Note: The `<opentopic:map>` element contains the effective table of contents structure.

Note: The TOC items are the elements with the class: `- map / topicref`.

Note: The ones identified as chapters have the `@is-chapter` attribute set.

The Header and Footers

These are based on string sets generated for the titles. The complete set of strings is defined in: `[INSTALLATION_DIR]/css/print/p-pages-and-headers.css`.

The CSS rules that build the string sets are matching the map title from the front page and the titles from the content.

```
<oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">
        <oxy:front-page-title>
            <title class="- topic/title ">Publication Title</title>
        </oxy:front-page-title>
</oxy:front-page>
```

The main content is organized as follows:

```
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
    ...
    <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">
        ...
    </opentopic:map>

    <topic is-chapter="true" oid="dcpp_overview">
        <title class="- topic/title ">Overview</title>
        <body class="- topic/body ">
            ...
        </body>
        <topic class="- topic/topic " id="unique_2" oid="dcpp_resources">
            <title class="- topic/title ">Resources</title>
            ...
        </topic>
        <topic class="- topic/topic " id="unique_2" oid="dcpp_parameters">
            <title class="- topic/title ">Parameters</title>
            ...
        </topic>
    </topic>
```

Note: The topic content comes after the `<opentopic:map>` element.

Note: The child topics are the elements that have the class `- topic/topic` included in the parents.

Note: The ones identified as chapters have the `@is-chapter` attribute set.

The Titles of Chapters

The titles from the content are children of the topics:

```
<topic class="- topic/topic " id="unique_2" oid="dcpp_parameters">
        <title class="- topic/title ">Parameters</title>
            ...
</topic>
```

Note: The title elements have the class: `- topic/title`. The actual element name can be different.

Numbering - Built-in CSS rules

This section contains information about how to deal with shallow or deep chapter numbering.

CSS for Shallow Numbering

There is a file located in `[PLUGIN_DIR]/css/print/p-numbering-shallow`. The following examples are from this file.

Note: This is listed solely for illustration purposes, as the plugin might use something different.

The counters should be reset on the root element. This is the element that has the class `map/map`. Note that bookmaps derive from maps and the following selector will also match them:

```
*[class ~= "map/map"] {
    counter-reset: page 1
                   toc-chapter 0
                   chapter 0
                   figcount 0
                   tablecount 0;
}
```

Table of Contents

There is only one counter for the chapters, named `toc-chapter`. This is reset on the book parts (for bookmaps) and is incremented on each chapter that is not a part.

Note: The parts are also marked as chapters.

```
*[class ~= "map/topicref"][is-chapter]:not([is-part]) {
    counter-increment:toc-chapter;
}
*[class ~= "map/topicref"][is-part] {
   counter-reset:toc-chapter !important;
   counter-increment:toc-part;
}

/* All other topicrefs that follow a part should not have a number (i.e appendices)  */
*[class ~= "map/topicref"][is-part] ~ *[class ~= "map/topicref"]:not([is-part]) > *[class ~= "map/topicmeta"] >
 *[class ~= "topic/navtitle"]:before{
   content: none !important;
   counter-increment:none;
}
```

To display the numbers in the TOC, a `:before` pseudo element is used on the navigation titles from the `<topicref>` elements:

```
*[class ~= "map/topicref"][is-part] > *[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before{
   content:"Part " counter(toc-part, upper-roman) ". " !important;
   color:inherit;
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicmeta"] > *[class ~= "topic/
navtitle"]:before{
    content:"Chapter " counter(toc-chapter) ". " !important;
    color:inherit;
}
```

The Titles of Chapters in the Main Content

The `part` and `chapter` counters are incremented on the elements that have the class `topic/topic`:

```
*[class ~= "topic/topic"][is-part]{
    counter-increment:part;
    counter-reset:chapter;
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]){
    counter-increment:chapter;
}
```

Except for `<frontmatter>`, `<backmatter>`, and other topics following the last book part (for bookmaps).

```
*[class ~= "bookmap/frontmatter"],
*[class ~= "bookmap/frontmatter"] *[class ~= "topic/topic"],
*[class ~= "bookmap/backmatter"],
*[class ~= "bookmap/backmatter"] *[class ~= "topic/topic"],
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) {
   counter-increment:none !important;
   counter-reset: chapter part;
}
```

These counters are used in the content, before the titles:

```
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"]:before {
    content: "Part " counter(part, upper-roman) ". ";
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"]:before {
    content: "Chapter " counter(chapter) ". ";
}
```

Except for <frontmatter>, <backmatter>, and other topics following the last book part (for bookmaps).

```
*[class ~= "bookmap/frontmatter"] > *[class ~= "topic/title"]:before,
*[class ~= "bookmap/frontmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/title"]:before,
*[class ~= "bookmap/backmatter"] > *[class ~= "topic/title"]:before,
*[class ~= "bookmap/backmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/title"]:before,
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) > *[class ~= "topic/title"]:before,
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) *[class ~= "topic/topic"] > *[class
 ~= "topic/title"]:before{
    content:none !important;
}
```

Headers

Define the string-sets used in the header, using the `part` and `chapter` counters:

```
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"] {
    string-set: parttitle " | " counter(part, upper-roman) " - " content(), chaptertitle  ""; /* Avoid propagating a
 past chapter title on a new part */
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"] {
    string-set: chaptertitle " | " counter(chapter) " - " content();
}
```

Except for front matter, backmatter and other topics following the last book part (for bookmaps).

```
*[class ~= "bookmap/frontmatter"] > *[class ~= "topic/title"],
*[class ~= "bookmap/frontmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/title"],
*[class ~= "bookmap/backmatter"] > *[class ~= "topic/title"],
*[class ~= "bookmap/backmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/title"],
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) > *[class ~= "topic/title"],
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) *[class ~= "topic/topic"] > *[class
 ~= "topic/title"]{
   string-set: parttitle "", chaptertitle "";
}
```

CSS for Deep Numbering

The CSS file responsible for deep numbering is `[PLUGIN_DIR]/css/print/p-optional-numbering-deep.css`. The following examples are taken from this file.

Note: This CSS file is not used by default. To use it, you should copy it and then import it from your customization css.

Note: This is listed solely for illustration purposes, as the plugin might use something different.

For implementing the deep numbering, first the counters for the root element should be reset. In our example, the root is the element that has the class attribute set to `map/map`. Note that the following selector will also match bookmaps, as they are derived from maps:

```
*[class ~= "map/map"] {
    counter-reset: page 1
                   toc-chapter 0
                   toc-section1 0
                   toc-section2 0
                   toc-section3 0
                   toc-section4 0
                   chapter 0
                   section1 0
                   section2 0
                   section3 0
                   section4 0
                   figcount 0
                   tablecount 0;
}
```

Table of Contents

There are counters for parts (`toc-part`), chapters (`toc-chapter`) and sections (`toc-section1`, `toc-section2`, `toc-section3`).

Note: The parts are also marked as chapters.

```
*[class ~= "map/topicref"][is-chapter]:not([is-part]) {
 counter-increment:toc-chapter;
 counter-reset: toc-section1;
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicref"]{
```

```
 counter-increment:toc-section1;
 counter-reset: toc-section2;
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicref"] > *[class ~= "map/topicref"]{
 counter-increment:toc-section2;
 counter-reset: toc-section3;
}

/*
  All the parts get a part number.
  Each chapter gets a chapter number.
  All other topicrefs following a part do not have a number.
*/
*[class ~= "map/topicref"][is-part] {
   counter-reset:toc-chapter !important;
   counter-increment:toc-part;
}

/* All other topicrefs that follow a part should not have a number (i.e appendices)  */
*[class ~= "map/topicref"][is-part] ~ *[class ~= "map/topicref"]:not([is-part]) > *[class ~= "map/topicmeta"]:before{
   content: none !important;
   counter-increment:none;
}

*[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before {
 display:none !important; /* In case this CSS is used in cascade with the shallow numbering. */
}
```

To display the numbers in the table of contents, a pseudo `:before` element is used on `<topicmeta>` (this contains the TOC label and the header and page number).

To avoid wrapping the text under the chapter/section number, these pseudo elements are moved to the left of the `<topicmeta>` using position **absolute**:

```
*[class ~= "map/topicref"] {
    position:relative;
}

*[class ~= "map/topicref"] > *[class ~= "map/topicmeta"]:before {
    display:block;
    position:absolute; /* If the TOC item is wrapping, it won't wrap under the numbering. */
    top:0.4em; /* This aligns the before with the TOC item text. */
}

*[class ~= "map/topicref"][is-part] > *[class ~= "map/topicmeta"]:before {
    left: -1.5em; /* Increase the value of width and left as the depth increases. */
    width:1em;
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicmeta"]:before {
    left: -1.5em;
    width:1em;
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicref"] > *[class ~= "map/
topicmeta"]:before {
    left: -2em;
    width:2em;
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicref"] > *[class ~= "map/topicref"] >
 *[class ~= "map/topicmeta"]:before {
    left: -2.5em;
    width:2.5em;
}
```

And now the content for each pseudo element (depending on its depth) is set:

```
*[class ~= "map/topicref"][is-part] > *[class ~= "map/topicmeta"]:before {
    content: counter(toc-part, upper-roman) ".";
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicmeta"]:before {
    content: counter(toc-chapter) ".";
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicref"] > *[class ~= "map/
topicmeta"]:before {
    content: counter(toc-chapter) "." counter(toc-section1);
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicref"] > *[class ~= "map/topicref"] >
 *[class ~= "map/topicmeta"]:before {
    content: counter(toc-chapter) "." counter(toc-section1) "." counter(toc-section2);
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicref"] > *[class ~= "map/topicref"] >
 *[class ~= "map/topicref"] > *[class ~= "map/topicmeta"]:before {
    content: counter(toc-chapter) "." counter(toc-section1) "." counter(toc-section2) "." counter(toc-section3);
}
```

The Titles of Chapters in the Main Content

The `part`, `chapter` and `section1`/`section2`/`section3` counters are incremented on the elements that have the class `topic/topic`:

```
*[class ~= "topic/topic"][is-part]{
    counter-increment:part;
    counter-reset:chapter;
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) {
    counter-increment: chapter;
    counter-reset:section1;
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] {
    counter-increment:section1;
    counter-reset:section2;
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] > *[class ~= "topic/topic"] {
    counter-increment:section2;
    counter-reset:section3;
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] > *[class ~= "topic/topic"]  >
 *[class ~= "topic/topic"] {
    counter-increment:section3;
    counter-reset:section4;
}
```

Now avoid incrementing the counters for `<frontmatter>`, `<backmatter>`, and other topics following the last book part (for bookmaps).

```
*[class ~= "bookmap/frontmatter"],
*[class ~= "bookmap/frontmatter"] *[class ~= "topic/topic"],
*[class ~= "bookmap/backmatter"],
*[class ~= "bookmap/backmatter"] *[class ~= "topic/topic"],
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) {
   counter-increment:none !important;
   counter-reset: part chapter section1 section2 section3 section4 !important;
}
```

The following counters are used in the content, before the titles:

```
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"]:before{
        content: counter(part, upper-roman) ". ";
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"]:before{
        content: counter(chapter) ". ";
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] > *[class ~= "topic/title"]:before{
        content: counter(chapter) "." counter(section1) ". ";
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] > *[class ~= "topic/topic"] >
 *[class ~= "topic/title"]:before{
        content: counter(chapter) "." counter(section1) "." counter(section2) ". ";
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] > *[class ~= "topic/topic"] >
 *[class ~= "topic/topic"] > *[class ~= "topic/title"]:before{
        content: counter(chapter) "." counter(section1) "." counter(section2) "." counter(section3) ". ";
}
```

Avoid however setting content for `<frontamatter>`, `<backmatter>`, and other topics following the last book part (for bookmaps).

```
*[class ~= "bookmap/frontmatter"] > *[class ~= "topic/title"]:before,
*[class ~= "bookmap/frontmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/title"]:before,
*[class ~= "bookmap/backmatter"] > *[class ~= "topic/title"]:before,
*[class ~= "bookmap/backmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/title"]:before,
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) > *[class ~= "topic/title"]:before,
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) *[class ~= "topic/topic"] > *[class
 ~= "topic/title"]:before{
  content:none !important;
}
```

Headers

Define the string-sets used in the header and make use of counters:

```
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"] {
    string-set: parttitle " | " counter(part, upper-roman) " - " content(), chaptertitle  ""; /* Avoid propagating a
 past chapter title on a new part */
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"] {
    string-set: chaptertitle " | " counter(chapter) " - " content(), sectiontitle "";
```

```
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] > *[class ~= "topic/title"] {
    string-set: sectiontitle " | " counter(chapter) "." counter(section1) " - " content();
}
```

Avoid using counters for <frontamatter>, <backmatter>, and other topics following the last book part (for bookmaps).

```
*[class ~= "bookmap/frontmatter"] > *[class ~= "topic/title"],
*[class ~= "bookmap/frontmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/title"],
*[class ~= "bookmap/backmatter"] > *[class ~= "topic/title"],
*[class ~= "bookmap/backmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/title"],
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) > *[class ~= "topic/title"],
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) *[class ~= "topic/topic"] > *[class
 ~= "topic/title"]{
   string-set: parttitle "", chaptertitle "", sectiontitle "";
}
```

How to Reset the Page Numbers after the TOC

In your customization css, use the following rule:

```
*[class ~= "map/map"] > map + *[class ~= "topic/topic"]{
    counter-reset: page 1;
}
```

The map selector matches the <opentopic:map> element that contains the table of contents. So, the effect is to reset the page number at the beginning of the first topic following the TOC.

How to Remove the 'chapter NN' Prefix from Table of Contents and Content.

If you are using the shallow numbering CSS (this is the default), and you want to hide the "Chapter" prefix, use the following rules in your customization css:

For the TOC:

```
*[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before {
 display:none !important;
}
```

For the titles in the content, change the content of the title :before (this example just uses the chapter number):

```
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"]:before {
    content: counter(chapter) ". ";
}
```

How to Use a Deeper Numbering for Sections

If you need a deeper numbering, that goes to the sections and subsections, import the rules defined in the [INSTALLATION_DIRECTORY]/css/print/p-optional-double-side-pagination.css from your customization css.

Related Information:

CSS for Deep Numbering on page 914

Double Side Pagination

By default, the processor generates pages that are mirror images (the right page has the header on the right side, the left pages have the header on the left side). The chapters follow one another with no constraint on the page side.

Note: For a plain DITA map, the chapters are the <topicref> elements that are placed on the first level. For bookmaps, the chapters are the topics referenced by a <chapter> element.

This section contains information about how to position the start of the chapters on an odd folio number. Some of the CSS rules given here as examples are already listed in: [INSTALLATION_DIRECTORY]/css/print/p-optional-double-side-pagination.css. You may choose to import this file from your customization css.

How to Start Chapters on Odd Pages

A common use case is to arrange the chapters of the publication to start on an odd page number.

In your customization css, add the following:

```
@page chapter {
 -oxy-initial-page-number: auto-odd;
}
@page table-of-contents {
 -oxy-initial-page-number: auto-odd;
}
```

Supported values for `-oxy-initial-page-number` include: **auto**, **auto-even**, **auto-odd**, or a number.

How to Style the Empty (Blank) Pages

By making the chapters start on an odd page, the CSS processor might add blank pages to the previous page sequence as padding.

To style those blank pages add the following code in your customization css:

```
@page chapter:blank, table-of-contents:blank {
     @top-left      { content: none; }
     @top-center    { content: none; }
     @top-right     { content: none; }
     @bottom-left   { content: none; }
     @bottom-center { content: none; }
     @bottom-right  { content: none; }
}
```

Note: This just removes the headers and footers, but you can use a background image or a header with "Intentionally left blank" text.

Related Information:

How to Add a Background Image for the Cover on page 908

How to Force an Odd or Even Number of Pages in a Chapter

Another use case is to specify a number of pages for a section. Suppose that you have a table of contents that follows the cover page and you need to have an even number of pages. Hence, the next chapter would start on an even page.

In your customization css, use the `-oxy-force-page-count` property with an even value:

```
@page table-of-contents {
 -oxy-force-page-count: even;
}
```

Supported values for `-oxy-force-page-count` include: **even**, **odd**, **end-on-even**, **end-on-odd**, **auto**, **no-force**.

How to Style the First page of a Chapter

You can use the `:first` page rule selector to control how the first page of a chapter looks. Suppose that you have defined the following layout for your default page and you want to put the publication title (the `maptile` string) on the header of the first page (instead of the chapter name that is displayed on this page):

In your customization css, add the following:

```
@page chapter:first {
 @top-right-corner { content: string(maptitle); }
 @top-left { content: none; }
}
```

Table of Contents

The table of contents is a hierarchy of topic titles with links to the topic content.

Table of contents - Input XML fragment

In the merged DITA map, the `<opentopic:map>` contains a hierarchy of `<topicref>` elements, or other elements (such as `<chapter>` or `<part>`) that are specializations of `<topicref>`.

Each of the `<topicref>` elements include a *metadata* section that includes the topic title.

```
<bookmap ...>

<oxy:front-page> ... </oxy:front-page>
<oxy:front-matter> ... </oxy:front-matter>
```

```
<opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">

       <oxy:toc-title xmlns:oxy="http://www.oxygenxml.com/extensions/author" empty="true"/>

       <booktitle class="- topic/title bookmap/booktitle ">
           <booklibrary class="- topic/ph bookmap/booklibrary ">Retro Tools</booklibrary>
           <mainbooktitle class="- topic/ph bookmap/mainbooktitle ">Product tasks</mainbooktitle>
           <booktitlealt class="- topic/ph bookmap/booktitlealt ">Tasks and what they can do</booktitlealt>
       </booktitle>

       <chapter is-chapter="true"
           class="- map/topicref bookmap/chapter " href="#unique_5" type="topic">
           <topicmeta class="- map/topicmeta " data-topic-id="installing">
               <navtitle href="#unique_5" class="- topic/navtitle ">Installing</navtitle>
               ...
           </topicmeta>

           <topicref class="- map/topicref " href="#unique_6" type="task">
               <topicmeta class="- map/topicmeta " data-topic-id="installstorage">
                   <navtitle href="#unique_6" class="- topic/navtitle ">Installing hard drives or other
                       storage</navtitle>
                   ...
               </topicmeta>
               ...
           </topicref>
           ...
       </chapter>
```

Note: The `<oxy:toc-title>` element is used as a placeholder for the name of the TOC. For instance, you can use the string "Contents", specified on a pseudo element, in the CSS.

Table of contents - Built-in CSS

The built-in CSS rules are in: `[PLUGIN_DIR]/css/p-toc.css`.

Related Information:

Page Headers and Footers on page 921

How to Style the Table of Contents Entries

You can change the font of the labels and aspect of the dots and page numbers from the table of contents.

Note: Each of the items from the table of contents is an element that has the `map/topicref` class.

The following example uses the italic font for the label and changes the color and style of the connecting line between the title and the page number.

In your customization css, add the next two selectors:

```
/* The toc item label - the topic title */
*[class ~= "map/topicref"] *[class ~= "topic/navtitle"] {
    font-style:italic;
    color: navy;
}

/* The dotted line between the topic name and the page number. */
*[class ~= "map/topicref"] *[class ~= "topic/navtitle"]:after {
    content: leader('-') target-counter(attr(href), page);
    color: navy;
}
```

And if you need to alter the indent of the nested table of contents items, use the following selector:

```
*[class ~= "map/topicref"] *[class ~= "map/topicref"] {
    margin-left: 1em;
}
```

The numbers can be styled like this:

```
*[class ~= "map/topicref"] > *[class ~= "map/topicmeta"]:before,
*[class ~= "map/topicref"]
    > *[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before{
  color:blue;
}
```

How to Change the Header of the Table of Contents

In the built-in CSS, there is a page named *table-of-contents*. The default is to have the word 'Contents' in its header (this is localized, using the `toc-header` string defined in the `p-18n.css`) alternating in the left or right side of the header:

```
@page table-of-contents:left {
    @top-left {
        content: string(toc-header) " | " counter(page, lower-roman);
        font-size: 8pt;
    }
}
@page table-of-contents:right {
     @top-right {
         content: string(toc-header) " | " counter(page, lower-roman);
         font-size: 8pt;
     }
}
```

If you need to change this string, or change the color, you should use the following `@page` selectors as a starting point in your customization css:

```
@page table-of-contents:left {
    @top-left {
        content: "My publication table of contents | " counter(page, lower-roman);
        color:red;
    }
}
@page table-of-contents:right {
     @top-right {
        content: "My publication table of contents | " counter(page, lower-roman);
        color:red;
     }
}
```

Related Information:

Localization on page 929

How to Make the Table of Contents Start on an Odd Page

In your customization css, add the following snippet for the *table-of-contents* page:

```
@page table-of-contents{
    -oxy-initial-page-number: auto-odd;
}
```

Related Information:

Double Side Pagination on page 917

How to Display a Topic Before the Table of Contents

To display a topic before the *table-of-contents* page, follow these steps:

1. Make sure the topic is referenced on the first level in the DITA map.
2. Set the `@outputclass` to **before-toc** on the root element of the topic.

```
<topic id="MyTopic" outputclass="before-toc">
```

Result: When the PDF is processed, the topic will automatically appear before the table of contents.

PDF Bookmarks

The PDF Bookmarks are used to generate a hierarchical structure similar to a table of contents in a specialized view of your PDF Reader.

PDF Bookmarks - Built-in CSS

The PDF bookmarks are generated by matching the titles from the topics in the content. The built-in CSS rules are in: `[PLUGIN_DIR]/css/p-bookmarks.css`.

```
*[class~="topic/topic"] > *[class~="topic/title"] {
  bookmark-label:content(before) content(text);
  -ah-bookmark-label:content(before) content();
}

*[class~="topic/topic"] > *[class~="topic/title"] {
  prince-bookmark-level: 1;
```

```
  -ah-bookmark-level: 1;
  bookmark-level: 1;
}
*[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"] {
  prince-bookmark-level: 2;
  -ah-bookmark-level: 2;
  bookmark-level: 2;
}
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"] {
  prince-bookmark-level: 3;
  -ah-bookmark-level: 3;
  bookmark-level: 3;
}
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/
title"] {
  prince-bookmark-level: 4;
  -ah-bookmark-level: 4;
  bookmark-level: 4;
}
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/
topic"] > *[class~="topic/title"] {
  prince-bookmark-level: 5;
  -ah-bookmark-level: 5;
  bookmark-level: 5;

}
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/
topic"] *[class~="topic/topic"] > *[class~="topic/title"] {
  prince-bookmark-level: 6;
  -ah-bookmark-level: 6;
  bookmark-level: 6;

}
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/
topic"] *[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"] {
  prince-bookmark-level: 7;
  -ah-bookmark-level: 7;
  bookmark-level: 7;

}
```

Note: This is listed solely for illustration purposes, as the plugin might use something different.

How to Control the Depth of the Sections From the PDF Bookmarks.

By default, the PDF bookmarks are generated for up to 7 levels. If you need to limit them (for example to 2 levels), you can use the following CSS rules in your customization css:

```
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/
title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/
topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/
topic"] *[class~="topic/topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/
topic"] *[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"] {
  bookmark-label:none;
}
```

These rules clear the labels generated by the titles starting with the depth 3 (the topic nesting level is given by the selectors `*[class~="topic/topic"]`).

How to Remove the Numbering From the PDF Bookmarks

By default, the PDF bookmark labels are generated while taking the text set before the chapters titles into account. Since this usually contains the part, chapter, or section numbers, the PDF Bookmarks will make use of them.

The solution is to remove the `content(before)` from the `bookmark-label`, leaving just the `content(text)`.

In your customization css, add the following CSS rules:

```
*[class~="topic/topic"] > *[class~="topic/title"] {
  bookmark-label:content(text);
  -ah-bookmark-label: content();
}
```

Related Information:

Numbering on page 911

Page Headers and Footers

The page headers and footers use the string sets defined for publication, chapter, and section titles. These string-sets are defined in the numbering css. This section contains information about how they are used in the page definitions.

Page Headers and Footers - Built-in CSS

All page definitions are found in: `[PLUGIN_DIR]css/print/p-pages-and-headers.css`.

Note: This is listed solely for illustration purposes, as the plugin might use something different.

There are pages for:

Default Page

The default page imposes a header that contains the publication title, chapter, and section title. They alternate on the left or right side of the page:

```
   @page :left {
       @top-left {
           content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
counter(page);
           font-size:8pt;
       }
   }

   @page :right{
       @top-right {
           content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
counter(page);
           font-size:8pt;
       }
   }
```

Chapter Page

This is inherited from the default page. The chapter page is associated to the topics marked as chapters, usually the ones that are direct children of the map. It clears the header from the first page of each chapter.

```
   @page chapter{
    /* Currently inherit from the default page.*/
   }

   /* No headers on the chapter first page. */
   @page chapter:first:left{
    @top-left {
     content: none;
    }
   }
   @page chapter:first:right{
    @top-right {
     content: none;
    }
   }
```

Front Matter and Back Matter page

The bookmap front matter and back matter page. It clears the headers.

```
  @page matter-page {
       @top-left-corner    {          content:none }
       @top-left           {          content:none }
       @top-center         {          content:none }
       @top-right          {          content:none }
       @top-right-corner   {          content:none }
       @bottom-left-corner {          content:none }
       @bottom-left        {          content:none }
       @bottom-center      {          content:none }
       @bottom-right       {          content:none }
       @bottom-right-corner{          content:none }
   }
```

Blank Pages

Clears the header for the blank pages that may be created by a `page-break-before`, `page-break-after`, or by using double side pagination:

```
    @page :blank{
     @top-left {
      content: none;
     }
     @top-right {
      content: none;
     }
    }
```

Index Page

The page that contains the index terms (appears only if there are such items in your topics). It uses a lower roman page number in the footer:

```
 @page index {
        @top-left-corner    {          content:none }
        @top-left           {          content:none }
        @top-center         {          content:none }
        @top-right          {          content:none }
        @top-right-corner   {          content:none }
        @bottom-left-corner {          content:none }
        @bottom-left        {          content:none }
        @bottom-center      {          content: counter(page, lower-alpha) }
        @bottom-right       {          content:none }
        @bottom-right-corner{          content:none }
 }
 @media oxygen-chemistry {
        @page index {
            column-count: 2;
            column-fill: auto;
        }
  }
```

When transformed with Chemistry, the page layout is spread on two columns.

Large Tables Page

The big tables are placed on a rotated page, with orientation landscape:

```
@page landscape-page :right {
    size: landscape;

    @top-left {
        content: none
    }
    @top-center {
        content: none
    }
    @top-right {
        content: none
    }

    @right-bottom {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
        font-size: 8pt;
        transform: rotate(90);
        vertical-align: middle;
        text-align: right;
    }
}

@page landscape-page :left {
    size: landscape;

    @top-left {
        content: none
    }
    @top-center {
        content: none
    }
    @top-right {
        content: none
    }

    @right-top {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
        font-size: 8pt;
        transform: rotate(90);
```

```
        vertical-align: middle;
        text-align: left;
    }
}
```

How to Add a Multi-line Copyright Notice to the Footer

Suppose you want to add a footer with the following two lines of text at the end of each page that is shown on the right side:

```
© 2017 - My Company Ltd
All rights reserved
```

For this, you need to specify a rule that matches all the right pages and adds that content in the `bottom-center`. In your customization css, add the following CSS rule:

```
@page :right{
    @bottom-center {
        content: "© 2017 - My Company Ltd \A All rights reserved";
        font-size: 0.5em;
        color: silver;
    }
}
```

Note: Other page rules (such as the *table-of-contents*) override the contents of the `@bottom-center` because they are more specific. If you need to also print the copyright in the TOC pages, then use this as the selector:

```
@page :right, table-of-contents:right {
  ...
}
```

Note: To use new lines (`\n` characters) in your headers or footers, use the `\A` notation, as in the example above.

How to Add a Background Image to the Header

A common use-case is to add a background image to one of the page corners.

```
@page :left {
    @bottom-left-corner{
        content: " ";
        background-image: url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
        background-repeat:no-repeat;
        background-position:50% 50%;
    }
}
```

Important: Always specify a `content` property. If not, the page margin box will not be generated.

Note: You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They can be scaled and produce better results when printed.

Related Information:

Images on page 931
How to Add a Background Image for the Cover on page 908

How to Simplify the Header (Only Keep the Chapter Title)

The headers display information such as *map title*, *part title*, *chapter title*, and *section title*, ending in the page number.

```
content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | " counter(page);
```

This might be too much if you have long titles. The solution is to override the default header content.

In your customization css, add the following CSS rule:

```
@page :left {
    @top-left {
        content: string(chaptertitle) " | " counter(page);
    }
}
@page :right{
    @top-right {
        content: string(chaptertitle) " | " counter(page);
    }
```

```
}
```

How to Change the Header Separators (Between Sections and Chapter Titles)

There are a number of `strings` defined for part, chapter, and sections. Each of these strings start with the " | " character as a separator. For example, in the header of a page, you may find a sequence of strings:

```
My Publication | Introduction | Getting Started
```

1. "My Publication" is the value of the `maptitle` string.
2. "Introduction" is the value of the `chaptertitle` string.
3. "Getting Started" is the value of the `sectiontitle` string.

There might be cases where you want to change this separator. You will need to recompose the header content using the above string sets. Suppose you want to use " - " as a separator. In your customization css, add the following CSS rule:

```
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"] {
    string-set: parttitle " - " counter(part, upper-roman) " - " content(), chaptertitle  ""; /* Avoid propagating a
 past chapter title on a new part */
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"] {
    string-set: chaptertitle " - " counter(chapter) " - " content();
}
```

If you enabled the CSS for Deep Numbering on page 914, then use:

```
/*
 * Alter the string sets that are shown in the header of the page.
 */
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"] {
    string-set: parttitle " - " counter(part, upper-roman) " - " content(), chaptertitle  ""; /* Avoid propagating a
 past chapter title on a new part */
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"] {
    string-set: chaptertitle " - " counter(chapter) " - " content(), sectiontitle "";
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] > *[class ~= "topic/title"] {
    string-set: sectiontitle " - " counter(chapter) "." counter(section1) " - " content();
}
```

How to Change the Header Styling Depending on Page Side

To modify the styling of the default page headers, add the following CSS rule in your customization css:

```
@page :left {
    @top-left {
        color:navy;
        font-style:italic;
    }
    @top-right {
        color:red;
    }
}
```

If you intend to modify **just the headers of the table of contents**, use the `table-of-contents` page rule selector:

```
@page table-of-contents:left {
    @top-left {
        color:navy;
        font-style:italic;
    }
    @top-right {
        color:red;
    }
}
```

Index

The index section collects all the index terms from the publication and shows them in a sorted tree.

Index - Input XML fragment

The structure that holds the index tree is the `<<opentopic-index:index.groups>` element.

```
```

Each of the groups contain:

- A label, the starting letter ("T" in the following example).
- A tree of `<opentopic-index:index.entry>` elements.

Each of the entries contain:

- The formatted value (`<opentopic-index:formatted-value>`).
- A link to the publication content (`<opentopic-index:refID>/<oxy:index-link>`).
- Possibly other child entries.

Index - Built-in CSS

All index styling is found in: `[PLUGIN_DIR]css/print/p-index.css`.

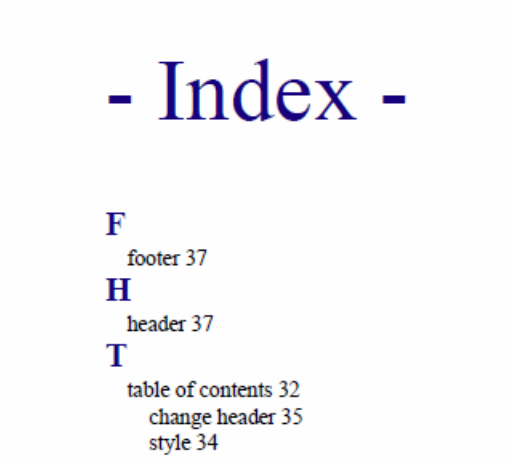
How to Style the Index Page Title and the Grouping Letters

In your customization css, add the following CSS rules:

```
index\.groups index\.group label {
    font-size:1.5em;
    color:navy;
}

index\.groups:before {
    content: "- Index - ";
    color:navy;
    font-size: 4em;
}
```

The result is:

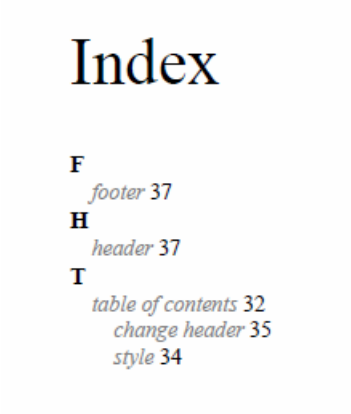


How to Style the Index Terms Labels

In your customization css, add the following CSS rule:

```
index\.groups formatted-value {
    font-style:oblique;
    color:gray;
}
```

The result is:



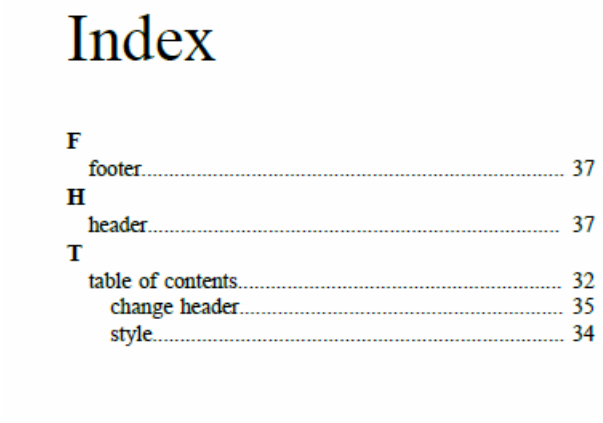
How to Add Filling Dots Between the Index Labels and the Page Numbers

Suppose you want the leader CSS content to generate a row of dots. It is necessary that the parent entry have the text justified.

In your customization css, add the following CSS rule:

```
index\.entry {
    text-align:justify;
}
index\.entry  formatted-value:after {
    content:leader('.');
}
```

The output now contains the dots:



How to Change the Index Page Number Format

The page number is reset at the beginning of the index page by the built-in CSS rule:

```
index\.groups {
        counter-reset: page 1;
}
```

If you want to start the page counter from a different initial number, just change the value of this counter.

If you need to style the page number differently (for example, using decimals), add the following CSS rule in your customization css:

```
@page index {
        @bottom-center      {          content: counter(page, decimal) }
}
```

Page Breaks

The page breaks can be controlled in multiple ways:

1. By creating an `@page` and assigning it to an element will create a page break between this element and the sibling elements that have a different page.
2. Using the CSS properties: `page-break-before` `page-break-after`.

Related Information:

Double Side Pagination on page 917

Page Breaks - Built-in CSS

Page break properties are used in: `[PLUGIN_DIR]css/print/p-page-breaks.css`.

How to Avoid Page Breaks in Lists and Tables

To avoid splitting elements over two pages, you can use the `page-break-inside` CSS property. For example, if you want to impose this on tables and lists, then add the following rules to your customization css:

```
*[class ~= "topic/table"] {
    page-break-inside:avoid;
}
*[class ~= "topic/ol"] {
    page-break-inside:avoid;
}
*[class ~= "topic/ul"] {
    page-break-inside:avoid;
}
```

Note: Since the task steps are inherited from `topic/ol`, they will also not be split over two separate pages. However, if you want to allow this, add the following CSS rule:

```
*[class ~= "task/steps"] {
    page-break-inside:auto;
}
```

Note: Another way to do this is to mark the element with an `@outputclass` set to `page-break-avoid`.

How to Force a Page Break Before or After a Topic or Another Element

If you want to force a page break, mark the topic (or any other element you need to control page breaking for) with an `@outputclass` set to one of these values:

page-break-before

Use this for a page break before the marked element.

page-break-after

Use this for a page break after the marked element.

page-break-avoid

Use this to avoid page breaks inside the marked element.

To force a page break before a certain topic, you should write:

```
<topic outputclass="page-break-before" ... >
```

You can also control page breaking for lists, paragraphs, or any other block type elements. The following example avoids page breaks inside an ordered list:

```
<ol outputclass="page-break-avoid" ... >
```

How to Enforce a Number of Lines from Paragraphs that Continue in Next Page

In typography, an *orphan* is the first line of a paragraph that appears alone at the bottom of a page (the paragraph continues on a following page), while a *widow* is the last line of a paragraph that appears alone at the top of a page. The default is 2 for each of them. You can control this number by adding the following to your customization css:

```
:root {
    widows:4;
    orphans:4;
}
```

Hyphenation

Hyphenation specifies how words should be hyphenated when text wraps across multiple lines.

How to Enable Hyphenation for Entire Map

To enable hyphenation for your entire map:

1. Make sure you set an `@xml:lang` attribute on the root of your map.
2. In your customization css, add:

```
:root {
    hyphens: auto;
}
```

3. To except certain elements from being hyphenated, use `hyphens:none`. The following example excludes the `<keyword>` elements from being hyphenated:

```
*[class ~= "topic/keyword"] {
    hyphens: none;
}
```

How to Enable/Disable Hyphenation for Tables

To enable hyphenation for your entire map:

1. Make sure you set an `@xml:lang` attribute on the root of your map or your table elements.
2. In your customization css, add:

```
*[class ~= "topic/table"] {
    hyphens: auto;
}
```

3. To except certain elements from being hyphenated, use `hyphens:none`. The following example excludes the `<keyword>` elements from being hyphenated:

```
*[class ~= "topic/keyword"] {
    hyphens: none;
}
```

Accessibility

By default, the PDF documents produced using this plugin are partially accessible in the sense that most of the paragraphs, tables, lists, headers, and footers are tagged automatically so a PDF reader can use this information to present the content.

Related Information:

Oxygen PDF Chemistry: Accessibility

Accessibility - Built-in CSS

Accessibility properties are defined in `[PLUGIN_DIR]css/print/p-accessibility.css`.

How to Create Fully Accessible Documents

To make your documents fully accessible (**PDF/UA1**), do the following:

1. In your customization css, specify fonts for all elements and for all page margin boxes. There should be no text that falls back to the basic provided fonts (Times, Courier, etc.). For instance, you can use:

```
:root { font-family: Arial }
@page {
    @top-left {font-family: Arial }
    ...
}
```

2. Specify an `@alt` attribute with a description on any image.
3. Change the Chemistry invocation from the `build.xml` file, adding the argument `-pdf-ua`. There are two targets to change: `chemistry` and `chemistry.embedded`.

Localization

The **DITA-OT CSS Publishing to PDF plugin** comes with localized CSS strings for English and German. In the future, support for more languages will be added.

Localization - Built-in CSS

The built-in localization strings for editing and printing media are defined in:

- `[PLUGIN_DIR]css/core/-i18n.css`
- `[PLUGIN_DIR]css/core/-i18n-en.css`
- `[PLUGIN_DIR]css/core/-i18n-de.css`
- `[PLUGIN_DIR]css/core/-i18n-fr.css`

There are several strings that are used only in the printed media, such as the table of contents title or the index page title. They can be found in the following CSS files:

- `[PLUGIN_DIR]css/print/p-i18n.css`
- `[PLUGIN_DIR]css/print/p-i18n-en.css`
- `[PLUGIN_DIR]css/print/p-i18n-de.css`
- `[PLUGIN_DIR]css/print/p-i18n-fr.css`

Note: The actual number of localization files may vary.

How to Enable German Localization

Suppose you need to produce your publication for a German audience. In this case, you would want the text from the headers and footers to be translated to German.

To achieve that, set the `@xml:lang` attribute on the root of your DITA map to `de_de`.

Warning: The `default.language` transformation parameter is not taken into account.

How to Create a Localization CSS for Another Language

Suppose you want to localize your publishing for the Dutch language (language code `nl`). To do this, use the following procedure:

1. Copy and paste the contents of the following files in your customization css:
   - `[PLUGIN_DIR]/css/core/-i18n-de.css`
   - `[PLUGIN_DIR]/css/print/p-i18n-de.css`
2. Search for and replace `:lang(de)` with `:lang(nl)`.
3. In an editor, open the English localization files, side by side with your customization CSS:
   - `[PLUGIN_DIR]/css/core/-i18n-en.css`
   - `[PLUGIN_DIR]css/print/p-i18n-en.css`
4. Translate each of the strings from your customization, using the English localization as reference.

This is a very simple example of localizing just the table of contents, index page title, and the figure and table captions:

```
/* Title in the TOC page */
toc-title[empty]:lang(nl):before {
    content: "Inhoud";
}

/* This string is used in the TOC page header. */
:root:lang(nl) {
    string-set: toc-header "Inhoud";
}

/* Title in the Index page */
index\.groups:lang(nl):before {
    content: "Index";
}

@media print {
    *[class ~= "topic/table"] > *[class ~= "topic/title"]:lang(de):before {
        content: "Tafel " counter(tablecount) ": ";
    }
}
@media print {
    *[class ~= "topic/fig"] > *[class ~= "topic/title"]:lang(de):before {
        content: "Figuur " counter(figcount) ": ";
    }
}
...
```

Styling the Content

If you need to change the styles of the elements from the topic contents, you should create a customization CSS and then add CSS rules. To create the CSS rules, you can use the development tools described in Debugging the CSS on page 900.

Links

Links allow the users to navigate through the documentation.

How to Remove 'on page NNN' Link Label

For paper printed materials, it is desirable that the links display a label (similar to "on page 54") after their text content. This gives the user the possibility to identify the target page. However, if the produced PDF is not printed on paper and is intended only for electronic use, this label may create clutter and makes the document harder to read. To eliminate this label, add the following in your customization css:

```
*[class ~= "topic/xref"][href]:after,
*[class ~= "topic/link"][href]:after {
    content: none;
}
```

How to Change Link Styles

Suppose you want the links to be bold and with an underline. In your customization css, add this snippet:

```
*[class ~= "topic/xref"][href]:after,
*[class ~= "topic/link"][href]:after {
    font-weight: bold;
    text-decoration: underline;
}
```

Images

Images are an important part of a publication.

Note: You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They can be scaled and produce better results when printed.

Images - Built-in CSS

Image properties are defined in `[PLUGIN_DIR]css/print/p-images.css`.

```
*[class ~= "topic/image"] {
      prince-image-resolution: 120dpi;
      -ah-image-resolution: 120dpi;
      image-resolution: 120dpi;
      /* The US-letter page size minus page margins. See p-page-size.css for the current page size. */
      max-width: 6.5in;
  }
```

How to Fix Image Bleeding - Control Image Size

Sometimes the images may be too big for the page. The built-in CSS rules specify a maximum size for images, limiting to the width of the parent block. But if the parent block is itself too wide and bleeds out of page, you might consider specifying a length.

In your customization css, add the following snippet:

```
*[class ~= "topic/image"] {
  ...
      /* The US-letter page size minus page margins. See p-page-size.css for the current page size. */
      max-width: 6.5in;
  }
```

How to Change Image Resolution

This is a good technique to change the size of all **raster** images from your documentation. This will not work for vector images, such as PDF or SVG. If the images (PNG, for example) contain the image resolution in their metadata, this will be taken into account. For all other images, the default resolution is 120dpi.

If the default resolution is not good (suppose you need a higher pixel density of 300dpi), you can change it by adding the following in your customization css:

```
*[class ~= "topic/image"] {
        prince-image-resolution: 300dpi;
        -ah-image-resolution: 300dpi;
        image-resolution: 300dpi;
}
```

How to Place Big Images on Rotated Pages

Very wide images may bleed out of the page. One solution for this is to use landscape pages for these wide images.

In your customization css, add:

```
*[class~="topic/image"][outputclass='land'] {
    page: landscape-page;
}
```

Setting the attribute `@outputclass` = 'land' on the table element will force the table on a new landscape page.

Another solution is to set an `@outputclass` attribute on the image, then create a rule that matches it, and associate a landscape page for it.

How to Place a Text and Image Side by Side

If you need to align text and an image side by side, you can use the following technique:

1. Organize your text and image under a `<div>` element like this:

```
...
 <div outputclass="side-by-side">
      <p> This will be in the left side, the next figure in the right. </p>
      <fig>
        <image href="cactus.jpeg"/>
      </fig>
 </div>
...
```

   Note: You can use the `@outputclass` attribute to mark the `<div>` elements that have this special layout.
2. In your customization css, add:

```
*[outputclass ~= "side-by-side"] > *[class ~= "topic/p"] {
  display:inline-block;
  width: 45%;
}

*[outputclass ~= "side-by-side"] > *[class ~= "topic/fig"] {
  display:inline-block;
  width: 45%;
}
```

   The image should fill the entire width of the parent `<fig>` element:

```
*[outputclass ~= "side-by-side"] > *[class ~= "topic/fig"]  > *[class ~= "topic/image"] {
  width:100%;
}
```

   By default, the bottom of the image is on the same line as the text baseline. If you want the text and the image to be aligned at the top, add these lines:

```
*[outputclass ~= "side-by-side"] > *[class ~= "topic/p"] {
  vertical-align:top;
}

*[outputclass ~= "side-by-side"] > *[class ~= "topic/fig"] {
  vertical-align:top;
  font-size:0pt;
}
```

   Note: The `font-size:0pt` is needed to remove the font ascent and descent around the image rectangle.

Tables

Tables are widely used in technical documentation. This section contains information about the CSS rules that are used to style them and how to fix some problems.

Tables - Built-in CSS

There is a combination of CSS files that address tables: `[PLUGIN_DIR]/css/core/-table-html-cals.css`, `[PLUGIN_DIR]/css/core/-table-cals.css`.

How to Deal With Wide Tables - Page Rotation

Some of the tables can have a large number of columns. In this case, the table may bleed out of the page. One solution is to use landscape pages for these tables.

Setting the attribute `@orient` = 'land' on the table element will force the table on a new landscape page.

Another solution is to use automatic detection of wide tables (5 or more columns):

```
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='5'],
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='6'],
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='7'],
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='8'] {
    page: landscape-page;
    max-width: 100%;
    page-break-before: avoid;
}
```

Note: The `landscape-page` page layout is defined in the `[PLUGIN_DIR]css/print/p-pages-and-headers.css`.

If you want to rotate the entire topic that contains the big table, use:

```
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='5'],
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='6'],
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='7'],
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='8'] {
    max-width: 100%;
    table-layout:auto;
}

*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *[class~="topic/table"] > *[class~="topic/tgroup"]
[cols='5']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *[class~="topic/table"] > *[class~="topic/tgroup"]
[cols='6']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *[class~="topic/table"] > *[class~="topic/tgroup"]
[cols='7']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *[class~="topic/table"] > *[class~="topic/tgroup"]
[cols='8']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/topic"]) > *[class~="topic/table"] >
 *[class~="topic/tgroup"][cols='5']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/topic"]) > *[class~="topic/table"] >
 *[class~="topic/tgroup"][cols='6']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/topic"]) > *[class~="topic/table"] >
 *[class~="topic/tgroup"][cols='7']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/topic"]) > *[class~="topic/table"] >
 *[class~="topic/tgroup"][cols='8']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/topic"]) > *:not([class~="topic/
topic"]) > *[class~="topic/table"] > *[class~="topic/tgroup"][cols='5']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/topic"]) > *:not([class~="topic/
topic"]) > *[class~="topic/table"] > *[class~="topic/tgroup"][cols='6']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/topic"]) > *:not([class~="topic/
topic"]) > *[class~="topic/table"] > *[class~="topic/tgroup"][cols='7']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/topic"]) > *:not([class~="topic/
topic"]) > *[class~="topic/table"] > *[class~="topic/tgroup"][cols='8']){
      page: landscape-page;
}
```

How to Fix Text Bleeding From Table Cells

Slim tables or tables that have many columns make the text from the cells to be confined to a small horizontal space. Long words would bleed outside the cell boundaries. To fix this, you should enable hyphenation in your tables, thus making the words spread on multiple lines. In your customization CSS, add:

```
*[class~="topic/table"] {
    hyphens: auto;
}
```

Related Information:

Hyphenation on page 928

How to Enable the Automatic Table Layout

The DITA specification indicates that tables should have a fixed layout. However, you can get a more optimal arrangement of the cells using the automatic layout. In your customization CSS, add:

```
*[class~="topic/tgroup"] {
    table-layout:auto !important;
}
```

If you want to control which table you want this layout, you can set the `@outputclass` attribute on the `<table>` element:

```
<table outputclass='auto_tbl'> ... </table>
```

Then, in the CSS, use a rule that matches the `@outputclass`:

```
*[class~="topic/table"][outputclass='auto_tbl'] > *[class~="topic/tgroup"] {
    table-layout:auto !important;
}
```

Important: Make sure the tables have no column width specified.

DITA Map to MS Office Word Transformation

Oxygen XML Editor plugin comes bundled with a transformation scenario that allows you to convert *DITA maps* to Microsoft Office Word documents. It utilizes the **DITA to Word plugin** created by Jarno Elovirta. This *plugin* contains a Word document named **Normal.docx** (located in: *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/DITA-OT2.x/plugins/com.elovirta.ooxml/resources`) that is used by the transformation scenario as a template to generate the final Word document.

Tip: You can make general modifications to the **Normal.docx** template file to alter the published output.

Configuring the Transformation Scenario

To configure an **DITA Map to MS Office Word** transformation scenario, follow these steps:

1. Open the DITA map in the **DITA Maps Manager**.
2. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** toolbar.
3. Select **DITA Map MS Office Word**.
4. For advanced customizations, in the **Parameters** tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
   - `dotx.file` - Specifies the path to a Word template file (`.docx`) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the **Normal.docx** file that is used by default.
   - `document.flat.xsl` - Specifies the path to a pre-process clean-up stylesheet.
   - `core.xsl` - Specifies the path to a core metadata stylesheet.
   - `custom.xsl` - Specifies the path to a custom metadata stylesheet.
   - `document.xsl` - Specifies the path to a main document stylesheet.
   - `comments.xsl` - Specifies the path to a comments stylesheet.
   - `numbering.xsl` - Specifies the path to a list and title numbering stylesheet.
   - `footnotes.xsl` - Specifies the path to a footnote stylesheet.
   - `document.xml.xsl` - Specifies the path to a document relations metadata stylesheet.
   - `inkscape.exec` - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.
5. Click **OK** and run the transformation scenario.

Result: The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

DITA Map to CHM (Compiled HTML Help) Transformation

To perform a *Compiled HTML Help (CHM)* transformation, Oxygen XML Editor plugin needs `Microsoft HTML Help Workshop` to be installed on your computer. Oxygen XML Editor plugin automatically detects `HTML Help Workshop` and uses it.

Note: `HTML Help Workshop` might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the *.hhp* and *.hhc* files. If the transformation fails to produce the CHM output but the *.hhp* (HTML Help Project) file is already generated, you can manually try to build the CHM output using `HTML Help Workshop`.

Changing the Output Encoding

Oxygen XML Editor plugin uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the *Compiled HTML Help (CHM)* transformation. By default, the **DITA Map CHM** transformation scenario that comes bundled with Oxygen XML Editor plugin has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the toolbar or the **XML** menu.
2. Select the **DITA Map CHM** transformation scenario and click the **Edit** button.
3. In the **Parameter** tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

   Note: The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (en, for example) and `CC` represents the country code (US, for example). The language codes are contained in the `ISO 639-1` standard and the country codes are contained in the `ISO 3166-1` standard. For further details about language tags, go to http://www.rfc-editor.org/rfc/rfc5646.txt.

DITA Map to Kindle Transformation

Oxygen XML Editor plugin requires *KindleGen* to generate Kindle output from *DITA maps*. To install *KindleGen* for use by Oxygen XML Editor plugin, follow these steps:

1. Go to www.amazon.com/kindleformat/kindlegen and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Editor plugin and open a *DITA map* in the **DITA Maps Manager** view.
4. Click the **Configure Transformation Scenario(s)** button.
5. Select the **DITA Map Kindle** transformation and press the **Edit** button to edit it.
6. Go to **Parameters** tab and set the **kindlegen.executable** parameter as the path to the *KindleGen* directory.
7. Accept the changes.

Run DITA OT Integrator Transformation

Oxygen XML Editor plugin comes bundled with a transformation scenario designed to integrate DITA-OT plugins. These DITA-OT *plugins* are used for various customizations. It is called **Run DITA-OT Integrator** and is found in the **DITA Map** section of the **Configure Transformation Scenario(s)** dialog box.

Attention: The integration will be performed on the DITA-OT version specified in the **DITA Open Toolkit** section of the **DITA** preferences page.

Running the Transformation Scenario

To integrate a DITA OT *plugin*, follow these steps:

1. If Oxygen XML Editor plugin was installed in the default location, you may need to restart and run it as an administrator.

2. Select the **Apply Transformation Scenario(s)** or **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar (you could also use the same action on the main toolbar or open the **Transformation Scenarios** view).
3. Select the **Run DITA-OT Integrator** transformation scenario. If the *integrator* is not visible, select the **Show all scenarios** action that is available in the **Settings** drop-down menu.
4. Apply the scenario.
5. Check the **Results** panel at the bottom of the application to make sure the build was successful.
6. Restart Oxygen XML Editor plugin with your normal permissions.

Localizing the Interface of DITA Map to WebHelp Classic Output

Creating New Transformation Scenarios

Defining a transformation scenario is the first step in the process of transforming a document. This section includes information on the types of new scenarios that are available in Oxygen XML Editor plugin and how to create each type of transformation.

XML Transformation with XSLT
This type of transformation specifies the transformation parameters and location of an XSLT stylesheet that is applied to the edited XML document. This scenario is useful when you develop an XML document and the XSLT document is in its final form.

To create an **XML transformation with XSLT** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (**Alt + Shift + T, C (Command + Alt + T, C on OS X)**) action from the toolbar or the **XML** menu. Then click the **New** button and select **XML transformation with XSLT**.
- Go to **Window** > **Show View** and select **Transformation Scenarios** to display this view. Click the **New Scenario** drop-down menu button and select **XML transformation with XSLT**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page, the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template is specified in the scenario, the **XML URL** field can be empty. The **XML URL** field can also be empty if you use external XSLT processors. Otherwise, a value is mandatory in this field.

XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xml-stylesheet" declaration

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the `xml-stylesheet` processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the **XSL URL** field.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page. For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens a **Configure parameters** dialog box that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets. If the XSLT transformation engine is custom-defined, you can not use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a dialog box for configuring the XSLT extension *JARS* or classes that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a dialog box for adding XSLT stylesheets that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets, along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (such as **${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`

2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

Editor Variables on page 125

XSLT Extensions

The **Extensions** button opens a dialog box that allows you to specify the *JARS* and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

Tip: You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the **Move up** or **Move down** buttons.

Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an editor variable in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the **Saxon HE/PE/EE** preferences page but they are configured as a specific set of transformation

options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.8 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode ("-im")

A Saxon-specific option that sets the initial mode for the transformation.

Template ("-it")

A Saxon-specific option that sets the name of the initial XSLT template to be executed.

Use a configuration file ("-config")

Sets a Saxon 9.8.0.8 configuration file that is executed for XSLT transformation and validation processes.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the XSLT Debugger to *step into* XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

  Note: Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Recoverable errors ("-warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces ("-strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 9.8.0.8 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-JS extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.8.0.8 processors.

Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the **xsl:assert** element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `xsl:assert` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The advanced options that are specific for Saxon 9.8.0.8 Enterprise Edition (EE) are as follows:

XML Schema version

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, open the **Preferences** dialog box and go to **XML** > **XML Parser** > **XML Schema** and use the **Default XML Schema version** option.

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable streaming mode

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the *net.sf.saxon.lib.Initializer* interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-

HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XSLT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor.

Output Tab (XSLT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to **Window** > **Preferences** > **General** > **Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

  Important: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

  - **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Oxygen XML Editor plugin Browser View

The Oxygen XML Editor plugin Browser view is automatically displayed in the views pane of the Eclipse window to display HTML output from XSLT transformations. It contains a tab for each file with HTML results displayed in the view.

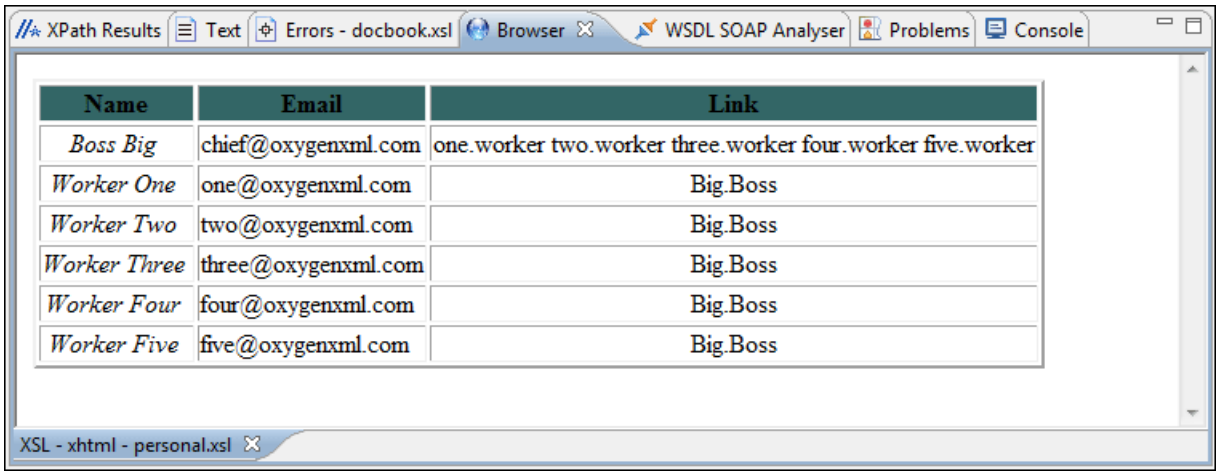

Figure 545: Browser View

Oxygen XML Editor plugin Text View

The Oxygen XML Editor plugin **Text** view is automatically displayed in the views pane of the Eclipse window to display text output from XSLT transformations, FO processor info, warnings, and error messages. It contains a tab for each file with text results displayed in the view.

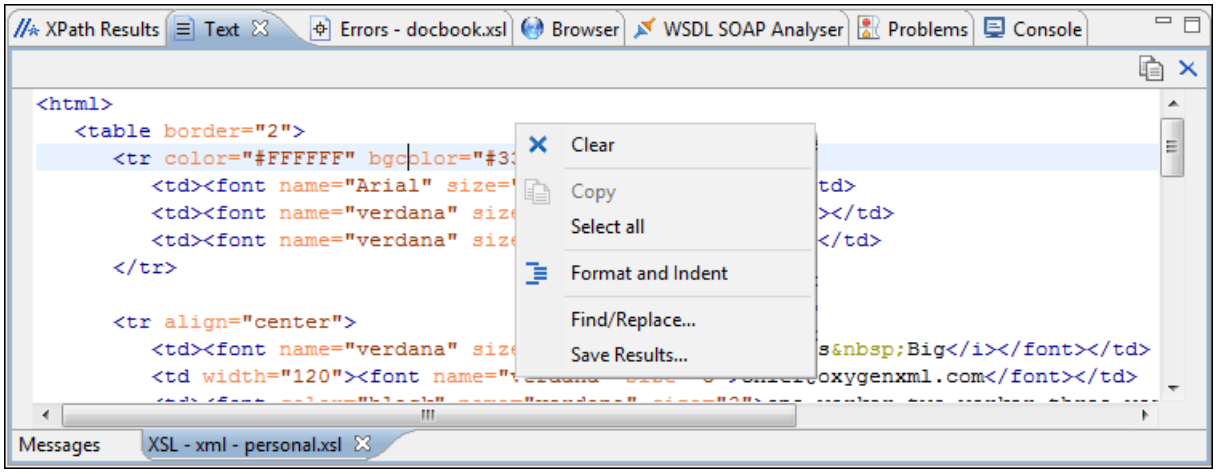

Figure 546: Text View

Text View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

Clear

Removes all content from the view.

Copy

Copies the selected content to the clipboard.

Select All

Selects all content in the view.

Format and Indent

Formats (*pretty-prints*) the content in this view.

Find/Replace

Allows you to perform search and replace operations.

Save Results

Saves the content in the view to a file in text format.

Generating Output Using an XSLT Processor

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Editor plugin.

Supported XSLT Processors

Oxygen XML Editor plugin includes the following XSLT processors:

- **Xalan 2.7.2** - Xalan-Java is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.
- **Saxon 6.5.5** - Saxon 6.5.5 is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.
- **Saxon 9.8.0.8 Home Edition (HE), Professional Edition (PE)** - Saxon-HE/PE implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term *basic XSLT 2.0 / 3.0 processor* is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.
- **Saxon 9.8.0.8 Enterprise Edition (EE)** - Saxon EE is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Editor plugin. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

  The validation in schema aware transformations is done according to the W3C XML Schema 1.0 or 1.1. This can be configured in Preferences.

  Note: Oxygen XML Editor plugin implements a Saxon *framework* that allows you to create Saxon configuration files. Two templates are available: **Saxon collection catalog** and **Saxon configuration**. Both of these templates support content completion, element annotation, and attribute annotation.

  Note: Saxon can use the *ICU-J localization library* (`saxon9-icu.jar`) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Editor plugin installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

  1. Download Saxon 9.8.0.8 Professional Edition (PE) or Enterprise Edition (EE) from http://www.saxonica.com.
  2. Unpack the downloaded archive.
  3. Create a new XSLT transformation scenario (or edit an existing one). In the **XSLT** tab, click the **Extensions** button to open the list of additional libraries used by the transformation process.

4. Click **Add** and browse to the folder where you unpacked the downloaded archive and choose the `saxon9-icu.jar` file.

Note that the `saxon9-icu.jar` should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Editor plugin.

- **Saxon-CE (Client Edition)** is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Editor plugin provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

  Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

  Note: A specific template, named **Saxon-CE stylesheet**, is available in the **New from Templates** wizard.
- **Xsltproc (libxslt)** - Libxslt is the XSLT C library developed for the Gnome project. **Libxslt** is based on *libxml2*, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

  Oxygen XML Editor plugin uses **Libxslt** through its command line tool (*Xsltproc*). Depending on your operating system, you must download the Libxslt libraries on your machine from http://xmlsoft.org/XSLT/downloads.html and place them in a local folder. Then you need to update the PATH environmental variable to contain the parent folder where the `xsltproc` executable is located.

  Tip: As an example, a Windows installation of the Xsltproc engine would follow these steps:

  1. Go to ftp://ftp.zlatkovic.com/libxml/ and download the following ZIP files: **iconv-1.9.2.win32.zip**, **libxml2-2.7.8.win32.zip**, **libxslt-1.1.26.win32.zip**, **zlib-1.2.5.win32.zip**.
  2. Unzip all of them into the same folder of your choice.
  3. Edit the PATH environment variable and add the `bin` folder for all four archives:

     
  4. Restart Oxygen XML Editor plugin.

     Result: You can now use the **xsltproc** processor as an XSLT engine in the XSLT transformation scenario.

  Note: The Xsltproc processor can be configured from the **XSLTPROC** options page.

  CAUTION: There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in *XML Catalog* files of the predefined document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Editor plugin is installed in the default location on Windows (C:\Program Files). This is because the built-in *XML catalog* files are stored in the *[OXYGEN_INSTALL_DIR]*`/frameworks` subdirectory of the installation directory, and in this case it contains a space character.
- **MSXML 4.0** - MSXML 4.0 is available only on Windows platforms. It can be used for transformation and validation of XSLT stylesheets.

  Oxygen XML Editor plugin uses the Microsoft XML parser through its command line tool *msxsl.exe*.

  Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.
- **MSXML .NET** - MSXML .NET is available only on Windows platforms. It can be used for transformation and validation of XSLT stylesheets.

Oxygen XML Editor plugin performs XSLT transformations and validations using the .NET *Framework* XSLT implementation (*System.Xml.Xsl.XslTransform* class) through the **nxslt** command line utility. The **nxslt** version included in Oxygen XML Editor plugin is 1.6.

You should have the .NET *Framework* version 1.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128`.

You can get the .NET *Framework* version 1.0 from the Microsoft website.

- **.NET 1.0** - A transformer based on the **System.Xml** 1.0 library available in the .NET 1.0 and .NET 1.1 *frameworks* from Microsoft (http://msdn.microsoft.com/xml/). It is available only on Windows.

  You should have the .NET *Framework* version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128`.

  You can get the .NET *Framework* version 1.0 from the Microsoft website.
- **.NET 2.0** - A transformer based on the **System.Xml** 2.0 library available in the .NET 2.0 *Framework* from Microsoft. It is available only on Windows.

  You should have the .NET *Framework* version 2.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128`.

  You can get the .NET *Framework* version 2.0 from the Microsoft website.

Configuring Custom XSLT Processors

Oxygen XML Editor plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the **Preferences** dialog box and go to **XML** > **XSLT-FO-XQuery** > **Custom Engines**.
2. Click the **New** button at the bottom of the dialog box.
3. Configure the parameters for the custom engine.
4. Click **OK**.

Note: You can not use these custom engines in the Debugger *perspective*.

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Editor plugin linked message, clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

Related Information:

Custom Engines Preferences on page 109

Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- **Xalan** - http://xml.apache.org/xalan-j/extensions.html
- **Saxon 6.5.5** - http://saxon.sourceforge.net/saxon6.5.5/extensions.html
- **Saxon 9.8.0.8** - http://www.saxonica.com/documentation9.5/index.html#!extensibility

To set an XSLT processor extension (a directory or a `jar` file), use the **Extensions** button in the **Edit scenario** dialog box.

XML Transformation with XQuery
This type of transformation specifies the transform parameters and location of an XQuery file that is applied to the edited XML document.

Use the **XML transformation with XQuery** scenario to apply a transformation in which an XQuery file queries an XML file for the output results.

To create an **XML transformation with XQuery** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the toolbar or the **XML** menu. Then click the **New** button and select **XML transformation with XQuery**.
- Go to **Window** > **Show View** and select **Transformation Scenarios** to display this view. Click the **New Scenario** drop-down menu button and select **XML transformation with XQuery**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page, the XML input of the transformation is passed to that URI resolver.

XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page. For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens the **Configure parameters** dialog box for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a dialog box for configuring the XQuery extension *JARS* or classes that define extension Java functions or extension XSLT elements used in the transformation.

XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or editor variables (such as **${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

Editor Variables on page 125

XQuery Extensions

The **Extensions** button is used to specify the *JAR* and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the **Move up** or **Move down** buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the **Saxon HE/PE/EE** preferences page but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.8 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 9.8.0.8 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Recoverable errors ("-warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces ("-strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 9.8.0.8 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 9.8.0.8 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the *net.sf.saxon.lib.Initializer* interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XQuery Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor.

Output Tab (XQuery Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Present as a sequence

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to **Window** > **Preferences** > **General** > **Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

  Important: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

  - **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

DITA OT Transformation

This type of transformation specifies the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Editor plugin includes a built-in version of Ant and a built-in version of DITA-OT, but other versions can be set in the scenario.

To create a **DITA OT Transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the **DITA Maps Manager** toolbar, main toolbar, or the **XML** menu. Then click the **New** button and select **DITA OT Transformation**.

- Go to **Window** > **Show View** and select **Transformation Scenarios** to display this view. Click the **New Scenario** drop-down menu button and select **DITA OT Transformation**.

Both methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

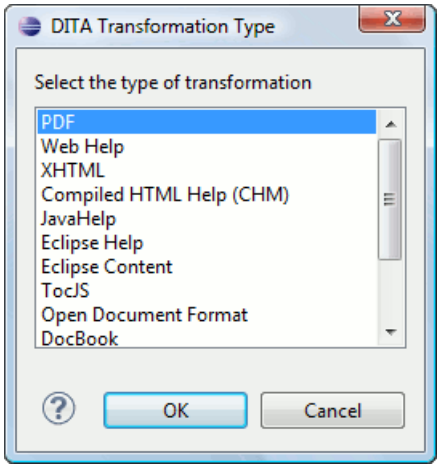

Figure 547: DITA Transformation Type Dialog Box

Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a **Skins** tab is only available for **WebHelp Classic** and **WebHelp Classic with Feedback** output types, a **Templates** tab is available only for **WebHelp Responsive** and **WebHelp Responsive with Feedback**, and a **FO Processor** tab is available for PDF output).

Skins Tab (DITA OT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Skins** tab is available for DITA OT transformations with **WebHelp Classic** or **WebHelp Classic with Feedback** output types and it provides a set of predefined skins that you can use as a base for your WebHelp system output.

A *skin* is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

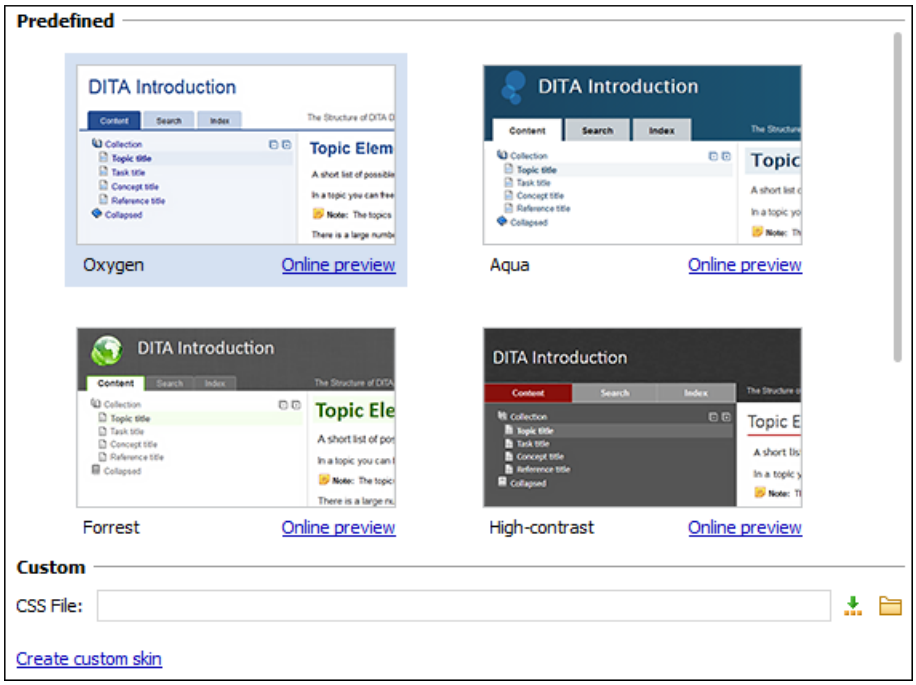

Figure 548: Skins Tab

The **Skins** tab includes the following sections:

Predefined Skins

This sections presents the predefined skins that are included in Oxygen XML Editor plugin. The predefined skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the *skin* looks when applied on a sample documentation project that is stored on the Oxygen XML Editor plugin website, press the **Online preview** link.

Custom Skins

You can use this section to customize the look of the output.

CSS File

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.

Note: The output can also be styled by setting the `args.css` parameter in the **Parameters tab**. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the **Skins tab**.

Create custom skin

Use this link to open the **WebHelp Skin Builder** tool.

Templates Tab (DITA OT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Templates** tab is available for DITA OT transformations with **WebHelp Responsive** or **WebHelp Responsive with Feedback** output types and it provides a set of predefined publishing templates. You can use one of them to publish your documentation or as a starting point for a new publishing template.

There are two main types of templates, *Tiles* and *Tree* and each of the built-in templates includes of version of each type. You can click on the tags at the top of the pane to filter the templates and narrow your search. You can filter them by either **tiles** or **tree** and then various color schemes. Each built-in template also includes an **Online preview** link that opens a webpage in your default browser that provides a sample of how the main page will look when that particular template is used to generate the output.

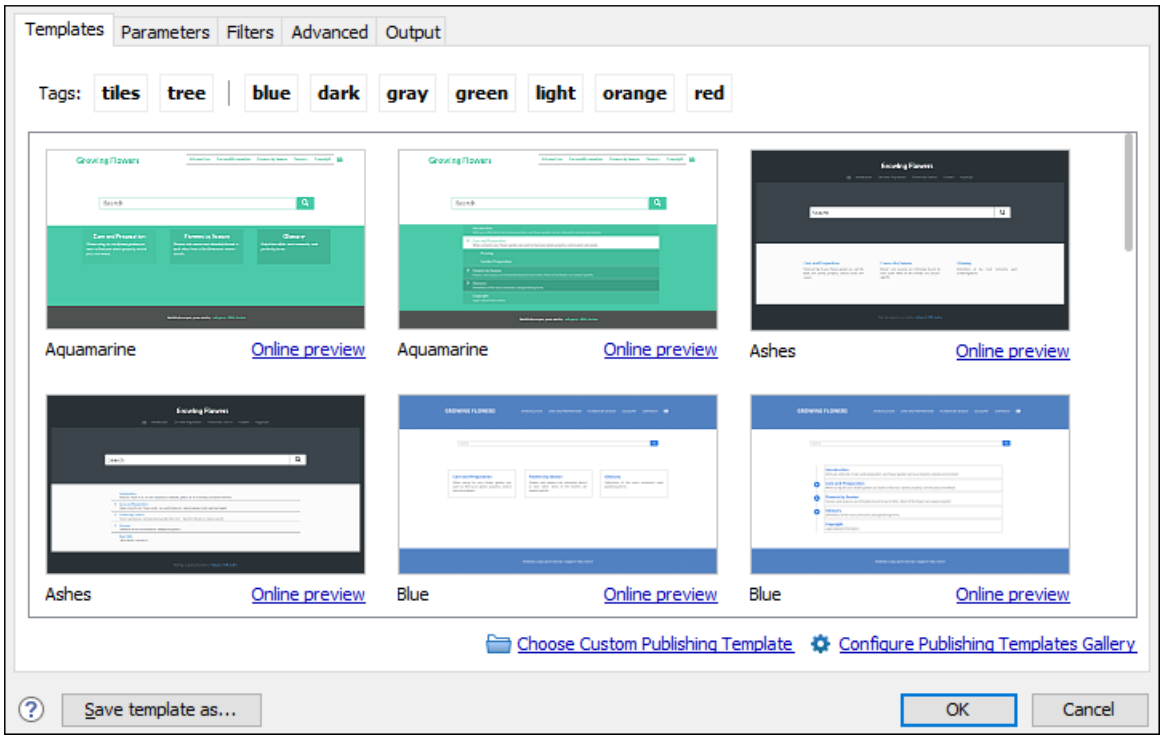

Figure 549: Templates Tab

The two main types of layouts:

Tiles

The main page in the WebHelp output presents a tile for each main topic (chapter) of the documentation. Each tile includes a link to the topic and a short description.

Tree

The main page in the WebHelp output presents a tree-like table of contents with links to the first and second level topics in the publication.

Built-in Templates Location

All built-in templates are stored in the following directory: *`DITA-OT-DIR`*`/plugins/com.oxygenxml.webhelp.responsive/templates`.

Save Template As Button

You can use the **Save template as** button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template. Clicking this button will open a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

Selecting Custom Templates

Once you are finished configuring your template, you can click the **Choose Custom Publishing Template** link to select your template.

You can also add your custom templates to the list of templates displayed in the **Templates** tab. To do this, store them in a directory, then click the **Configure Publishing Templates Gallery** link and add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Template Errors

When the **Templates** tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

If you click the **More details** link, a window will open with more information about the encountered error. For example, it might offer a hint for which element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠) will be displayed on the template's image (in the **Templates** tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to **Options** > **Preferences** > **DITA** > **Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

Publishing Templates on page 1055
Working with Publishing Templates on page 1083

Template Package Configuration Dialog Box

The **Save template as** button (at the bottom-left of the transformation dialog box for **WebHelp Responsive** transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to create your own custom template. The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

Name

Required field used to specify the name for the new template. This will become the text value of the `name` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

Description

Optional field used to specify a template description. This will become the text value of the `description` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

Parameter Table

This table displays the parameters that will be exported. Only relevant parameters are exported. The parameters and their values will be inserted in the `parameters` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

Note: Additional resources that are referenced in CSS files, HTML fragments, or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

Include HTML Page Layout Files

Select this option if you want to copy the default *HTML Page Layout Files* into your template package. They are helpful if you want to change the structure of the generated HTML pages.

Save as

Use this field to specify the name and path of the ZIP file where the template will be saved.

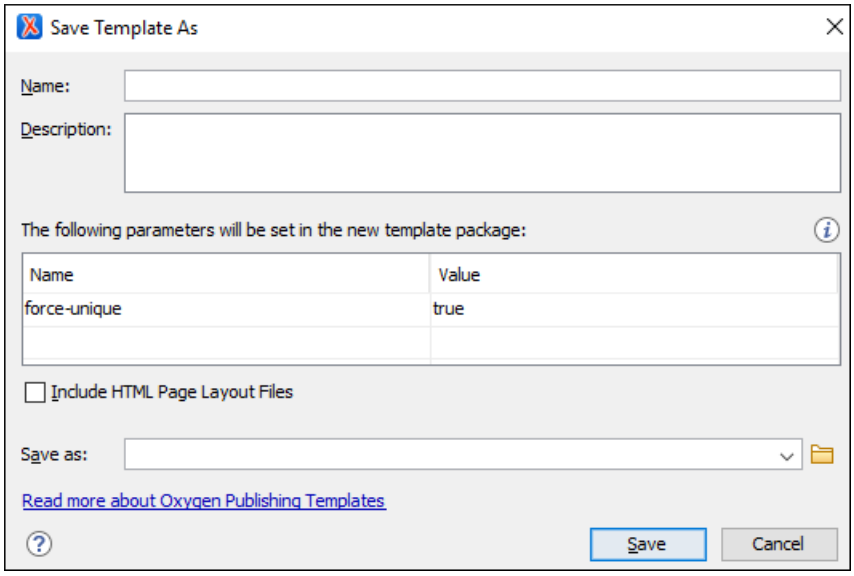

Figure 550: Template Package Configuration Dialog Box

FO Processor Tab (DITA OT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.

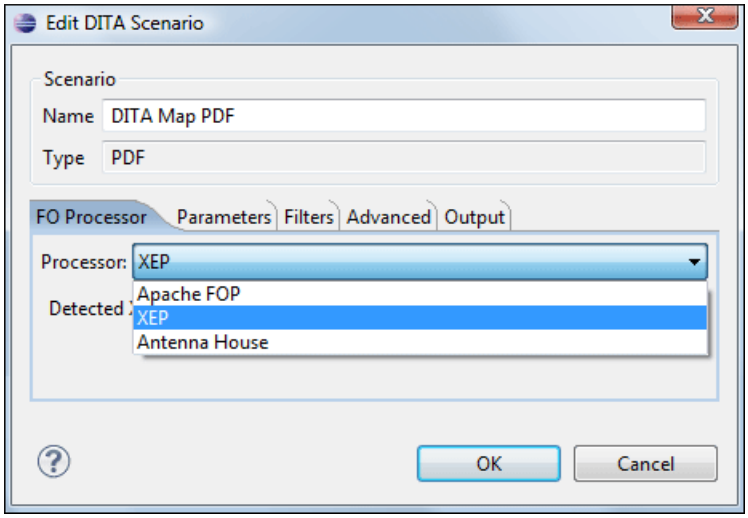

Figure 551: FO Processor Configuration Tab

You can choose one of the following processors:

Apache FOP

The default processor that comes bundled with Oxygen XML Editor plugin.

XEP

The RenderX XEP processor. If XEP is already installed, Oxygen XML Editor plugin displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the **FO Processors** option page.

- The system property *com.oxygenxml.xep.location* was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the *`DITA-OT-DIR`*`/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Editor plugin installation directory.

Antenna House

The Antenna House (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor plugindisplays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Editor plugin preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters** tab.
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

Related Information:

FO Processors Preferences on page 111
Generating PDF Output Using an XSL-FO Processor on page 1123

Parameters Tab (DITA OT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA OT Documentation. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the *ask* editor variable in the **Value** column.

Below the table, the following actions are available for managing parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the **Insert Editor Variables** button or the **Browse** button.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

WebHelp Responsive Parameters Contributed by an Oxygen Publishing Template

WebHelp Responsive transformation parameters that are defined in an *Oxygen Publishing Template* descriptor file are displayed in italics. After creating a publishing template and adding it to the templates gallery, when you select the template in the **Templates** tab, the **Parameters** tab will automatically be updated to include the parameters defined in the template descriptor file.

Related Information:
DITA Open Toolkit Documentation

Filters Tab (DITA Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.

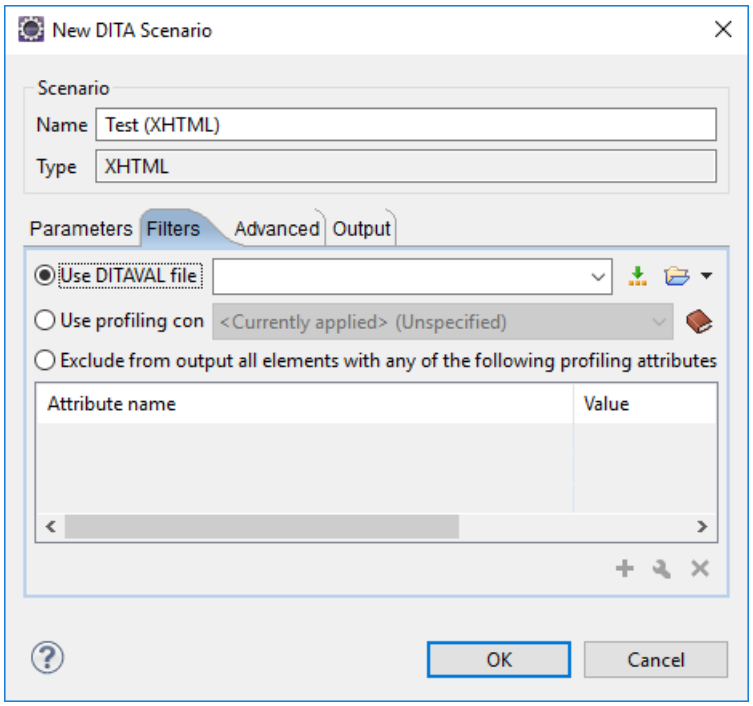

Figure 552: Edit Filters Tab

You can choose one of the following options to define filters:

Use DITAVAL file

If you already have a *DITAVAL* file associated with the *DITA map*, you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list. You can find out more about constructing a *DITAVAL* file in the DITA Documentation.

Attention: If a filter file is specified in the `args.filter` parameter (in the **Parameters** tab), that file takes precedence over a *DITAVAL* file specified here.

Use profiling condition set

Sets the profiling condition set that will be applied to your transformation.

Exclude from output all elements with any of the following attributes

By using the **New**, **Edit**, or **Delete** buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

Advanced Tab (DITA OT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Advanced** tab allows you to specify advanced options for the transformation scenario.

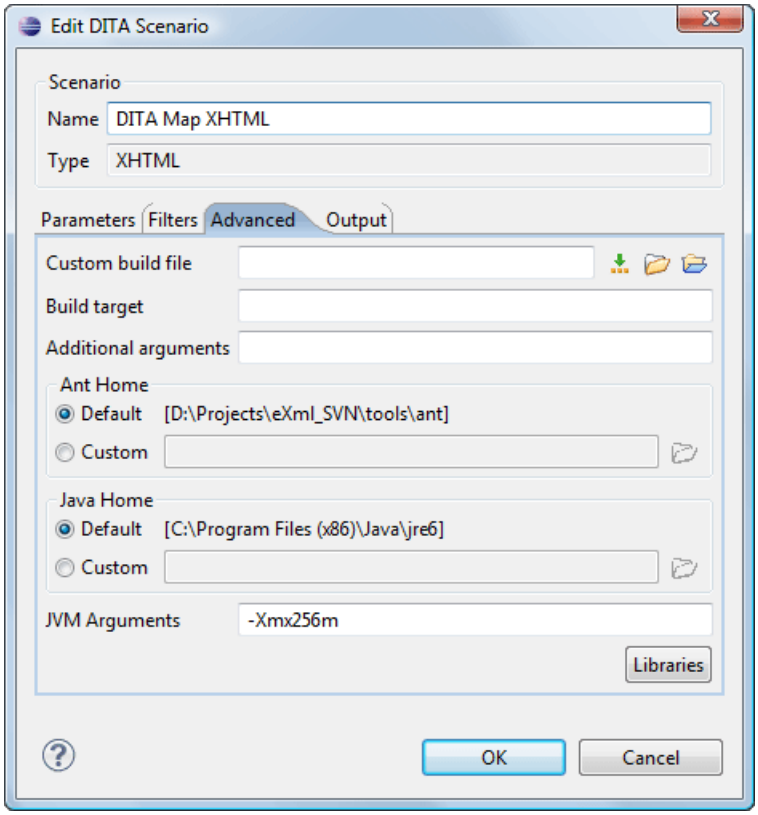

Figure 553: Advanced Settings Tab

You can specify the following parameters:

Custom build file

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the **Parameters** tab is used. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Build target

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

Additional arguments

You can specify additional command line arguments to be passed to the transformation (such as `-verbose`).

Ant Home

You can choose between the default or custom Ant installation to run the transformation.

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor plugin.

Note: It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA-OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA OT publishing engine and using it in the **Java Home** text field.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to **-Xmx384m**, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (**OutOfMemoryError**).

Libraries

By default, Oxygen XML Editor plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (*JAR* files or additional class paths) to be used by the Ant transformer.

Tip: You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

Output Tab (DITA OT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.

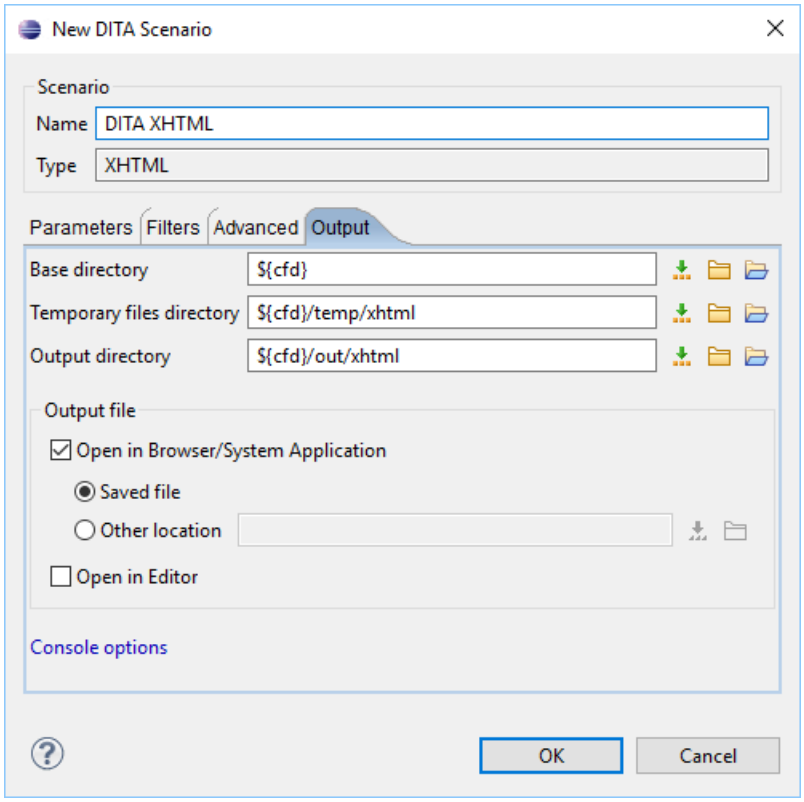

Figure 554: Output Settings Tab

You can specify the following parameters:

Base directory

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Temporary files directory

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Output directory

The folder where the content of the final output is stored. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Note: If the *DITA map* or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

Open in Browser/System Application

If selected, Oxygen XML Editor plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to **Window** > **Preferences** > **General** > **Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Troubleshooting DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. Validate the *DITA map* by using the **Validate and Check for Completeness** action that is available on the **DITA Maps Manager** toolbar and in the **DITA Maps** menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. Run the DITA transformation scenario.
4. If the transformation results in errors or warnings, they are displayed in the **Results** panel at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
   - **Severity** - The first column displays the following icons that indicate the severity of the problem:
     - **Informational** - The transformation encountered a condition of which you should be aware.
     - **Warning** - The transformation encountered a problem that should be corrected.
     - **Error** - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
   - **Info** - You can click the **See More** icon to open a web page that contains details about DITA-OT error messages.
   - **Description** - A description of the problem.
   - **Resource** - The name of the transformation resource.
   - **System ID** - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
6. If you need to contact the *Oxygen* technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
   a. Go to the **Options** > **Preferences** > **DITA** preferences page and set the **Show console output** option to **Always**.

b. Execute the transformation scenario again. The console output messages are displayed in the **DITA OT** view.
c. Copy the entire log, save it in a text file, then send it to the *Oxygen* technical support team.
d. After your issue has been solved, go back to the **Options** > **Preferences** > **DITA** preferences page and set the **Show console output** option to **When build fails**.

Ant Transformation
This type of transformation allows you to configure the options and parameters of an Ant build script.

An Ant transformation scenario is usually associated with an Ant build script. Oxygen XML Editor plugin runs an Ant transformation scenario as an external process that executes the Ant build script with the built-in Ant distribution (*Apache Ant* version 1.9.8) that is included with the application, or optionally with a custom Ant distribution configured in the scenario.

To create an Ant transformation scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the toolbar or the **XML** menu. Then click the **New** button and select **ANT transformation**.
- Go to **Window** > **Show View** and select **Transformation Scenarios** to display this view. Click the **New Scenario** drop-down menu button and select **ANT transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Options Tab (Ant Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Options** tab allows you to specify the following options:

Working directory
The path of the current directory of the Ant external process. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Build file
The Ant script file that is the input of the Ant external process. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Build target
Optionally, you can specify a build target for the Ant script file. If no target is specified, the Ant target that is specified as the default in the Ant script file is used.

Additional arguments
You can specify additional command line arguments to be passed to the transformation (such as `-verbose`).

Ant Home
You can choose between the default or custom Ant installation to run the transformation.

Java Home
You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor plugin.

JVM Arguments
This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to **-Xmx384m**, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (**OutOfMemoryError**).

Libraries

By default, Oxygen XML Editor plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (*JAR* files or additional class paths) to be used by the Ant transformer.

Tip: You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

Parameters Tab (Ant Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters that are accessible as Ant properties in the Ant build script.

The table displays all the parameters that are available in the Ant build script, along with their description and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the *ask* editor variable in the **Value** column.

Below the table, the following actions are available for managing parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the **Insert Editor Variables** button or the **Browse** button.

Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

Output Tab (Ant Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Open

Allows you to specify the file to open automatically when the transformation is finished. This is usually the output file of the Ant process. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

- **In System Application** - The file specified in the **Open** text box is opened in the system application that is set in the operating system as the default application for that type of file (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).
- **In Editor** - The file specified in the **Open** text box is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor).

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.

- **Always** - Displays the console output log, regardless of whether or not the build fails.

XSLT Transformation
This type of transformation specifies the parameters and location of an XML document that the edited XSLT stylesheet is applied on. This scenario is useful when you develop an XSLT document and the XML document is in its final form.

To create an **XSLT transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the toolbar or the **XML** menu. Then click the **New** button and select **XSLT transformation**.
- Go to **Window** > **Show View** and select **Transformation Scenarios** to display this view. Click the **New Scenario** drop-down menu button and select **XSLT transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page, the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template is specified in the scenario, the **XML URL** field can be empty. The **XML URL** field can also be empty if you use external XSLT processors. Otherwise, a value is mandatory in this field.

XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xml-stylesheet" declaration

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the `xml-stylesheet` processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the **XSL URL** field.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page. For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens a **Configure parameters** dialog box that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets. If the XSLT transformation engine is custom-defined, you can not use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a dialog box for configuring the XSLT extension *JARS* or classes that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a dialog box for adding XSLT stylesheets that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets, along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables (such as **${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.

- The system ID of the stylesheet that declares it.

Related Information:
Editor Variables on page 125

XSLT Extensions

The **Extensions** button opens a dialog box that allows you to specify the *JARS* and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

Tip: You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the **Move up** or **Move down** buttons.

Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add
: Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an editor variable in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove
: Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

Up
: Moves the selected stylesheet up in the list.

Down
: Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the **Saxon HE/PE/EE** preferences page but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.8 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode ("-im")
: A Saxon-specific option that sets the initial mode for the transformation.

Template ("-it")
: A Saxon-specific option that sets the name of the initial XSLT template to be executed.

Use a configuration file ("-config")
: Sets a Saxon 9.8.0.8 configuration file that is executed for XSLT transformation and validation processes.

Debugger trace into XPath expressions (applies to debugging sessions)
: Instructs the XSLT Debugger to *step into* XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

  Note: Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Recoverable errors ("-warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces ("-strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 9.8.0.8 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-JS extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.8.0.8 processors.

Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the **xsl:assert** element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `xsl:assert` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The advanced options that are specific for Saxon 9.8.0.8 Enterprise Edition (EE) are as follows:

XML Schema version

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, open the **Preferences** dialog box and go to **XML** > **XML Parser** > **XML Schema** and use the **Default XML Schema version** option.

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable streaming mode

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the *net.sf.saxon.lib.Initializer* interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XSLT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor.

Output Tab (XSLT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to **Window** > **Preferences** > **General** > **Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

  Important: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

  - **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Generating Output Using an XSLT Processor

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Editor plugin.

Supported XSLT Processors

Oxygen XML Editor plugin includes the following XSLT processors:

- **Xalan 2.7.2** - Xalan-Java is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.
- **Saxon 6.5.5** - Saxon 6.5.5 is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.
- **Saxon 9.8.0.8 Home Edition (HE), Professional Edition (PE)** - Saxon-HE/PE implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term *basic XSLT 2.0 / 3.0 processor* is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.
- **Saxon 9.8.0.8 Enterprise Edition (EE)** - Saxon EE is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Editor plugin. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

  The validation in schema aware transformations is done according to the W3C XML Schema 1.0 or 1.1. This can be configured in Preferences.

  Note: Oxygen XML Editor plugin implements a Saxon *framework* that allows you to create Saxon configuration files. Two templates are available: **Saxon collection catalog** and **Saxon configuration**. Both of these templates support content completion, element annotation, and attribute annotation.

  Note: Saxon can use the *ICU-J localization library* (`saxon9-icu.jar`) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Editor plugin installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

  1. Download Saxon 9.8.0.8 Professional Edition (PE) or Enterprise Edition (EE) from http://www.saxonica.com.
  2. Unpack the downloaded archive.
  3. Create a new XSLT transformation scenario (or edit an existing one). In the **XSLT** tab, click the **Extensions** button to open the list of additional libraries used by the transformation process.
  4. Click **Add** and browse to the folder where you unpacked the downloaded archive and choose the `saxon9-icu.jar` file.

  Note that the `saxon9-icu.jar` should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Editor plugin.
- **Saxon-CE (Client Edition)** is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Editor plugin provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

  Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

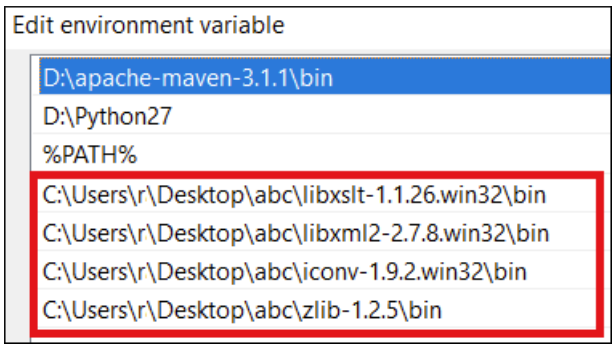
  Note: A specific template, named **Saxon-CE stylesheet**, is available in the **New from Templates** wizard.
- **Xsltproc (libxslt)** - Libxslt is the XSLT C library developed for the Gnome project. **Libxslt** is based on *libxml2*, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

  Oxygen XML Editor plugin uses **Libxslt** through its command line tool (*Xsltproc*). Depending on your operating system, you must download the Libxslt libraries on your machine from http://xmlsoft.org/XSLT/

downloads.html and place them in a local folder. Then you need to update the PATH environmental variable to contain the parent folder where the `xsltproc` executable is located.

Tip: As an example, a Windows installation of the Xsltproc engine would follow these steps:

1. Go to ftp://ftp.zlatkovic.com/libxml/ and download the following ZIP files: **iconv-1.9.2.win32.zip**, **libxml2-2.7.8.win32.zip**, **libxslt-1.1.26.win32.zip**, **zlib-1.2.5.win32.zip**.
2. Unzip all of them into the same folder of your choice.
3. Edit the PATH environment variable and add the `bin` folder for all four archives:



4. Restart Oxygen XML Editor plugin.

   Result: You can now use the **xsltproc** processor as an XSLT engine in the XSLT transformation scenario.

Note: The Xsltproc processor can be configured from the **XSLTPROC** options page.

CAUTION: There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in *XML Catalog* files of the predefined document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Editor plugin is installed in the default location on Windows (C:\Program Files). This is because the built-in *XML catalog* files are stored in the *[OXYGEN_INSTALL_DIR]*`/frameworks` subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0** - MSXML 4.0 is available only on Windows platforms. It can be used for transformation and validation of XSLT stylesheets.

  Oxygen XML Editor plugin uses the Microsoft XML parser through its command line tool *msxsl.exe*.

  Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.
- **MSXML .NET** - MSXML .NET is available only on Windows platforms. It can be used for transformation and validation of XSLT stylesheets.

  Oxygen XML Editor plugin performs XSLT transformations and validations using the .NET *Framework* XSLT implementation (*System.Xml.Xsl.XslTransform* class) through the **nxslt** command line utility. The **nxslt** version included in Oxygen XML Editor plugin is 1.6.

  You should have the .NET *Framework* version 1.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128`.

  You can get the .NET *Framework* version 1.0 from the Microsoft website.
- **.NET 1.0** - A transformer based on the **System.Xml** 1.0 library available in the .NET 1.0 and .NET 1.1 *frameworks* from Microsoft (http://msdn.microsoft.com/xml/). It is available only on Windows.

  You should have the .NET *Framework* version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128`.

  You can get the .NET *Framework* version 1.0 from the Microsoft website.
- **.NET 2.0** - A transformer based on the **System.Xml** 2.0 library available in the .NET 2.0 *Framework* from Microsoft. It is available only on Windows.

You should have the .NET *Framework* version 2.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128`.

You can get the .NET *Framework* version 2.0 from the Microsoft website.

Configuring Custom XSLT Processors

Oxygen XML Editor plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the **Preferences** dialog box and go to **XML** > **XSLT-FO-XQuery** > **Custom Engines**.
2. Click the **New** button at the bottom of the dialog box.
3. Configure the parameters for the custom engine.
4. Click **OK**.

Note: You can not use these custom engines in the Debugger *perspective*.

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Editor plugin linked message, clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

Related Information:

Custom Engines Preferences on page 109

Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- **Xalan** - http://xml.apache.org/xalan-j/extensions.html
- **Saxon 6.5.5** - http://saxon.sourceforge.net/saxon6.5.5/extensions.html
- **Saxon 9.8.0.8** - http://www.saxonica.com/documentation9.5/index.html#!extensibility

To set an XSLT processor extension (a directory or a `jar` file), use the **Extensions** button in the **Edit scenario** dialog box.

XProc Transformation

This type of transformation specifies the parameters and location of an XProc script.

A sequence of transformations described by an XProc script can be executed with an XProc transformation scenario. To create an **XProc transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the toolbar or the **XML** menu. Then click the **New** button and select **XProc transformation**.
- Go to **Window** > **Show View** and select **Transformation Scenarios** to display this view. Click the **New Scenario** drop-down menu button and select **XProc transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Related Information:

Integrating an External XProc Engine on page 974
Editing XProc Scripts on page 787

XProc Tab

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XProc** tab contains the following options:

XProc URL

Specify the source XSL file to be used by the transformation. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Processor

Allows you to select the XProc engine to be used for the transformation. You can select the built-in *Calabash* engine or a custom engine that is configured in the **Preferences** dialog box.

Inputs Tab (XProc Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Inputs** tab contains a list with the ports that the XProc script uses to read input data. Use the **Filter** text box to search for a specific term in the entire ports collection.

Each input port has an assigned name in the XProc script. The XProc engine reads data from the URL specified in the **URL** column.

The following actions are available for managing the input ports:

New

Opens an **Edit** dialog box that allows you to add a new port and its URL. The built-in editor variables and custom editor variables can be used to specify the URL.

Edit

Opens an **Edit** dialog box that allows you to modify the selected port and its URL. The built-in editor variables and custom editor variables can be used to specify the URL.

Delete

Removes the selected port from the list. It is available only for new ports that have been added to the list.

Parameters Tab (XProc Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab presents a list of ports and parameters collected from the XProc script. The tab is divided into three sections:

List of Ports

In this section, you can use the **New** and **Delete** buttons to add or remove ports.

List of Parameters

This section presents a list of parameters for each port and includes columns for the parameter name, namespace URI, and its value. Use the **Filter** text box to search for a specific term in the entire parameters collection. You can use the **New** and **Delete** buttons to add or remove parameters. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers.

Editor Variable Information

The built-in editor variables and custom editor variables can be used for specifying the URI. The message pane at the bottom of the dialog box provides more information about the editor variables that can be used.

Outputs Tab (XProc Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Outputs** tab displays a list of output ports (along with the URL) collected from the XProc script. Use the **Filter** text box to search for a specific term in the entire ports collection. You can also sort the columns by clicking the column headers.

The following actions are available for managing the output ports:

New

Opens an **Edit** dialog box that allows you to add a new output port and its URL. An editor variable can be inserted for the URL by using the **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output **Results** view.

Edit

Opens an **Edit** dialog box that allows you to edit an existing output port and its URL. An editor variable can be inserted for the URL by using the **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output **Results** view.

Delete

Removes the selected output port from the list. It is available only for new ports that have been added to the list.

Additional options that are available at the bottom of this tab include:

Open in Editor

If this option is selected, the XProc transformation result is automatically opened in an editor panel.

Open in Browser/System Application

If this option is selected, you can specify a file to be opened at the end of the XProc transformation in the browser or system application that is associated with the file type. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.

Results

The result of the XProc transformation can be displayed as a sequence in an output view with two sections:

- A list with the output ports on the left side.
- The content that correspond to the selected output port on the right side.

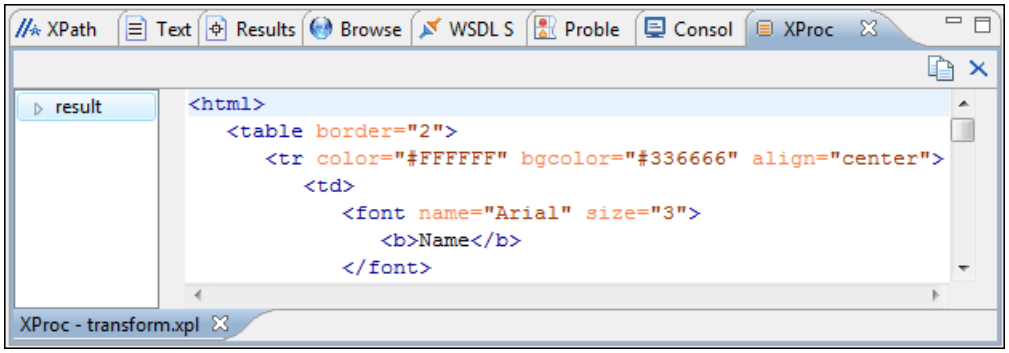


Figure 555: XProc Transformation Results View

Options Tab (XProc Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Options** tab displays a list of the options collected from the XProc script. The tab is divided into two sections:

List of Options

This section presents a list of options and includes columns for the option name, namespace URI, and its value. Use the **Filter** text box to search for a specific term in the entire options collection. You can use the **New** and **Delete** buttons to add or remove options. You can edit the value of each cell in this table by double-

clicking the cell. You can also sort the parameters by clicking the column headers. The names of edited options are displayed in bold.

Editor Variable Information

The built-in editor variables and custom editor variables can be used for specifying the URI. This section provides more information about the editor variables that can be used.

Integrating an External XProc Engine

If you edit an XProc transformation scenario, there is a **Processor** drop-down menu where you can select the XProc engine to be used for the transformation. You can select the built-in *Calabash* engine or a custom engine based on another XProc implementation. For example, there is a public project on GitHub that is an implementation for integrating Morgana XProc with Oxygen XML Editor plugin: https://github.com/xml-project/support-for-xmleditor. Also, the Javadoc documentation of the XProc API is available for download from the application website as a zip file: *xprocAPI.zip*.

To create an XProc integration project, follow these steps:

1. Move the `oxygen.jar` file from *`[OXYGEN_INSTALL_DIR]`*`/lib` to the `lib` folder of your project.
2. Implement the *ro.sync.xml.transformer.xproc.api.XProcTransformerInterface* interface.
3. Create a *Java archive (JAR)* from the classes you created.
4. Create an `engine.xml` file according to the `engine.dtd` file. The attributes of the `engine` element are as follows:
   a. **name** - The name of the XProc engine.
   b. **description** - A short description of the XProc engine.
   c. **class** - The complete name of the class that implements *ro.sync.xml.transformer.xproc.api.XProcTransformerInterface*.
   d. **version** - The version of the integration.
   e. **engineVersion** - The version of the integrated engine.
   f. **vendor** - The name of the vendor / implementer.
   g. **supportsValidation** - **true** if the engine supports validation (otherwise, **false**).

   The `engine` element has only one child, `runtime`. The `runtime` element contains several `library` elements with the `name` attribute containing the relative or absolute location of the libraries necessary to run this integration.
5. Create a new folder (for example, named `MyXprocEngine`) and place the `engine.xml` and all the libraries necessary to run the new integration in that folder.
6. Place that new folder (i.e. `MyXprocEngine`) inside a new plugin folder. This new plugin folder should also contain a `plugin.xml` file that points to the new engine folder (i.e. `MyXprocEngine`).

   The `plugin.xml` file would look like this:

```
<plugin
 id="morgana.xproc.addon"
 name="Contribute Morgana XProc"
 description="Contribute Morgana XProc"
 version="1.0"
 vendor="SyncroSoft"
 class="ro.sync.exml.plugin.Plugin"
 classLoaderType="preferReferencedResources">
 <extension type="AdditionalXProcEngine" path="MyXprocEngine/"></extension>
</plugin>
```

Related Information:

Editing XProc Scripts on page 787

Creating an XProc Transformation Scenario on page 971

This type of transformation specifies the parameters and location of an XProc script.

XQuery Transformation

This type of transformation specifies the parameters and location of an XML source that the edited XQuery file is applied on.

Note: When the XML source is a native XML database, the source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the input field of the scenario.

To create an **XQuery transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the toolbar or the **XML** menu. Then click the **New** button and select **XQuery transformation**.
- Go to **Window** > **Show View** and select **Transformation Scenarios** to display this view. Click the **New Scenario** drop-down menu button and select **XQuery transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page, the XML input of the transformation is passed to that URI resolver.

XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor plugin for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page. For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens the **Configure parameters** dialog box for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a dialog box for configuring the XQuery extension *JARS* or classes that define extension Java functions or extension XSLT elements used in the transformation.

XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or editor variables (such as **${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

Editor Variables on page 125

XQuery Extensions

The **Extensions** button is used to specify the *JAR* and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the **Move up** or **Move down** buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the **Saxon HE/PE/EE** preferences page but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.8 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 9.8.0.8 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Recoverable errors ("-warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces ("-strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 9.8.0.8 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 9.8.0.8 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.

- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the *net.sf.saxon.lib.Initializer* interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XQuery Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor.

Output Tab (XQuery Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Present as a sequence

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to **Window** > **Preferences** > **General** > **Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor plugin displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

  Important: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

  - **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

SQL Transformation

This type of transformation specifies a database connection for the database server that runs the SQL file associated with the scenario. The data processed by the SQL script is located in the database.

To create an **SQL transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (**Alt + Shift + T, C (Command + Alt + T, C on OS X)**) action from the toolbar or the **XML** menu. Then click the **New** button and select **SQL transformation**.
- Go to **Window** > **Show View** and select **Transformation Scenarios** to display this view. Click the **New Scenario** drop-down menu button and select **SQL transformation**.

Both methods open the **New Scenario** dialog box. This dialog box allows you to configure the following options that control the transformation:

Name

The unique name of the SQL transformation scenario.

SQL URL

Allows you to specify the URL of the SQL script. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.

Connection

Allows you to select a connection from a drop-down list. To configure a connection, use the **Advanced options** button to open the **Data Source** preferences page.

Parameters

Allows you to add or configure parameters for the transformation.

Editing a Transformation Scenario

Editing a transformation scenario is useful if you need to configure some of its parameters.

Note: Since transformation scenarios that are associated with predefined *frameworks* are read-only, to edit one of these scenarios you will need to duplicate it and edit the duplicated scenario.

To configure an existing transformation scenario, follow these steps:

1. Select the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the toolbar or the **XML** menu.

   Step Result: The **Configure Transformation Scenario(s)** dialog box is opened.
2. Select the particular transformation scenario and click the **Edit** button at the bottom of the dialog box or from the contextual menu.

   Tip: You could also select the scenario and the **Edit** button in the **Transformation Scenarios** view to achieve the same result.

Result: This will open an **Edit scenario** configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected.

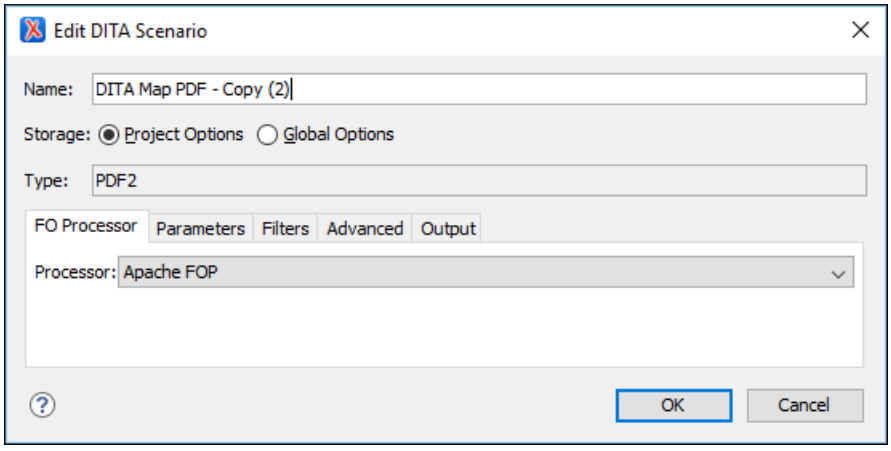

Figure 556: Edit Scenarios Configuration Dialog Box

Transformation Types

The **Configure Transformation Scenario(s)** dialog box contains a **Type** column that shows you the transformation type for each of the listed scenarios. Each type of transformation contains includes some tabs with various configuration options.

The following is a list of the transformation types and their particular tabs (click the name of each tab below to see details about all the options that are available):

- **DITA OT** - This type of transformation includes configurable options in the following tabs:
  - Skins Tab (Available for **WebHelp Classic** and **WebHelp Classic with Feedback**)
  - Templates Tab (Available for **WebHelp Responsive** and **WebHelp Responsive with Feedback**)
  - FO Processor Tab (Available for PDF output)
  - Parameters Tab
  - Filters Tab
  - Advanced Tab
  - Output Tab
- **ANT** - This type of transformation includes configurable options in the following tabs:
  - Options Tab
  - Parameters Tab
  - Output Tab
- **XSLT** - This type of transformation includes configurable options in the following tabs:
  - XSLT Tab
  - FO Processor Tab
  - Output Tab
- **XProc** - This type of transformation includes configurable options in the following tabs:
  - XProc Tab
  - Inputs Tab
  - Parameters Tab
  - Outputs Tab
  - Options Tab
- **XQuery** - This type of transformation includes configurable options in the following tabs:
  - XQuery Tab
  - FO Processor Tab
  - Output Tab

Applying Associated Transformation Scenarios on page 982

Duplicating a Transformation Scenario

Duplicating a transformation scenario is useful for creating a scenario that is similar to an existing one or to edit a predefined transformation scenario.

To configure an existing transformation scenario, follow these steps:

1. Select the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the toolbar or the **XML** menu.

   Step Result: The **Configure Transformation Scenario(s)** dialog box is opened.
2. Select the particular transformation scenario and click the **Duplicate** button at the bottom of the dialog box or from the contextual menu.

   Tip: You could also select the scenario and the **Duplicate** button in the **Transformation Scenarios** view to achieve the same result.

Result: This will open an **Edit scenario** configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the Transformation Types section.

Related Information:

Creating New Transformation Scenarios on page 936

Editing a Transformation Scenario on page 980

Applying Associated Transformation Scenarios

If you have associated transformation scenarios for the current document (in the **Configure Transformation Scenario(s)** dialog box or **Transformation Scenarios** view), Oxygen XML Editor plugin included an **Apply Transformation Scenario(s)** action that allows you to quickly apply the associated transformation scenarios on the current document. Note that if an association is not detected, this action will open the **Configure Transformation Scenario(s)** dialog box where you can choose the scenarios you want to apply.

The **Apply Transformation Scenario(s)** action can be initiated from any of the following methods:

- Use the **Alt + Shift + T, T (Command + Alt + T, T on OS X))** keyboard shortcut.
- Click the **Apply Transformation Scenario(s)** button on the main toolbar.
- Click the **Apply Transformation Scenario(s)** button on the toolbar in the **Transformation Scenarios** view.
- Right-click a file in the **Navigator** view and select **Transform** > **Apply Transformation Scenario(s)**.
- Use the **Apply Associated** button in the **Configure Transformation Scenario(s)** dialog box.

Related Information:

Creating New Transformation Scenarios on page 936

Configure Transformation Scenario(s) Dialog Box on page 982
Transformation Scenarios View on page 986

Configure Transformation Scenario(s) Dialog Box

You can use the **Configure Transformation Scenarios(s)** dialog box for editing existing transformation scenarios or creating new ones.

To open this dialog box, use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the toolbar or the **XML** menu.

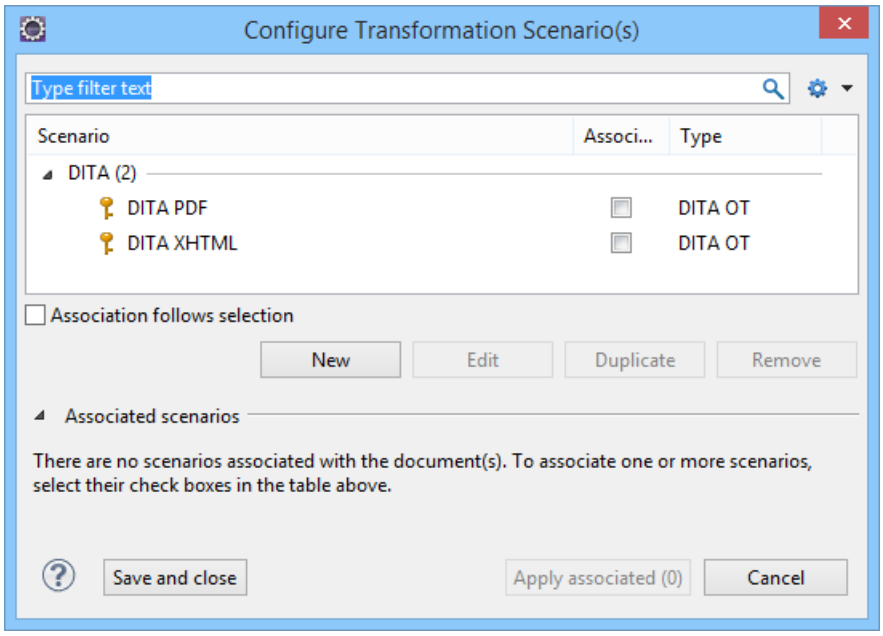

Figure 557: Configure Transformation Scenario(s) Dialog Box

Top Section

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the **Settings** button allows you to configure the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor plugin can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

  Note: When you keep both scenarios, Oxygen XML Editor plugin adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor plugin creates a `scenarios` file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

Middle Section

The middle section of the dialog box displays the scenarios that you can apply to the current document. The following columns are used to display the transformation scenarios:

- **Association** - The checkboxes in this column mark whether or not a transformation scenario is associated with the current document.
- **Scenario** - This column presents the names of the transformation scenarios.
- **Type** - If the **Show Type** contextual menu option is selected, this column displays the type of the transformation scenario. For further details about the types of transformation scenarios that are available in Oxygen XML Editor plugin, see the Transformation Types section.
- **Storage** - If the **Show Storage** contextual menu option is selected, this column displays where a transformation scenario is stored.

To sort each column you can left-click its header. The contextual menu of each header also includes the following actions:

Show Type

Use this option to display the transformation type of each scenario.

Show Storage

Use this option to display the storage location of the scenarios.

Group by Type

Select this option to group the scenarios by their type.

Group by Storage

Select this option to group the scenarios by their storage location.

Ungroup all

Select this option to ungroup all the scenarios.

Reset Layout

Select this option to restore the default settings of the layout.

Each transformation scenarios listed in the middle section of the dialog box also includes the following contextual menu actions:

Edit

This button opens the **Edit Scenario** configuration dialog box that allows you to configure the options of the transformations scenario.

Duplicate

Use this button to create a duplicate transformation scenario.

Remove

Use this button to remove custom transformation scenarios.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

  Note: When you keep both scenarios, Oxygen XML Editor plugin adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor plugin creates a `scenarios` file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

Bottom Section

The bottom section of the dialog box contains the following actions and information:

Association follows selection

Select this checkbox to automatically associate selected transformation scenarios with the current document. This option can also be used for multiple selections.

Note: When this option is selected, the **Association** column is hidden.

New

This button allows you to create a new transformation scenario.

Edit

This button opens the **Edit Scenario** dialog box that allows you to configure the options of the transformations scenario. For information about all the specific options in the various tabs, see the Transformation Types section.

Note: If you try to edit a transformation scenario associated with a defined document type, Oxygen XML Editor plugin displays a warning message to inform you that this is not possible and gives you the option to create a duplicate transformation scenario to edit instead.

Duplicate

Use this button to create a duplicate transformation scenario.

Remove

Use this button to remove transformation scenarios.

Note: Removing scenarios associated with a defined document type is not allowed.

Associated scenarios section

Displays the scenarios that are associated with the current document. Selecting a checkbox in the **Association** column in the list of scenarios will add that scenario to this section. To remove a scenario from being associated with the current document, simply click the remove icon ( ) to the right of the scenario name.

Save and close

Saves the current configuration and closes the dialog box.

Apply associated

Use this button to apply the associated scenarios and run the transformation on the current document.

Cancel

Cancels any changes made in the dialog box and reverts to the previously saved association.

Your selections in the **Configure Transformation Scenarios(s)** dialog box are persistent so the configured associations for the current document will be remembered after the dialog box is closed.

Related Information:

Editing a Transformation Scenario on page 980

Applying Associated Transformation Scenarios on page 982
Creating New Transformation Scenarios on page 936
Sharing Transformation Scenarios on page 985

Batch Transformations

A transformation action can be applied on a batch of selected files from the contextual menu of the **Navigator** view without having to open the files involved in the transformation. You can apply the same scenario to a batch of files or multiple scenarios to a single file or batch of files.

1. Select the files you want to transform and from the contextual menu, select **Transform** > **Configure Transformation Scenario(s)** to choose one or more transformation scenarios to be applied on all the files in the logical folder.
2. Use Oxygen XML Editor plugin editor variables to specify the input and output files. This ensures that each file from the selected set of resources is processed and that the output is not overwritten by the subsequent processing.
   a) Edit the transformation scenario to make sure the appropriate editor variable is assigned for the input file. For example, for a *DocBook PDF transformation* make sure the **XML URL** input box is set to the *${currentFileURL}* editor variable. For a DITA PDF transformation make sure the `args.input` parameter is set to the *${cf}* editor variable.
   b) Edit the transformation scenario to make sure the appropriate editor variable is assigned for the output file. For example, for an **XML transformation with XSLT**, switch to the **Output** tab and set the path of the output file using a construct of editor variables, such as `${cfd}/${cfn}.html`.
3. Now that logical folder has been associated with one or more transformation scenarios, whenever you want to apply the same batch transformation you can select **Transform** > **Transform with** from the contextual menu and the same previously associated scenario(s) will be applied.
4. If you want a different type of transformation to be applied to each file inside the logical folder, associate individual scenarios for each file and select **Transform** > **Apply Transformation Scenario(s)** from the contextual menu of the logical folder.

Related Information:

Editor Variables on page 125

Sharing Transformation Scenarios

The transformation scenarios and their settings can be shared with other users by exporting them to a specialized scenarios file that can then be imported.

Transformation Scenarios View

You can manage the transformation scenarios by using the **Transformation Scenarios** view. To open this view, select **Window** > **Show View** > **Transformation Scenarios**.

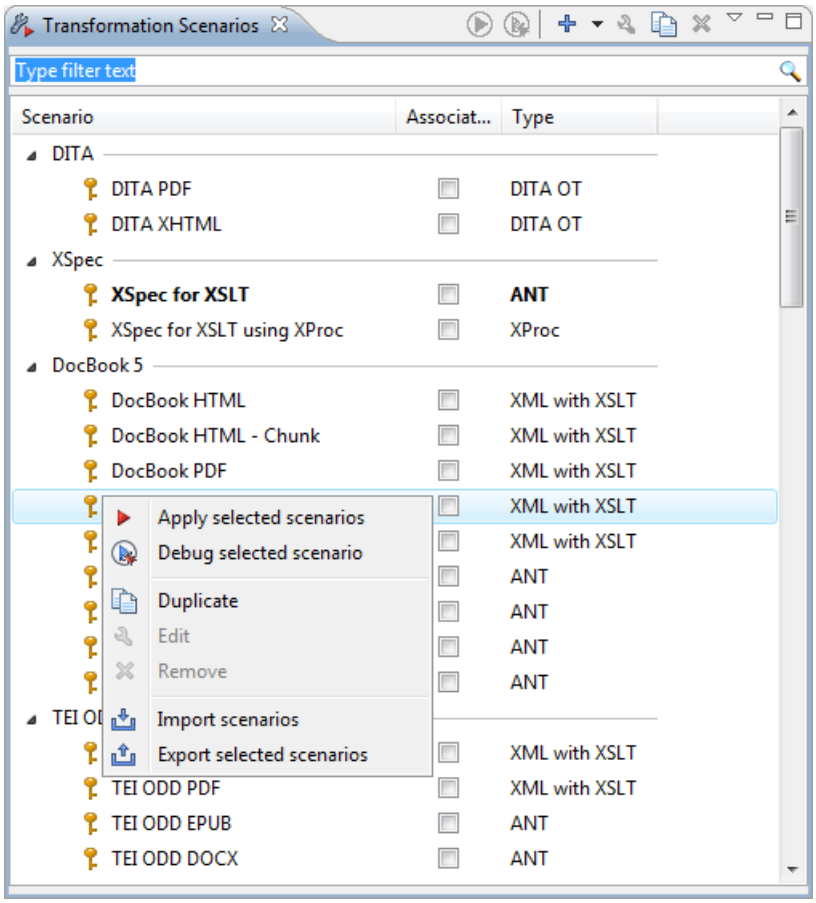

Figure 558: Transformation Scenarios view

Oxygen XML Editor plugin supports multiple scenarios association. To associate multiple scenarios with a document, select the checkboxes in front of each scenario. You can also associate multiple scenarios with a document from the **Configure Transformation Scenario(s)** dialog box.

By default, Oxygen XML Editor plugin presents the items in the following order:

1. Scenarios that match the current *framework*.
2. Scenarios that match the current project.
3. Scenarios that match other *frameworks*.

Toolbar/Contextual Menu Actions and Options

The following actions and options are available on the toolbar or in the contextual menu:

Apply selected scenarios

Select this option to run the current transformation scenario.

Debug selected scenario

Select this option to switch to the **Debugger** *perspective* and initialize it with the parameters from the scenario (the XML, XSLT, or XQuery input, the transformation engine, the XSLT parameters).

New

This drop-down menu contains a list of the scenarios that you can create. Oxygen XML Editor plugin determines the most appropriate scenarios for the current type of file and displays them at the beginning of the list, followed by the rest of the scenarios.

Duplicate

Adds a new scenario to the list that is a duplicate of the current scenario. It is useful for creating a scenario that is similar to an existing one.

Edit

Opens the dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the Transformation Types section.

Remove

Removes the current scenario from the list. This action is also available by using the **Delete** key.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

  Note: When you keep both scenarios, Oxygen XML Editor plugin adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export transformation and validation scenarios individually. Oxygen XML Editor plugin creates a `scenarios` file that contains the scenarios that you export.

Settings

This drop-down menu allows you to configure the following options (many of these options are also available if you right-click the name of a column):

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor plugin can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

  Note: When you keep both scenarios, Oxygen XML Editor plugin adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor plugin creates a `scenarios` file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

Show Type

Use this option to display the transformation type of each scenario.

Show Storage

Use this option to display the storage location of the scenarios.

Group by Type

Select this option to group the scenarios by their type.

Group by Storage

Select this option to group the scenarios by their storage location.

Ungroup all

Select this option to ungroup all the scenarios.

Reset Layout

Select this option to restore the default settings of the layout.

Your selections in the **Transformation Scenarios** view are persistent so the configured associations for the current document will be remembered whenever the document is opened.

WebHelp Output

Oxygen XML WebHelp provides the ability to generate two different types of output, **WebHelp Responsive** and **WebHelp Classic**. Both types include a feedback-enabled variant and each has its own set of options and features. The **WebHelp Responsive** variants are available for DITA documents while the **WebHelp Classic** variants are available for both DITA and DocBook.

Table 65: WebHelp System Feature Matrix

Features	WebHelp System Variants			
	Responsive w/ Feedback	**Responsive**	**Classic w/ Feedback**	**Classic**
Desktop Systems	✔	✔	✔	✔
Mobile Devices	✔	✔		
Predefined Skins	✔	✔	✔	✔
Predefined Templates	✔	✔		
Search Capabilities	✔	✔	✔	✔
Modern Layout	✔	✔		
Adaptable to Any Screen Size	✔	✔		
Comments Section	✔		✔	
DITA Documents	✔	✔	✔	✔

Features	WebHelp System Variants			
	Responsive w/ Feedback	Responsive	Classic w/ Feedback	Classic
DocBook Documents			✔	✔
Tri-Pane Frames or Frameless Version			✔	✔

WebHelp Classic Output

The **WebHelp Classic** variant is designed for desktop systems when feedback from users is not necessary and it is available for DocBook and DITA document types. The **WebHelp Classic with Feedback** variant also includes a feedback system that allows your users to make comments and allows you to manage and reply to them. This section contains information about configuring a WebHelp Classic system and customizing the output.

This type of WebHelp system can be generated by using one of the following transformation scenarios:

- **DITA Map WebHelp Classic** transformation scenario
- **DITA Map WebHelp Classic with Feedback** transformation scenario
- **DocBook WebHelp Classic** transformation scenario
- **DocBook WebHelp Classic with Feedback** transformation scenario

WebHelp Classic Output Layout and Features

Layout of the WebHelp Classic System Interface

The layout of the **WebHelp Classic** system is comprised of the following components:

Left Pane or Frame

This section on the left side of the help system includes the following tabs:

Content

A typical table of contents style presentation of your content. You can use the **Expand all/Collapse all** buttons to expand or collapse all the topics presented in the Table of Contents.

Note: You can enhance the appearance of items in the *Table of Contents*. See the Customizing WebHelp Classic Output chapter for more details.

Index

Presents the index terms for your content. If your content does not contain any `indexterm` elements, this tab is not generated.

Search Results

This tab is generated when the **Search** field is used. It presents the search results in the form of links to topics where the search terms are found, along with a rating scheme for each result. For more details, see the Search Feature section.

Upper Pane or Frame

The upper section of the help system includes the following features:

Search Field

Use this feature to perform searches in your content. When you enter search terms in this field, the results are displayed in the **Search Results** tab in the left section of the help system, along with a rating scheme for each result. For more details, see the Search Feature section.

Frames Option

Click on this option to display the output rendered in HTML frames.

Print Option

Opens a dialog box with various printing options and a print preview.

Navigation Links

You can navigate through the content of your output using the navigation links or arrows in the upper-right part of the page. These arrows allow you to move to the **Parent topic**, **Previous topic**, or **Next topic**. Links to the parent topics of the currently opened topic are also presented at the top of the page. For DITA output, these navigation links are controlled by the `collection-type` attribute.

Tip: To hide the **Parent**, **Next**, and **Previous** links, you can edit the transformation scenario and set the value of the `args.hide.parent.link` parameter to `yes`.

Main Pane or Frame

The content of the help pages are rendered and displayed in this main section.

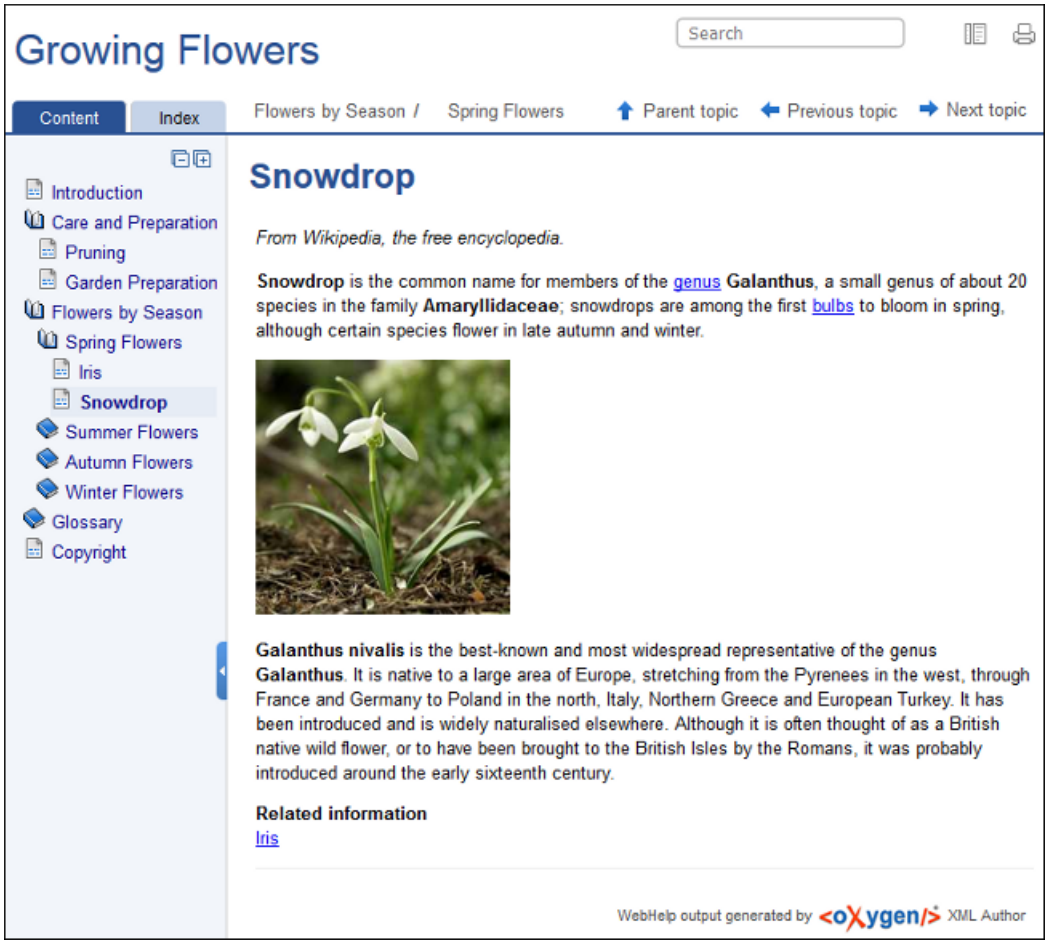

Figure 559: WebHelp Classic Output

WebHelp Classic with Feedback Enabled

The **WebHelp Classic with Feedback** variant also contains a **Comments** section at the bottom of each topic. This section is where you can interact with users through a comment system. For information about deploying a feedback-enabled system, see Deploying a Feedback-Enabled System on page 1050.

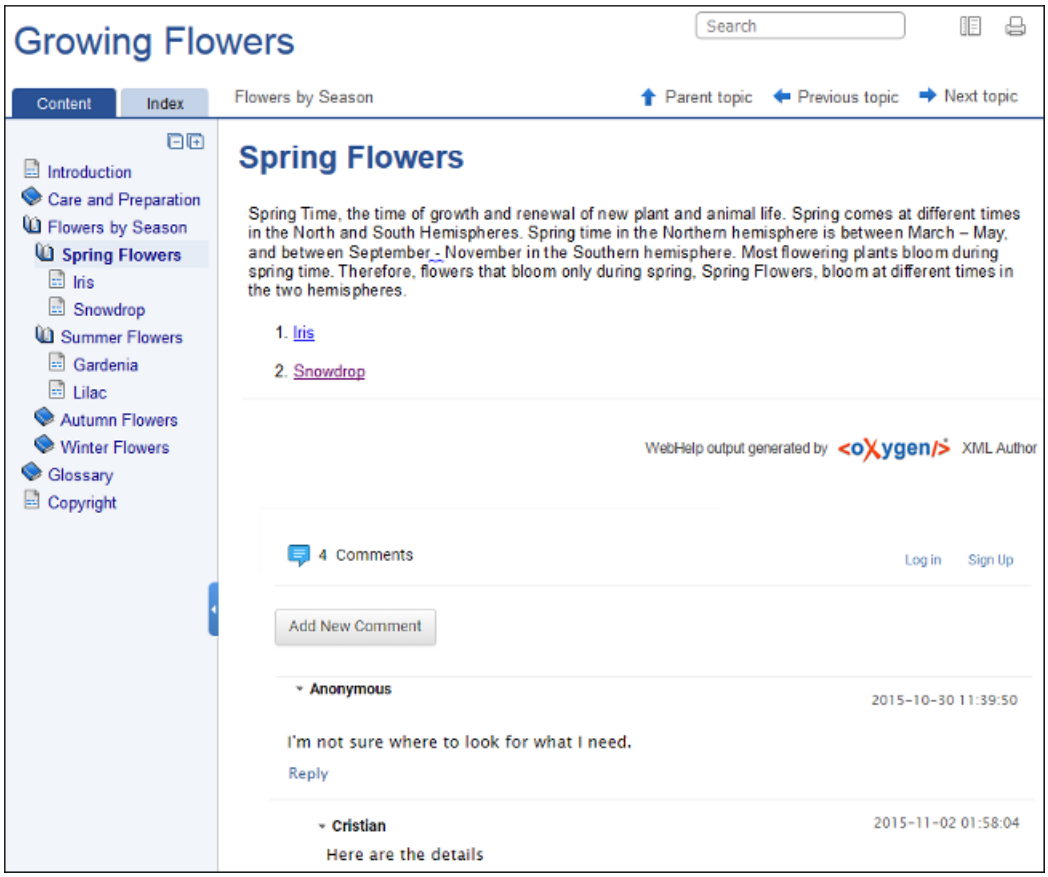

Figure 560: WebHelp Classic with Feedback Comments Section

To add a new comment, click the **Add New Comment** button, or click **Reply** to add a comment to an existing thread. You can click on the **Log in** button on the right side of this bar to be authenticated as a user and your user name will be included in any comments that you add. If you do not have a user name, you can click on the **Sign Up** button to create a new user.

After you log in, your name and user name are displayed in the **Comments** bar, along with the **Log off** and **Edit** buttons. Click the **Edit** button to open the **User Profile** dialog box where you can customize the following options:

- **Your Name** - You can use this field to edit the initial name that you used to create your user profile.
- **Your email address** - You can use this field to edit the initial email address that you used to create your profile.
- You can choose to receive an email in the following situations:
  - When a comment is left on a page that you commented on.
  - When a comment is left on any topic in the WebHelp Classic system.
  - When a reply is left to one of my comments.
- **New Password** - Allows you to enter a new password for your user account.

  Note: The **Current Password** field from the top of the **User Profile** is mandatory if you want to save the changes you make.

If you are an administrator, you can manage user information and comments. For more information, see Managing Users and Comments in a Feedback-Enabled System on page 1052.

WebHelp Classic Search Engine
Search Rules

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, *"grow flowers"* will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a *phrase search*.

- *Boolean Search* is supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).
- `indexterm` and `keywords` DITA elements are an effective way to increase the ranking of a page (for example, content inside a *keywords* element weighs more than an *H1* HTML element).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot (".") characters count as a single word.
- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

5-Star Rating Mechanism and Sorting

The **Search** feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
  - The search term is included in a meta keyword
  - The search term is in the title of the page
  - The search term is in bold text in a paragraph
  - The search term is in normal text in a paragraph

Excluded Terms

To improve performance, the **Search** feature excludes certain *stop words*. For example, the English version of such *stop words* include: *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*.

WebHelp Classic Search Results Tab

When you enter search terms in the **Search** field at the top of the help system, the results are displayed in the **Search Results** tab in the left section. When you click on a result in the **Search Results** tab, that result is displayed in the main pane with the search terms highlighted. If you press **Enter** with the **Search** field empty, the highlights are removed.

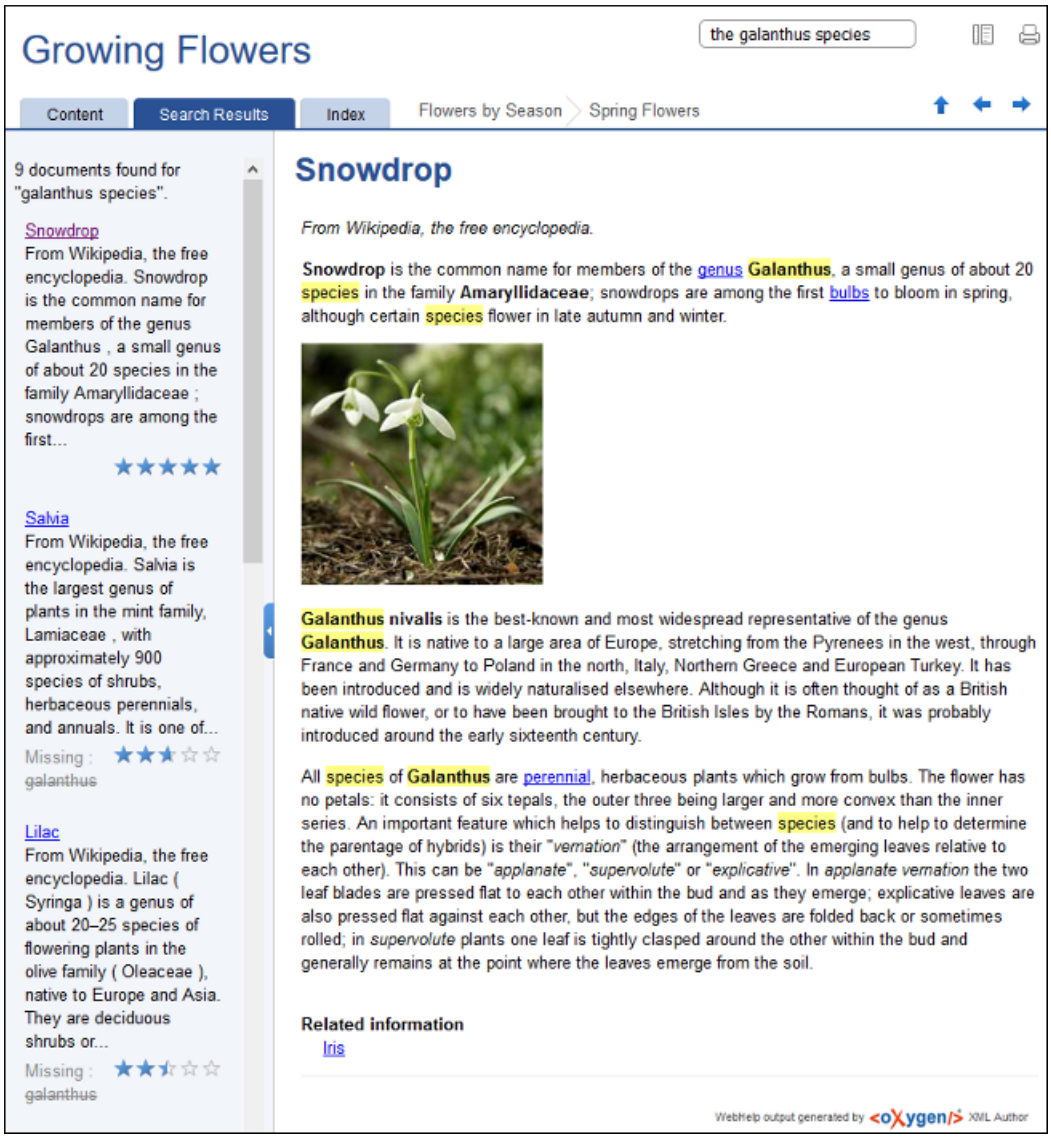

Figure 561: WebHelp Classic Search Results Tab

Missing Terms

If you enter multiple search terms (other than *stop words*), for any result that the search engine found at least one term but not one or more of the other terms, the **Missing** terms will be listed below each result.

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see Changing Element Scoring in Search Results on page 1015.

Browser Compatibility

This output format is compatible with the most recent versions of the following common browsers:

- Edge
- Internet Explorer (IE 10 or newer)
- Chrome
- Firefox
- Safari
- Opera

Important: Due to some security restrictions in certain browsers (Google Chrome and Internet Explorer), WebHelp Classic pages loaded from the local system (through URLs of the `file:///...` format) may not

work properly. We recommend that you load WebHelp Classic pages in Google Chrome or Internet Explorer only from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`).

Warning: Due to some restrictions in web browsers in regards to JavaScript code, the *frameless* version (`index.html` start page) of the WebHelp Classic system should only be loaded from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`). When loading WebHelp Classic pages from the local file system, the *frameset* version (`index_frames.html` start page) of the WebHelp Classic system should be used instead (`file:///...`).

Deploying a Feedback-Enabled System

System Requirements

The feedback-enabled WebHelp system requires a standard server deployment. You can request this from your server administrator and it requires the following system components:

- A Web server (such as *Apache Web Server*)
- A *MySQL* or *MariaDB* database server
- A database admin tool (such as *phpMyAdmin*)
- PHP Version 5.1.6 or later

The WebHelp system supports most of the recent versions of the following browsers: Chrome, Firefox, Edge, Internet Explorer, Safari, Opera.

Create WebHelp with Feedback Database

The **WebHelp with Feedback** system needs a database to store user details and the actual feedback, and a user added to it with all privileges. After this is created, you should have the following information:

- Database name
- Username
- Password

Exactly how you create the database and user depends on your web host and your particular needs.

Example:

The following procedure uses *phpMyAdmin* to create a MySQL database for the feedback system and a MySQL user with privileges for that database. The feedback system uses these credentials to connect to the database.

Using *phpMyAdmin* to create a database:

1. Access the *phpMyAdmin* instance running on your server.
2. Click *Databases* (in the right frame) and then create a *database*. You can give it any name you want (for example *comments*).
3. Create a user with connection privileges for this database.
4. Under *localhost*, in the right frame, click *Privileges* and then at the bottom of the page click the **reload the privileges** link.

Deploying the WebHelp with Feedback Output

If you have a web server configured with PHP and MySQL, you can deploy the **WebHelp with Feedback** output by following these steps:

1. Connect to your server using an FTP client.
2. Locate the home directory (from now on, referred to as *DOCUMENT_ROOT*) of your server.
3. Copy the transformation output folder into the `DOCUMENT_ROOT` folder.
4. Rename it to something relevant (for example, `myProductWebHelp`).
5. Open the output folder (for example, `http://[YOUR_SERVER]/myProductWebHelp/`). You are redirected to the installation wizard. Proceed with the installation as follows:
   a. Verify that the prerequisites are met.

b. Press **Start Installation**.
c. Configure the **Deployment Settings** section. Default values are provided, but you should adjust them as needed.

   Tip: You can change some of the options later. The installation creates a `config.php` file in `[OXYGEN_WEBHELP_INSTALL_DIR]/feedback/resources/php/config/config.php` where all your configuration options are stored.
d. Configure the **MySql Database Connection Settings** section. Use the information (database name, username, password) from the Create WebHelp with Feedback Database section to fill-in the appropriate text boxes.

   Warning: Selecting the **Create new database structure** option will overwrite any existing data in the selected database, if it already exists. Therefore, it is useful the first time you install the **WebHelp with Feedback** system, but you do not want to select this option on subsequent deployments.
e. If you are using a domain (such as *OpenLDAP* or *Active Directory*) to manage users in your organization, select the **Enable LDAP Autehntication** option. This will allow you to configure the LDAP server, which will provide information and credentials for users who will access the WebHelp system. Also, this will allow you to choose which of the domain users will have administrator privileges.
f. If the **Create new database structure** option is selected, the **Create WebHelp Administrator Account** section becomes available. Here you can set the administrator account data. The administrator is able to moderate new posts and manage WebHelp users.

   The same database can be used to store comments for multiple **WebHelp with Feedback** deployments. If a topic is available in multiple deployments and there are comments associated with it, you can choose to display the comments in all deployments that share the database. To do this, select the **Display comments from other products** option. In the **Display comments from** section, a list with the deployments sharing the same database is displayed. Select the deployments allowed to share common feedback.

   Note: You can restrict the displayed comments of a product depending on its version. If you have two products that use the same database and you restrict one of them to display comments starting from a certain version, the comments of the other product are also displayed from the specified version onwards.
g. Press **Next Step**.
h. Remove the installation folder from your web server.

   Important: When you publish subsequent iterations of your **WebHelp with Feedback** system, you will not upload the `/install` folder in the output, as you only need it uploaded the first time you create the installation. On subsequent uploads, you will just upload the other output files.
i. In your Web browser, go to your **WebHelp with Feedback** system main page.

Testing Your WebHelp with Feedback System

To test your system, create a user and post a comment. Check to see if the notification emails are delivered to your email inbox.

Note: To read debug messages generated by the system:

1. Enable *JavaScript* logging by doing one of the following:
   - Open the `log.js` file, locate the `var log= new Log(Level.NONE);` line, and change the logging level to: `Level.INFO`, `Level.DEBUG`, `Level.WARN`, or `Level.ERROR`.
   - Append `?log=true` to the WebHelp URL.
2. Inspect the PHP and Apache server log files.

Documentation Product ID and Version

When you run a **WebHelp with Feedback** transformation scenario, by default you are prompted for a documentation product ID and version number. This is needed when multiple WebHelp systems are deployed on the same server. Think of your WebHelp output as a *product*. If you have three different WebHelp outputs, you have three different *products* (each with their own unique documentation product ID). This identifier is included in a configuration file so that comments are tied to a particular output (product ID and version number).

Note: The **WebHelp with Feedback** installation includes a configuration option (**Display comments from other products**) that allows you to choose to have comments visible in other specified *products*.

Related Information:

Managing Users and Comments in a Feedback-Enabled System on page 1052

Refreshing the Content of a Feedback-Enabled System

It is common to update the content of an existing installation of a **WebHelp with Feedback** system on a regular basis. In this case, reinstalling the whole system is not a viable option since it might result in the loss of the comments associated with your topics. Also, reconfiguring the system every time you want to refresh it may be time consuming.

Fortunately, you can refresh just the content without losing the comments or the initial system configuration. To do so, follow these steps:

1. Execute the transformation scenario that produces the *WebHelp with Feedback* output directory.
2. Go to the output directory (specified in the **Output** tab of the transformation scenario), locate the `\feedback\resources\php\config\config.php` file, and delete it.
3. Locate the `\feedback\install` directory and delete it.
4. Copy the remaining structure of the output folder and paste it into your *WebHelp with Feedback* system installation directory, overwriting the existing content.

Managing Users and Comments in a Feedback-Enabled System

When you installed the **WebHelp with Feedback** system the first time (assuming the **Create new database structure** option was selected), you should have been prompted to create an administrator account (or a user named *administrator* was created by default). As an administrator, you have access to manage comments posted in your feedback-enabled WebHelp system. You can also manage the user information (such as role, status, or notification options).

To manage comments and user information, follow these steps:

1. At the bottom of each specific topic there is a **Comments** navigation bar and on the right side there is a **Log in** button. Click this button and log in with your administrator credentials. This gives you access to an **Admin Panel** button.
2. Click the **Admin Panel** button to display an administration page.

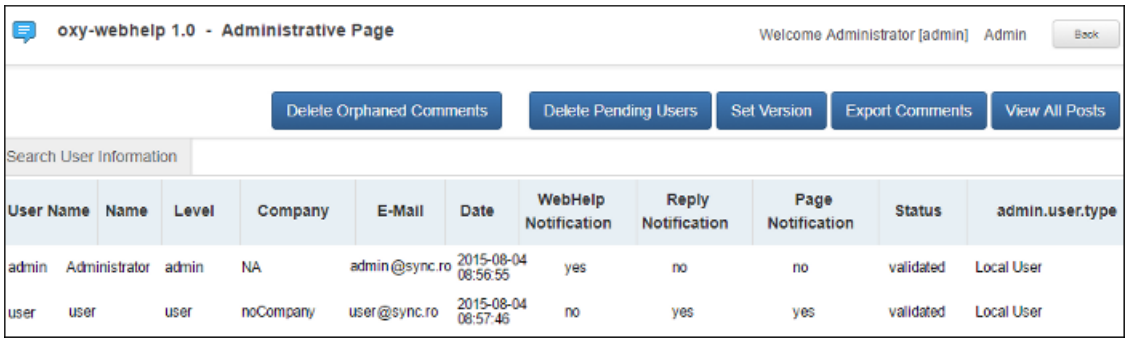

Figure 562: Administrative Page

3. Use this page to manage the following options:

Delete Orphaned Comments

Allows you to delete comments that are no longer associated with a topic in your WebHelp system.

Delete Pending Users

Allows you to delete user accounts that you do not wish to activate.

View All Posts

Allows you to view all the comments that are associated with topics in your WebHelp system.

Export Comments

Allows you to export all posts associated with topics in your WebHelp system into an XML file.

Set Version

Use this action to display comments starting with a particular version.

Manage User Information

To edit the details for a user, click on the corresponding row. This opens a window that allows you to customize the following information associated with the user:

Name

The full name of the user.

Level

Use this field to modify the privilege level (role) for the selected user. You can choose from the following:

- **User** - Regular user, able to post comments and receive e-mail notifications.
- **Moderator** - In addition to the regular **User** rights, this type of user has access to the **Admin Panel** where a moderator can view, delete, export comments, and set the version of the feedback-enabled WebHelp system.
- **Admin** - Full administrative privileges. Can manage WebHelp-specific settings, users, and their comments.

Company

The name of the organization associated with the user.

E-Mail

The contact email address for the user. This is also the address where the WebHelp system sends notifications.

WebHelp Notification

When selected, the user receives notifications when comments are posted anywhere in your feedback-enabled WebHelp system.

Reply Notification

When selected, the user receives notifications when comments are posted as a reply to one of their comments.

Page Notification

When selected, the user receives notifications when comments are posted on a topic where they previously posted a comment.

Date

The date the user registered is displayed.

Status

Use this drop-down list to change the status of the user. You can choose from the following:

- **Created** - The user is created but does not yet have any rights for the feedback-enabled WebHelp system.
- **Validated** - The user is able to use the feedback-enabled WebHelp system.
- **Suspended** - The user has no rights for the feedback-enabled WebHelp system.

Warning: The key used for identifying the page a comment is attached to is the relative file path to the output page. Since the output file and folder names mirror the source, any change to the file name (or its folder) in the source will affect the comments associated with that WebHelp page. If you change the file name or path, the comment history for that topic will become orphaned (a change to the topic ID does not affect the comment history).

Context-Sensitive WebHelp Classic System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

Generating Context-Sensitive Help

When WebHelp Classic output is generated, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `appContext` element, as in the following example:

```
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
  <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
    . . .
</map>
```

The possible attributes are as follows:

`helpID`

A Unique ID provided by a topic from two possible sources (`resourceid` element or the `id` attribute that is set on the topic root element):

`resourceid`

The `resourceid` element is mapped into the `appContext` element and can be specified in either the `topicref` within a *DITA map* or in a `prolog` within a DITA topic. The `resourceid` element accepts the following attributes:

- **`appname`** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty (" ").
- **`appid`** - An ID used by an application to identify the topic.
- **`id`** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an **`appid`** attribute is used. Also, starting with DITA 1.3, the **`id`** attribute was deprecated in favor of the **`appid`** attribute.

Note: Multiple `appid` values can be associated with a single `appname` value (and multiple `appname` values can be associated with a single `appid` value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the `appid` and `appname` attributes should be unique within the context of a single *root map*. For example, suppose that you need two different functions of an application to both open the same WebHelp page.

Example: `resourceid` Specified in a DITA Map

The `resourceid` element can be specified in a `topicmeta` element within a `topicref`.

```
<map title="App Help">
  <topicref href="app-help1.dita" type="task">
     <topicmeta>
       <resourceid appname="myapp" appid="functionid1"/>
       <resourceid appname="myapp" appid="functionid2"/>
     </topicmeta>
  </topicref>
</map>
```

Example: `resourceid` Specified in a DITA Topic

The `resourceid` element can be specified in a `prolog` element within a DITA topic.

```
<task id="app-help1">
  <title>My App Help</title>
  <prolog>
    <resourceid appname="myapp" appid="functionid1"/>
    <resourceid appname="myapp" appid="functionid2"/>
  </prolog>
...
</task>
```

For more information about the `resourceid` element, see DITA Specifications: <resourceid>.

`id`

If a `resourceid` element is not declared in the *DITA map* or DITA topic (as described above), the `id` attribute that is set on the topic root element is mapped into the `appContext` element.

Important: You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

`path`

The path to a corresponding WebHelp page. This path is relative to the location of the `context-help-map.xml` mapping file.

`productID` (Applicable only if you are using the WebHelp Classic with Feedback transformation scenario)

The ID of the product for your documentation project.

`productVersion` (Applicable only if you are using the WebHelp Classic with Feedback transformation scenario)

The version of the product for your documentation project.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the `contextId` value and will look it up in the XML file.
- Invoke one of the WebHelp system files `index.html` or `index_frames.html` and pass the `contextId` parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the `contextId` parameter.

  Note: The `contextId` parameter is not case sensitive.

The following example will open a *frameless* version of the WebHelp system showing the page associated with the ID `dialog1ID`:

```
index.html?contextId=dialog1ID
```

The following example will open a *frameset* version of the WebHelp system showing the page associated with the ID `view1ID`:

```
index_frames.html?contextId=view1ID
```

Tip: You can use an *anchor* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.

Context-Sensitive Queries

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

- **contextId** - The WebHelp JavaScript engine will look for this value in the `context-help-map.xml` mapping file and load the corresponding help page.

  Note: You can use an *anchor* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.
- **appname** - You can use this parameter in conjunction with `contextId` to search for this value in the corresponding *appname* attribute value in the mapping file.

  ```
  http://localhost/webhelp/index.html?contextId=topicID&appname=myApplication
  ```

Generating WebHelp Classic Output for DITA

The publishing process can be initiated from a transformation scenario within **Oxygen XML Editor/Author**, from a command line outside **Oxygen XML Editor/Author**, or from an integration server.

Running from Oxygen XML Editor/Author

To publish DITA content to WebHelp Classic output from a transformation scenario inside **Oxygen XML Editor/Author**, use one of the following procedures, depending on whether or not you want a feedback section in your output.

WebHelp Classic Output

To publish a *DITA map* as a **WebHelp Classic** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

   - **Templates Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
   - **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
   - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
   - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
   - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to process the transformation.

   When the **DITA Map WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

To further customize this transformation, you can edit various parameters, including the following most commonly used ones:

WebHelp Classic with Feedback Output

To publish a *DITA map* as a **WebHelp Classic with Feedback** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

   - **Templates Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
   - **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
   - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
   - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
   - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to begin the transformation.
5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

   When the **DITA Map WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment.

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

https://www.youtube.com/embed/eoQ2uxHvppE

Running from Command Line

To publish to the **WebHelp Classic** output from a command line outside of **Oxygen XML Editor/Author**, you can use the `dita` startup script that comes bundled with *DITA Open Toolkit* distribution.

Required Arguments for the *dita* Command Startup Script:

`DITA-OT-DIR on page 1622\bin\[executable] -i [path_to_input.ditamap] -f [transformation_type]`

executable

Windows - The `dita.bat` script located in: `DITA-OT-DIR on page 1622\bin\`.

Linux/Mac OS X - The `dita` script file located in: `DITA-OT-DIR on page 1622/bin/`.

-i / -input

Specifies the master file for your DITA documentation project. Typically this is a DITA map.

-f / -format

Specifies the transformation type. The **Oxygen XML WebHelp Plugin** contributes the following transformation types for DITA:

- **webhelp** - The transformation that produces **WebHelp Classic** output for desktop.
- **webhelp-feedback** - The transformation that produces feedback-enabled **WebHelp Classic with Feedback** for desktop.

Additional Options or Parameters:

You can also use DITA-OT options to modify the command behavior or additional configuration parameters that are contributed by the **Oxygen XML WebHelp Plugin**.

`DITA-OT-DIR on page 1622\bin\[executable] -i [path_to_input.ditamap] -f [transformation_type] [option] -D[parameter=value]`

Command Line Examples:

- **Windows:** `dita.bat -i c:\mySample.ditamap -f webhelp-responsive -o c:\output -Dwebhelp.logo.image=C:\images\myLogo.jpg`
- **Linux/Mac OS X:** `dita -i C:/mySample.ditamap -f webhelp-responsive -o C:/output -Dwebhelp.logo.image=C:/images/myLogo.jpg`

Additional WebHelp Parameters for DITA

You can append the following parameters to the command line that runs the transformation:

`-Dwebhelp.copyright` (not available for WebHelp Responsive systems)

Adds a small copyright text that appears at the end of the **Table of Contents** pane.

`-Dwebhelp.custom.resources`

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

`-Dwebhelp.favicon`

The file path that points to an image to be used as a *favicon* in the WebHelp output.

`-Dwebhelp.footer.file` (not available for WebHelp Responsive systems)

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); }
       (document, 'script', 'facebook-jssdk')); -->
    </script>
    <div data-share="true" data-show-faces="true" data-action="like"
       data-layout="standard" class="fb-like"/>
</div>
```

-Dwebhelp.footer.include (not available for WebHelp Responsive systems)

Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, no. If set to no, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then a default **Oxygen** footer is inserted in each WebHelp page.

-Dwebhelp.google.search.results

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommend to set the `linkTarget` attribute to `frm` for frameless (*iframe*) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`

-Dwebhelp.google.search.script

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

-Dwebhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

-Dwebhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

-Dwebhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, `mobile-phone-user-guide`, `hvac-installation-guide`).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

-Dwebhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

-Dwebhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages.

-Dwebhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

-Dwebhelp.show.changes.and.comments

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

-Dwebhelp.sitemap.base.url

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the *DITA map*, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

-Dwebhelp.sitemap.change.frequency

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq`

element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

`-Dwebhelp.sitemap.priority`

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

`-Dwebhelp.skin.css` (available only for WebHelp Classic and WebHelp Classic with Feedback systems)

Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the predefined skin CSS from the *`DITA-OT-DIR`*`/plugins/com.oxygenxml.webhelp.classic/predefined-skins` directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

Parameters Specific to WebHelp Responsive Output (available only for WebHelp Responsive and WebHelp Responsive with Feedback systems)

`-Dwebhelp.default.collection.type.sequence`

Specifies if the **sequence** value will be used by default when the `collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.

`-Dwebhelp.enable.search.autocomplete`

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is `yes`.

`-Dwebhelp.fragment.after.body`

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.after.logo_and_title`

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.after.main.page.search`

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.after.toc_or_tiles`

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.after.top_menu`

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.before.body`

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.before.logo_and_title`

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.before.main.page.search`

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.before.toc_or_tiles`

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.before.top_menu`

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

-Dwebhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

-Dwebhelp.fragment.head

In the generated output it inserts a given XHTML fragment in the <head> element. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

-Dwebhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

-Dwebhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is yes.

-Dwebhelp.publishing.template.descriptor

Specifies the name of the descriptor to be loaded from the WebHelp Responsive template package. If it is not specified, the first encountered descriptor will be automatically loaded.

-Dwebhelp.publishing.template

Specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

-Dwebhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are yes or no.

-Dwebhelp.search.page.numberOfItems

Specifies the number of search results items displayed on each page. This parameter is only used when the **webhelp.search.enable.pagination** parameter is enabled.

-Dwebhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

-Dwebhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

-Dwebhelp.show.indexterms.link

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

-Dwebhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a *tree* style layout, this parameter should be set to no.

-Dwebhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

-Dwebhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is yes.

-Dwebhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

-Dwebhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is yes.

-Dwebhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. The default value is yes.

-Dwebhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is `yes`.

-Dwebhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for *chunked* topics. The default value is `yes`.

-Dwebhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

-Dwebhelp.publication.toc.tooltip.position

By default, if a topic contains a `shortdesc` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left** (default)
- **right**
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

-Dwebhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is `3`. A value of `0` means that the menu has unlimited depth.

-Dwebhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are `collapsed` or `expanded` (default value).

Note: Note that the `fix.external.refs.com.oxygenxml` parameter is not supported. This parameter is normally used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.

Further Customization

If you need to further customize the transformation process, you can append other DITA-OT parameters as well. Any parameter that you want to append must follow the `-D` model of the above parameters. For example, to append the `args.csspath` parameter, use:

```
-Dargs.csspath=[CSS_FILE_PATH]
```

where `[CSS_FILE_PATH]` is the location of the directory that contains the CSS file.

Related Information:

DITA-OT Parameter Reference

Running from an Integration Server

Oxygen XML Editor plugin can be processed from an automatic publishing system, such as *Jenkins* or *Travis*.

Automating DITA to WebHelp Output with Jenkins

To integrate WebHelp output with the Jenkins continuous integration tool, follow these steps:

1. Create a Maven project to incorporate the DITA-OT that already integrates Oxygen XML Editor plugin.
2. Go to the root of your Maven project and edit the `pom.xml` file to include the following fragment:

```
<properties>
  <oxygen-webhelp>${basedir}/tools/DITA-OT2.5.2/
       plugins/com.oxygenxml.webhelp.responsive</oxygen-webhelp>
</properties>
```

```
<plugin>
  <artifactId>exec-maven-plugin</artifactId>
  <groupId>org.codehaus.mojo</groupId>
  <executions>
    <execution><!-- Run our version calculation script -->
      <id>Version Calculation</id>
      <phase>generate-sources</phase>
      <goals>
        <goal>exec</goal>
      </goals>
      <configuration>
        <executable>${oxygen-webhelp}/ditaWebhelp.bat</executable>
      </configuration>
    </execution>
  </executions>
</plugin>
```

Note: In the fragment above it is assumed that you are using DITA-OT version 2.5.4. If you are using another version, please adjust the path accordingly.

3. Go to the Jenkins top page and create a new Jenkins job. Configure this job to suit your particular requirements, such as the build frequency and location of the Maven project.

Automating DITA to WebHelp Output with Travis CI

This topic assumes you have a DITA project hosted on a GitHub public or private repository.

The goal of this tutorial is to help you setup a Travis continuous integration job that automatically publishes your DITA project to GitHub pages after every commit. The published website will contain a feedback link on each page that would allow a contributor to easily suggest changes to the documentation by creating a pull request on GitHub with just a few clicks.

Enable the Travis CI Build

1. Sign in to Travis CI with your GitHub account, accepting the GitHub access permissions confirmation.
2. Once you are signed in, and you have synchronized your GitHub repositories, go to your profile page and enable Travis CI for the repository you want to build.

Configure the Travis CI Build in your GitHub Project

1. Checkout your GitHub project locally.
2. Copy the `.travis` folder from here to the root directory of your project.
3. In the root of your GitHub project, add a file called `.travis.yml` with the following content:

```
language: dita
install:
  - echo "Installed"
script:
  - sh .travis/publish.sh
after_success:
  - sh .travis/deploy.sh
env:
  global:
    - DITAMAP=/path/to/your/ditamap/file
    - DITAVAL=/path/to/your/ditaval/file
    - ANT_OPTS=-Xmx1024M
```

Note: Replace `/path/to/your/ditamap/file` and `/path/to/your/ditaval/file` with the appropriate paths to your *DITA map* and `ditaval` files.

4. Create a GitHub personal access token by following this procedure.
5. Define an environment variable in the repository settings that has the name `GH_TOKEN` and the value equal with the GitHub personal access token created earlier.

Register Your License Key

1. Edit your `.gitignore` file (or create it if it does not already exist) and add the following line:

```
licenseKey.txt
```

2. Copy your WebHelp license to the root of your GitHub project in a file called `licenseKey.txt`.

   Important: The `licenseKey.txt` file should not be committed to GitHub as it contains a license key that is issued only to you.

3. Encrypt the license key file and **add** it to the `.travis.yml` configuration file. This way only the Travis CI server will be able to decrypt it during the build process.

Commit to GitHub

1. Commit the following files and folders and push the commit to GitHub:

```
git add .gitignore licenseKey.txt.enc .travis.yml .travis/
git commit -m "Set up the Travis CI publishing system"
git push
```

2. Create a `gh-pages` branch in your GitHub project where the WebHelp output will be published. You can follow the procedure here.

Generating WebHelp Classic Output for DocBook

The publishing process can be initiated from a transformation scenario within **Oxygen XML Editor/Author** or from a command line outside **Oxygen XML Editor/Author**.

Running from Oxygen XML Editor/Author

To publish DocBook content to WebHelp Classic output from a transformation scenario inside **Oxygen XML Editor/Author**, use one of the following procedures, depending on whether or not you want a feedback section in your output.

WebHelp Classic Output

To publish a DocBook document as a **WebHelp Classic** system, follow these steps:

1. Click the **Configure Transformation Scenario(s)** action from the toolbar.
2. Select the **DocBook WebHelp Classic** scenario from the **DocBook 4** or **DocBook 5** section.
3. Click **Apply associated**.

   When the **DocBook WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Output

To publish a DocBook document as a **WebHelp Classic with Feedback** system, follow these steps:

1. Click **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic with Feedback** scenario from the **DocBook 4** or **DocBook 5** section.
3. Click **Apply associated**.
4. Enter the documentation product ID and the documentation version.

   When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see Deploying a Feedback-Enabled System on page 1050.

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

https://www.youtube.com/embed/eoQ2uxHvppE

Running from Command Line

To run a DocBook to WebHelp transformation outside of **Oxygen XML Editor/Author**, use the following script file:

- **Windows** - `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\docbook.bat`
- **Linux/Mac OS X** - `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/docbook.sh`

Before running the script to generate output, you must customize it to specify various paths and transformation type. To do this, open the script file and edit the following variables:

- **JVM_INSTALL_DIR** - Specifies the path to the Java Virtual Machine installation directory on your disk.
- **ANT_INSTALL_DIR** - Specifies the path to the installation directory of Ant.

- **SAXON_6_DIR** - Specifies the path to the installation directory of Saxon 6.5.5.
- **SAXON_9_DIR** - Specifies the path to the installation directory of Saxon 9.1.0.8.
- **DOCBOOK_XSL_DIR** - Specifies the path to the installation directory of the DocBook XSL distribution.
- **TRANSTYPE** - Specifies the type of the transformation you want to apply. The **Oxygen XML WebHelp Plugin** contributes the following transformation types for DocBook:
  - **webhelp** - The transformation that produces **WebHelp Classic** output for desktop.
  - **webhelp-feedback** - The transformation that produces feedback-enabled **WebHelp Classic with Feedback** for desktop.
- **INPUT_DIR** - Specifies the path to the input directory, containing the input XML file.
- **XML_INPUT_FILE** - Specifies the name of the input XML file.
- **OUTPUT_DIR** - Specifies the path to the output directory where the transformation output is generated.
- **DOCBOOK_XSL_DIR_URL** - Specifies the path to the directory of the DocBook XSL distribution in URL format.

You can also add additional configuration parameters that are contributed by the **Oxygen XML WebHelp Plugin**.

Additional WebHelp Parameters for DocBook

You can use various parameters in the command line to customize the transformation. Some of the most commonly used parameters include:

`-Dargs.default.language`

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

`-Dclean.output`

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

`-Dl10n.gentext.default.language`

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

`-Duse.stemming`

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

`-Dwebhelp.copyright`

Adds a small copyright text that appears at the end of the **Table of Contents** pane.

`-Dwebhelp.custom.resources`

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

`-Dwebhelp.favicon`

The file path that points to an image to be used as a *favicon* in the WebHelp output.

`-Dwebhelp.footer.file`

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); }
       (document, 'script', 'facebook-jssdk')); -->
    </script>
    <div data-share="true" data-show-faces="true" data-action="like"
       data-layout="standard" class="fb-like"/>
</div>
```

-Dwebhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, no. If set to no, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then a default **Oxygen** footer is inserted in each WebHelp page.

-Dwebhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

-Dwebhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

-Dwebhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, `mobile-phone-user-guide`, `hvac-installation-guide`).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

-Dwebhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

-Dwebhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

-Dwebhelp.skin.css

Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the predefined skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\predefined-skins` directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

If you need to further customize your transformation, other DocBook XSL parameters can be appended. Any parameter that you want to append must follow the `-D` model of the above parameters. For example, you can append the `html.stylesheet` parameter in the following form:

```
-Dhtml.stylesheet=/path/to/directory/of/stylesheet.css
```

Customizing WebHelp Classic Output

Oxygen XML WebHelp provides support for customizing the **WebHelp Classic** output to suit your specific needs. The **WebHelp Classic** type of output is designed for desktop systems and features a familiar *tri-pane* layout. You can use this system to publish DITA and DocBook document types. The **WebHelp Classic with Feedback** variant allows your users to add comments to your output.

To change the overall appearance of the **WebHelp Classic** output, you can use the visual WebHelp Skin Builder tool, which does not require knowledge of CSS language. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying option and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp system output, such as how to improve the appearance of the Table of Contents, add logo images in the title area, integrate with social media, add custom headers and footers, and much more.

Adding Custom HTML Content in WebHelp Classic Output

You can add custom HTML content in the WebHelp Classic output by inserting it in a well-formed XML file that will be referenced in the transformation. This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

Using Oxygen XML Editor/Author

To include custom HTML content in the WebHelp Classic output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:
   - **Well-Formedness** - If the file is not a *Well-formed XML* document (or fragments are not well-formed), the transformation will fail.

     A common use case is if you want to include several `script` or `link` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `html` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `head`, `body`, `html/head`, or `html/body` elements.
   - **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the predefined `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

     ```
     <html>
       <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
       <link rel="stylesheet" type="text/css"
             href="${oxygen-webhelp-output-dir}/css/test.css" />
     </html>
     ```

     To copy the referenced resources to the output directory, follow the procedure in: Copying Additional Resources to Output Directory.
   - **Inline JavaScript or CSS Content** - If you want to include inline JavaScript or CSS content in the XML file, it is important to place this content inside an XML comment, as in the following examples:

     JavaScript:

     ```
     <script type="text/javascript">
       <!--
         /* Include JavaScript code here. */

         function myFunction() {
           return true;
         }
       -->
     </script>
     ```

     CSS:

     ```
     <style>
       <!--
         /* Include CSS style rules here. */

         *{
           color:red
         }
       -->
     </style>
     ```
2. Edit the WebHelp Classic transformation scenario.
3. Go to the **Parameters** tab.
4. Edit the value of the `webhelp.head.script` parameter and set it to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

   Note: If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.
5. Click **OK** to save the changes and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To include custom HTML content in the WebHelp Classic output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:
   - **Well-Formedness** - If the file is not a *Well-formed XML* document (or fragments are not well-formed), the transformation will fail.

     A common use case is if you want to include several `script` or `link` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `html` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `head`, `body`, `html/head`, or `html/body` elements.
   - **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the predefined `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

     ```
     <html>
       <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
       <link rel="stylesheet" type="text/css"
             href="${oxygen-webhelp-output-dir}/css/test.css" />
     </html>
     ```

     To copy the referenced resources to the output directory, follow the procedure in: Copying Additional Resources to Output Directory.
   - **Inline JavaScript or CSS Content** - If you want to include inline JavaScript or CSS content in the XML file, it is important to place this content inside an XML comment, as in the following examples:

     JavaScript:

     ```
     <script type="text/javascript">
       <!--
         /* Include JavaScript code here. */

         function myFunction() {
           return true;
         }
       -->
     </script>
     ```

     CSS:

     ```
     <style>
       <!--
         /* Include CSS style rules here. */

         *{
           color:red
         }
       -->
     </style>
     ```
2. Use the `webhelp.head.script` parameter in your transformation script and set its value to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

   Note: If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.
3. Execute the transformation script.

For example, a DITA script might look like this::

- **Windows:**

```
dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.head.script=c:\myFile.xml
```

- **Mac OS X/ Linux:**

```
dita -i C:/mySample.ditamap -f webhelp -Dwebhelp.head.script=C:/myFile.xml
```

Copying Additional Resources to Output Directory

Adding a Favicon in WebHelp Systems

You can add a custom *favicon* to your WebHelp output by simply using a parameter in the transformation scenario to point to your *favicon* image. This is available for DITA and DocBook WebHelp output using **WebHelp Classic** or **WebHelp Classic with Feedback** transformations.

Using Oxygen XML Editor/Author

To add a *favicon* to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the WebHelp transformation scenario and open the **Parameters** tab.
2. Locate the `webhelp.favicon` parameter and enter the file path that points to the image that will be use as the *favicon*.
3. Run the transformation scenario.

   Result: Browsers that provide *favicon* support will display the *favicon* (typically in the browser's address bar, in the list of bookmarks, and in the history).

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a *favicon* to your WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Specify the file path that points to the image that will be use as the *favicon* using the `webhelp.favicon` parameter.
2. Execute the transformation script.

   Result: Browsers that provide *favicon* support will display the *favicon* (typically in the browser's address bar, in the list of bookmarks, and in the history).

For example:

- **Windows:**

```
dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.favicon=c:\myFavicon.jpg
```

- **Mac OS X/ Linux:**

```
dita -i C:/mySample.ditamap -f webhelp -Dwebhelp.favicon=C:/myFavicon.jpg
```

Adding a Logo Image in the Title Area

You can customize **WebHelp Classic** output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using a transformation scenario from within **Oxygen XML Editor/Author** or using a command line script outside of **Oxygen XML Editor/Author**.

Using Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit a **WebHelp Classic** transformation scenario, then open the **Parameters** tab.
2. Specify the path to your logo in the `webhelp.logo.image` parameter.
3. If you also want to add a link to your website when you click the logo image, set the URL in the `webhelp.logo.image.target.url` parameter.
4. Run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a logo in the title area of your WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Specify the path to your logo using the `webhelp.logo.image` parameter.
2. If you also want to add a link to your website when you click the logo image, set the URL using the `webhelp.logo.image.target.url` parameter.
3. Execute the transformation script.

For example:

- **Windows:**

  ```
  dita.bat -f webhelp -Dwebhelp.logo.image=c:\myLogo.jpg -
  Dwebhelp.logo.image.target.url=http://sample-site.com
  ```
- **Mac OS X/ Linux:**

  ```
  dita -f webhelp -Dwebhelp.logo.image=C:/myLogo.jpg -
  Dwebhelp.logo.image.target.url=http://sample-site.com
  ```

Adding Video and Audio Objects in DITA WebHelp Classic

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

Adding Videos to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the video through one of the following methods:
   - Use the **Insert Media Object** toolbar action.
   - Drag (or copy) the video file from your system explorer or the **Navigator** view and drop (or paste) it into your document.
   - Manually add an `object` element, as in one of the following examples:

     ```
     <object outputclass="video" type="video/mp4" data="MyVideo.mp4"/>
     ```

     or, instead of the `data` attribute, you can specify the video using a parameter like this:

     ```
     <object outputclass="video">
       <param name="src" value="videos/MyVideo.mp4"/>
     </object>
     ```
2. Apply a **DITA to WebHelp** transformation to obtain the output.

Result: The transformation converts the `object` element to an HTML5 `video` element.

```
<video controls="controls"><source type="video/mp4" src="MyVideo.mp4"></source>
</video>
```

Adding Audio Clips to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the audio clip through one of the following methods:
   - Use the **Insert Media Object** toolbar action.
   - Drag (or copy) the audio file from your system explorer or the **Navigator** view and drop (or paste) it into your document.
   - Manually add an `object` element, as in one of the following examples:

     ```
     <object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>
     ```

     or, instead of the `data` attribute, you can specify the video using a parameter like this:

     ```
     <object outputclass="audio">
       <param name="src" value="audio/MyClip.mp3"/>
     </object>
     ```
2. Apply a **DITA to WebHelp** transformation to obtain the output.

   Result: The transformation converts the `object` element to an HTML5 `audio` element.

   ```
   <audio controls="controls"><source type="audio/mpeg" src="MyClip.mp3"></source>
   </audio>
   ```

Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the **Insert Media Object** toolbar action or by manually adding an `object` element, as in one of the following examples:

   ```
   <object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
   ```

   or, instead of the `data` attribute, you can specify the object using a parameter like this:

   ```
   <object outputclass="iframe">
     <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4"/>
   </object>
   ```
2. If you want the video to be allowed to play in full screen mode once the document is converted to XHTML output, also add an `allowfullscreen` parameter and set its value to **true**:

   ```
   <object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
     <param name="allowfullscreen" value="true"/>
   </object>
   ```

   Tip: If you copy the embed code from the source and paste it into the **Insert Media** dialog box (see the specific instructions: here), the `allowfullscreen` parameter will automatically be added and all you have to do is set the value to **true**.
3. Apply a **DITA to WebHelp** transformation to obtain the output.

   Result: The transformation converts the `object` element to an HTML5 `iframe` element.

   ```
   <iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4">
   </iframe>
   ```

For more information, see the following video demonstration:

https://www.youtube.com/embed/llX11gS4WaU

Related Information:

Adding Video, Audio, and Embedded HTML Resources in DITA Topics on page 1511

Adding Videos in DocBook WebHelp Classic Output

You can insert references to videos in your DocBook topics and then publish them to **WebHelp Classic** output. The videos can be played directly in all HTML5-based outputs, including WebHelp systems.

To add videos in the **WebHelp Classic** output generated from DocBook documents, follow these steps:

1. Edit the DocBook document and reference the video using an `mediaobject` element, as in the following example:

```
<mediaobject>
  <videoobject>
    <videodata fileref="http://www.youtube.com/watch/v/VideoName"/>
  </videoobject>
</mediaobject>
```

2. Apply a *WebHelp* or *WebHelp with Feedback* transformation scenario to obtain the output.

Changing Number Styles for Ordered Lists

Ordered lists (`ol`) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `outputclass` value and set it as an attribute of the ordered list, as in the following example:

```
<ol outputclass="number-alpha">
    <li>A</li>
    <li>B</li>
    <li>C</li>
</ol>
```

2. Add the following code snippet in a custom CSS file:

```
ol.number-alpha{
    list-style-type:lower-alpha;
}
```

3. Edit the WebHelp transformation scenario and open the **Parameters** tab.
   a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
4. Run the transformation scenario.

Changing Element Scoring in Search Results

The WebHelp **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA or DocBook WebHelp systems. The properties file includes instructions and examples to help you with your customization.
   a) For DITA WebHelp Classic systems, edit the following file: *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\indexer\scoring.properties`.
   b) For DocBook WebHelp system, edit the following file: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\indexer\scoring.properties`.

   The values that can be edited in the `scoring.properties` file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i=3
u=3
div.toc=-10
```

```
title=20
div.ignore=ignored
meta_keywords = 20
meta_indexterms = 20
meta_description = 25
shortdesc=25
```

2. Save your changes to the file.
3. Re-run your WebHelp transformation.

Changing the Icons in a WebHelp Classic Table of Contents

You can change the icons that appear in a WebHelp Classic table of contents by assigning new image files in a custom CSS file. By default, these icons are defined with the following CSS codes (the first example is the icon that appears for a collapsed menu and the second for an expanded menu):

```
.hasSubMenuClosed{
    background: url('../img/book_closed16.png') no-repeat;
    padding-left: 16px;
    cursor: pointer;
}
```

```
.hasSubMenuOpened{
    background: url('../img/book_opened16.png') no-repeat;
    padding-left: 16px;
    cursor: pointer;
}
```

Using Oxygen XML Editor/Author

To assign other icons and use a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

   ```
   .hasSubMenuClosed{
       background: url('TOC-my-closed-button.png') no-repeat;
   }
   ```

   ```
   .hasSubMenuOpened{
       background: url('TOC-my-opened-button.png') no-repeat;
   }
   ```

2. It is recommended that you store the image files in the same directory as the default icons.
   - For DITA transformations: *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`.
   - For DocBook transformations: *[OXYGEN_INSTALL_DIR]*`\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`.
3. Edit the WebHelp transformation scenario and open the **Parameters** tab.
   - For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
4. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To assign other icons and use a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

```
.hasSubMenuClosed{
    background: url('TOC-my-closed-button.png') no-repeat;
}
```

```
.hasSubMenuOpened{
    background: url('TOC-my-opened-button.png') no-repeat;
}
```

2. It is recommended that you store the image files in the same directory as the default icons.
   - For DITA transformations: *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`.
   - For DocBook transformations: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`.
3. Reference your custom CSS file:
   - For DITA transformations, use the `args.css` parameter in your transformation script and set its value to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For DocBook transformations, use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.
4. Execute the transformation script.

For example, a DITA script might look like this::

- **Windows:**

  ```
  dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.css=c:\myFile.css -Dargs.copycss=yes
  ```
- **Mac OS X/ Linux:**

  ```
  dita -i C:/mySample.ditamap -f webhelp -Dargs.css=C:/myFile.css -Dargs.copycss=yes
  ```

Copying Additional Resources to Output Directory

You can copy additional resources (such as JavaScript, CSS or other resources) to the output directory of a WebHelp system by using the `webhelp.custom.resources` parameter.

Using Oxygen XML Editor/Author

To copy additional resources to the output directory using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Place all your resources in the same directory.
2. Edit the WebHelp transformation scenario, then open the **Parameters** tab.
3. Edit the value for the `webhelp.custom.resources` parameter and set it to the absolute path of the directory in step 1.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

   Result: All files from the new directory will be copied to the root of the WebHelp output directory.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To copy additional resources to the output directory using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Place all your resources in the same directory.
2. Specify the absolute path to that directory using the `webhelp.custom.resources` parameter.
3. Execute the transformation script.

   Result: All files from the new directory will be copied to the root of the WebHelp output directory.

For example:

- **Windows:**

  ```
  dita.bat -i c:\mySample.ditamap -f webhelp-responsive -
  Dwebhelp.custom.resources=c:\resources
  ```
- **Mac OS X/ Linux:**

  ```
  dita -i C:/mySample.ditamap -f webhelp-responsive -Dwebhelp.custom.resources=C:/
  resources
  ```

Customizing the Appearance of Selected Items in the Table of Contents

The appearance of selected items in the table of contents of WebHelp Classic output can be enhanced.

For example, to highlight the background of the selected item, follow these steps:

1. Locate the `toc.css` file in the following directory:
   a. For DITA transformations: *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\css`.
   b. For DocBook transformations: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\css`.
2. Edit that CSS file, find the `menuItemSelected` class, and change the value of the `background` property.
3. Run the transformation.

Note: You can also overwrite the same value from your own custom CSS and then specify the path to your CSS in the transformation scenario by doing one of the following:

- For DITA transformations, use the `args.css` parameter and set its value to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
- For DocBook transformations, use the `html.stylesheet` parameter and set its value to the path of your custom CSS file.

Customizing WebHelp Output Through CSS Styling

The most common way to customize the look and style of your WebHelp output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario or script. This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using the CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using **F12** or by selecting **Inspect Element** (or simply **Inspect**) from the contextual menu.

Tip: When using Safari on Mac OS X, you must first enable the Develop menu by going to the Advanced settings and selecting **Show Develop menu in menu bar**. Then you can select **Show Web Inspector** from the Develop menu or click **Command + Option + I**.

Referencing the Custom CSS Using Oxygen XML Editor/Author

To use a custom CSS to style WebHelp output and use a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create your custom CSS file.
2. Edit the WebHelp transformation scenario and open the **Parameters** tab.
   - For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
3. Run the WebHelp transformation scenario to generate the output.

Referencing the Custom CSS Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To use a custom CSS to style WebHelp output and use a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Create your custom CSS file.
2. Reference your custom CSS file:
   - For DITA transformations, use the `args.css` parameter in your transformation script and set its value to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For DocBook transformations, use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.
3. Execute the transformation script.

For example, a DITA script might look like this::

- **Windows:**

  ```
  dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.css=c:\myFile.css -
  Dargs.copycss=yes
  ```
- **Mac OS X/ Linux:**

  ```
  dita -i C:/mySample.ditamap -f webhelp -Dargs.css=C:/myFile.css -
  Dargs.copycss=yes
  ```

Disable Caching in WebHelp Classic Output

In cases where a set of WebHelp Classic pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a Web browser on the client side, rather than re-using an outdated *cached* version in the browser.

To disable caching in WebHelp Classic output, follow this procedure:

1. Edit the following XSL file for DITA or DocBook WebHelp systems:
   - For DITA WebHelp systems, edit the following file: *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.classic\xsl\createMainFiles.xsl`.
   - For DocBook WebHelp system, edit the following file: *[OXYGEN_INSTALL_DIR]*`\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\xsl\createMainFiles.xsl`.
2. Locate the following template in the XSL file: `<xsl:template name-"create-toc-common-file">` and add the following code snippet:

```
<meta http-equiv="Pragma" content="no-cache" />
```

```
<meta http-equiv="Expires" content="-1" />
```

Note: The code should look like this:

```
  <html>
    <head>
      <xsl:if test="$withFrames">
      <base target="contentwin"/>
      </xsl:if>
      <meta http-equiv="Content-Type" content="text/html; charset=utf-8"/>
           <!-- Disable caching of WebHelp pages in web browser. -->
      <meta http-equiv="Pragma" content="no-cache" />
      <meta http-equiv="Expires" content="-1" />
....
```

3. Save your changes to the file.
4. Re-run your WebHelp transformation scenario.

Excluding Certain DITA Topics from Search Results

There are several ways to exclude certain DITA resources from your WebHelp system's search results. This is useful if you have topics in your *DITA map* structure that you do not want to be included in search results for your WebHelp system. The first method involves setting a parameter in the WebHelp transformation scenario and the second involves setting an attribute for each DITA topic reference that you want to exclude.

Transformation Parameter Method

To exclude DITA topics from WebHelp search results using a transformation parameter, follow these steps:

1. Create a simple text file that will contain your excluded file patterns. Each pattern must be on a new line. The patterns are considered to be relative to the output directory and they accept wildcards such as `'*'` (matches zero or more characters) or `'?'` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

   Example: Suppose that in your project, you want to exclude all files located in the `resources` directory and all files located in the `topics` directory that have a `.bak` file extension. You could create a simple text file (for example, named `exclude.properties`), and add the following lines:

   ```
   resources/*
   topics/*.bak
   ```

2. Edit the WebHelp transformation scenario and open the **Parameters** tab.
3. Set the `webhelp.search.custom.excludes.file` parameter to specify the path to the file that contains the excluded file patterns (for example, `exclude.properties` in step 1).
4. Run the transformation scenario.

Search Attribute Method

The WebHelp **Search** engine does not index DITA topics that have the `@search` attribute set to no.

To exclude DITA topics from WebHelp search results using this attribute, follow these steps:

1. Edit the *DITA map* and for any `topicref` that you want to exclude from search results, set the `search` attribute to no.

   For example:

   ```
   <topicref href="../topics/internal-topic1.dita" search="no"/>
   ```

2. Save your changes to the *DITA map*.
3. Run your WebHelp system transformation scenario.

Flagging DITA Content in WebHelp Output

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for *block elements* (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in text.

Using Oxygen XML Editor/Author

To flag content in the DITA Map to WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as `audience-flag-build.ditaval`.
2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the `audience` attribute set to `programmer`, the content of the DITAVAL file should look like the following example:

   ```
   <?xml version="1.0" encoding="UTF-8"?>
   <val>
     <prop att="audience" val="programmer" action="flag"
    img="D:\resource\delta.gif" alt="sample alt text"/>
   </val>
   ```

   Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.
3. Edit a **DITA Map to WebHelp** transformation scenario.
4. Specify the DITAVAL file in the **Filters** tab of the transformation scenario.
5. Run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To flag content in the DITA Map to WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as `audience-flag-build.ditaval`.
2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the `audience` attribute set to `programmer`, the content of the DITAVAL file should look like the following example:

   ```
   <?xml version="1.0" encoding="UTF-8"?>
   <val>
     <prop att="audience" val="programmer" action="flag"
    img="D:\resource\delta.gif" alt="sample alt text"/>
   </val>
   ```

   Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.
3. Use the `args.filter` parameter in your transformation script and set its value to the path of the DITAVAL file.
4. Execute the transformation script.

For example:

- **Windows:**

  ```
  dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.filter=c:\myFile.ditaval
  ```
- **Mac OS X/ Linux:**

  ```
  dita -i C:/mySample.ditamap -f webhelp -Dargs.filter=C:/myFile.ditaval
  ```

Integrating Social Media and Google Tools in the WebHelp Classic Output

Oxygen XML Editor plugin includes support for integrating some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Classic Output

It is possible to integrate Facebook™ into your **WebHelp Classic** output and the widget will appear in the footer sections of your WebHelp page.

Using Oxygen XML Editor/Author

To add a Facebook™ *Like* widget to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

```
<div id="facebook">
    <div id="fb-root"/>
    <script>
        <!--
            (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
        }(document, 'script', 'facebook-jssdk'));
        -->
    </script>
    <div class="fb-like" data-layout="standard" data-action="like"
        data-show-faces="true" data-share="true"/>
</div>
```

4. In **Oxygen XML Editor/Author**, click the **Configure Transformation Scenario(s)** action from the toolbar.
5. Select an existing WebHelp Classic transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `facebook-widget.xml` file that you created earlier.
7. Click **Ok** and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a Facebook™ *Like* widget to your WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="facebook">
    <div id="fb-root"/>
    <script>
        <!--
            (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
        }(document, 'script', 'facebook-jssdk'));
        -->
    </script>
    <div class="fb-like" data-layout="standard" data-action="like"
        data-show-faces="true" data-share="true"/>
</div>
```

4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `facebook-widget.xml` file that you created earlier.
5. Execute the transformation script.

   For example:

   - **Windows:**

     ```
     dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\facebook-widget.xml
     ```
   - **Mac OS X/ Linux:**

     ```
     dita -i C:/mySample.ditamap -f webhelp -Dwebhelp.footer.file=C:/facebook-widget.xml
     ```

How to Add a Google+ Button in WebHelp Classic Output

It is possible to integrate *Google* into your **WebHelp Classic** output and the widget will appear in the footer section of your WebHelp page.

Using Oxygen XML Editor/Author

To add a *Google+* widget to your WebHelp Classic output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Google Developers website.
2. Fill-in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

   ```
   <div id="google-plus">
     <!-- Place this tag in your head or just before your close body tag. -->
     <script src="https://apis.google.com/js/platform.js" async defer></script>

     <!-- Place this tag where you want the +1 button to render. -->
     <div class="g-plusone" data-annotation="inline" data-width="300"></div>
   </div>
   ```
4. In **Oxygen XML Editor/Author**, click the **Configure Transformation Scenario(s)** action from the toolbar.
5. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `google-plus-button.xml` file that you created earlier.
7. Click **Ok** and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a *Google+* widget to your WebHelp Classic output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Google Developers website.
2. Fill-in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

```
<div id="google-plus">
  <!-- Place this tag in your head or just before your close body tag. -->
  <script src="https://apis.google.com/js/platform.js" async defer></script>

  <!-- Place this tag where you want the +1 button to render. -->
  <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```

4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `google-plus-button.xml` file that you created earlier.
5. Execute the transformation script.

   For example:

   - **Windows:**

     ```
     dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\google-plus-button.xml
     ```
   - **Mac OS X/ Linux:**

     ```
     dita -i C:/mySample.ditamap -f webhelp -Dwebhelp.footer.file=C:/google-plus-button.xml
     ```

How to Add Tweet Button in WebHelp Classic Output

It is possible to integrate *Twitter* into your **WebHelp Classic** output and the widget will appear in the footer section of your WebHelp page.

Using Oxygen XML Editor/Author

To add a Twitter™ *Tweet* widget to your WebHelp Classic output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill-in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `div` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:

   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
      !function (d, s, id) {
      var
      js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
 ? 'http': 'https';
      if (! d.getElementById(id)) {
      js = d.createElement(s);
      js.id = id;
      js.src = p + '://platform.twitter.com/widgets.js';
      fjs.parentNode.insertBefore(js, fjs);
      }
```

```
      }
      (document,
      'script', 'twitter-wjs');
     -->
  </script>
</div>
```

4. In **Oxygen XML Editor/Author**, click the **Configure Transformation Scenario(s)** action from the toolbar.
5. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `tweet-button.xml` file that you created earlier.
7. Click **Ok** and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a Twitter™ *Tweet* widget to your WebHelp Classic output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill-in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `div` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
      !function (d, s, id) {
      var
      js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
 ? 'http': 'https';
      if (! d.getElementById(id)) {
      js = d.createElement(s);
      js.id = id;
      js.src = p + '://platform.twitter.com/widgets.js';
      fjs.parentNode.insertBefore(js, fjs);
      }
      }
      (document,
      'script', 'twitter-wjs');
     -->
  </script>
</div>
```

4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `tweet-button.xml` file that you created earlier.
5. Execute the transformation script.

   For example:

   - **Windows:**

     ```
     dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\tweet-button.xml
     ```

   - **Mac OS X/ Linux:**

```
dita -i C:/mySample.ditamap -f webhelp -Dwebhelp.footer.file=C:/tweet-
button.xml
```

How to Integrate Google Analytics in WebHelp Classic Output

You can use *Google Analytics* to track and report site data for your **WebHelp Classic** output.

Using Oxygen XML Editor/Author

To integrate *Google Analytics* into your WebHelp Classic output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your *Tracking ID*. A **Tracking Code** looks like this:

```
<script>
 (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
 (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
 m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

 ga('create', 'UA-XXXXXXXX-X', 'auto');
 ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. In **Oxygen XML Editor/Author**, click the **Configure Transformation Scenario(s)** action from the toolbar.
6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `googleAnalytics.html` file that you created earlier.
8. Click **Ok** and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To integrate *Google Analytics* into your WebHelp Classic output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your *Tracking ID*. A **Tracking Code** looks like this:

```
<script>
 (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
 (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
 m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

 ga('create', 'UA-XXXXXXXX-X', 'auto');
 ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `googleAnalytics.html` file that you created earlier.

6. Execute the transformation script.

   For example:

   - **Windows:**

     ```
     dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:
     \googleAnalytics.xml
     ```
   - **Mac OS X/ Linux:**

     ```
     dita -i C:/mySample.ditamap -f webhelp -Dwebhelp.footer.file=C:/
     googleAnalytics.xml
     ```

How to Integrate Google Search in WebHelp Classic Output

It is possible to integrate the *Google Search Engine* into your **WebHelp Classic** output and you can specify where you want the results to appear in your WebHelp page.

Using Oxygen XML Editor/Author

To integrate the *Google Search Engine* into your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

   ```
   <script>
    (function()  {
     var cx =
       '000888210889775888983:8mn4x_mf-yg';
     var gcse = document.createElement('script');
     gcse.type = 'text/javascript';
     gcse.async = true;
     gcse.src = (document.location.protocol == 'https:' ?
       'https:' : 'http:') +         '//www.google.com/cse/cse.js?cx=' + cx;
     var s = document.getElementsByTagName('script')[0];
     s.parentNode.insertBefore(gcse, s);
    }
    )();
   </script>
   ```
4. Save the script into a well-formed HTML file called `googlecse.html`.
5. In **Oxygen XML Editor/Author**, click the **Configure Transformation Scenario(s)** action from the toolbar.
6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.
8. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.

   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName-"searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.

   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.
9. Click **Ok** and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To integrate the *Google Search Engine* into your WebHelp Classic output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```
<script>
 (function()  {
  var cx =
    '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  gcse.src = (document.location.protocol == 'https:' ?
    'https:' : 'http:') +         '//www.google.com/cse/cse.js?cx=' + cx;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
 }
 )();
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.
5. Use the `webhelp.google.search.script` parameter in your transformation script and set its value to reference the `googlecse.html` file that you created earlier.
6. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName-"searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.
7. Execute the transformation script.

   For example:

   - **Windows:**

     ```
     dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.google.search.script=c:\googlecse.html -Dwebhelp.google.search.results=c:\myFile.html
     ```

   - **Mac OS X/ Linux:**

     ```
     dita -i C:/mySample.ditamap -f webhelp -Dwebhelp.google.search.script=C:/googlecse.html -Dwebhelp.google.search.results=C:/myFile.html
     ```

Localization in WebHelp Classic Output

This section contains topics that explain the localization support for DITA or DocBook WebHelp Classic transformations.

Localizing Email Notifications of WebHelp Classic with Feedback Output

The feedback-enabled WebHelp systems use emails to notify users when comments are posted. These emails are based on templates stored in the WebHelp directory. The default messages are in English, French, German, and Japanese. These messages are copied into the WebHelp system deployment directory during the execution of the corresponding transformation scenario.

Using Oxygen XML Editor/Author

To change the language of the emails for WebHelp Classic with Feedback output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create the following directory, depending on your framework:
   - **DITA:** *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
   - **DocBook:** `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
2. Copy all English template files from the following directory (depending on your framework) and paste them into the directory you just created.
   - **DITA:** *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\en`
   - **DocBook:** `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\en`
3. Edit the HTML files from the following directory (depending on your framework) and translate the content into your language.
   - **DITA:** *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
   - **DocBook:** `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
4. Edit a **WebHelp Classic with Feedback** transformation scenario and open the **Parameters** tab.
5. In the **Parameters** tab, look for the `args.default.language` parameter and set its value to the appropriate language code (for example, `nl` for Dutch).

   Note: If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code.
6. Run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To change the language of the emails for WebHelp Classic with Feedback output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Create the following directory, depending on your framework:
   - **DITA:** *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
   - **DocBook:** `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
2. Copy all English template files from the following directory (depending on your framework) and paste them into the directory you just created.
   - **DITA:** *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\en`

- **DocBook:** `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\en`

3. Edit the HTML files from the following directory (depending on your framework) and translate the content into your language.
   - **DITA:** *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
   - **DocBook:** `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
4. Use the `args.default.language` parameter in your transformation script and set its value to the appropriate language code (for example, `nl` for Dutch).

   Note: If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code.
5. Execute the transformation script.

For example, a DITA to WebHelp Classic with Feedback script might look like this:

- **Windows:**

  ```
  dita.bat -i c:\mySample.ditamap -f webhelp-feedback -Dargs.default.language=nl
  ```
- **Mac OS X/ Linux:**

  ```
  dita -i C:/mySample.ditamap -f webhelp-feedback -Dargs.default.language=nl
  ```

Localizing the Interface of DITA Map to WebHelp Classic Output

Static labels used in the WebHelp output are stored in translation files that have the *strings-lang1-lang2.xml* name format, where *lang1* and *lang2* are ISO language codes. For example, the US English labels are kept in the *strings-en-us.xml* file.

These translation files are collected from two locations:

- *DITA-OT-DIR*`/xsl/common` folder - DITA-OT's default translations.
- *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization` folder - These translations are contributed by the WebHelp plugin and extend the default ones provided by DITA-OT. The labels defined in this folder take precedence over the DITA-OT default ones.

  Important: If you need to customize the translation labels, you should do this by updating the translation files found in the *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization` folder.

Using Oxygen XML Editor/Author

To localize the interface of the DITA Map to WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Look for the *strings-[lang1]-[lang2].xml* file in *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization` directory (for example, the Canadian French file would be: *strings-fr-ca.xml*). If it does not exist, use the following procedure to create one:
   a. Create a new `strings-fr-ca.xml` file in the *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization` directory.
   b. Copy all the labels found in the *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization/strings-en-us.xml` and paste them into the newly created file.
   c. Copy all the labels found in the `DITA-OT_DIR/xsl/common/strings-en-us.xml` and paste them into the newly created file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.

3. Run the predefined transformation scenario called **Run DITA-OT Integrator** from the **Apply Transformation Scenario(s)** or **Configure Transformation Scenario(s)** dialog box. If the *integrator* is not visible, select the **Show all scenarios** action that is available in the **Settings** drop-down menu.
4. Make sure that the new XML file that you created is listed in the file *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization/strings.xml`. For example, the Canadian French file would be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.
5. Edit any of the **DITA Map to WebHelp** transformation scenarios (with or without feedback) and set the `args.default.language` parameter to the code of the language you want to localize (for example, *fr-ca* for Canadian French).
6. Run the transformation scenario to produce the WebHelp output.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To localize the interface of the DITA Map to WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Look for the *strings-[lang1]-[lang2].xml* file in *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization` directory (for example, the Canadian French file would be: *strings-fr-ca.xml*). If it does not exist, use the following procedure to create one:
   a. Create a new `strings-fr-ca.xml` file in the *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization` directory.
   b. Copy all the labels found in the *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization/strings-en-us.xml` and paste them into the newly created file.
   c. Copy all the labels found in the `DITA-OT_DIR/xsl/common/strings-en-us.xml` and paste them into the newly created file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. In the home directory of the DITA Open Toolkit, run the `startcmd.bat` script on Windows or `startcmd.sh` script on Linux/Mac OS X. In the displayed command line interface console, run `ant -f integrator.xml`.
4. Make sure that the new XML file that you created is listed in the file *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization/strings.xml`. For example, the Canadian French file would be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.
5. Use the `args.default.language` parameter in your transformation script and set its value to the appropriate language code (for example, *fr-ca* for Canadian French).
6. Execute the transformation script.

For example:

- **Windows:**

  ```
  dita.bat -i c:\mySample.ditamap -f webhelp-responsive -Dargs.default.language=fr-ca
  ```

- **Mac OS X/ Linux:**

  ```
  dita -i C:/mySample.ditamap -f webhelp-responsive -Dargs.default.language=fr-ca
  ```

Indexing Japanese Content in WebHelp Classic on page 1032

Localizing the Interface of DocBook to WebHelp Classic Output

Static labels that are used in the WebHelp output are kept in translation files in the `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization` folder. Translation files have the *strings-lang1-lang2.xml* name format, where *lang1* and *lang2* are ISO language codes. For example, the US English text is kept in the *strings-en-us.xml* file.

To localize the interface of the WebHelp output for DocBook transformations, follow these steps:

1. Look for the *strings-[lang1]-[lang2].xml* file in `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization` directory (for example, the Canadian French file would be: *strings-fr-ca.xml*). If it does not exist, create one starting from the *strings-en-us.xml* file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. Make sure that the new XML file that you created in the previous two steps is listed in the file `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization/strings.xml`. In our example for the Canadian French file, it should be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.
4. Edit any of the DocBook to WebHelp transformation scenarios (with or without feedback) and set the **l10n.gentext.default.language** parameter to the code of the language you want to localize (for example, *fr-ca* for Canadian French).
5. Run the transformation scenario to produce the WebHelp output.

Related Information:
Indexing Japanese Content in WebHelp Classic on page 1032

Indexing Japanese Content in WebHelp Classic

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the **Oxygen XML Editor/Author** installation kit.

Using Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Set the language for your content to Japanese (depending on your framework):
   - **DITA:** Edit a **DITA to WebHelp** transformation scenario and in the **Parameters** tab, set the value of the `args.default.language` parameter to `ja-jp`.

     Note: Alternatively, you could set the `xml:lang` attribute on the root of the *DITA map* and the referenced topics to `ja-jp`. Another alternative for DITA output is to use the `webhelp.search.japanese.dictionary` parameter to specify a path to a Japanese dictionary that will be used by the *Kuromoji* morphological engine.
   - **DocBook:** Edit a **DocBook to WebHelp** transformation scenario and in the **Parameters** tab, set the value of the `l10n.gentext.default.language` parameter to `ja`.
2. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To activate the Japanese indexing in your WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Set the language for your content to Japanese (depending on your framework):
   - **DITA:** Use the `args.default.language` parameter in your transformation script and set its value to `ja-jp`.

     Note: Alternatively, you could set the `xml:lang` attribute on the root of the *DITA map* and the referenced topics to `ja-jp`. Another alternative for DITA output is to use the `webhelp.search.japanese.dictionary` parameter to specify a path to a Japanese dictionary that will be used by the *Kuromoji* morphological engine.
   - **DocBook:** Use the `l10n.gentext.default.language` parameter in your transformation script and set its value to `ja`.
2. Execute the transformation script.

For example, a DITA script might look like this::

- **Windows:**

  ```
  dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.default.language=ja-jp
  ```
- **Mac OS X/ Linux:**

  ```
  dita -i C:/mySample.ditamap -f webhelp -Dargs.default.language=ja-jp
  ```

Activating Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, edit the *DITA map* and set the `xml:lang` attribute on its root element (`map`). The corresponding attribute value can be set for following RTL languages:

- `ar-eg` - Arabic
- `he-il` - Hebrew
- `ur-pk` - Urdu

Optimizing Search Results in WebHelp Classic

A **DITA Map WebHelp** transformation scenario can be configured to produce a `sitemap.xml` file that is used by search engines to aid crawling and indexing mechanisms. A *sitemap* lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the `sitemap.xml` file looks like this:

```
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  <url>
    <loc>http://www.example.com/topics/care.html#care</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
   .  .  .
</urlset>
```

Each page has a `<url>` element structure containing additional information, such as:

- **loc** - the URL of the page. This URL must begin with the protocol (such as `http`), if required by your web server. It is constructed from the value of the `webhelp.sitemap.base.url` parameter from the transformation scenario and the relative path to the page (collected from the `href` attribute of a `topicref` element in the *DITA map*).

  Note: The value must have fewer than 2,048 characters.

- **lastmod** (optional) - the date when the page was last modified. The date format is `YYYY-MM-DD`.
- **changefreq** (optional) - indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

  Note: The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.
- **priority** (optional) - the priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. Open the **Parameters** tab and set a value for the following parameters:
   - **webhelp.sitemap.base.url** - the URL of the location where your WebHelp system is deployed

     Note: This parameter is required for Oxygen XML Editor plugin to generate the `sitemap.xml` file.
   - **webhelp.sitemap.change.frequency** - how frequently the WebHelp pages are likely to change (accepted values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`)
   - **webhelp.sitemap.priority** - the priority of each page (value ranging from 0.0 to 1.0)
3. Run the transformation scenario.
4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

Overriding XSLT Processing Step of DITA WebHelp Classic Transformations

Since WebHelp output is primarily obtained by running XSLT transformations over the DITA input files (through the **DITA Map WebHelp Classic** transformation scenarios), one customization method would be to override the default XSLT templates that are used by the WebHelp transformations.

There are two methods available to override the XSLT stylesheets implied by the WebHelp transformation.

- The first method is to use one of the **WebHelp XSLT-import extension points** that allow you to import an XSLT stylesheet so that it becomes part of the normal build. This method uses the same mechanism as the DITA-OT XSLT-import extension points. Note that this method will affect all the outputs generated with the WebHelp system.
- The second method implies that you will create a DITA-OT extension plugin with a custom *transtype* and use an Ant build file to define the transformation process. The main difference from the first customization method is that you will not affect all WebHelp transformations. Only the transformations that use the declared plugin *transtype* will be affected.

WebHelp Classic XSLT-Import and XSLT-Parameter Extension Points

The WebHelp XSLT-Import extension points allows you to extend the XSLT stylesheets associated with some of the WebHelp transformation steps. The DITA-OT plug-in installer adds an XSLT import statement in the default WebHelp XSLT so that the XSLT stylesheet referenced by the extension point becomes part of the normal build.

Example:

```
<plugin id="com.oxygenxml.webhelp.classic.extension">
  <feature extension="com.oxygenxml.webhelp.classic.xsl.dita2webhelp"
           file="xsl/fixup.xsl"/>
```

```
</plugin>
```

Attention: The customizations you make by using this extension point will affect all WebHelp transformations. If you want to have a customization that is only available for a certain transformation, please use the Overriding a WebHelp XSLT Stylesheet from an Ant Build File method.

XSLT-Import Extension Points

The following extension points are available:

com.oxygenxml.webhelp.classic.xsl.dita2webhelp

Extension point to override the XSLT stylesheet (`dita2webhelpImpl.xsl`) that produces an HTML file for each DITA topic. The path to this stylesheet is: *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\xsl\dita\desktop\dita2webhelpImpl.xsl`

com.oxygenxml.webhelp.classic.xsl.createMainFiles

Extension point to override the XSLT stylesheet (`createMainFilesImpl.xsl`) that produces the WebHelp main HTML page (`index.html`). The path to this stylesheet is: *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\xsl\dita\desktop\createMainFilesImpl.xsl`

com.oxygenxml.webhelp.classic.xsl.createTocXML

Extension point to override the XSLT stylesheet (`tocDita.xsl`) that produces the `toc.xml` file. This file contains information extracted from the *DITA map* and it is mainly used to construct the WebHelp Table of Contents and navigational links. The path to this stylesheet is: *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\xsl\dita\tocDita.xsl`.

XSLT-Parameter Extension Points

If your customization stylesheet declares one or more XSLT parameters and you want to control their values from the transformation scenario, you can use one of the following XSLT parameter extension points:

com.oxygenxml.webhelp.classic.xsl.dita2webhelp.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.classic.xsl.dita2webhelp** extension point.

com.oxygenxml.webhelp.classic.xsl.createMainFiles.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.classic.xsl.createMainFiles** extension point.

com.oxygenxml.webhelp.classic.xsl.createTocXML.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.classic.xsl.createTocXML** extension point.

[DITA-OT] XSLT-Import Extension Points

[DITA-OT] XSLT-Parameter Extension Points

Overriding a WebHelp Classic XSLT Stylesheet from an Ant Build File

To create a WebHelp XSLT customization that is only available for a certain DITA OT transformation, the extension plugin should declare a custom *transtype*. The WebHelp XSLT stylesheets can be overridden from an ANT file provided by the DITA-OT extension plugin. From the Ant target associated with the plugin, you will specify a custom XSLT stylesheet that imports the original WebHelp stylesheet and add some customization templates.

The following procedure explains how to create a DITA-OT extension plugin that uses this extension method:

1. In the *`DITA-OT-DIR`*`\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.classic.custom`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies a new DITA-OT `transtype` and the build file associated with the plugin. For example:

```
<plugin id="com.oxygenxml.webhelp.classic.custom">
    <feature extension="dita.conductor.target.relative" file="integrator.xml"/>
    <transtype name="webhelp-classic-custom" extends="webhelp"
      desc="WebHelp Classic Customization"/>
```

```
</plugin>
```

3. Create the **integrator.xml** file that will import the actual plugin Ant build file.

```
<project basedir="." name="Webhelp Classic Customization">
    <import file="build.xml"/>
</project>
```

4. Create the **build.xml** file that overrides the value of properties associated with the XSLT stylesheets used to produce HTML files. The following Ant properties can be overridden to specify your customization stylesheets:

   `args.wh.classic.topic.xsl`

   Specify this property if you want to customize the XSLT stylesheet used to produce an HTML file for each topic.

   `args.wh.classic.create.main.files.xsl`

   Specify this property if you want to customize the XSLT stylesheet used to produce the main HTML files.

   `args.wh.classic.createTocXML.xsl`

   Specify this property if you want to customize the XSLT stylesheet used to produce the *toc.xml* file. The toc.xml file contains information extracted from DITA map and it is mainly used to create the WebHelp TOC.

   For example, to customize a WebHelp Classic transformation type, the build file should look like:

```
<project basedir="." name="Webhelp Classic Customization">
 <target name="dita2webhelp-classic-custom">
   <!--
     Override this property if you want to customize the XSLT stylesheet
     used to produce an HTML file for each topic
   -->
   <property
     name="args.wh.classic.topic.xsl"
     value="${dita.plugin.com.oxygenxml.webhelp.classic.custom.dir}
                                              /xsl/dita2webhelpCustom.xsl"/>
   <!--
     Override this property if you want to customize the XSLT stylesheet
     used to produce the main HTML file.
   -->
   <property
     name="args.wh.classic.create.main.files.xsl"
     value="${dita.plugin.com.oxygenxml.webhelp.classic.custom.dir}
                                             /xsl/createMainFilesCustom.xsl"/>
   <!--
     Override this property if you want to customize the XSLT stylesheet
     used to produce the toc.xml file.
   -->
   <property
     name="args.wh.classic.createTocXML.xsl"
     value="${dita.plugin.com.oxygenxml.webhelp.classic.custom.dir}
                                             /xsl/createTocXMLCustom.xsl"/>
   <!--
     You need to delegate the build target:
     * dita2webhelp - for WebHelp Classic
   -->
   <antcall target="dita2webhelp"/>
 </target>
</project>
```

5. Create an **xsl** directory in the plugin customization directory (that you created in step 1) to store the customized XSLT stylesheets.
6. Now that the extension plugin is created, install it in the DITA Open Toolkit.

Referencing the WebHelp XSLT Stylesheets from Your Customizations

Note that your customization stylesheets should import the original stylesheets that they override. To reference the WebHelp stylesheets, you can use the **plugin:com.oxygenxml.dita-ot.plugin.webhelp** prefix. This prefix is rewritten by an XML catalog to the WebHelp root directory.

Customizing the `dita2webhelp.xsl` Stylesheet

The XSLT stylesheet that customizes the WebHelp **dita2webhelp.xsl** stylesheet should look like:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
   xmlns:xs="http://www.w3.org/2001/XMLSchema"
   xmlns:math="http://www.w3.org/2005/xpath-functions/math"
   exclude-result-prefixes="xs math"
   version="2.0">
   <!--
     Import the original stylesheet used to produce an HTML file for each topic.
```

```
    -->
    <xsl:import href="plugin:com.oxygenxml.webhelp.classic:xsl/
                                        dita/classic/dita2webhelp.xsl"/>
    <!--
      Please add your customization templates here.
    -->
</xsl:stylesheet>
```

You need to import the following XSLT stylesheet:

```
<xsl:import href="plugin:com.oxygenxml.webhelp.classic:xsl/dita/desktop/
dita2webhelp.xsl"/>
```

Customizing the `createMainFiles.xsl` Stylesheet

The XSLT stylesheet that customizes the WebHelp **createMainFiles.xsl** stylesheet should look like:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="2.0">
    <!--
        Import the original stylesheet used to produce the main HTML file.
    -->
    <xsl:import href="plugin:com.oxygenxml.webhelp.classic:xsl/dita/
                                            desktop/createMainFiles.xsl"/>
    <!--
        Please add your customization templates here.
    -->

</xsl:stylesheet>
```

You need to import the following XSLT stylesheet:

```
<xsl:import href="plugin:com.oxygenxml.webhelp.classic:xsl/dita/desktop/
createMainFiles.xsl"/>
```

Customizing the `tocDita.xsl` File

The XSLT stylesheet that customizes the WebHelp **tocDita.xsl** stylesheet should look like:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="2.0">
    <!--
        Import the original stylesheet used to produce the toc.xml file.
    -->
    <xsl:import href="plugin:com.oxygenxml.webhelp.classic:xsl/dita/tocDita.xsl"/>
    <!--
        Please add your customization templates here.
    -->
</xsl:stylesheet>
```

Publishing WebHelp Classic Output on a SharePoint Site

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to `.aspx`, as described in the steps below.

Using Oxygen XML Editor/Author

To publish WebHelp Classic output on a SharePoint site and use a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. Edit the WebHelp transformation scenario and open the **Parameters** tab.
   - For a DITA transformation, set the `args.outext` parameter to `.aspx`.
   - For a DocBook transformation, set the `html.ext` parameter to `.aspx`.
3. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To publish WebHelp Classic output on a SharePoint site and use a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. Use the following parameter to change your file extensions to `.aspx`:
   - For DITA transformations, use the `args.outext` parameter in your transformation script and set its value to `.aspx`.
   - For DocBook transformations, use the `html.ext` parameter in your transformation script and set its value to `.aspx`.
3. Execute the transformation script.

For example, a DITA script might look like this::

- **Windows:**

  ```
  dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.outext=.aspx
  ```
- **Mac OS X/ Linux:**

  ```
  dita -i C:/mySample.ditamap -f webhelp -Dargs.outext=.aspx
  ```

Removing the *Previous*/*Next* Links from WebHelp Classic Output

The **Previous** and **Next** links that are created at the top area of each WebHelp Classic page can be hidden with a CSS code.

Using Oxygen XML Editor/Author

To remove these links from WebHelp Classic output and use a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a custom CSS file and add the following CSS code:

   ```
   .navparent, .navprev, .navnext {
       visibility:hidden;
   }
   ```
2. Edit the WebHelp transformation scenario and open the **Parameters** tab.
   - For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
3. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To remove these links from WebHelp Classic output and use a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Create a custom CSS file and add the following CSS code:

```
.navparent, .navprev, .navnext {
    visibility:hidden;
}
```

2. Reference your custom CSS file:
   - For DITA transformations, use the `args.css` parameter in your transformation script and set its value to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For DocBook transformations, use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.
3. Execute the transformation script.

For example, a DITA script might look like this::

- **Windows:**

  ```
  dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.css=c:\myFile.css -
  Dargs.copycss=yes
  ```
- **Mac OS X/ Linux:**

  ```
  dita -i C:/mySample.ditamap -f webhelp -Dargs.css=C:/myFile.css -
  Dargs.copycss=yes
  ```

WebHelp Skin Builder

The **WebHelp Skin Builder** is a simple, easy-to-use tool, specially designed to assist users to visually customize the look and feel of the WebHelp output. It is implemented as an online tool hosted on the **Oxygen XML** website and allows you to experiment with various styles and colors over a documentation sample.

To be able to use the **Skin Builder**, you need:

- An Internet connection and unrestricted access to **Oxygen XML** website.
- A late version web browser.

To start the **Skin Builder**, do one of the following:

- For DocBook or DITA WebHelp systems, use a web browser to go to https://www.oxygenxml.com/webhelp-skin-builder.
- For DITA WebHelp systems, you can click the **Online preview** link in the **Skins tab** of a DITA OT transformation scenario. In the upper section of the preview, click the **Select Skin** button, then choose **Customize Skin**.

Skin Builder Layout

The left side panel of the **Skin Builder** is divided into 3 sections:

- **Actions** - Contains the following two buttons:
  - **Import** - Opens an **Import CSS** dialog box that allows you to load a CSS stylesheet and apply it over the documentation sample.
  - **Export** - Saves all properties as a CSS file.
- **Settings** - Includes a **Highlight selection** option that helps you identify the areas affected by a particular element customization.
  - When hovering an item in the customizable elements menu, the affected sample area is highlighted with a dotted blue border.
  - When an item in the customizable elements menu is selected, the affected sample area is highlighted with a solid red border.
- **Customize** - Provides a series of customizable elements organized under four main categories:
  - Header
  - TOC Area

- Vertical Splitter
- Content

For each customizable element, you can alter properties such as background color or font face. Any alteration made in the customizable elements menu is applied in real time over the sample area.

Creating a Customization Skin

1. You can start with one of the predefined skins or a CSS stylesheet applied over the sample using the **Import** button.
2. Use the elements in the **Customize** section to set properties that modify the look of the skin. By default, all customizable elements display a single property, but you can make more visible by clicking the **+Add** button and choosing from the available properties.

   Note: If you want to revert a particular property to its initial value, press the **Reset** button.
3. When you are happy with the skin customizations you have made, press the **Export** button. All settings will be saved in a CSS file.

Applying a Custom Skin to a DITA Map to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Editor plugin.
2. Load the *DITA map* you want to produce as a WebHelp output.
3. Edit a **DITA Map to WebHelp** transformation scenario. Set the previously exported CSS file in the **Custom** section of the **Skins** tab.
4. Run the transformation to obtain the WebHelp output.

Apply a Customization Skin to a DocBook to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Editor plugin.
2. Load the DocBook file you want to produce as a WebHelp output.
3. In the **Parameters** tab, set the `webhelp.skin.css` parameter to point to the previously exported CSS.
4. To customize the logo, use the following parameters: webhelp.logo.image and webhelp.logo.image.target.url.
5. Run the transformation to obtain the WebHelp output.

For more information about using the WebHelp Skin Builder, watch our video demonstration:

https://www.youtube.com/embed/32PGX--PQx0

Skins Tab (DITA OT Transformations) on page 1582

WebHelp Responsive Output

The **WebHelp Responsive** features a very flexible layout, is designed to adapt to any screen size to provide an optimal viewing and interaction experience. It is based upon the *Bootstrap* responsive front-end framework and is available for DITA document types.

The **WebHelp Responsive with Feedback** variant also includes a feedback system that allows your users to add comments and allows you to manage and reply to them.

WebHelp Responsive output can be generated by using the **DITA Map WebHelp Responsive** or **DITA Map WebHelp Responsive with Feedback** transformation scenario.

WebHelp Responsive Output Layout and Features

This section contains information about the layout and features of the WebHelp Responsive output.

HTML5 Responsive Pages

You can select from several different styles of layouts (for example, by default, you can select either a *tiles* or *tree* style of layout). Furthermore, each of these layouts include a collection of skins that you can choose from, or you can customize your own.

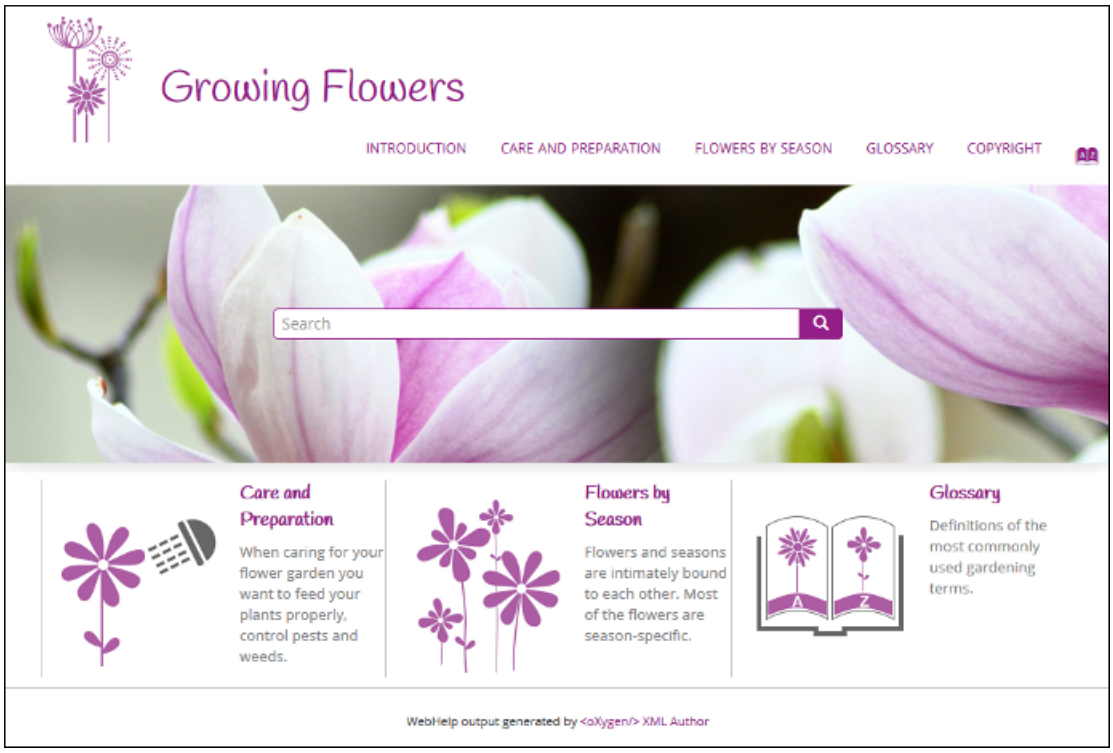

Figure 563: WebHelp Responsive Output on a Normal Screen

Figure 564: WebHelp Responsive Output on a Narrow Screen

Main Page

The *Main Page* is the home page generated in the WebHelp Responsive output. The main function of the home page is to display top level information and provide links that help you easily navigate to any of the top level topics of the publication. These links can be rendered in either a *Tiles* or *Tree* style of layout. The main page also consists of various other components, such as a logo, title, menu, search field, or index link.

Main Page - Tiles Layout

In the *tiles* presentation mode, a tile component is created for each chapter (first level topic) in the publication. The tile presents a link to the topic and its short description.

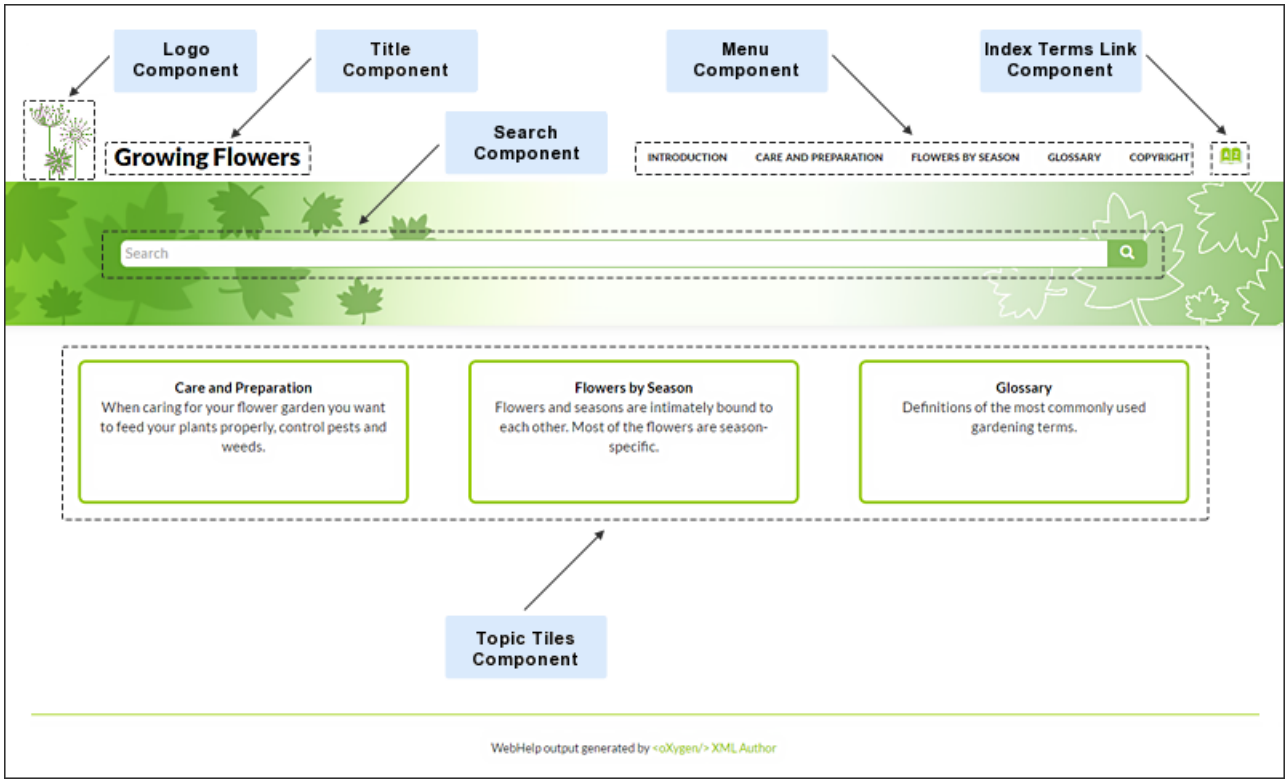

Figure 565: Main Page - Tiles Layout

Main Page - Tree Layout

In the *tree* presentation mode, links to the first and second level topics in the publication are displayed using a tree-like component.

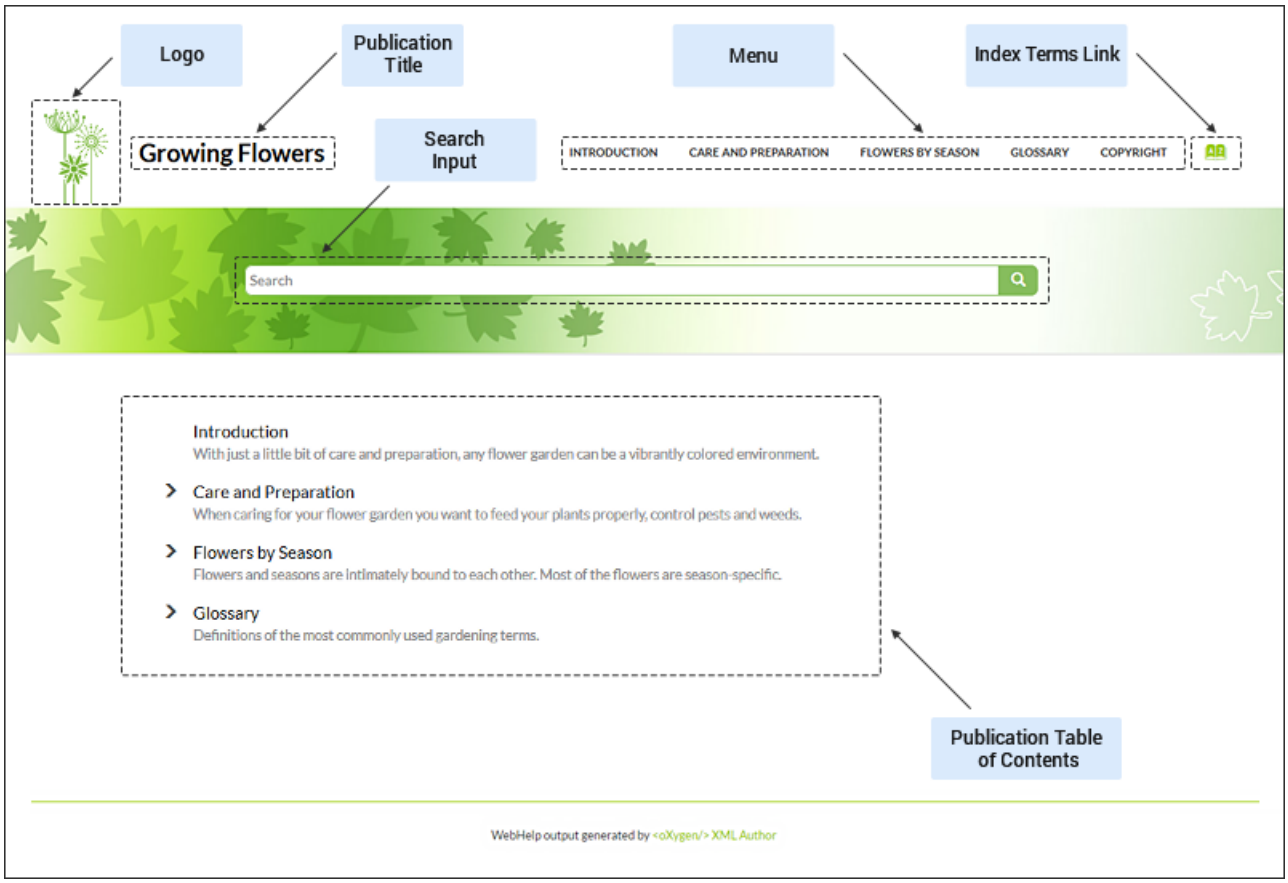

Figure 566: Main Page - Tree Layout

Main Page Components

The layout components displayed in the main page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the webhelp.logo.image transformation parameter. For target URL use the webhelp.logo.image.target.url parameter.

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu on page 1089 topic.

Index terms link

Presents a link to the index terms page. You can control if this component is displayed by using the webhelp.show.indexterms.link parameter.

Search query input

Input text field allowing you to easily enter your search queries.

Tiles area

This section contains a tile for each root topic of the published documentation.

Topic Tile

A tile associated with a main topic. Each topic tile has three sections that corresponds to the topic title, short description, and image.

Topic Tile Title

Presents the navigation title of the associated topic.

Topic Tile Short Description

Presents the short description of the topic. It may be collected either from the topic or from the DITA map topic meta.

Topic Tile Image

Presents an image associated with the topic. The image association is done in the DITA map.

Tree area

An area containing topic titles from first and second level of your publication.

Page Footer

WebHelp Responsive output footer.

Topic Page

The *Topic Page* is the page generated for each DITA topic in the WebHelp Responsive output. The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

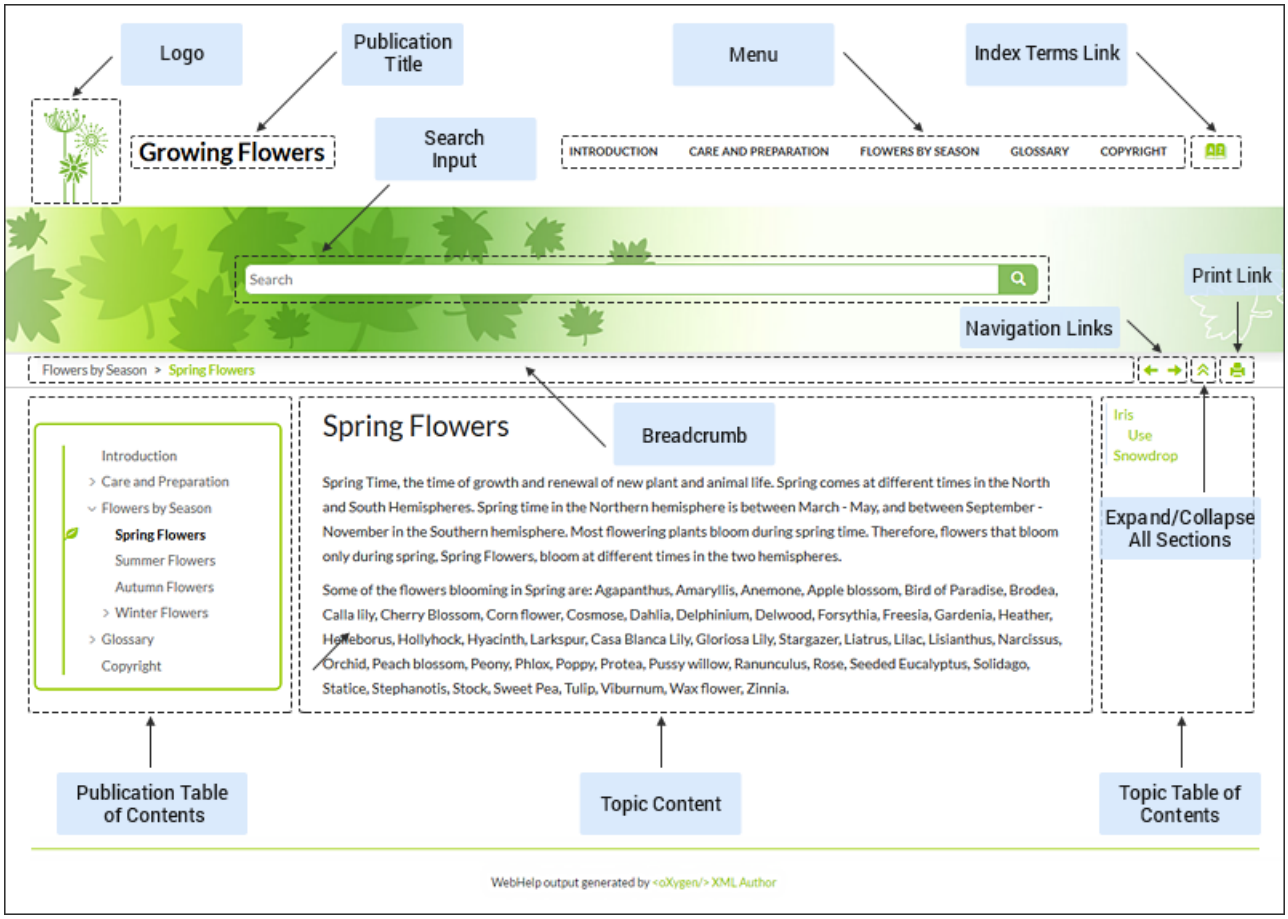

Figure 567: Topic Page

Topic Page Components

The layout components displayed in this page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the webhelp.logo.image transformation parameter. For target URL use the webhelp.logo.image.target.url parameter.

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu on page 1089 topic.

Index terms link

Presents a link to the index terms page. You can control if this component is displayed by using the webhelp.show.indexterms.link parameter.

Print Icon

A print icon that opens the print dialog box for your particular browser.

Search query input

Input text field allowing you to easily enter your search queries.

Topic Content

Presents the content of the associated DITA topic.

Breadcrumb

Presents the path of the current displayed DITA topic in documentation.

Publication Table of Contents

A Table of Content for the publication displayed in the left side.

Topic Table of Contents

A Table of Content for the topic displayed on the right side. This table of contents contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted.

Expand/Collapse Sections Icon

Icon that expands or collapses sections listed in the side table of contents within a topic.

Page Footer

WebHelp Responsive output footer.

Search Page

The *Search Page* presents search results in the WebHelp Responsive output. The HTML page consists of a search results component along with various other additional components, such as a title, menu, or index link.

When you enter search terms in the **Search** field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the **Toggle Highlights** button at the top-right side of the page. The **Search** field also includes an *autocomplete* feature.

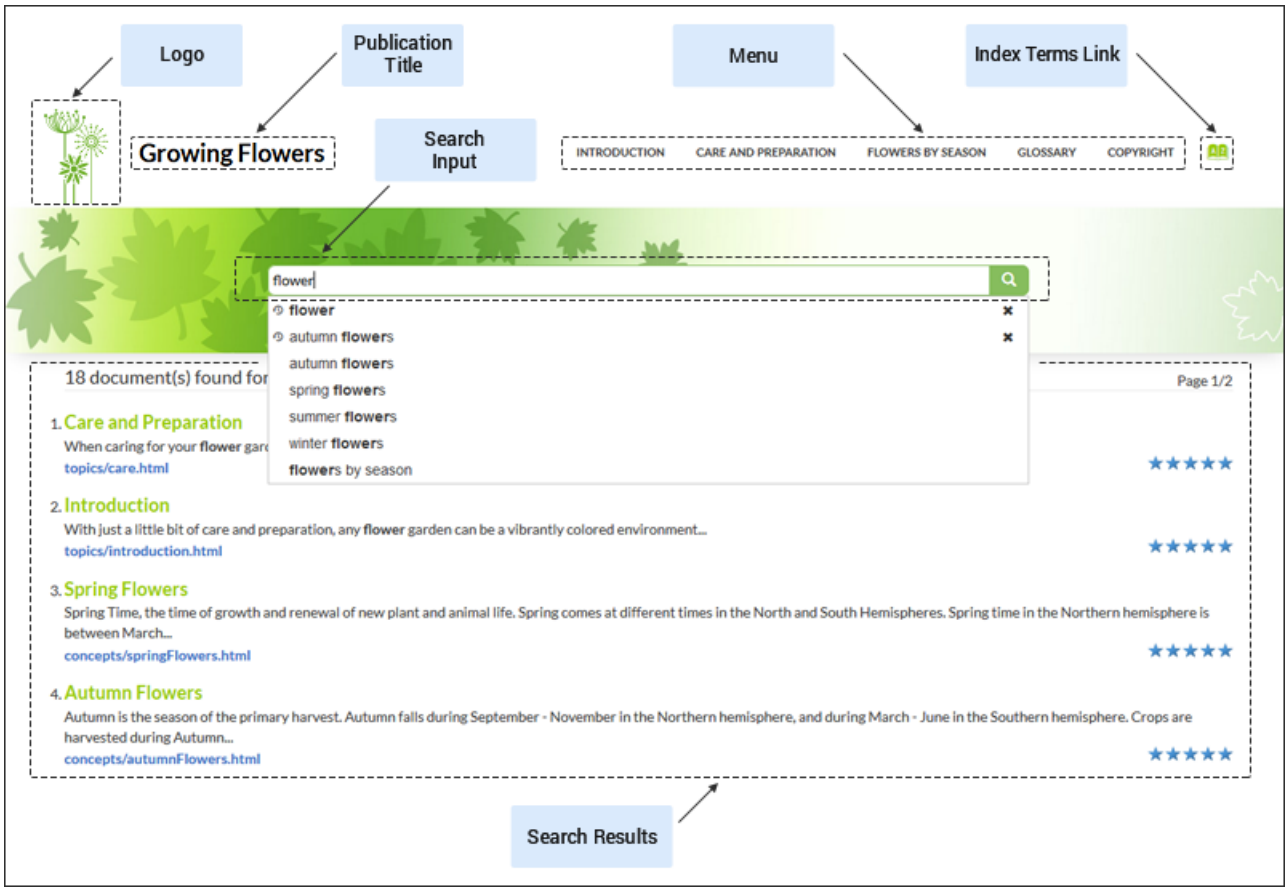

Figure 568: Search Results Page

Autocomplete Suggestions in the Search Text Field

When you are typing in the search text field, proposals are presented to help you to compute the search query. The information proposed when you are typing is collected from:

- The search queries from the history of the previous searches.
- The titles collected from your documentation.
- Documentation index terms and keywords. For example, in a DITA topic, the keywords and index terms are specified in the topic prolog section like this:

```
<prolog>
  <metadata>
 <keywords><indexterm>databases</indexterm></keywords>
 <keyword>installing</keyword>
 <keyword>uninstalling</keyword>
    <keyword>prerequisites</keyword>
  </metadata>
</prolog>
```

Missing Terms

If you enter multiple search terms (other than *stop words*), for any result that the search engine found at least one term but not one or more of the other terms, the **Missing** terms will be listed below each result.

Search Page Components

The layout components displayed in the search page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the webhelp.logo.image transformation parameter. For target URL use the webhelp.logo.image.target.url parameter.

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu on page 1089 topic.

Index terms link

Presents a link to the index terms page. You can control if this component is displayed by using the webhelp.show.indexterms.link parameter.

Search query input

Input text field allowing you to easily enter your search queries.

Search results area

This section is where the search results are displayed.

Page Footer

WebHelp Responsive output footer.

Index Terms Page

The *Index Terms Page* page consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section. The indexes are presented in multiple columns to make it easier to read this page.

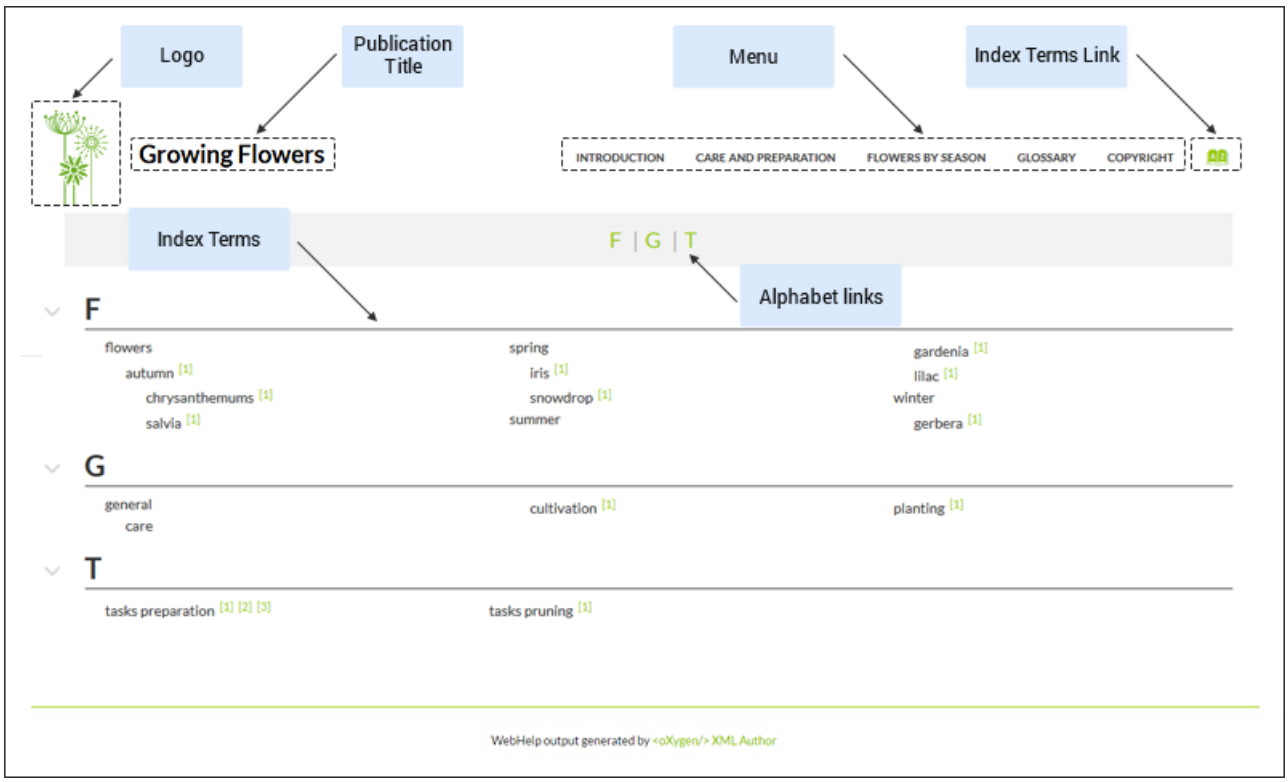

Figure 569: Index Terms Page

Index Terms Page Components

The layout components displayed in this page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the webhelp.logo.image transformation parameter. For target URL use the webhelp.logo.image.target.url parameter.

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu on page 1089 topic.

Index terms link

Presents a link to the index terms page. You can control if this component is displayed by using the webhelp.show.indexterms.link parameter.

Index Terms Alphabet

An alphabet that contains the first letter of index terms. Each letter represents a link to a specific indices section.

Index Term First Letter

The first letter of the index.

Page Footer

WebHelp Responsive output footer.

Search Engine

Search engine has two main components:

Search indexer

It is also known as a **spider**. This component is active when you publish your documentation to WebHelp and it is responsible for creating the *search index*. This component traverses all HTML pages (for DITA topics) to gather information.

Search interface

This component is an interface between the user and the *search index*. It helps the user to search through the *search index* and displays results in the search page.

Search Rules

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, *"grow flowers"* will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a *phrase search*.
- *Boolean Search* is supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).
- `indexterm` and `keywords` DITA elements are an effective way to increase the ranking of a page (for example, content inside a *keywords* element weighs more than an *H1* HTML element).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot (".") characters count as a single word.
- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

5-Star Rating Mechanism and Sorting

The **Search** feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
  - The search term is included in a meta keyword
  - The search term is in the title of the page
  - The search term is in bold text in a paragraph
  - The search term is in normal text in a paragraph

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see How to Change Element Scoring in Search Results on page 1096.

Excluded Terms

To improve performance, the **Search** feature excludes certain *stop words*. For example, the English version of such *stop words* include: *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*.

Feedback System

The **WebHelp Responsive with Feedback** variant contains a **Comments** section at the bottom of each topic. This section is where you can interact with users through a comment system. For information about deploying a feedback-enabled system, see Deploying a Feedback-Enabled System on page 1050.

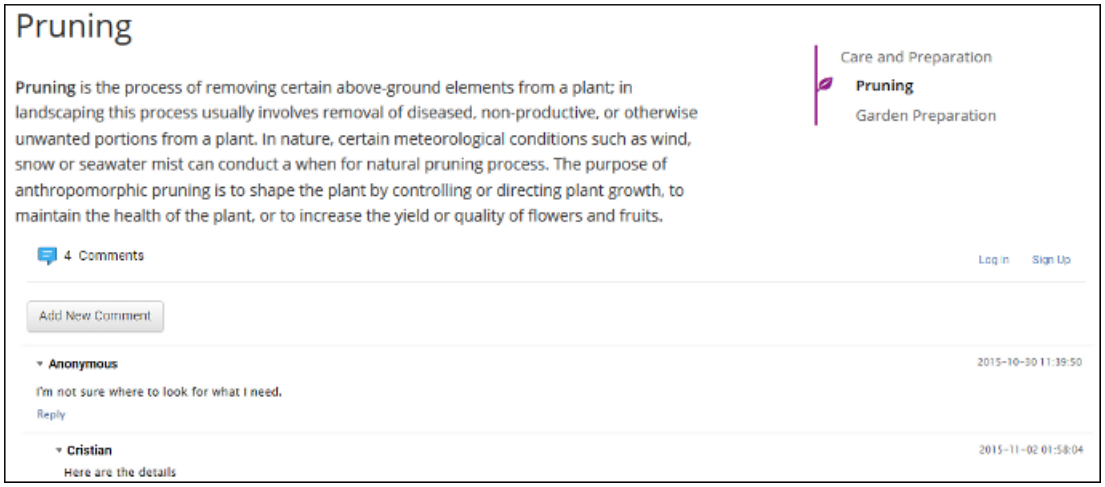

Figure 570: WebHelp Responsive with Feedback Comments Section

To add a new comment, click the **Add New Comment** button, or click **Reply** to add a comment to an existing thread. You can click on the **Log in** button on the right side of this bar to be authenticated as a user and your user name will be included in any comments that you add. If you do not have a user name, you can click on the **Sign Up** button to create a new user.

After you log in, your name and user name are displayed in the **Comments** bar, along with the **Log off** and **Edit** buttons. Click the **Edit** button to open the **User Profile** dialog box where you can customize the following options:

- **Your Name** - You can use this field to edit the initial name that you used to create your user profile.
- **Your email address** - You can use this field to edit the initial email address that you used to create your profile.
- You can choose to receive an email in the following situations:

    - When a comment is left on a page that you commented on.
    - When a comment is left on any topic in the WebHelp Classic system.
    - When a reply is left to one of my comments.
- **New Password** - Allows you to enter a new password for your user account.

  Note: The **Current Password** field from the top of the **User Profile** is mandatory if you want to save the changes you make.

If you are an administrator, you can manage user information and comments. For more information, see Managing Users and Comments in a Feedback-Enabled System on page 1052.

Related Information:

Deploying a Feedback-Enabled System on page 1050

Deploying a Feedback-Enabled System

System Requirements

The feedback-enabled WebHelp system requires a standard server deployment. You can request this from your server administrator and it requires the following system components:

- A Web server (such as *Apache Web Server*)
- A *MySQL* or *MariaDB* database server
- A database admin tool (such as *phpMyAdmin*)
- PHP Version 5.1.6 or later

The WebHelp system supports most of the recent versions of the following browsers: Chrome, Firefox, Edge, Internet Explorer, Safari, Opera.

Create WebHelp with Feedback Database

The **WebHelp with Feedback** system needs a database to store user details and the actual feedback, and a user added to it with all privileges. After this is created, you should have the following information:

- Database name
- Username
- Password

Exactly how you create the database and user depends on your web host and your particular needs.

Example:

The following procedure uses *phpMyAdmin* to create a MySQL database for the feedback system and a MySQL user with privileges for that database. The feedback system uses these credentials to connect to the database.

Using *phpMyAdmin* to create a database:

1. Access the *phpMyAdmin* instance running on your server.
2. Click *Databases* (in the right frame) and then create a *database*. You can give it any name you want (for example *comments*).
3. Create a user with connection privileges for this database.
4. Under *localhost*, in the right frame, click *Privileges* and then at the bottom of the page click the **reload the privileges** link.

Deploying the WebHelp with Feedback Output

If you have a web server configured with PHP and MySQL, you can deploy the **WebHelp with Feedback** output by following these steps:

1. Connect to your server using an FTP client.
2. Locate the home directory (from now on, referred to as *DOCUMENT_ROOT*) of your server.
3. Copy the transformation output folder into the `DOCUMENT_ROOT` folder.
4. Rename it to something relevant (for example, `myProductWebHelp`).

5. Open the output folder (for example, `http://[YOUR_SERVER]/myProductWebHelp/`). You are redirected to the installation wizard. Proceed with the installation as follows:
   a. Verify that the prerequisites are met.
   b. Press **Start Installation**.
   c. Configure the **Deployment Settings** section. Default values are provided, but you should adjust them as needed.

      Tip: You can change some of the options later. The installation creates a `config.php` file in `[OXYGEN_WEBHELP_INSTALL_DIR]/feedback/resources/php/config/config.php` where all your configuration options are stored.
   d. Configure the **MySql Database Connection Settings** section. Use the information (database name, username, password) from the Create WebHelp with Feedback Database section to fill-in the appropriate text boxes.

      Warning: Selecting the **Create new database structure** option will overwrite any existing data in the selected database, if it already exists. Therefore, it is useful the first time you install the **WebHelp with Feedback** system, but you do not want to select this option on subsequent deployments.
   e. If you are using a domain (such as *OpenLDAP* or *Active Directory*) to manage users in your organization, select the **Enable LDAP Autehntication** option. This will allow you to configure the LDAP server, which will provide information and credentials for users who will access the WebHelp system. Also, this will allow you to choose which of the domain users will have administrator privileges.
   f. If the **Create new database structure** option is selected, the **Create WebHelp Administrator Account** section becomes available. Here you can set the administrator account data. The administrator is able to moderate new posts and manage WebHelp users.

      The same database can be used to store comments for multiple **WebHelp with Feedback** deployments. If a topic is available in multiple deployments and there are comments associated with it, you can choose to display the comments in all deployments that share the database. To do this, select the **Display comments from other products** option. In the **Display comments from** section, a list with the deployments sharing the same database is displayed. Select the deployments allowed to share common feedback.

      Note: You can restrict the displayed comments of a product depending on its version. If you have two products that use the same database and you restrict one of them to display comments starting from a certain version, the comments of the other product are also displayed from the specified version onwards.
   g. Press **Next Step**.
   h. Remove the installation folder from your web server.

      Important: When you publish subsequent iterations of your **WebHelp with Feedback** system, you will not upload the `/install` folder in the output, as you only need it uploaded the first time you create the installation. On subsequent uploads, you will just upload the other output files.
   i. In your Web browser, go to your **WebHelp with Feedback** system main page.

Testing Your WebHelp with Feedback System

To test your system, create a user and post a comment. Check to see if the notification emails are delivered to your email inbox.

Note: To read debug messages generated by the system:

1. Enable *JavaScript* logging by doing one of the following:
   - Open the `log.js` file, locate the `var log= new Log(Level.NONE);` line, and change the logging level to: `Level.INFO`, `Level.DEBUG`, `Level.WARN`, or `Level.ERROR`.
   - Append `?log=true` to the WebHelp URL.
2. Inspect the PHP and Apache server log files.

Documentation Product ID and Version

When you run a **WebHelp with Feedback** transformation scenario, by default you are prompted for a documentation product ID and version number. This is needed when multiple WebHelp systems are deployed on the same server. Think of your WebHelp output as a *product*. If you have three different WebHelp outputs, you

have three different *products* (each with their own unique documentation product ID). This identifier is included in a configuration file so that comments are tied to a particular output (product ID and version number).

Note: The **WebHelp with Feedback** installation includes a configuration option (**Display comments from other products**) that allows you to choose to have comments visible in other specified *products*.

Related Information:

Managing Users and Comments in a Feedback-Enabled System on page 1052

Refreshing the Content of a Feedback-Enabled System

It is common to update the content of an existing installation of a **WebHelp with Feedback** system on a regular basis. In this case, reinstalling the whole system is not a viable option since it might result in the loss of the comments associated with your topics. Also, reconfiguring the system every time you want to refresh it may be time consuming.

Fortunately, you can refresh just the content without losing the comments or the initial system configuration. To do so, follow these steps:

1. Execute the transformation scenario that produces the *WebHelp with Feedback* output directory.
2. Go to the output directory (specified in the **Output** tab of the transformation scenario), locate the `\feedback\resources\php\config\config.php` file, and delete it.
3. Locate the `\feedback\install` directory and delete it.
4. Copy the remaining structure of the output folder and paste it into your *WebHelp with Feedback* system installation directory, overwriting the existing content.

Managing Users and Comments in a Feedback-Enabled System

When you installed the **WebHelp with Feedback** system the first time (assuming the **Create new database structure** option was selected), you should have been prompted to create an administrator account (or a user named *administrator* was created by default). As an administrator, you have access to manage comments posted in your feedback-enabled WebHelp system. You can also manage the user information (such as role, status, or notification options).

To manage comments and user information, follow these steps:

1. At the bottom of each specific topic there is a **Comments** navigation bar and on the right side there is a **Log in** button. Click this button and log in with your administrator credentials. This gives you access to an **Admin Panel** button.
2. Click the **Admin Panel** button to display an administration page.

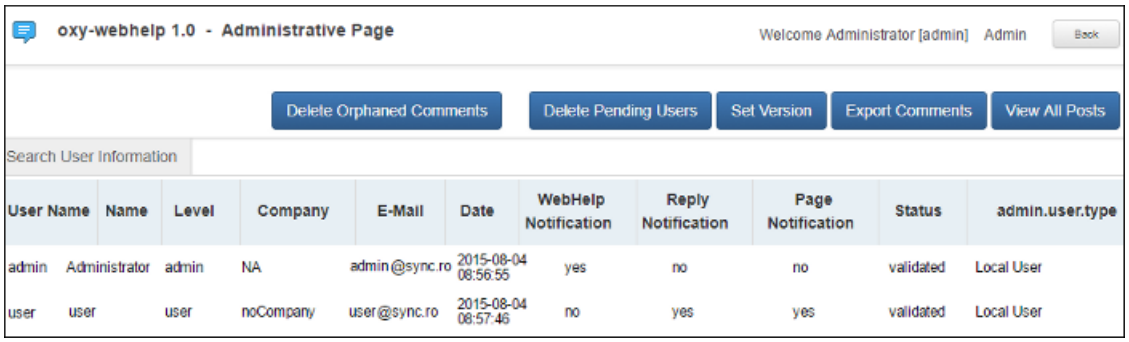

Figure 571: Administrative Page

3. Use this page to manage the following options:

Delete Orphaned Comments

Allows you to delete comments that are no longer associated with a topic in your WebHelp system.

Delete Pending Users

Allows you to delete user accounts that you do not wish to activate.

View All Posts

Allows you to view all the comments that are associated with topics in your WebHelp system.

Export Comments

Allows you to export all posts associated with topics in your WebHelp system into an XML file.

Set Version

Use this action to display comments starting with a particular version.

Manage User Information

To edit the details for a user, click on the corresponding row. This opens a window that allows you to customize the following information associated with the user:

Name

The full name of the user.

Level

Use this field to modify the privilege level (role) for the selected user. You can choose from the following:

- **User** - Regular user, able to post comments and receive e-mail notifications.
- **Moderator** - In addition to the regular **User** rights, this type of user has access to the **Admin Panel** where a moderator can view, delete, export comments, and set the version of the feedback-enabled WebHelp system.
- **Admin** - Full administrative privileges. Can manage WebHelp-specific settings, users, and their comments.

Company

The name of the organization associated with the user.

E-Mail

The contact email address for the user. This is also the address where the WebHelp system sends notifications.

WebHelp Notification

When selected, the user receives notifications when comments are posted anywhere in your feedback-enabled WebHelp system.

Reply Notification

When selected, the user receives notifications when comments are posted as a reply to one of their comments.

Page Notification

When selected, the user receives notifications when comments are posted on a topic where they previously posted a comment.

Date

The date the user registered is displayed.

Status

Use this drop-down list to change the status of the user. You can choose from the following:

- **Created** - The user is created but does not yet have any rights for the feedback-enabled WebHelp system.
- **Validated** - The user is able to use the feedback-enabled WebHelp system.
- **Suspended** - The user has no rights for the feedback-enabled WebHelp system.

Warning: The key used for identifying the page a comment is attached to is the relative file path to the output page. Since the output file and folder names mirror the source, any change to the file name (or its folder) in the source will affect the comments associated with that WebHelp page. If you change the file name or path, the comment history for that topic will become orphaned (a change to the topic ID does not affect the comment history).

Context-Sensitive Help System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

Generating Context-Sensitive Help

When WebHelp Responsive output is generated, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `appContext` element, as in the following example:

```
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
  <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
    . . .
</map>
```

The possible attributes are as follows:

`helpID`

A Unique ID provided by a topic from two possible sources (`resourceid` element or `id` attribute):

`resourceid`

The `resourceid` element is mapped into the `appContext` element and can be specified in either the `topicref` within a *DITA map* or in a `prolog` within a DITA topic. The `resourceid` element accepts the following attributes:

- **`appname`** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty (" ").
- **`appid`** - An ID used by an application to identify the topic.
- **`id`** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an **`appid`** attribute is used.

Note: Multiple `appid` values can be associated with a single `appname` value (and multiple `appname` values can be associated with a single `appid` value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the `appid` and `appname` attributes should be unique within the context of a single *root map*. For example, suppose that you need two different functions of an application to both open the same WebHelp page.

Example: `resourceid` Specified in a DITA Map

The `resourceid` element can be specified in a `topicmeta` element within a `topicref`.

```
<map title="App Help">
  <topicref href="app-help1.dita" type="task">
     <topicmeta>
       <resourceid appname="myapp" appid="functionid1"/>
       <resourceid appname="myapp" appid="functionid2"/>
     </topicmeta>
  </topicref>
</map>
```

Example: `resourceid` Specified in a DITA Topic

The `resourceid` element can be specified in a `prolog` element within a DITA topic.

```
<task id="app-help1">
  <title>My App Help</title>
  <prolog>
    <resourceid appname="myapp" appid="functionid1"/>
    <resourceid appname="myapp" appid="functionid2"/>
  </prolog>
...
</task>
```

For more information about the `resourceid` element, see DITA Specifications: <resourceid>.

`id`

If a `resourceid` element is not declared in the *DITA map* or DITA topic (as described above), the `id` attribute that is set on the topic root element is mapped into the `appContext` element.

Important: You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

`path`

The path to a corresponding WebHelp page. This path is relative to the location of the `context-help-map.xml` mapping file.

`productID` (Applicable only if you are using the WebHelp Responsive with Feedback transformation scenario)

The ID of the product for your documentation project.

`productVersion` (Applicable only if you are using the WebHelp Responsive with Feedback transformation scenario)

The version of the product for your documentation project.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the `contextId` value and will look it up in the XML file.
- Invoke the `index.html` WebHelp system file and pass the `contextId` parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the `contextId` parameter.

```
index.html?contextId=myDITATopic
```

Note: The `contextId` parameter is not case sensitive.

Context-Sensitive Queries

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

- **contextId** - The WebHelp JavaScript engine will look for this value in the `context-help-map.xml` mapping file and load the corresponding help page.

  Note: You can use an *anchor* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.
- **appname** - You can use this parameter in conjunction with `contextId` to search for this value in the corresponding *appname* attribute value in the mapping file.

```
http://localhost/webhelp/index.html?contextId=topicID&appname=myApplication
```

Another parameter indicates the search query:

- **searchQuery** - You can use this parameter to perform a search operation when WebHelp is loaded. For example, if you want to open WebHelp showing all search results for *growing flowers*, the URL should look like this: `http://localhost/webhelp/index.html?searchQuery=growing%20flowers`.

Publishing Templates

An *Oxygen Publishing Template* defines all aspects of the layout and styles for **WebHelp Responsive** output. It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Some possible customizations include:

- Add additional template resources to customize the output (such as logos, favicons, or CSS files).
- Change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.

The following graphic is sample structure for an *Oxygen Publishing Template* package:

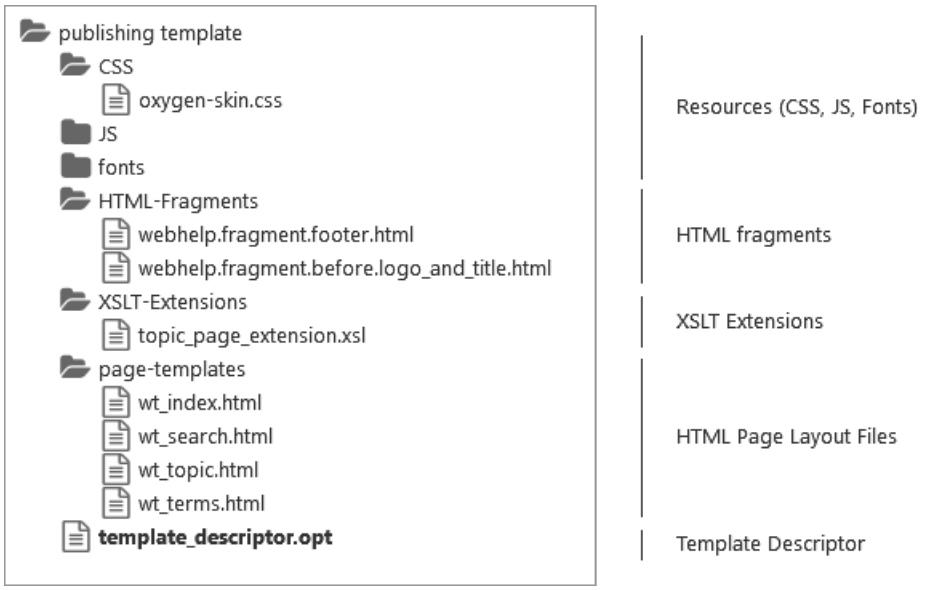

Figure 572: Oxygen Publishing Template Package

How to Add a Publishing Template to the Publishing Templates Gallery on page 1084
How to Use a Publishing Template from Command Line on page 1084

Publishing Templates Gallery

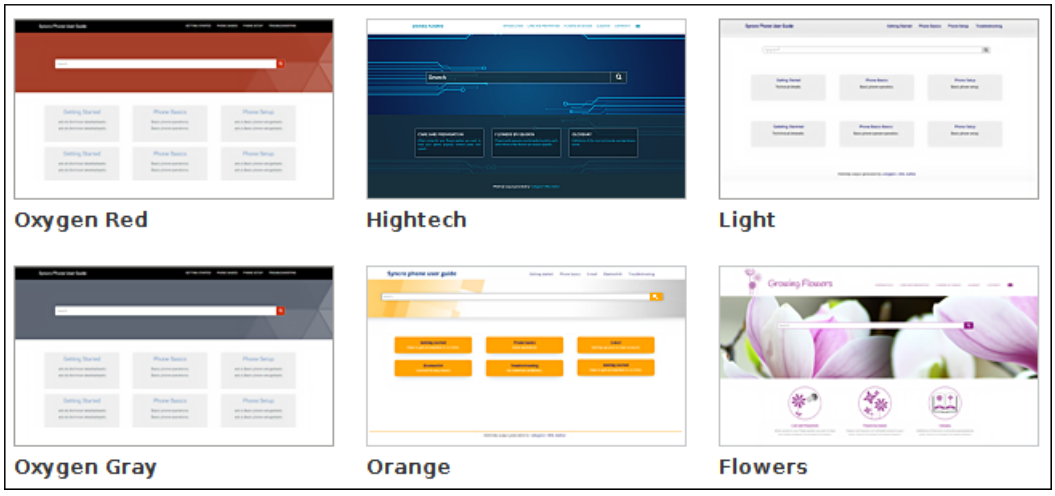
Oxygen XML Editor plugin comes bundled with a variety of built-in templates. You can use one of them to publish your documentation or as a starting point for a new publishing template.

Built-in Templates

There are two categories of templates, *Tiles* and *Tree*. You can see the built-in templates in the **Templates** tab when editing a WebHelp Responsive transformation scenario in **Oxygen XML Editor/Author**. Each one also includes an **Online preview** link that opens a webpage in your default browser that provides a sample of how the main page will look when that particular template is used to generate the output.

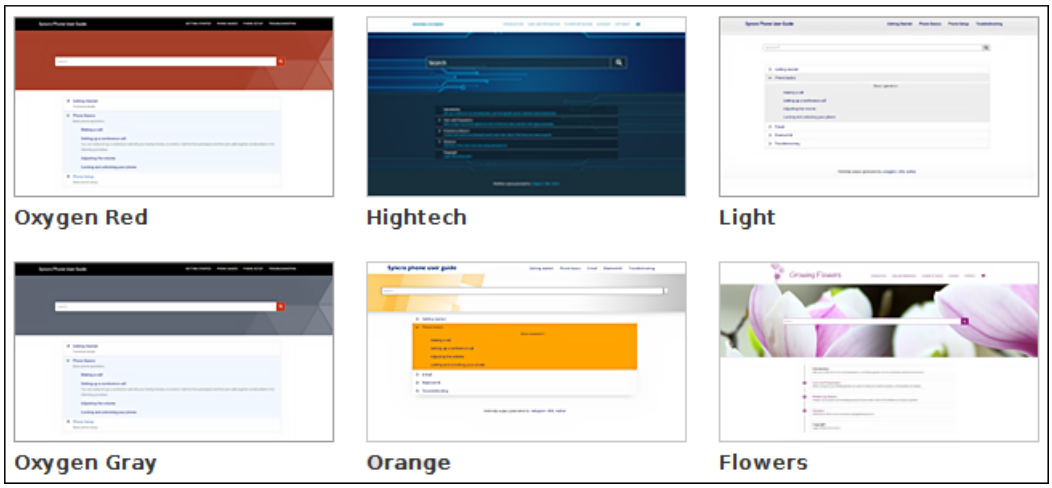
Tiles Templates

The main page in the WebHelp output presents a tile for each main topic (chapter) of the documentation.



Tree Templates

The main page in the WebHelp output presents a tree-like table of contents.



Built-in Templates Location

All built-in templates are stored in the following directory: *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.responsive/templates`.

Custom Templates

You can use a built-in template as a starting point for creating your own custom template. You can store all of your custom templates in a particular directory. Then, go to **Options** > **Preferences** > **DITA** > **Publishing** and add your directory to the list, and all the templates stored in that directory will be displayed in the preview pane in the transformation scenario's **Template** tab along with all the built-in templates.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to **Options** > **Preferences** > **DITA** > **Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

Publishing Template Package Contents

An *Oxygen Publishing Template* package must contain a template descriptor file and some other resources (such as CSS files). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.

Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with template. It is an XML file that defines all the resources included in a template (such as HTML page layout files, CSS, JS, fonts, and transformation parameters).

The template descriptor file must have the `.opt` file extension and must be located in the templates' root folder.

A template descriptor might look like this:

```
<publishing-template>
    <name>Flowers</name>

    <webhelp>
        <tags>
            <tag>tree</tag>
            <tag>light</tag>
        </tags>
        <preview-image file="flowers-tree.png"/>
```

```
        <!-- Resources (CSS, favicon, logo and others) -->
        <resources>
            <!-- Main CSS file -->
            <css file="flowers.css"/>

             <!-- Resources to copy to the output folder -->
            <fileset>
                <include name="resources/**/*"/>
                <exclude name="resources/**/.svn"/>
                <exclude name="resources/**/.git"/>
            </fileset>
        </resources>

        <parameters>
            <parameter name="webhelp.show.main.page.tiles" value="no"/>
            <parameter name="webhelp.show.main.page.toc" value="yes"/>
            <parameter name="webhelp.top.menu.depth" value="3"/>
        </parameters>
    </webhelp>
</publishing-template>
```

Tip: It is recommended to edit the template descriptor in **Oxygen XML Editor/Author** because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a **name** element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a **description** and it displayed when the user hovers over the template in the transformation scenario dialog box.

```
<publishing-template>
    <name>Lorem Ipsum</name>
    <description>Lorem ipsum dolor sit amet, consectetur adipiscing elit</description>
    ...
```

Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the **author** element, a **name** is required and optionally you can include **email**, **organization**, and **organizationUrl** information.

```
<publishing-template>
    ...
    <author>
      <name>John Doe</name>
      <email>jdoe@example.com</email>
      <organization>ACME</organization>
      <organizationUrl>http://www.example.com/jdoe</organizationUrl>
    </author>
    ...
```

Webhelp Element

The **webhelp** element contains various details that define the WebHelp Responsive output. The elements that are allowed in this **webhelp** section specify the template tags, template preview image, resources (such as CSS, JS, fonts, logos), HTML page layout files, transformation parameters, HTML fragment extensions (used to add fragments to placeholders), or XSLT extensions.

```
    <webhelp>
        <tags>
          ...
        </tags>
        <preview-image file="MyPreview.png"/>

        <resources>
          ...
        </resources>

        <html-page-layouts>
          ...
        </html-page-layouts>
```

```
        <parameters>
          ...
        </parameters>
    </webhelp>
```

Template Tags

The **tags** section provides meta information about the template (such as layout type or color theme). Each **tag** is displayed at the top of the **Templates** tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```
<publishing-template>
    ...
    <webhelp>
      <tags>
        <tag>tree</tag>
        <tag>dark</tag>
      </tags>
```

Template Preview Image

The **preview-image** element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be `200 x 115` pixels and the supported image formats are: `JPEG`, `PNG`, or `GIF`.

You can also include an **online-preview-url** element to specify the URL of a published sample of your template. This will display an **Online preview** link inside the image in the transformation scenario dialog box and if the user clicks that link, it will open the specified URL in their default browser.

```
<publishing-template>
    ...
    <webhelp>
      ...
      <preview-image file="ashes/ashes-tree.png"/>
      <online-preview-url=https://www.example.com/samples/tiles/ashes</online-preview-url>
```

Template Resources

The **resources** section of the descriptor file specifies a set of resources (CSS, JS, fonts, logos, etc.) that are used to customize various components in generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included, while the other types of resources are optional.

The types of resources that can be specified include:

- **CSS files** - One or more CSS files that will define the styles of all generated HTML pages.
- **Favicon** - You can specify the path to an image for the *favicon* associated with your website.
- **Logo** - You can specify the path to a logo image that will be displayed in the left side of the output header. Optionally, you can also specify a **target-url** that will redirect the user to the specified URL if they click the logo in the output.
- **Additional Resources (JS, Fonts)** - You can specify one or more sets of additional resources that will be copied to the output folder during the transformation process. These resources are specified with the **fileset** element and you can use one or more **include** and **exclude** elements. This semantic is similar to the ANT FileSet.

```
<publishing-template>
    ...
    <webhelp>
      ...
      <resources>
          <css file="css/custom_styles.css"/>
          <css file="css/custom_fonts.css"/>

          <favicon file="images/favicon.png"/>

          <logo
           file="images/logo.png"
           target-url="http://www.example.com"/>

          <fileset>
              <include name="common/**/*"/>
              <include name="JS/**/*"/>
              <exclude name="**/*.svn"/>
```

```
            <exclude name="**/*.git"/>
        </fileset>
    </resources>
```

Note: All relative paths specified in the descriptor file are relative to the template root folder.

The resources specified in the template descriptor are copied to the following output folder: *[WebHelp_OUTPUT_DIR]*`/oxygen-webhelp/template`. The following graphic illustrates the mapping between the template resources and the location where they will be copied to the output folder:

Figure 573: Template Resources Mapping

HTML Page Layout Files

The HTML page layout files define the layout of the generated pages in the output. There are four types of pages (*main*, *search*, *topic*, *index*) and each type of page is a simple HTML file. Each type of page is defined inside an **html-page-layout-files** element in the descriptor file.

```
<publishing-template>
    ...
    <webhelp>
    ...
    <!-- HTML page layout files -->
    <html-page-layout-files>
      <page-layout-file page="main" file="page-templates/wt_index.html"/>
      <page-layout-file page="search" file="page-templates/wt_search.html"/>
      <page-layout-file page="topic" file="page-templates/wt_topic.html"/>
      <page-layout-file page="index-terms" file="page-templates/wt_terms.html"/>
    </html-page-layout-files>
```

These HTML files are not required in the descriptor file, but if you do use the **html-page-layout-files** element, you must specify all four types of pages (*main*, *search*, *topic*, *index*). If you do not specify these HTML page layout files, the files from the *[WebHelp_OUTPUT_DIR]*`/oxygen-webhelp/page-templates` folder will be used to define the layout of each type of page.

HTML Page Components

Each type of page contains various components that control the layout of that page. The rendering of each component depends on the context where it is placed and its content depends on the transformed *DITA map*.

Some of the components can be used in all four types of pages, while some are only available for certain pages. For instance, the *Publication Title* component can be used in all pages, but the *Navigation Breadcrumb* component can only be used in the **Topic Page**.

To include a component in the output of a particular type of page, you have to reference a specific element in that particular HTML file. All the elements associated with a component should belong to the `http://www.oxygenxml.com/webhelp/components` namespace.

Every component can contain custom content or reference another component. To specify where the component content will be located in the output, you can use the whc`:component_content` element as a descendant of

the component element. It can specify the location as before, after, or it can wrap the component content. The following snippet contains an example of each:

```
<whc:webhelp_search_input class="navbar-form wh_main_page_search"
       role="form" >
       <div class="custom-content-before">Enter search terms here:</div>
 <div class="custom-wrapper">
        <whc:component_content/>
 </div>
       <div class="custom-content-after">Results will be displayed in a new window.</div>
</whc:webhelp_search_input>
```

Main Page

The *Main Page* is the home page generated in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_index.html` and it is located in the following directory: *[WebHelp_OUTPUT_DIR]*`/oxygen-webhelp/page-templates`.

The main function of the home page is to display top level information and provide links that help you easily navigate to any of the top level topics of the publication. These links can be rendered in either a *Tiles* or *Tree* style of layout. The HTML page produced for the home page also consists of various other components, such as a logo, title, menu, search field, or index link.

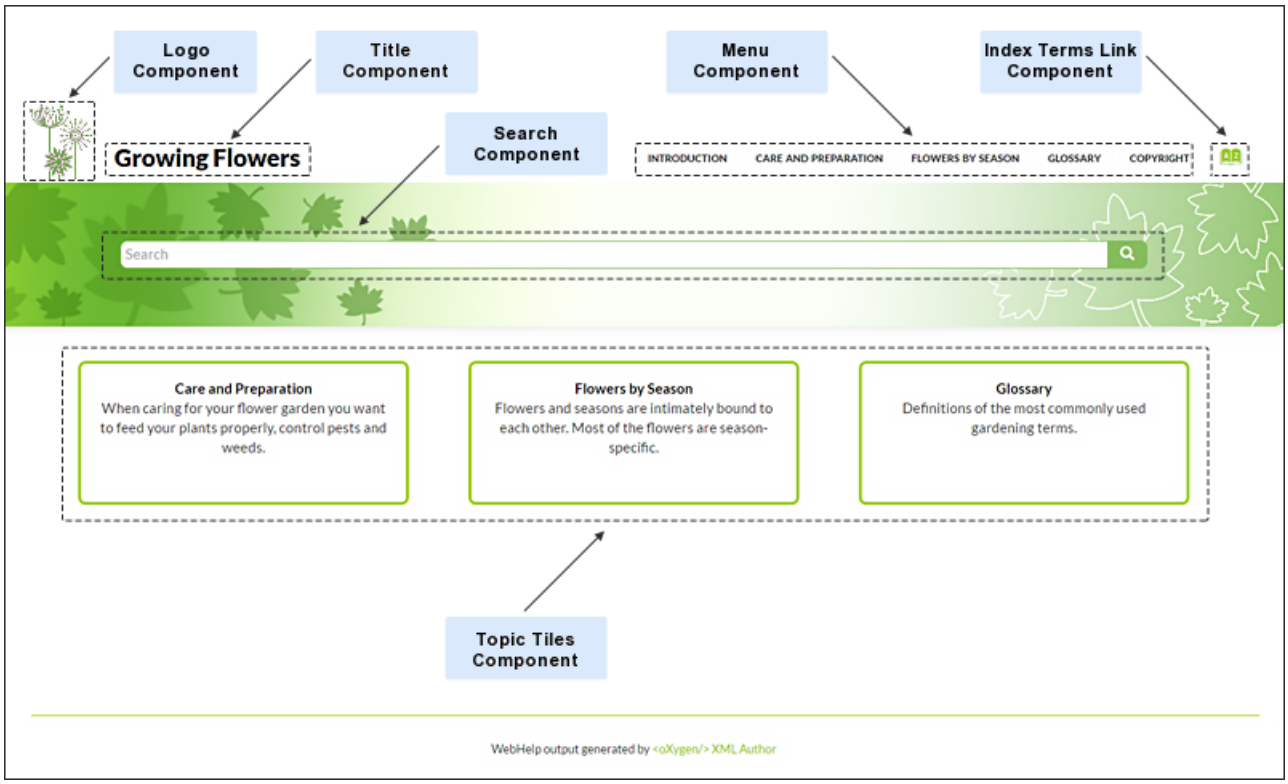


Figure 574: Examples of Main Page Components for a Tiles Style of Layout

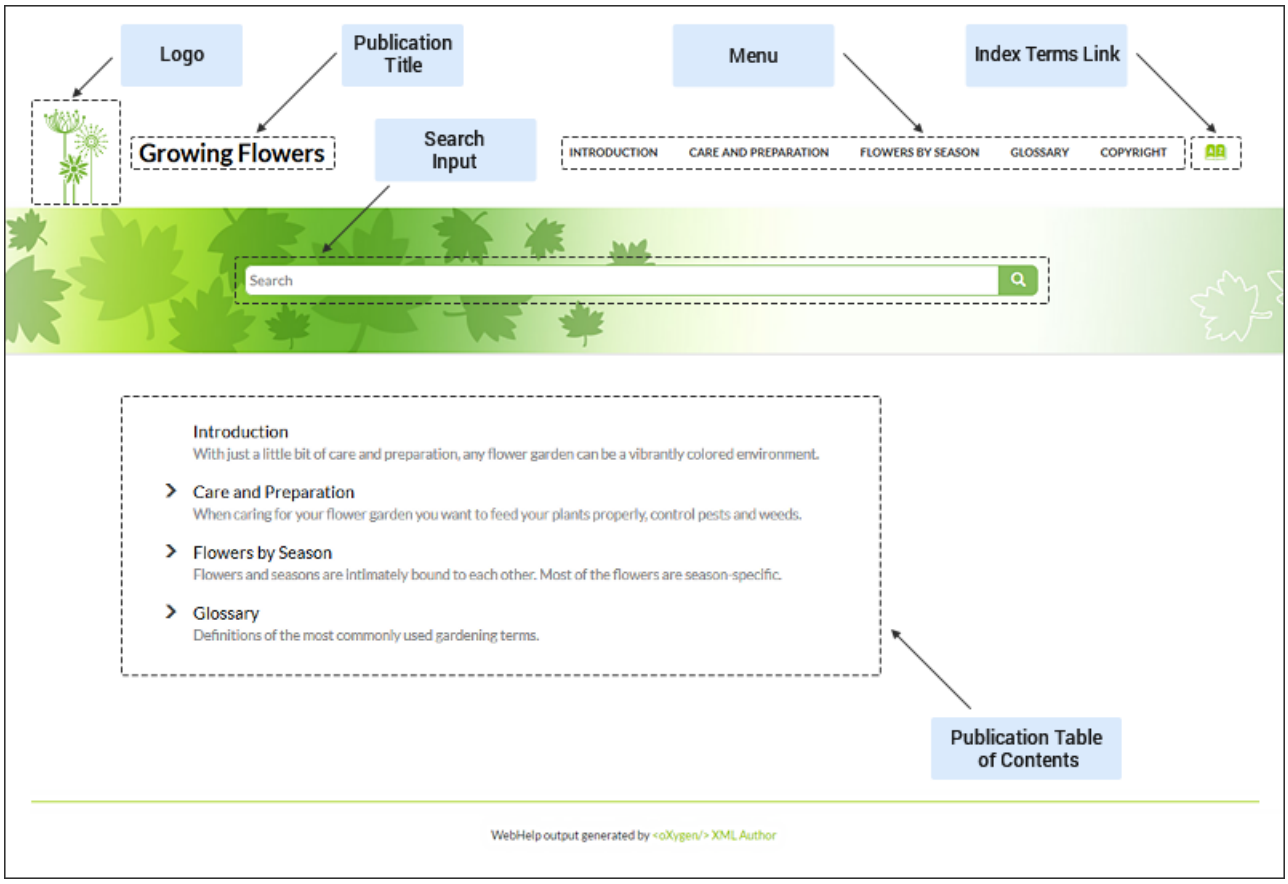

Figure 575: Examples of Main Page Components for a Tree Style of Layout

The following components can be referenced in the *Main Page* (`wt_index.html`) file:

Publication Title (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_input`.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `webhelp_print_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_print_link`.

Main Page Menu (`webhelp_topics_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `webhelp_topics_menu` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topics_menu
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_topics_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu on page 1089.

Main Page Topic Tiles (`webhelp_tiles`)

This component generates the tiles section in the main page. This section will contain a tile for each root topic of the published documentation. Each topic tile has three sections that corresponds to the topic title, short description, and image. To generate this component, the `webhelp_tiles` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_tiles
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_tiles`.

If you want to control the HTML structure that is generated for a WebHelp tile you can also specify the template for a tile by using the `whc:webhelp_tile` component, as in the following example:

```
<whc:webhelp_tile class="col-md-4">
  <!-- Place holder for tile's image -->
  <whc:webhelp_tile_image/>

  <div class="wh_tile_text">
    <!-- Place holder for tile's title -->
     <whc:webhelp_tile_title/>

     <!-- Place holder for tile's shordesc -->
     <whc:webhelp_tile_shortdesc/>
  </div>
</whc:webhelp_tile>
```

For information about customizing the tiles, see How to Configure the Tiles on the WebHelp Responsive Main Page on page 1091.

Main Page Table of Contents (`webhelp_main_page_toc`)

This component generates a simplified Table of Contents. It is simplified because it contains only two levels from the documentation hierarchy. To generate this component, the `webhelp_main_page_toc` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_main_page_toc
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_main_page_toc`.

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contains any index terms, then the link will not be generated. To generate this component, the `webhelp_indexterms_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `webhelp_skin_resources` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

Topic Page

The *Topic Page* is the page generated for each DITA topic in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_topic.html` and it is located in the following directory: *`[WebHelp_OUTPUT_DIR]`*`/oxygen-webhelp/page-templates`.

The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

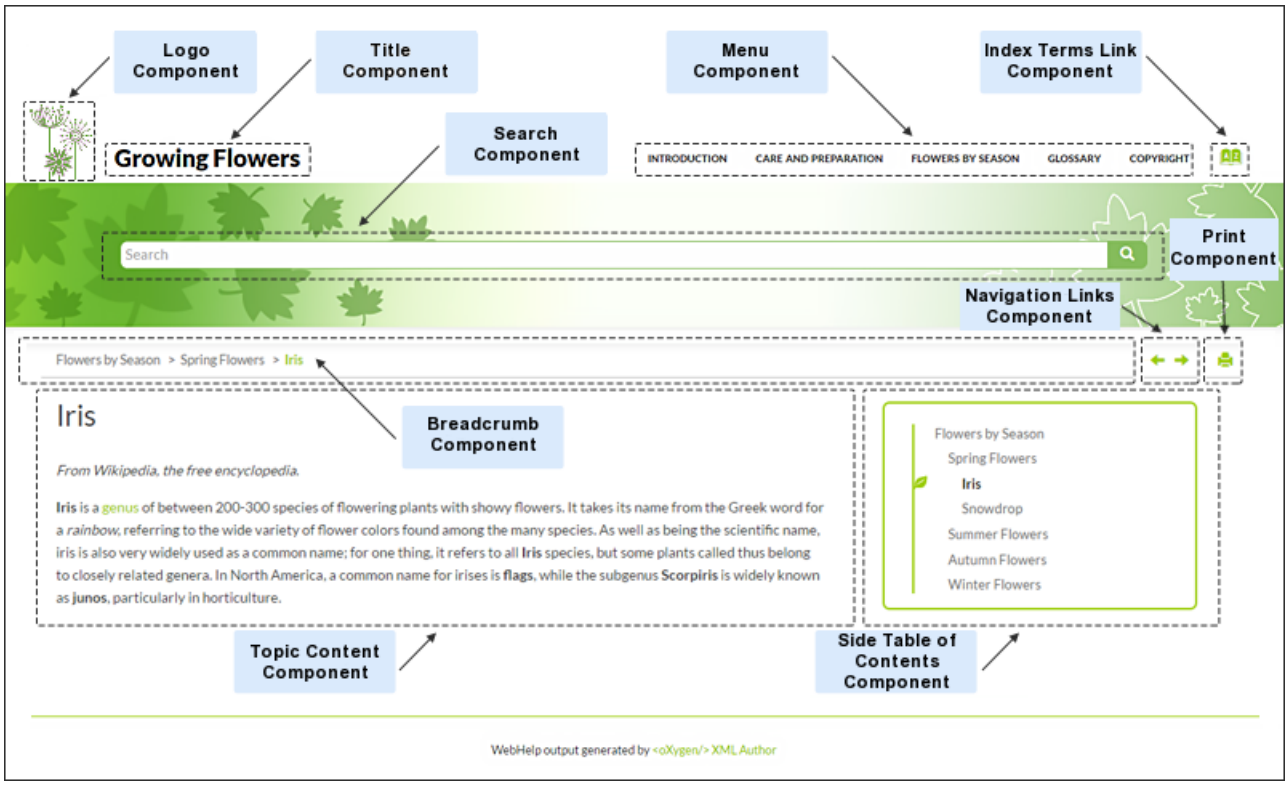

Figure 576: Examples of Topic Page Components

The following components can be referenced in the *Topic Page* (`wt_topic.html`) file:

Publication Title (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_input`.

Topic Breadcrumb (`webhelp_breadcrumb`)

This component generates a breadcrumb that displays the path of the current topic. To generate this component, the `webhelp_breadcrumb` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_breadcrumb
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_breadcrumb`. This element will contain a list with items that correspond to the topics in the path. The first item in the list has a link to the main page with the `home` class. The last item in the list corresponds to the current topic and has the `active` class set.

Navigation Links (`webhelp_navigation_links`)

This component generates navigation links to the next and previous topics. To generate this component, the `webhelp_navigation_links` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_navigation_links
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_navigation_links`. This element will contain the links to the next and previous topics.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `webhelp_print_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_print_link`.

Topic Content (`webhelp_topic_content`)

This component generates the content of a topic and it represent the content of the HTML files as they are produced by the DITA-OT processor. To generate this component, the `webhelp_topic_content` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topic_content
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_topic_content`.

Publication TOC (`webhelp_publication_toc`)

This component generates a mini table of contents for the current topic (on the left side). It will contain links to the children of current topic, its siblings, and all of its ancestors. To generate this component, the `webhelp_publication_toc` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_toc
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_toc`. This element will contain links to the topics that are close to the current topic.

Topic TOC (`webhelp_topic_toc`)

This component generates a topic table of contents for the current topic (on the right side). This table of contents contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. To generate this component, the `webhelp_topic_toc` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topic_toc
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_topic_toc`. This element will contain links to the topics that are close to the current topic.

Expand/Collapse Sections (`webhelp_expand_collapse_sections`)

This component is used to generate an icon that expands or collapses sections listed in the side table of contents within a topic. To generate this component, the `webhelp_expand_collapse_sections` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_expand_collapse_sections
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `webhelp_expand_collapse_sections`.

Topic Feedback (`webhelp_feedback`)

This component generates a placeholder for where the comments section will be presented. To generate this component, the `webhelp_feedback` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_feedback
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

Main Page Menu (`webhelp_topics_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `webhelp_topics_menu` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topics_menu
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_topics_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu on page 1089.

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contains any index terms, then the link will not be generated. To generate this component, the `webhelp_indexterms_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

Child Links (`webhelp_child_links`)

For all topics with subtopics (child topics), this component generates a list of links to each child topic. To generate this component, the `webhelp_child_links` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_child_links
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

Related Links (`webhelp_related_links`)

For all topics that contain related links, this component generates a list of related links that will appear in the output. To generate this component, the `webhelp_related_links` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_related_links
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `webhelp_skin_resources` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

Search Results Page

The *Search Results Page* is the page generated that present search results in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_search.html` and it is located in the following directory: *`[WebHelp_OUTPUT_DIR]`*`/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of a search results component along with various other additional components, such as a title, menu, or index link.

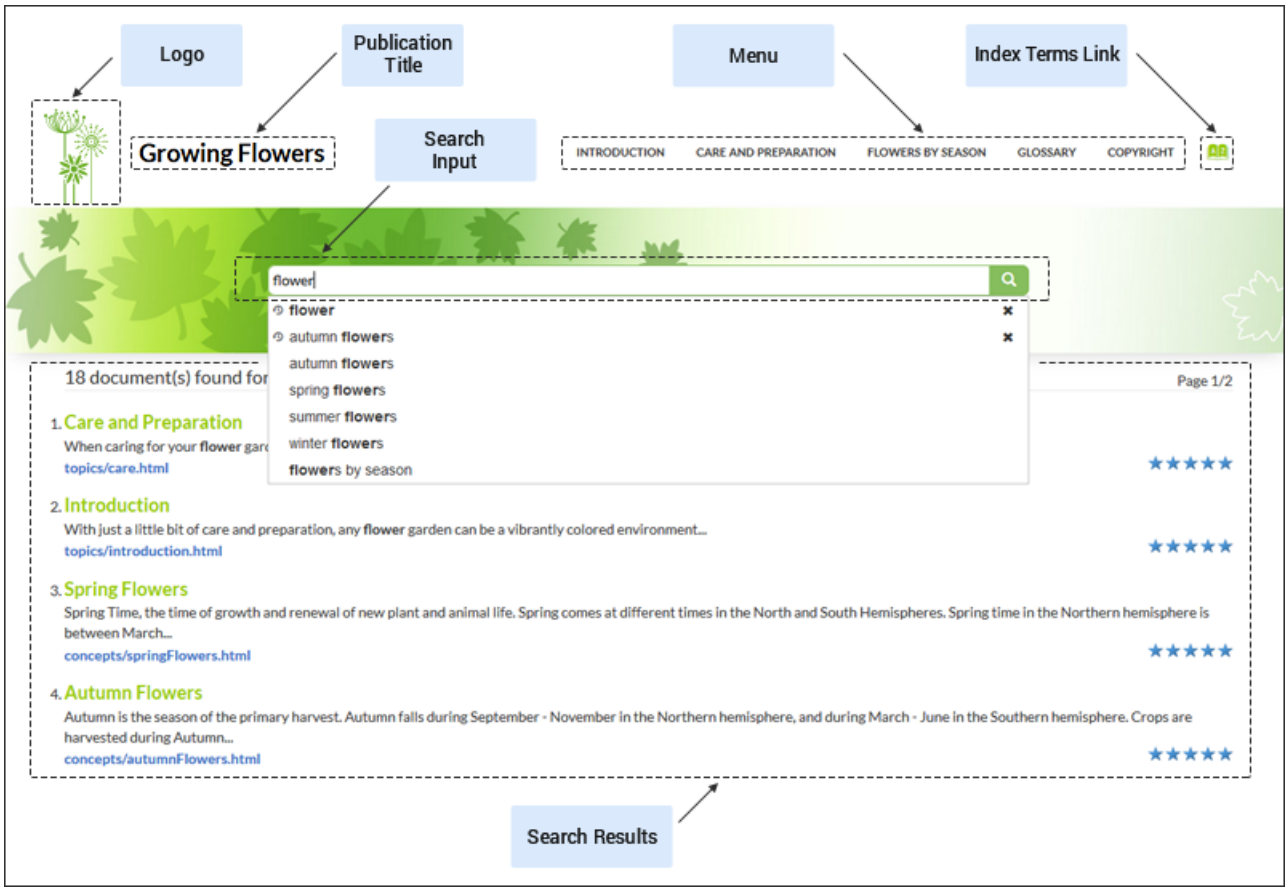

Figure 577: Examples of Search Results Page Components

The following components can be referenced in the *Search Results Page* (`wt_search.html`) file:

Publication Title (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_input`.

Search Results (`webhelp_search_results`)

This component is used to generate a placeholder to signal where the search results will be presented in the output. To generate this component, the `webhelp_search_results` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_results
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_results`.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `webhelp_print_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_print_link`.

Main Page Menu (`webhelp_topics_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `webhelp_topics_menu` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topics_menu
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_topics_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu on page 1089.

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contains any index terms, then the link will not be generated. To generate this component, the `webhelp_indexterms_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `webhelp_skin_resources` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

Index Terms Page

The *Index Terms Page* is the page generated that presents index terms in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_terms.html` and it is located in the following directory: *`[WebHelp_OUTPUT_DIR]`*`/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section.

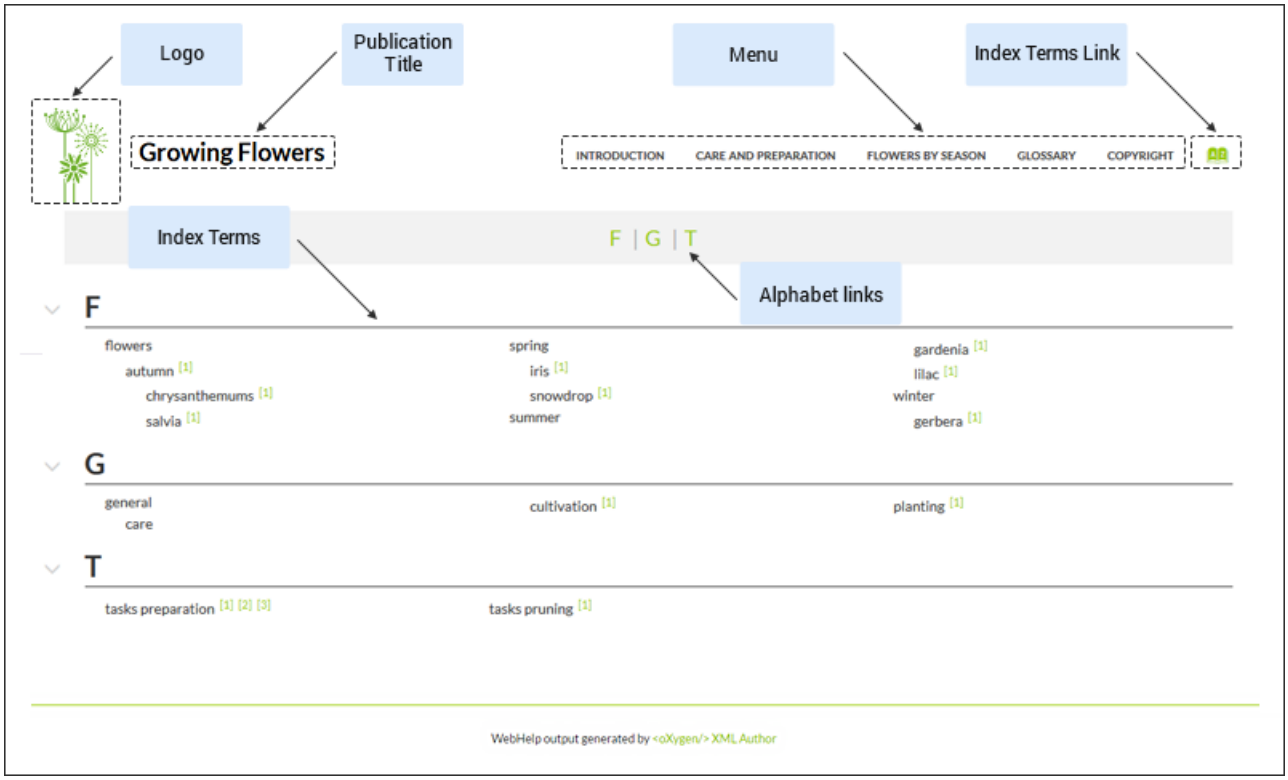

Figure 578: Examples of Index Terms Page Components

The following components can be referenced in the *Index Terms Page* (`wt_terms.html`) file:

Publication Title (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_input`.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `webhelp_print_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_print_link`.

Main Page Menu (`webhelp_topics_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `webhelp_topics_menu` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topics_menu
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_topics_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu on page 1089.

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contains any index terms, then the link will not be generated. To generate this component, the `webhelp_indexterms_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `webhelp_skin_resources` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

HTML Fragment Extension Points

The HTML pages contain component placeholders that can be used to insert custom HTML fragments.

You can specify one or more HTML fragment extension points in the descriptor file using the following structure:

```
<publishing-template>
    ...
    <webhelp>
      ...
      <html-fragments>
        <fragment
          file="html-fragments/webhelp.fragment.welcome"
          placeholder="webhelp.fragment.welcome"/>
        <fragment
          file="html-fragments/webhelp.fragment.footer.html"
          placeholder="webhelp.fragment.footer"/>
      </html-fragments>
```

Some of these placeholders are left empty in the default output configurations, but you can use them to insert custom content.

Each placeholder has an associated parameter in the transformation. These predefined empty placeholder parameters are illustrated and described below.

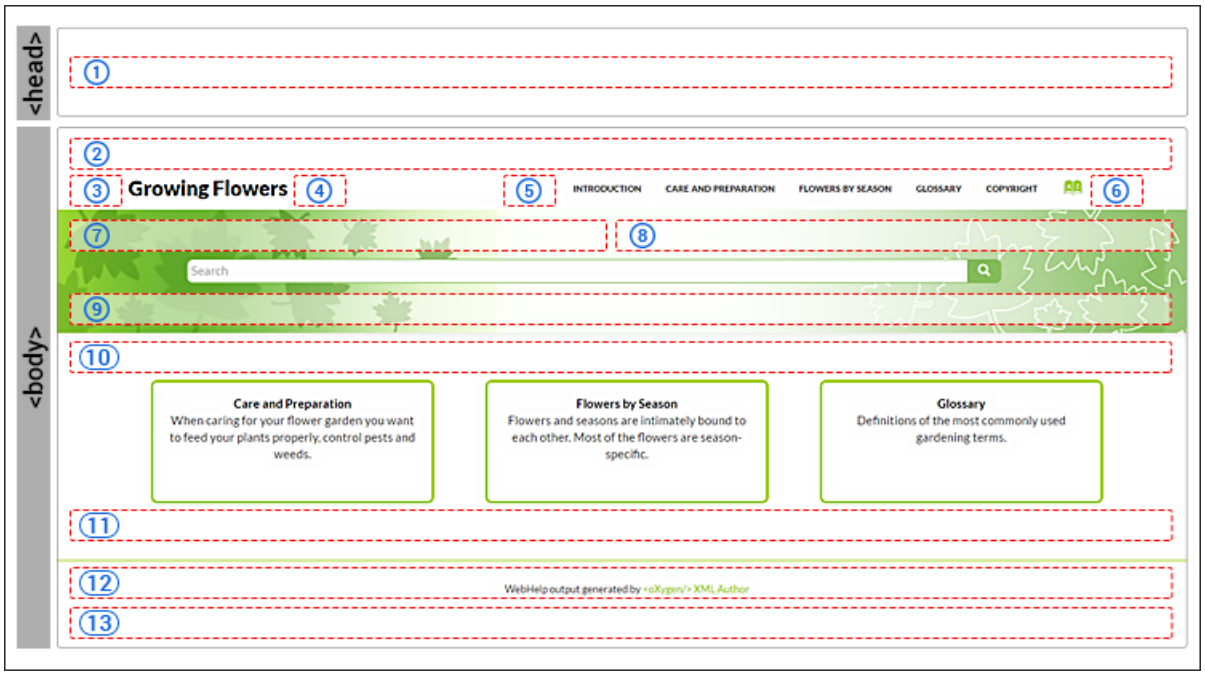

Figure 579: Predefined Placeholders Diagram

Each of these parameters can hold either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment:

1- webhelp.fragment.head

In the generated output it inserts a given XHTML fragment in the <head> element. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

2- webhelp.fragment.before.body

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

3- webhelp.fragment.before.logo_and_title

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

4- webhelp.fragment.after.logo_and_title

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

5- webhelp.fragment.before.top_menu

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

6- webhelp.fragment.after.top_menu

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

7- webhelp.fragment.before.main.page.search

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

8- webhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

9- webhelp.fragment.after.main.page.search

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

10- webhelp.fragment.before.toc_or_tiles

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

11- webhelp.fragment.after.toc_or_tiles

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

12- webhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

13- webhelp.fragment.after.body

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

How to Insert HTML Content in WebHelp Responsive Output on page 1087

XSLT Extension Points

The publishing template allows supports one or more XSLT extension points. They are helpful when you want to change the structure of the HTML pages that are primarily generated from XSLT processing. They can be specified in the descriptor file using the following structure:

```
<publishing-template>
    ...
    <webhelp>
        ...
        <xslt>
            <extension
              id="com.oxygenxml.webhelp.xsl.dita2webhelp"
              file="xsl/customDita2webhelp.xsl"/>
            <extension
              id="com.oxygenxml.webhelp.xsl.createMainPage"
              file="xsl/customMainPage.xsl"/>
        </xslt>
```

For more information, and a full list of the available extension points, see: XSLT-Import and XSLT-Parameter Extension Points.

Note: You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.

Transformation Parameters

You can also set one or more WebHelp transformation parameters in the descriptor file.

```
<publishing-template>
    ...
    <webhelp>
      ...
      <parameters>
        <parameter
          name="webhelp.show.main.page.toc"
          value="yes"/>
        <parameter
          name="webhelp.top.menu.depth"
          value="3"/>
        <parameter
          name="webhelp.fragment.welcome"
          value="html-fragment/webhelp.fragment.welcome.html"
          type="filePath"/>
      </parameters>
    </webhelp>
```

The following information can be specified in the `parameter` element:

Parameter name

The name of the parameter. It may be one of the WebHelp Responsive transformation parameters or a DITA-OT HTML-based output parameter.

Note: It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

Parameter Value

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

Parameter Type

The type of the parameter: `string` or `filepath`. The `string` value is default.

After creating a publishing template and adding it to the templates gallery, when you select the template in the transformation scenario dialog box, the **Parameters** tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

Generating WebHelp Responsive Output

The publishing process can be initiated from a transformation scenario within **Oxygen XML Editor/Author**, from a command line outside **Oxygen XML Editor/Author**, or from an integration server.

Running from Oxygen XML Editor/Author

To publish to the WebHelp Responsive output from a transformation scenario inside **Oxygen XML Editor/Author**, use one of the following procedures, depending on whether or not you want a feedback section in your output.

WebHelp Responsive Output

To publish a *DITA map* as **WebHelp Responsive** output, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

   - **Templates Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
   - **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
   - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
   - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
   - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to process the transformation.

   When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

WebHelp Responsive with Feedback Output

To publish a *DITA map* as a **WebHelp Responsive with Feedback** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.
5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

   When the **DITA Map WebHelp Responsive with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment.

Running from Command Line

To publish to the WebHelp Responsive output from a command line outside of **Oxygen XML Editor/Author**, you can use the `dita` startup script that comes bundled with *DITA-OT* distribution.

`dita` Command Format

DITA-OT `dita` command has the following format:

```
DITA-OT-DIR/bin/dita --format=webhelp-responsive --input=input-file options
```

where the arguments are as follows:

`dita`

Windows - The `dita.bat` script located in: DITA-OT-DIR on page 1622\bin\.

Linux/Mac OS X - The `dita` script file located in: DITA-OT-DIR on page 1622/bin/.

`--format=webhelp-responsive`

Specifies the output format (transformation type) for WebHelp Responsive transformation.

`--input=input-file`

The `input-file` represents the path to the DITA map that you want to process.

`options`

`options` include the following optional build parameters:

`--output=dir`

`-o dir`

Specifies the path of the output directory; the path can be absolute or relative to the current directory. By default, the output is written to the `out` subdirectory of the current directory.

`--filter=file`

Specifies filter file(s) used to include, exclude, or flag content.

Relative paths are resolved against the current directory and internally converted to absolute paths.

`--temp=dir`

`-t dir`

Specifies the location of the temporary directory.

`--verbose`

`-v`

Verbose logging.

--debug

-d

Debug logging.

--logfile=file

-l file

Write logging messages to a file.

--parameter=value

-Dparameter=value

Specify a value for a DITA-OT or Ant build parameter.

--propertyfile=file

Use build parameters defined in the referenced `.properties` file.

Build parameters specified on the command line override those set in the `.properties` file.

WebHelp and DITA-OT parameters

In addition to the transformation parameters that are specific to WebHelp Responsive, you can use to the common DITA-OT transformation parameters and the HTML-based Output Parameters.

Command Line Example

- Windows:

```
dita.bat
   --format=webhelp-responsive
   --input=c:\mySample.ditamap
   --output=c:\output
   -Dwebhelp.logo.image=C:\images\myLogo.jpg
```

- Linux/Mac OS X:

```
dita
   --format=webhelp-responsive
   --input=c:\mySample.ditamap
   --output=c:\output
   -Dwebhelp.logo.image=C:\images\myLogo.jpg
```

WebHelp Responsive Output Parameters on page 1078

Running from an Integration Server

Oxygen XML Editor plugin can be processed from an automatic publishing system, such as *Jenkins* or *Travis*.

Automating DITA to WebHelp Output with Jenkins

To integrate WebHelp output with the Jenkins continuous integration tool, follow these steps:

1. Create a Maven project to incorporate the DITA-OT that already integrates Oxygen XML Editor plugin.
2. Go to the root of your Maven project and edit the `pom.xml` file to include the following fragment:

```
<properties>
  <oxygen-webhelp>${basedir}/tools/DITA-OT2.5.2/
       plugins/com.oxygenxml.webhelp.responsive</oxygen-webhelp>
</properties>

<plugin>
  <artifactId>exec-maven-plugin</artifactId>
  <groupId>org.codehaus.mojo</groupId>
  <executions>
    <execution><!-- Run our version calculation script -->
      <id>Version Calculation</id>
      <phase>generate-sources</phase>
      <goals>
        <goal>exec</goal>
```

```
      </goals>
      <configuration>
        <executable>${oxygen-webhelp}/ditaWebhelp.bat</executable>
      </configuration>
    </execution>
  </executions>
</plugin>
```

Note: In the fragment above it is assumed that you are using DITA-OT version 2.5.4. If you are using another version, please adjust the path accordingly.

3. Go to the Jenkins top page and create a new Jenkins job. Configure this job to suit your particular requirements, such as the build frequency and location of the Maven project.

Automating DITA to WebHelp Output with Travis CI

This topic assumes you have a DITA project hosted on a GitHub public or private repository.

The goal of this tutorial is to help you setup a Travis continuous integration job that automatically publishes your DITA project to GitHub pages after every commit. The published website will contain a feedback link on each page that would allow a contributor to easily suggest changes to the documentation by creating a pull request on GitHub with just a few clicks.

Enable the Travis CI Build

1. Sign in to Travis CI with your GitHub account, accepting the GitHub access permissions confirmation.
2. Once you are signed in, and you have synchronized your GitHub repositories, go to your profile page and enable Travis CI for the repository you want to build.

Configure the Travis CI Build in your GitHub Project

1. Checkout your GitHub project locally.
2. Copy the `.travis` folder from here to the root directory of your project.
3. In the root of your GitHub project, add a file called `.travis.yml` with the following content:

```
language: dita
install:
  - echo "Installed"
script:
  - sh .travis/publish.sh
after_success:
  - sh .travis/deploy.sh
env:
  global:
    - DITAMAP=/path/to/your/ditamap/file
    - DITAVAL=/path/to/your/ditaval/file
    - ANT_OPTS=-Xmx1024M
```

Note: Replace `/path/to/your/ditamap/file` and `/path/to/your/ditaval/file` with the appropriate paths to your *DITA map* and `ditaval` files.

4. Create a GitHub personal access token by following this procedure.
5. Define an environment variable in the repository settings that has the name `GH_TOKEN` and the value equal with the GitHub personal access token created earlier.

Register Your License Key

1. Edit your `.gitignore` file (or create it if it does not already exist) and add the following line:

```
licenseKey.txt
```

2. Copy your WebHelp license to the root of your GitHub project in a file called `licenseKey.txt`.

Important: The `licenseKey.txt` file should not be committed to GitHub as it contains a license key that is issued only to you.

3. Encrypt the license key file and **add** it to the `.travis.yml` configuration file. This way only the Travis CI server will be able to decrypt it during the build process.

Commit to GitHub

1. Commit the following files and folders and push the commit to GitHub:

```
git add .gitignore licenseKey.txt.enc .travis.yml .travis/
git commit -m "Set up the Travis CI publishing system"
git push
```

2. Create a `gh-pages` branch in your GitHub project where the WebHelp output will be published. You can follow the procedure here.

WebHelp Responsive Transformation Parameters

In addition to the common DITA-OT transformation parameters and the HTML-based Output Parameters, there are numerous other supported parameters that are specific to the WebHelp Responsive output.

Publishing Template Parameters

`webhelp.publishing.template`

Specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

`webhelp.publishing.template.descriptor`

Specifies the name of the descriptor to be loaded from the WebHelp Responsive template package. If it is not specified, the first encountered descriptor will be automatically loaded.

Custom Resource Parameters

`webhelp.custom.resources`

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

`webhelp.favicon`

The file path that points to an image to be used as a *favicon* in the WebHelp output.

`webhelp.logo.image.target.url`

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

`webhelp.logo.image`

Specifies a path to an image displayed as a logo in the left side of the output header.

Feedback-Enabled Parameters

`webhelp.product.id` (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, `mobile-phone-user-guide`, `hvac-installation-guide`).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

`webhelp.product.version` (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

HTML Fragment Extension Parameters

webhelp.fragment.after.body

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.logo_and_title

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.main.page.search

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.toc_or_tiles

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.top_menu

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.logo_and_title

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.page.search

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.toc_or_tiles

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.top_menu

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head

In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

Output Component Parameters

webhelp.default.collection.type.sequence

Specifies if the **sequence** value will be used by default when the `collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is yes.

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is yes.

webhelp.show.changes.and.comments

When set to yes, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is no.

webhelp.show.indexterms.link

Specifies if an icon that links to the index will be presented in the output. The default value is yes.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a *tree* style layout, this parameter should be set to no.

webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is yes.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is yes.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is yes.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is yes.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. The default value is yes.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is yes.

webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for *chunked* topics. The default value is yes.

webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

webhelp.publication.toc.tooltip.position

By default, if a topic contains a `shortdesc` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left** (default)
- **right**
- **top**
- **bottom**

- **hidden** - The tooltip will not be displayed.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is 3. A value of `0` means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are `collapsed` or `expanded` (default value).

Search-Related Parameters

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.sitemap.base.url

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the *DITA map*, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

webhelp.enable.search.autocomplete

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is `yes`.

webhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or no.

webhelp.search.page.numberOfItems

Specifies the number of search results items displayed on each page. This parameter is only used when the **webhelp.search.enable.pagination** parameter is enabled.

webhelp.sitemap.change.frequency

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

webhelp.sitemap.priority

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

webhelp.google.search.results

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommend to set the `linkTarget` attribute to `frm` for frameless (*iframe*) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`

webhelp.google.search.script

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

Note: The `fix.external.refs.com.oxygenxml` parameter is not supported when running the transformation from a command line. This parameter is normally used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.

DITA-OT Parameter Reference

WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points

XSLT extension points can be used from either from an *Oxygen Publishing Template* or from a DITA-OT extension plug-in.

Extension Points from an Oxygen Publishing Template

The publishing template allows you to specify one or more XSLT extension points. These extension points will affect only the transformations that use the particular template.

For an example of how to use these extension in a publishing template, see: How to Use a XSLT Extension Point from a Publishing Template topic.

Example:

```
<publishing-template>
    ...
    <webhelp>
        ...
        <xslt>
            <extension
              id="com.oxygenxml.webhelp.xsl.createMainPage"
              file="xsl/customMainPage.xsl"/>
        </xslt>
```

Extension Points from a DITA-OT Extension Plug-in

The DITA-OT plug-in installer adds an XSLT import statement in the default WebHelp XSLT so that the XSLT stylesheet referenced by the extension point becomes part of the normal build. You can use these extension points to override XSLT processing steps.

Example:

```
<plugin id="com.oxygenxml.webhelp.responsive.extension">
  <feature extension="com.oxygenxml.webhelp.responsive.xsl.dita2webhelp"
           file="xsl/fixup.xsl"/>
</plugin>
```

XSLT-Import Extension Points

The following extension points are available:

com.oxygenxml.webhelp.xsl.dita2webhelp

Extension point to override the XSLT stylesheet (`dita2webhelp.xsl`) that produces an HTML file for each DITA topic. The location of this topic is *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.responsive\xsl\dita2webhelp\dita2webhelp.xsl`

com.oxygenxml.webhelp.xsl.createMainPage

Extension point to override the XSLT stylesheet (`createMainPage.xsl`) that produces the WebHelp Responsive main HTML page (`index.html`). The location of this file is *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`

com.oxygenxml.webhelp.xsl.createSearchPage

Extension point to override the XSLT stylesheet (`createSearchPage.xsl`) that produces the WebHelp Responsive search HTML page (`search.html`). The location of this file is *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createSearchPage.xsl`

com.oxygenxml.webhelp.xsl.createIndexTermsPage

Extension point to override the XSLT stylesheet (`createIndextermsPage.xsl`) that produces the WebHelp Responsive index terms HTML page (`indexterms.html`). The location of this file is *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createIndextermsPage.xsl`

com.oxygenxml.webhelp.xsl.createTocXML

Extension point to override the XSLT stylesheet (`tocDita.xsl`) that produces the `toc.xml` file. This file contains information extracted from the *DITA map* and it is mainly used to construct the WebHelp Table of Contents and navigational links. The path to this stylesheet is: *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.responsive\xsl\toc\tocDita.xsl`.

XSLT-Parameter Extension Points

If your customization stylesheet declares one or more XSLT parameters and you want to control their values from the transformation scenario, you can use one of the following XSLT parameter extension points:

com.oxygenxml.webhelp.xsl.dita2webhelp.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.dita2webhelp** extension point.

com.oxygenxml.webhelp.xsl.createMainPage.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.createMainPage** extension point.

com.oxygenxml.webhelp.xsl.createSearchPage.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.createSearchPage** extension point.

com.oxygenxml.webhelp.xsl.createIndextermsPage.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.createIndexTermsPage** extension point.

com.oxygenxml.webhelp.xsl.createTocXML.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.createTocXML** extension point.

Customizing the WebHelp Responsive Output

Oxygen XML Editor plugin provides support for customizing the **WebHelp Responsive** output to suit your specific needs. The **WebHelp Responsive** output is based upon the *Bootstrap* responsive front-end framework and is available for DITA document types. The **WebHelp Responsive with Feedback** variant allows your users to add comments to your output.

To change the overall appearance of your **WebHelp Responsive** output, you can use several different customization methods or a combination of methods. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying existing templates, create your own layout pages, or by configuring certain options and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp Responsive system output, such as how to configure the tiles on the main page, add logos in the title area, integrate with social media, localizing the interface, and much more.

Working with Publishing Templates

An *Oxygen Publishing Template* defines all aspects of the layout and styles of the **WebHelp Responsive** output. It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

The recommended method for customizing the *WebHelp Responsive* output is to use a custom publishing template. This section contains a series of procedures about how to create, edit, publish, and share publishing templates.

Related Information:
Publishing Template Package Contents on page 1057

How to Create a Publishing Template

The easiest way to create a new *Oxygen Publishing Template* is to select an existing template in the transformation scenario dialog box and use the **Save template as** button to save that template into a new template package that can be used as a starting point.

To create a new *Oxygen Publishing Template*, follow these steps:

1. Open the **WebHelp Responsive** transformation scenario dialog box and select the publishing template you want to export and use as a starting point.
2. Optional: You can set one or more transformation parameters from the **Parameters** tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.
3. Click the **Save template as** button.
   This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.
4. Specify a name for the new template.
5. Optional: Specify a template description.
6. Optional: Select the **Include HTML Page Layout Files** option if you want to copy the default *HTML Page Layout Files* in your template package. They are helpful if you want to change the structure of the generated HTML pages.
7. In the **Save as** field, specify the name and path of the ZIP file where the template will be saved.

A new ZIP archive will be created on disk in the specified location with the specified name.

How to Edit a Publishing Template

To edit an existing *Oxygen Publishing Template* package, follow these steps:

1. Unzip the ZIP archive associated with the *Oxygen Publishing Template* in a separate folder.
2. Link the folder associated with the template in the **Navigator** view.
3. Using the **Navigator** view, you can modify the resources (CSS, JS, fonts) within the *Oxygen Publishing Template* folder to fit your needs.
4. Open the publishing template descriptor file (`.opt` extension) in the editor and modify to suit your needs.
5. Optional: Once you finish your customization, you can archive the folder as a ZIP file.

How to Add a Publishing Template to the Publishing Templates Gallery

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box.
2. In the **Templates** tab, click the **Configure Publishing Templates Gallery** link to.
   This will open the **DITA/Publishing** preferences page.
3. Click the **Add** button and specify the location of your template directory.
   Your template directory is now added to the **Additional Publishing Templates Galleries** list.
4. Click **OK** to return to the transformation scenario dialog box.
   All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

How to Use a Publishing Template from Command Line

Before you run the transformation, you need to know if the publishing template has a single or multiple template descriptor files. If you don't know, open the ZIP archive or folder and check for files with the `.opt` extension.

Publishing Template with a Single Descriptor

A template with a single descriptor is used for a single customization.

To run from a command line, you need to use the webhelp.publishing.template parameter. This parameter specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

Command line example:

- **Windows**:

```
dita.bat
   --format=webhelp-responsive
   --input=c:\mySample.ditamap
   --output=c:\output
   -Dwebhelp.publishing.template=custom-template
```

- **Linux/Mac OS X**:

```
dita
   --format=webhelp-responsive
   --input=c:\mySample.ditamap
   --output=c:\output
   -Dwebhelp.publishing.template=custom-template
```

Using a Publishing Template with Multiple Descriptors

A template with multiple descriptors contains multiple customizations.

Because the publishing template is self-contained, it is used to reuse resources that are common to multiple publications.

To run from a command line, you need to use the webhelp.publishing.template and webhelp.publishing.template.descriptor parameters.

The webhelp.publishing.template parameter specifies the path to the ZIP archive (or root folder) while the webhelp.publishing.template.descriptor parameter specifies the name of the descriptor you want to use.

Command line example:

- **Windows**:

```
dita.bat
   --format=webhelp-responsive
   --input=c:\mySample.ditamap
   --output=c:\output
   -Dwebhelp.publishing.template=custom-template
   -Dwebhelp.publishing.template.descriptor=flowers.opt
```

- **Linux/Mac OS X**:

```
dita
   --format=webhelp-responsive
   --input=c:\mySample.ditamap
   --output=c:\output
   -Dwebhelp.publishing.template=custom-template
   -Dwebhelp.publishing.template.descriptor=flowers.opt
```

How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to **Options** > **Preferences** > **DITA** > **Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

Troubleshooting: Errors Encountered when Loading Templates

When the **Templates** tab of a **WebHelp Responsive** transformation scenario dialog box is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

If you click the **More details** link, a window will open with more information about the encountered error. For example, it might offer a hint for which element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠) will be displayed on the template's image (in the **Templates** tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Changing the Layout and Styles

This section contains topics that explain how to customize the output using CSS, inserting HTML fragments, changing the layout of the main page, and more.

How to Customize the Output Using a CSS

The most common way to customize WebHelp Responsive output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario (using a *Oxygen Publising Templater* or a transformation parameter). This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using **F12** or by selecting **Inspect Element** (or simply **Inspect**) from the contextual menu.

Tip: When using Safari on Mac OS X, you must first enable the Develop menu by going to the Advanced settings and selecting **Show Develop menu in menu bar**. Then you can select **Show Web Inspector** from the Develop menu or click **Command + Option + I**.

Create the Custom CSS

As a practical example, the following procedure would change the background color of the footer bar in the WebHelp output:

1. Use the browser's CSS inspector to identify the current CSS code that styles the footer bar. In this particular case, the pertinent code that would be identified is:

```
.wh_footer {
  font-size: 15px;
  line-height: 1.7em;
  background-color: #000;
}
```

2. If you want to test the color you want to apply as the background of this particular element, use the browser's CSS inspector to change the value of the `background-color` attribute. After you find a suitable color, copy that new code.
3. Create a custom CSS file and paste or enter the copied code. For example:

```
.wh_footer {
  background-color: #255890;
}
```

4. Save the custom CSS file at a location of your convenience.
5. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template* or the `args.css` parameter.

Referencing the CSS Using a Publishing Template

1. If you haven't already created a Publishing Template, see Working with Publishing Templates on page 1083.
2. Using the **Navigator** view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the `custom_footer_template/resources` folder).
3. Open the template descriptor file associated with your publishing template and add your custom CSS in the *resources* section.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <resources>
            ...
```

```
            <css file="resources/MyCustom.css"/>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the *args.css* Parameter

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
2. Set the `args.css` parameter to the path of your custom CSS file.
3. Set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

How to Insert HTML Content in WebHelp Responsive Output

You can add custom HTML content in the WebHelp Responsive output by inserting it in a well-formed XML file that will be referenced in the transformation (either from a *Oxygen Publishing Template* or using one of the HTML fragment parameters). This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

The XML File

There are several things to consider in regards to this XML file:

- **Well-Formedness** - If the file is not a *Well-formed XML* document (or fragments are not well-formed), the transformation will fail.

  A common use case is if you want to include several `script` or `link` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `html` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `head`, `body`, `html/head`, or `html/body` elements.
- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the predefined `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

  ```
  <html>
    <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
    <link rel="stylesheet" type="text/css"
          href="${oxygen-webhelp-output-dir}/css/test.css" />
  </html>
  ```

  If you want that the path of your resource to be relative to the templates directory, you can use the `${oxygen-webhelp-template-dir}` macro.

  To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory on page 1093.
- **Inline JavaScript or CSS Content** - If you want to include inline JavaScript or CSS content in the XML file, it is important to place this content inside an XML comment, as in the following examples:

  JavaScript:

  ```
  <script type="text/javascript">
    <!--
      /* Include JavaScript code here. */

      function myFunction() {
        return true;
      }
    -->
  ```

```
</script>
```

CSS:

```
<style>
  <!--
    /* Include CSS style rules here. */

    *{
      color:red
    }
  -->
</style>
```

Referencing the HTML fragment using a Publishing Template

1. If you haven't already created a Publishing Template, see Working with Publishing Templates on page 1083.
2. Insert the HTML content in a well-formed XML file (for example, `custom-html.html`).
3. Using the **Navigator** view, copy your custom HTML fragment in a folder inside publishing the template root folder (for example, in the `custom_footer_template/html-fragments` folder).
4. Open the template descriptor file associated with your publishing template and add a reference to the custom HTML fragment in the *html-fragments* section.

```
<publishing-template>
    ...
    <webhelp>
      ...
      <html-fragments>
        <fragment
          file="html-fragments/custom-html.html"
          placeholder="webhelp.fragment.head"/>
```

Note: If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points.

5. Open the *DITA Map WebHelp Responsive* transformation scenario.
6. Click the **Choose Custom Publishing Template** link and select your template.
7. Click **OK** to save the changes to the transformation scenario.
8. Run the transformation scenario.

Results: Your additional content will be included at the end of the `head` element of your output document.

Referencing the HTML Fragment using a Transformation Parameter

1. Insert the HTML content in a well-formed XML file.
2. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
3. Edit the value of the `webhelp.fragment.head` parameter and set it to the absolute path of your XML file.

   Note: If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Results: Your additional content will be included at the end of the `head` element of your output document.

How to Change Numbering Styles for Ordered Lists

Ordered lists (`ol`) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `outputclass` value and set it as an attribute of the ordered list, as in the following example:

```
<ol outputclass="number-alpha">
    <li>A</li>
    <li>B</li>
```

```
    <li>C</li>
</ol>
```

2. Add the following code snippet in a custom CSS file:

```
ol.number-alpha{
    list-style-type:lower-alpha;
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template* or the `args.css` parameter.

Referencing the Custom CSS from a Publishing Template

1. If you haven't already created a Publishing Template, see Working with Publishing Templates on page 1083.
2. Using the **Navigator** view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the `custom_footer_template/resources` folder).
3. Open the template descriptor file associated with your publishing template and add your custom CSS in the *resources* section.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <resources>
            ...
            <css file="resources/MyCustom.css"/>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the *args.css* Parameter

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
2. Set the `args.css` parameter to the path of your custom CSS file.
3. Set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

How to Change the Main Page Layout

This section contains topics that explain how to customize the layout of the main page in the WebHelp Responsive output.

How to Customize the Menu

By default, the menu component is displayed in all WebHelp Responsive pages. However, you might want to hide it completely, or only display some of its menu entries.

How to Hide Some of the Menu Entries

There are two methods for doing this. One of them involves editing the *DITA map* and marking the topics that do not need to be included in the menu, and another one that uses a small CSS customization.

Editing the DITA Map

To edit the metadata in the *DITA map* to control which topics will not be displayed in the menu, follow these steps:

1. Open the *DITA map* in the **Text** editing mode of Oxygen XML Editor plugin.

2. Add the following metadata information in the `topicref` element (or any of its specializations) for each topic you do not want to be displayed in the menu:

```
<topicmeta>
  <data name="wh-menu">
    <data name="hide" value="yes"/>
  </data>
</topicmeta>
```

Customizing the CSS

To customize the CSS to control which topics will not be displayed in the menu, follow these steps:

1. Make sure you set an ID on the topic that you do not want to include in the menu.
2. Create a new CSS file that contains a rule that hides the menu entry generated for the topic (identified by the topic ID `growing-flowers` in the following example). The CSS file should have content that is similar to this:

```
.wh_top_menu *[data-id='growing-flowers'] {
  display:none;
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template* or the `args.css` parameter.

How to Hide the Entire Menu

If you do not want to include a main menu in the pages of the WebHelp Responsive output, you can instruct the transformation scenario to skip the menu generation completely.

Using a Publishing Template

To hide the menu using an *Oxygen Publishing Template*, follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates on page 1083.
2. Open the template descriptor file associated with your publishing template and add the `webhelp.show.top.menu` parameter in the *parameters* section with its value set to no.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter name="webhelp.show.top.menu" value="no"/>
        </parameters>
    </webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To hide the menu using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.show.top.menu` parameter to no.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

How to Add a Welcome Message in the WebHelp Responsive Main Page

The main page of the WebHelp Responsive output contains a set of empty placeholders that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the `webhelp.fragment.welcome` parameter displays text content above the search box in the main page.

Using a Publishing Template

To add a customized welcome message in the main page of the WebHelp Responsive output using an *Oxygen Publishing Template*, follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates on page 1083.
2. Open the template descriptor file associated with your publishing template and add the `webhelp.fragment.welcome` parameter in the *parameters* section with its value set to one of the following:
   - A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
   - A path to a file that contains well-formed XHTML content.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter name="webhelp.fragment.welcome" value="c:\myMessage.xhtml"/>
        </parameters>
    </webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

   Result: In the WebHelp output, your custom message will be displayed above the search box in the main page.

Using a Transformation Scenario in Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a customized welcome message in the main page of the WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.fragment.welcome` parameter with its value set to one of the following:
   - A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
   - A path to a file that contains well-formed XHTML content.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

   Result: In the WebHelp output, your custom message will be displayed above the search box in the main page.

How to Configure the Tiles on the WebHelp Responsive Main Page

The *tiles* version of the main page of the WebHelp Responsive output displays a tile for each topic found on the first level of the *DITA map*. However, you might want to customize the way they look or even to hide some of them.

Depending on your particular setup, you can choose to customize the these tiles either by setting metadata information in the *DITA map* or by customizing the CSS that is associated with the *DITA map*.

How to Hide Some of the Tiles

If your documentation is very large or there is a large number of topics on the first level, you might want to hide some of the tiles. Also, this might be useful if you only want to display the topics in the first page that are most relevant to your intended audience.

There are two methods for doing this. One of them involves editing the *DITA map* and marking the topics that do not need to be displayed as tiles, and another one that uses a small CSS customization level to hide some tiles identified by the ID of the topic.

Editing the DITA Map

To edit the metadata in the *DITA map* to control which topics on the first level of the *DITA map* will not be displayed as a tile, follow these steps:

1. Open the *DITA map* in the **Text** editing mode of Oxygen XML Editor plugin.
2. Add the following metadata information in the `topicref` element (or any of its specializations) for each first-level topic that you do not want to be displayed as a tile:

```
<topicmeta>
  <data name="wh-tile">
    <data name="hide" value="yes"/>
  </data>
</topicmeta>
```

Customizing the CSS

To customize the CSS to control which topics on the first level of the *DITA map* will not be displayed as a tile, follow these steps:

1. Make sure you set an ID on the topic you want to hide.
2. Create a new CSS file that contains a rule that hides the tile generated for the topic (identified in the following example by the topic ID `growing-flowers`). The CSS file should have content that is similar to this:

```
.wh_tile [data-id='growing-flowers'] {
  display:none;
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template* or the `args.css` parameter.

How to Add an Image to the Tiles

There are two methods that you can use to add an image to a tile. One of them involves editing the *DITA map*, and the other uses a CSS customization.

Editing the DITA Map

To edit the metadata in the *DITA map* to set an image to be displayed in a tile, follow these steps:

1. Open the *DITA map* in the **Text** editing mode of Oxygen XML Editor plugin.
2. Add the following metadata information in the `topicref` element (or any of its specializations) for each first-level topic that will have an image displayed in the corresponding tile:

```
<topicmeta>
  <data name="wh-tile">
    <data name="image" href="img/tile-image.png" format="png">
     <data name="attr-width" value="64"/>
     <data name="attr-height" value="64"/>
    </data>
  </data>
</topicmeta>
```

Note: The `attr-width` and `attr-height` attributes can be used to control the size of the image, but they are optional.

Customizing the CSS

To customize the CSS to set an image to be displayed in a tile, follow these steps:

1. Make sure you set an ID on the topic that you want the tile include an image.
2. Create a new CSS file that contains a rule that associates an image with a specific tile. The CSS file should have content that is similar to this:

```
.wh_tile[data-id='growing-flowers']> div {
    background-image:url('resources/flower.png');
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template* or the `args.css` parameter.

Adding Media Resources

This section contains topics that explain how to add media resources to the published output or the output directory.

How to Copy Additional Resources to Output Directory

You can copy additional resources (such as JavaScript, CSS, or other resources) to the output directory either by using an *Oxygen Publishing Template* or the `webhelp.custom.resources` parameter.

Copying Additional Resources to the Output Directory using a Publishing Template

1. If you haven't already created a Publishing Template, see Working with Publishing Templates on page 1083.
2. Add a new `<fileset>` element in the resources section of the template descriptor file.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <resources>
            <fileset>
                <include name="custom-resources/**/*"/>
                <exclude name="**/*.git"/>
            </fileset>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Results: All files from the custom resources directory will be copied to the *`WebHelp Output Directory`*`/oxygen-webhelp/template` folder.

Copying Additional Resources to the Output Directory using a Transformation Parameter

1. Place all your resources in the same directory.
2. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
3. Edit the value of the `webhelp.custom.resources` parameter and set it to the absolute path of the directory in step 1.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Results: All files from the new directory will be copied to the root of the WebHelp output directory.

How to Add a Logo Image in the Title Area

You can customize **WebHelp Responsive** output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using an *Oxygen Publishing Template* or using a transformation scenario from within **Oxygen XML Editor/Author**.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an *Oxygen Publishing Template*, follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates on page 1083.
2. Open the template descriptor file associated with your publishing template and add the `webhelp.logo.image` parameter in the *parameters* section with its value set to path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `webhelp.logo.image.target.url` parameter.

```
<publishing-template>
    ...
```

```
<webhelp>
    ...
    <parameters>
        <parameter name="webhelp.logo.image" value="c:\myLogo.jpg"/>
        <parameter name="webhelp.logo.image.target.url" value="http://sample.com"/>
    </parameters>
</webhelp>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.logo.image` parameter to the path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `webhelp.logo.image.target.url` parameter.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

How to Add a Favicon in WebHelp Systems

You can add a custom *favicon* to your WebHelp output by simply using a parameter in the transformation scenario to point to your *favicon* image.

This customization can be done using an *Oxygen Publishing Template* or using a transformation scenario from within **Oxygen XML Editor/Author**.

Using a Publishing Template

To add a *favicon* to your WebHelp output using an *Oxygen Publishing Template*, follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates on page 1083.
2. Open the template descriptor file associated with your publishing template and add the `webhelp.favicon` parameter in the *parameters* section with its value set to path of your image.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter name="webhelp.favicon" value="c:\myFavicon.jpg"/>
        </parameters>
    </webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

   Result: Browsers that provide *favicon* support will display the *favicon* (typically in the browser's address bar, in the list of bookmarks, and in the history).

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a *favicon* to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.favicon` parameter to the path of your image.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

How to Add Video and Audio Objects in DITA WebHelp Output

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

Adding Videos to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the video through one of the following methods:
   - Use the **Insert Media Object** toolbar action.
   - Drag (or copy) the video file from your system explorer or the **Navigator** view and drop (or paste) it into your document.
   - Manually add an `object` element, as in one of the following examples:

     ```
     <object outputclass="video" type="video/mp4" data="MyVideo.mp4"/>
     ```

     or, instead of the `data` attribute, you can specify the video using a parameter like this:

     ```
     <object outputclass="video">
       <param name="src" value="videos/MyVideo.mp4"/>
     </object>
     ```
2. Apply a **DITA to WebHelp** transformation to obtain the output.

   Result: The transformation converts the `object` element to an HTML5 `video` element.

   ```
   <video controls="controls"><source type="video/mp4" src="MyVideo.mp4"></source>
   </video>
   ```

Adding Audio Clips to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the audio clip through one of the following methods:
   - Use the **Insert Media Object** toolbar action.
   - Drag (or copy) the audio file from your system explorer or the **Navigator** view and drop (or paste) it into your document.
   - Manually add an `object` element, as in one of the following examples:

     ```
     <object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>
     ```

     or, instead of the `data` attribute, you can specify the video using a parameter like this:

     ```
     <object outputclass="audio">
       <param name="src" value="audio/MyClip.mp3"/>
     </object>
     ```
2. Apply a **DITA to WebHelp** transformation to obtain the output.

   Result: The transformation converts the `object` element to an HTML5 `audio` element.

   ```
   <audio controls="controls"><source type="audio/mpeg" src="MyClip.mp3"></source>
   </audio>
   ```

Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the **Insert Media Object** toolbar action or by manually adding an `object` element, as in one of the following examples:

   ```
   <object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
   ```

   or, instead of the `data` attribute, you can specify the object using a parameter like this:

   ```
   <object outputclass="iframe">
     <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4"/>
   ```

```
</object>
```

2. If you want the video to be allowed to play in full screen mode once the document is converted to XHTML output, also add an `allowfullscreen` parameter and set its value to **true**:

```
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
  <param name="allowfullscreen" value="true"/>
</object>
```

   Tip: If you copy the embed code from the source and paste it into the **Insert Media** dialog box (see the specific instructions: here), the `allowfullscreen` parameter will automatically be added and all you have to do is set the value to **true**.

3. Apply a **DITA to WebHelp** transformation to obtain the output.

   Result: The transformation converts the `object` element to an HTML5 `iframe` element.

```
<iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4">
</iframe>
```

For more information, see the following video demonstration:

https://www.youtube.com/embed/llX11gS4WaU

Adding Video, Audio, and Embedded HTML Resources in DITA Topics on page 1511

Searching the Output

This section contains topics that explain how to use some of the search features in WebHelp Responsive output.

How to Change Element Scoring in Search Results

The WebHelp **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA. The properties file includes instructions and examples to help you with your customization. The file is located in: *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.responsive\indexer\scoring.properties`.

   The values that can be edited in the `scoring.properties` file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i=3
u=3
div.toc=-10
title=20
div.ignore=ignored
meta_keywords = 20
meta_indexterms = 20
meta_description = 25
shortdesc=25
```

2. Save your changes to the file.
3. Re-run your WebHelp transformation.

How to Exclude Certain DITA Topics from Search Results

There are several ways to exclude certain DITA resources from your WebHelp system's search results. This is useful if you have topics in your *DITA map* structure that you do not want to be included in search results for your WebHelp system. The first method involves setting a parameter in the WebHelp transformation scenario and the second involves setting an attribute for each DITA topic reference that you want to exclude.

Transformation Parameter Method

To exclude DITA topics from WebHelp search results using a transformation parameter, follow these steps:

1. Create a simple text file that will contain your excluded file patterns. Each pattern must be on a new line. The patterns are considered to be relative to the output directory and they accept wildcards such as '`*`' (matches zero or more characters) or '`?`' (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

   Example: Suppose that in your project, you want to exclude all files located in the `resources` directory and all files located in the `topics` directory that have a `.bak` file extension. You could create a simple text file (for example, named `exclude.properties`), and add the following lines:

   ```
   resources/*
   topics/*.bak
   ```

2. Set the `webhelp.search.custom.excludes.file` parameter to specify the path to the file that contains the excluded file patterns (for example, `exclude.properties` in step 1). The parameter can be specified in the *parameters* section of the template descriptor file associated with your publishing template or in the **Parameters** tab of the transformation scenario dialog box in **Oxygen XML Editor/Author**.
3. Run the transformation.

Search Attribute Method

The WebHelp **Search** engine does not index DITA topics that have the `@search` attribute set to no.

To exclude DITA topics from WebHelp search results using this attribute, follow these steps:

1. Edit the *DITA map* and for any `topicref` that you want to exclude from search results, set the `search` attribute to no.

   For example:

   ```
   <topicref href="../topics/internal-topic1.dita" search="no"/>
   ```

2. Save your changes to the *DITA map*.
3. Run your WebHelp system transformation.

How to Optimize Search Results

A **DITA Map WebHelp** transformation scenario can be configured to produce a `sitemap.xml` file that is used by search engines to aid crawling and indexing mechanisms. A *sitemap* lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the `sitemap.xml` file looks like this:

```
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  <url>
    <loc>http://www.example.com/topics/care.html#care</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
    .  .  .
</urlset>
```

Each page has a <url> element structure containing additional information, such as:

- **loc** - the URL of the page. This URL must begin with the protocol (such as `http`), if required by your web server. It is constructed from the value of the `webhelp.sitemap.base.url` parameter from the transformation scenario and the relative path to the page (collected from the `href` attribute of a `topicref` element in the *DITA map*).

  Note: The value must have fewer than 2,048 characters.
- **lastmod** (optional) - the date when the page was last modified. The date format is `YYYY-MM-DD`.

- **changefreq** (optional) - indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

  Note: The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.
- **priority** (optional) - the priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. Open the **Parameters** tab and set a value for the following parameters:
   - **webhelp.sitemap.base.url** - the URL of the location where your WebHelp system is deployed

     Note: This parameter is required for Oxygen XML Editor plugin to generate the `sitemap.xml` file.
   - **webhelp.sitemap.change.frequency** - how frequently the WebHelp pages are likely to change (accepted values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`)
   - **webhelp.sitemap.priority** - the priority of each page (value ranging from 0.0 to 1.0)
3. Run the transformation scenario.
4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

How to Index Japanese Content

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the **Oxygen XML Editor/Author** installation kit.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an *Oxygen Publishing Template*, follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates on page 1083.
2. Open the template descriptor file associated with your publishing template and add the `args.default.language` parameter in the *parameters* section with its value set to `ja-jp`.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter name="args.default.language" value="ja-jp"/>
        </parameters>
    </webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit a **DITA to WebHelp** transformation scenario and in the **Parameters** tab, set the value of the `args.default.language` parameter to `ja-jp`.

   Note: Alternatively, you could set the `xml:lang` attribute on the root of the *DITA map* and the referenced topics to `ja-jp`. Another alternative for DITA output is to use the `webhelp.search.japanese.dictionary` parameter to specify a path to a Japanese dictionary that will be used by the *Kuromoji* morphological engine.
2. Run the WebHelp transformation scenario to generate the output.

Localization

This section contains topics that explain how to use the localization support in WebHelp Responsive output.

How to Localize Email Notifications of Feedback System

The feedback-enabled WebHelp Responsive systems use emails to notify users when comments are posted. These emails are based on templates stored in the WebHelp directory. The default messages are in English, French, German, and Japanese. These messages are copied into the WebHelp system deployment directory during the execution of the corresponding transformation scenario.

Using a Publishing Template

To change the language of the emails for DITA Map WebHelp Responsive with Feedback output using an *Oxygen Publishing Template*, follow this procedure:

1. Create the following directory:

   DITA-OT-DIR`\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\nl`
2. Copy all English template files from *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\en` and paste them into the directory you just created.
3. Edit the HTML files from the *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\nl` directory and translate the content into your language.
4. Open the template descriptor file associated with your publishing template and add the `args.default.language` parameter in the *parameters* section with its value set to the appropriate language code (for example, `nl` for Dutch).

   Note: If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code.

   ```
   <publishing-template>
       ...
       <webhelp>
           ...
           <parameters>
               <parameter name="args.default.language" value="nl"/>
           </parameters>
       </webhelp>
   ```
5. Open the *DITA Map WebHelp Responsive* transformation scenario.
6. Click the **Choose Custom Publishing Template** link and select your template.
7. Click **OK** to save the changes to the transformation scenario.
8. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To change the language of the emails for DITA Map WebHelp Responsive with Feedback output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create the following directory:

DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\nl

2. Copy all English template files from *DITA-OT-DIR*\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\en and paste them into the directory you just created.
3. Edit the HTML files from the *DITA-OT-DIR*\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\nl directory and translate the content into your language.
4. Edit a **DITA Map WebHelp Responsive** transformation scenario and open the **Parameters** tab.
5. In the **Parameters** tab, look for the `args.default.language` parameter and set its value to the appropriate language code (for example, `nl` for Dutch).

   Note: If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code.
6. Run the transformation scenario.

How to Localize the Interface of WebHelp Responsive Output

Static labels used in the WebHelp output are stored in translation files that have the *strings-lang1-lang2.xml* name format, where *lang1* and *lang2* are ISO language codes. For example, the US English labels are kept in the *strings-en-us.xml* file.

These translation files are collected from two locations:

- *DITA-OT-DIR*/xsl/common folder - DITA-OT's default translations.
- *DITA-OT-DIR*/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization folder - These translations are contributed by the WebHelp plugin and extend the default ones provided by DITA-OT. The labels defined in this folder take precedence over the DITA-OT default ones.

  Important: If you need to customize the translation labels, you should do this by updating the translation files found in the *DITA-OT-DIR*/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization folder.

Using a Publishing Template

To localize the interface of the DITA Map to WebHelp output using an *Oxygen Publishing Template*, follow this procedure:

1. Look for the *strings-[lang1]-[lang2].xml* file in *DITA-OT-DIR*/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization directory (for example, the Canadian French file would be: *strings-fr-ca.xml*). If it does not exist, use the following procedure to create one:
   a. Create a new `strings-fr-ca.xml` file in the *DITA-OT-DIR*/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization directory.
   b. Copy all the labels found in the *DITA-OT-DIR*/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization/strings-en-us.xml and paste them into the newly created file.
   c. Copy all the labels found in the DITA-OT_DIR/xsl/common/strings-en-us.xml and paste them into the newly created file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. In the home directory of the DITA Open Toolkit, run the `startcmd.bat` script on Windows or `startcmd.sh` script on Linux/Mac OS X. In the displayed command line interface console, run `ant -f integrator.xml`.
4. Make sure that the new XML file that you created is listed in the file *DITA-OT-DIR*/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization/strings.xml. For example, the Canadian French file would be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.

5. Open the template descriptor file associated with your publishing template and add the `args.default.language` parameter in the *parameters* section with its value set to the appropriate language code (for example, *fr-ca* for Canadian French).

```
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter name="args.default.language" value="fr-ca"/>
        </parameters>
    </webhelp>
```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To localize the interface of the DITA Map to WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Look for the *strings-[lang1]-[lang2].xml* file in *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization` directory (for example, the Canadian French file would be: *strings-fr-ca.xml*). If it does not exist, use the following procedure to create one:
   a. Create a new `strings-fr-ca.xml` file in the *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization` directory.
   b. Copy all the labels found in the *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization/strings-en-us.xml` and paste them into the newly created file.
   c. Copy all the labels found in the `DITA-OT_DIR/xsl/common/strings-en-us.xml` and paste them into the newly created file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. Run the predefined transformation scenario called **Run DITA-OT Integrator** from the **Apply Transformation Scenario(s)** or **Configure Transformation Scenario(s)** dialog box. If the *integrator* is not visible, select the **Show all scenarios** action that is available in the **Settings** drop-down menu.
4. Make sure that the new XML file that you created is listed in the file *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization/strings.xml`. For example, the Canadian French file would be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.
5. Edit a **DITA Map to WebHelp Responsive** transformation scenarios (with or without feedback) and set the `args.default.language` parameter to the code of the language you want to localize (for example, *fr-ca* for Canadian French).
6. Run the transformation scenario to produce the WebHelp output.

How to Activate Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, edit the *DITA map* and set the `xml:lang` attribute on its root element (`map`). The corresponding attribute value can be set for following RTL languages:

- `ar-eg` - Arabic
- `he-il` - Hebrew
- `ur-pk` - Urdu

Integrate Social Media and Google Tools in the WebHelp Output

Oxygen XML Editor plugin includes support for integrating some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Responsive Output

It is possible to integrate Facebook™ into your **WebHelp Responsive** output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Facebook™ *Like* widget to your WebHelp output using an *Oxygen Publishing Template*, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

```
<div id="facebook">
    <div id="fb-root"/>
    <script>
        <!--
            (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
        }(document, 'script', 'facebook-jssdk'));
        -->
    </script>
    <div class="fb-like" data-layout="standard" data-action="like"
        data-show-faces="true" data-share="true"/>
</div>
```

4. Open the template descriptor file associated with your publishing template.
5. Use one of the parameters that begin with *webhelp.fragment* in the *html-fragments* section of the descriptor file. Set the value of that parameter to reference the `facebook-widget.xml` file that you created earlier.

```
<publishing-template>
    ...
    <webhelp>
      ...
      <html-fragments>
        <fragment
          file="HTML-fragments/facebook-widget.xml"
          placeholder="webhelp.fragment.after.toc_or_tiles"/>
      </html-fragments>
    </webhelp>
```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a Facebook™ *Like* widget to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:

- The file must be well-formed.
- The code for each `script` element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

  The content of the XML file should look like this:

```
<div id="facebook">
    <div id="fb-root"/>
    <script>
        <!--
            (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
        }(document, 'script', 'facebook-jssdk'));
        -->
    </script>
    <div class="fb-like" data-layout="standard" data-action="like"
        data-show-faces="true" data-share="true"/>
</div>
```

4. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit one of the parameters that begin with *webhelp.fragment*. Set that parameter to reference the `facebook-widget.xml` file that you created earlier.
6. Click **Ok** and run the transformation scenario.

How to Add a Google+ Button in WebHelp Responsive Output

It is possible to integrate *Google* into your **WebHelp Responsive** output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a *Google+* widget to your WebHelp Responsive output using an *Oxygen Publishing Template*, follow this procedure:

1. Go to the Google Developers website.
2. Fill-in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

```
<div id="google-plus">
  <!-- Place this tag in your head or just before your close body tag. -->
  <script src="https://apis.google.com/js/platform.js" async defer></script>

  <!-- Place this tag where you want the +1 button to render. -->
  <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```

4. Open the template descriptor file associated with your publishing template.
5. Use one of the parameters that begin with *webhelp.fragment* in the *html-fragments* section of the descriptor file. Set the value of that parameter to reference the `google-plus-button.xml` file that you created earlier.

```
<publishing-template>
    ...
    <webhelp>
        ...
      <html-fragments>
        <fragment
          file="HTML-fragments/google-plus-button.xml"
          placeholder="webhelp.fragment.after.toc_or_tiles"/>
      </html-fragments>
    </webhelp>
```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a *Google+* widget to your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Google Developers website.
2. Fill-in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

```
<div id="google-plus">
  <!-- Place this tag in your head or just before your close body tag. -->
  <script src="https://apis.google.com/js/platform.js" async defer></script>

  <!-- Place this tag where you want the +1 button to render. -->
  <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```

4. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit one of the parameters that begin with *webhelp.fragment*. Set that parameter to reference the `google-plus-button.xml` file that you created earlier.
6. Click **Ok** and run the transformation scenario.

How to Add Tweet Button in WebHelp Responsive Output

It is possible to integrate *Twitter* into your **WebHelp Responsive** output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Twitter™ *Tweet* widget to your WebHelp Responsive output using an *Oxygen Publishing Template*, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill-in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `div` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
      !function (d, s, id) {
      var
      js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
 ? 'http': 'https';
      if (! d.getElementById(id)) {
      js = d.createElement(s);
      js.id = id;
      js.src = p + '://platform.twitter.com/widgets.js';
      fjs.parentNode.insertBefore(js, fjs);
      }
      }
      (document,
      'script', 'twitter-wjs');
     -->
  </script>
</div>
```

4. Open the template descriptor file associated with your publishing template.
5. Use one of the parameters that begin with *webhelp.fragment* in the *html-fragments* section of the descriptor file. Set the value of that parameter to reference the `tweet-button.xml` file that you created earlier.

```
<publishing-template>
    ...
    <webhelp>
```

```
      ...
    <html-fragments>
      <fragment
        file="HTML-fragments/tweet-button.xml"
        placeholder="webhelp.fragment.after.toc_or_tiles"/>
    </html-fragments>
  </webhelp>
```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a Twitter™ *Tweet* widget to your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill-in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `div` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
      !function (d, s, id) {
      var
      js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
 ? 'http': 'https';
      if (! d.getElementById(id)) {
      js = d.createElement(s);
      js.id = id;
      js.src = p + '://platform.twitter.com/widgets.js';
      fjs.parentNode.insertBefore(js, fjs);
      }
      }
      (document,
      'script', 'twitter-wjs');
     -->
  </script>
</div>
```

4. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit one of the parameters that begin with *webhelp.fragment*. Set that parameter to reference the `tweet-button.xml` file that you created earlier.
6. Click **Ok** and run the transformation scenario.

How to Integrate Google Analytics in WebHelp Responsive Output

You can use *Google Analytics* to track and report site data for your **WebHelp Responsive** output.

Using a Publishing Template

To integrate *Google Analytics* into your WebHelp Responsive output using an *Oxygen Publishing Template*, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your *Tracking ID*. A **Tracking Code** looks like this:

```
<script>
 (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
 (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
```

```
 m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

 ga('create', 'UA-XXXXXXXX-X', 'auto');
 ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. Open the template descriptor file associated with your publishing template.
6. Use the webhelp.fragment.after.body parameter in the *html-fragments* section of the descriptor file. Set the value of that parameter to reference the `googleAnalytics.xml` file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.

```
<publishing-template>
    ...
    <webhelp>
        ...
      <html-fragments>
        <fragment
          file="HTML-fragments/googleAnalytics.xml"
          placeholder="webhelp.fragment.after.body"/>
      </html-fragments>
    </webhelp>
```

7. Open the *DITA Map WebHelp Responsive* transformation scenario.
8. Click the **Choose Custom Publishing Template** link and select your template.
9. Click **OK** to save the changes to the transformation scenario.
10. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate *Google Analytics* into your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your *Tracking ID*. A **Tracking Code** looks like this:

```
<script>
 (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
 (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
 m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

 ga('create', 'UA-XXXXXXXX-X', 'auto');
 ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
6. Switch to the **Parameters** tab. Edit the webhelp.fragment.after.body parameter and set it to reference the `googleAnalytics.xml` file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.
7. Click **Ok** and run the transformation scenario.

How to Integrate Google Search in WebHelp Responsive Output

It is possible to integrate the *Google Search Engine* into your **WebHelp Responsive** output and you can specify where you want the results to appear in your WebHelp page.

Using a Publishing Template

To integrate the *Google Search Engine* into your WebHelp Responsive output using an *Oxygen Publishing Template*, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```
<script>
 (function()  {
  var cx =
    '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  gcse.src = (document.location.protocol == 'https:' ?
    'https:' : 'http:') +         '//www.google.com/cse/cse.js?cx=' + cx;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
 }
 )();
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.
5. Open the template descriptor file associated with your publishing template and add the `webhelp.google.search.script` parameter in the *parameters* section with its value set to reference the `googlecse.html` file that you created earlier.

```
<publishing-template>
  ...
  <webhelp>
     ...
     <parameters>
         <parameter name="webhelp.google.search.script" value="resources/googlecse.html"/>
     </parameters>
  </webhelp>
```

6. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName-"searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.
7. Open the *DITA Map WebHelp Responsive* transformation scenario.
8. Click the **Choose Custom Publishing Template** link and select your template.
9. Click **OK** to save the changes to the transformation scenario.
10. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate the *Google Search Engine* into your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```
<script>
 (function()  {
  var cx =
    '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  gcse.src = (document.location.protocol == 'https:' ?
    'https:' : 'http:') +         '//www.google.com/cse/cse.js?cx=' + cx;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
 }
 )();
```

```
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.
5. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
6. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.
7. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName-"searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.
8. Click **Ok** and run the transformation scenario.

XSLT Extensions

Since WebHelp Responsive output is primarily obtained by running XSLT transformations over the DITA input files (through the **DITA Map WebHelp Responsive** transformation scenarios), one customization method would be to override the default XSLT templates that are used by the WebHelp Responsive transformations.

There are two methods available to override the XSLT stylesheets implied by the WebHelp Responsive transformation.

- Use *XSLT-import extension points* from an *Oxygen Publishing Template*.

  Note: Use this method if you want to affect only the transformations that use this *publishing template*.
- Use *XSLT-import extension points* from a DITA-OT extension plugin.

  Note: This method will affect all the outputs generated with the WebHelp system.

Related Information:

WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points on page 1082

How to Use XSLT Extension Points from a Publishing Template

This example demonstrates how to use WebHelp XSLT-import Extension Points from a *Oxygen Publishing Template*.

Use Case 1: Add Copyright Information Extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
  <bookowner>
    <organization>SyncRO Soft SRL</organization>
  </bookowner>
</bookrights>
```

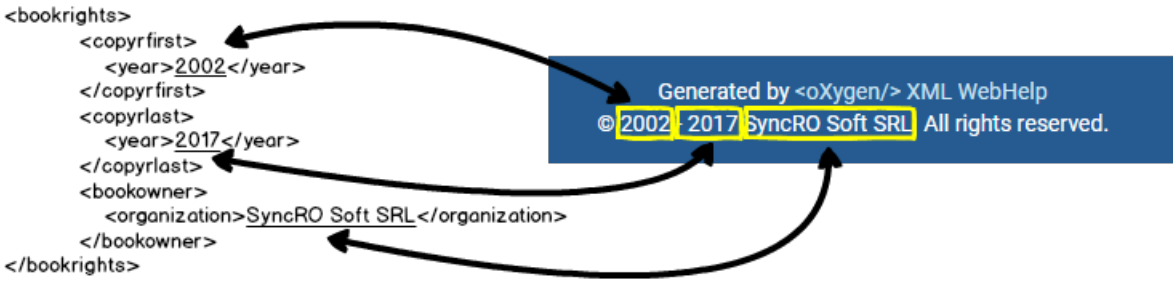

Figure 580: Example: Copyright information added in the WebHelp footer

The XSLT stylesheet that generates the main page is located in: *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`. This XSLT stylesheet declares the `copy_template` mode that processes the main page template to expand its components. The main page template declares a component for the footer section that looks like this:

```
<div class=" footer-container text-center ">
  <whc:include_html href="${webhelp.fragment.footer}"/>
</div>
```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
      <xsl:choose>
          <!-- Adds the start-end years if they are defined -->
          <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
                          exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
              <span class="copyright_years">
                 &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
                       -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
              </span>
          </xsl:when>

          <!-- Adds only the first year if last is not defined. -->
          <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
              <span class="copyright_years">
                 &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
              </span>
          </xsl:when>
      </xsl:choose>

      <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
          <span class="organization">
              <xsl:text> </xsl:text><xsl:value-of
                  select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>
              <xsl:text>. All rights reserved.</xsl:text>
          </span>
      </xsl:if>
  </div>
</xsl:template>
```

To add this functionality using a , follow these steps:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates on page 1083.
2. Link the folder associated with the template in the **Navigator** view.
   You should have the `custom_footer_template` folder linked in your project.
3. Using the **Navigator** view, create an `xslt` folder inside the project root folder.
   You should have the `custom_footer_template/xsl` folder in your project.
4. Create your customization stylesheet (for example, **custom_mainpage.xsl**) in the `custom_footer_template/xsl` folder. Edit it to override the template that produces the footer section:

   ```
   <xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
     <!-- Apply the default processing -->
     <xsl:next-match/>

     <!-- Add a div containing the copyright information -->
     <div class="copyright_info">
   ```

```
        <xsl:choose>
            <!-- Adds the start-end years if they are defined -->
            <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
                            exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
                <span class="copyright_years">
                   &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
                         -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
                </span>
            </xsl:when>

            <!-- Adds only the first year if last is not defined. -->
            <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
                <span class="copyright_years">
                   &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
                </span>
            </xsl:when>
        </xsl:choose>

        <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
            <span class="organization">
                <xsl:text> </xsl:text><xsl:value-of
                    select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>
                <xsl:text>. All rights reserved.</xsl:text>
            </span>
        </xsl:if>
    </div>
</xsl:template>
```

5. Open the template descriptor file associated with your publishing template and set the XSLT stylesheet created in previous step with the *com.oxygenxml.webhelp.xsl.createMainPage* XSLT extension point.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <xslt>
            <extension
            file="xslt/customMainPage.xsl"
            id="com.oxygenxml.webhelp.xsl.createMainPage"/>
```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Use Case 2: Add generation time in the output footer

Another possible customization for the main page is to add the generation time in its footer. We will use a transformation parameter to control if this customization is active or not.

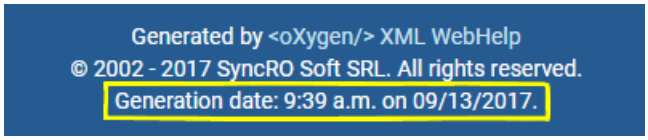

Figure 581: Generation time added in the WebHelp footer

To add this functionality, follow these steps:

1. In the customization stylesheet that you just created (for example, **custom_mainpage.xsl**), modify the template by adding the following XSLT code at the end.

```
<xsl:if test="oxyf:getParameter('webhelp.footer.add.generation.time') = 'yes'">
  <div class="generation_time">
    Generation date: <xsl:value-of
    select="format-dateTime(
                  current-dateTime(),
                  '[h1]:[m01] [P] on [M01]/[D01]/[Y0001].')"/>
  </div>
</xsl:if>
```

Note: You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.

2. Open the template descriptor file associated with your publishing template and set the `webhelp.footer.add.generation.time` parameter to the default value.

```
<publishing-template>
    ...
    <webhelp>
      ...
      <parameters>
        <parameter
          name="webhelp.footer.add.generation.time"
          value="yes"/>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. In the **Parameters** tab, you can change the value of the `webhelp.footer.add.generation.time` parameter.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

How to Use XSLT Extension Points from a DITA-OT Plugin

In this example, the main page footer is modified by adding copyright information extracted from the DITA bookmap or by adding the output generation time. The first use-case uses an XSLT-Import extension point while the second uses an XSLT-Parameter extension point.

Note: This customization is available as a GitHub project at: https://github.com/oxygenxml/com.oxygenxml.webhelp.responsive.custom.footer.

Use Case 1: WebHelp XSLT-Import extension point to add copyright information extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
  <bookowner>
    <organization>SyncRO Soft SRL</organization>
  </bookowner>
</bookrights>
```

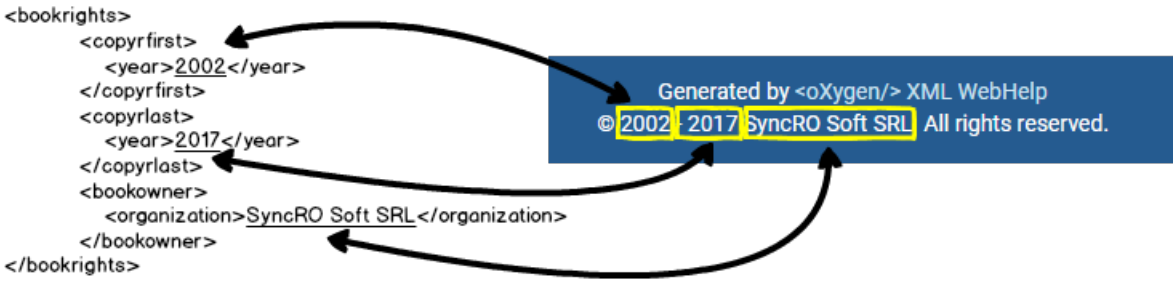

Figure 582: Example: Copyright information added in the WebHelp footer

The XSLT stylesheet that generates the main page is located in: *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`. This XSLT stylesheet declares the `copy_template` mode that processes the main page template to expand its components. The main page template declares a component for the footer section that looks like this:

```
<div class=" footer-container text-center ">
  <whc:include_html href="${webhelp.fragment.footer}"/>
</div>
```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
      <xsl:choose>
          <!-- Adds the start-end years if they are defined -->
          <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
                          exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
              <span class="copyright_years">
                 &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
                       -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
              </span>
          </xsl:when>

          <!-- Adds only the first year if last is not defined. -->
          <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
              <span class="copyright_years">
                 &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
              </span>
          </xsl:when>
      </xsl:choose>

      <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
          <span class="organization">
              <xsl:text> </xsl:text><xsl:value-of
                  select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>
              <xsl:text>. All rights reserved.</xsl:text>
          </span>
      </xsl:if>
  </div>
</xsl:template>
```

You can implement this functionality with a WebHelp extension plugin that uses the **com.oxygenxml.webhelp.xsl.createMainPage** extension point. This extension point allows you to specify a customization stylesheet that will override the template described above.

To add this functionality as a DITA-OT plugin, follow these steps:

1. In the *DITA-OT-DIR*`\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.responsive.custom.footer`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

   ```
   <plugin id="com.oxygenxml.webhelp.responsive.custom.footer">
     <feature extension="com.oxygenxml.webhelp.xsl.createMainPage"
              file="custom_mainpage.xsl"/>
   </plugin>
   ```

3. Create your customization stylesheet (for example, **custom_mainpage.xsl**), and edit it to override the template that produces the footer section:

   ```
   <xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
     <!-- Apply the default processing -->
     <xsl:next-match/>

     <!-- Add a div containing the copyright information -->
     <div class="copyright_info">
         <xsl:choose>
             <!-- Adds the start-end years if they are defined -->
             <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
                             exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
                 <span class="copyright_years">
                    &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
                          -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
                 </span>
             </xsl:when>

             <!-- Adds only the first year if last is not defined. -->
             <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
                 <span class="copyright_years">
                    &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
                 </span>
             </xsl:when>
         </xsl:choose>

         <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
             <span class="organization">
                 <xsl:text> </xsl:text><xsl:value-of
                     select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>
   ```

```
            <xsl:text>. All rights reserved.</xsl:text>
        </span>
    </xsl:if>
  </div>
</xsl:template>
```

4. Use the **Run DITA-OT Integrator** transformation scenario found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.
5. Run a **DITA Map WebHelp Responsive** transformation scenario to obtain the customized side TOC.

Use-Case 2: WebHelp XSLT-Parameter extension point to control if generation time is displayed in the output

Another possible customization for the main page is to add the generation time in its footer. You can use an XSLT-Parameter extension point to control if this customization is active or not. In this case, you can use the **com.oxygenxml.webhelp.xsl.createMainPage.param** extension point.

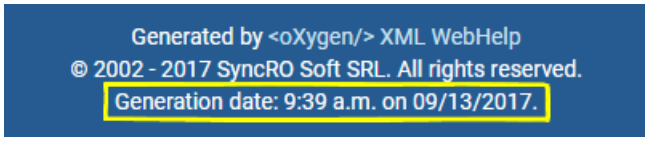

Figure 583: Generation time added in the WebHelp footer

To add this functionality, follow these steps:

1. Create a DITA-OT plugin structure by following the first 3 steps in the procedure above.
2. In the customization stylesheet that you just created (for example, **custom_mainpage.xsl**), declare `webhelp.footer.add.generation.time` as a global parameter and modify the template by adding the following XSLT code at the end.

```
<xsl:if test="$webhelp.footer.add.generation.time = 'yes'">
    <div class="generation_time">
        Generation date: <xsl:value-of select="format-dateTime(
            current-dateTime(), '[h1]:[m01] [P] on [M01]/[D01]/[Y0001].')"/>
    </div>
</xsl:if>
```

3. Edit the **plugin.xml** file to specify the **com.oxygenxml.webhelp.xsl.createMainPage.param** extension point and a custom parameter file by adding the following line:

```
<feature extension="com.oxygenxml.webhelp.xsl.createMainPage.param" file="params.xml"/>
```

4. Create a custom parameter file (for example, **params.xml**). It should look like this:

```
<dummy>
    <param name="webhelp.footer.add.generation.time"
        expression="${webhelp.footer.add.generation.time}"
        if="webhelp.footer.add.generation.time"/>
</dummy>
```

5. Use the **Run DITA-OT Integrator** transformation scenario found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.
6. Edit a **DITA Map WebHelp Responsive** transformation scenario and in the **Parameters** tab, specify the desired value (*yes* or *no*) for your custom parameter (`webhelp.footer.add.generation.time`).
7. Run the transformation scenario.

Miscellaneous Customization Topics

This section contains miscellaneous topics about how to customize the WebHelp Responsive output.

How to Add an Edit Link to Launch Oxygen XML Web Author

You can embed *Edit* links in the DITA WebHelp Responsive output that will automatically launch a particular document in Oxygen XML Web Author. A reviewer can then simply click the link and they will be redirected to the Oxygen XML Web Author editing page with that particular file open and editable.

Using a Publishing Template

To embed an *Edit* link in the DITA Map WebHelp Responsive output using an *Oxygen Publishing Template*, follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates on page 1083.
2. Open the template descriptor file associated with your publishing template and add the following parameters with their values set to the URLs:
   - **editlink.remote.ditamap.url** - The URL of the DITA Map suitable for opening in Oxygen XML Web Author.
   - **editlink.web.author.url** - The URL of the Oxygen XML Web Author installation.

   ```
   <publishing-template>
       ...
       <webhelp>
           ...
           <parameters>
               <parameter name="editlink.remote.ditamap.url"
                          value="webdav-https://dav.box.com/dav/my.ditamap"/>
               <parameter name="editlink.web.author.url"
                          value="https://www.oxygenxml.com/webauthor.html"/>
           </parameters>
       </webhelp>
   ```
3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

   Result: In the WebHelp output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

For example:

- **Windows:**

  ```
  dita.bat -i c:\mySample.ditamap -f webhelp-responsive -
  Deditlink.remote.ditamap.url=webdav-https://dav.box.com/dav/my.ditamap -
  Deditlink.web.author.url=https://www.oxygenxml.com/webauthor.html
  ```
- **Mac OS X/ Linux:**

  ```
  dita -i C:/mySample.ditamap -f webhelp-responsive -
  Deditlink.remote.ditamap.url=webdav-https://dav.box.com/dav/my.ditamap -
  Deditlink.web.author.url=https://www.oxygenxml.com/webauthor.html
  ```

Using a Transformation Scenario in Oxygen XML Editor/Author

To embed an *Edit* link in the DITA Map WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit a **DITA Map WebHelp Responsive** transformation scenario and open the **Parameters** tab.
2. Set values for the following parameters:
   - **editlink.remote.ditamap.url** - The URL of the DITA Map suitable for opening in Oxygen XML Web Author.
   - **editlink.web.author.url** - The URL of the Oxygen XML Web Author installation.
3. Run the transformation scenario.

   Result: In the WebHelp output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

For more information, see https://www.oxygenxml.com/doc/ug-waCustom/topics/webauthor-integrate-embedded-launch.html.

Web Author Customization Guide: Embedding an Edit Link that will Launch Web Author

How to Flag DITA Content in WebHelp Output

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for *block elements* (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in text.

Using a Publishing Template

To flag content in the DITA Map to WebHelp output using an *Oxygen Publishing Template*, follow this procedure:

1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as `audience-flag-build.ditaval`.
2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the `audience` attribute set to `programmer`, the content of the DITAVAL file should look like the following example:

   ```
   <?xml version="1.0" encoding="UTF-8"?>
   <val>
     <prop att="audience" val="programmer" action="flag"
    img="D:\resource\delta.gif" alt="sample alt text"/>
   </val>
   ```

   Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.
3. Open the template descriptor file associated with your publishing template and add the `args.filter` parameter in the *parameters* section with its value set to the path of the DITAVAL file.

   ```
   <publishing-template>
       ...
       <webhelp>
           ...
           <parameters>
               <parameter name="args.filter" value="resources/myFile.ditaval"/>
           </parameters>
       </webhelp>
   ```
4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To flag content in the DITA Map to WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as `audience-flag-build.ditaval`.
2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the `audience` attribute set to `programmer`, the content of the DITAVAL file should look like the following example:

   ```
   <?xml version="1.0" encoding="UTF-8"?>
   <val>
     <prop att="audience" val="programmer" action="flag"
    img="D:\resource\delta.gif" alt="sample alt text"/>
   </val>
   ```

   Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.
3. Edit a **DITA Map to WebHelp** transformation scenario.
4. Specify the DITAVAL file in the **Filters** tab of the transformation scenario.
5. Run the transformation scenario.

Filtering Profiling Values with a DITAVAL File on page 1605

How to Deploy the Output on a SharePoint Site

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to `.aspx`, as described in the steps below.

Using a Script Outside of Oxygen XML Editor/Author

To publish WebHelp Responsive output on a SharePoint site using an *Oxygen Publishing Template*, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. To allow browsers to open your published files (rather than downloading them), you need to change the file extensions from `.html` to `.aspx`.
3. Open the template descriptor file associated with your publishing template and add the `args.outext` parameter in the *parameters* section with its value set to `.aspx`.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter name="args.outext" value=".aspx"/>
        </parameters>
    </webhelp>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To publish WebHelp Responsive output on a SharePoint site using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. To allow browsers to open your published files (rather than downloading them), you need to change the file extensions from `.html` to `.aspx`. Fortunately, this can be done in the transformation.
   a. Edit the WebHelp transformation scenario and open the **Parameters** tab.
   b. Set the `args.outext` parameter to `.aspx`.
   c. Run the transformation scenario.

PDF Output

Oxygen XML Editor plugin provides support for generating PDF output using several different types of processors and there are numerous ways to customize the published output.

PDF Output Customization

Oxygen XML Editor plugin allows you to obtain PDF output using transformation scenarios for certain types of documents (for example, DITA, DocBook, TEI, and JATS). This section contains information about ways you can customize the PDF output to better fit your specific needs.

DITA Map to PDF Output Customization

Oxygen XML Editor plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting *DITA maps* to PDF output. There are numerous ways that you can customize the PDF output and the topics in this section discuss some of those possibilities.

Creating a DITA Map to PDF Transformation Scenario

To create a *DITA Map to PDF* transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** toolbar.
2. Select **DITA Map PDF** and click the **Edit** button (or use the **Duplicate** button if your *framework* is read-only).
3. Use the various tabs to configure the transformation scenario. In the **Parameters** tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
   - `show.changes.and.comments` - If set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output.
   - `customization.dir` - Specifies the path to a customization directory.
   - `editlink.remote.ditamap.url` - When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the PDF output.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

Customizing the PDF Output

DITA Open Toolkit PDF output can be customized in several ways:

- Creating a DITA Open Toolkit plugin that adds extensions to the PDF output. More details can be found in the DITA Open Toolkit Documentation.
- Creating a customization directory and using it from the PDF transformation scenario. A small example of this procedure can be found below.

How to Create a Customization Directory for PDF Output

The following procedure explains how to do a basic customization of the PDF output by setting up a customization directory. An example of a common use case is embedding a company logo image in the front matter of the book.

1. Copy the entire directory: *`DITA-OT-DIR`*`\plugins\org.dita.pdf2\Customization` to another location (for instance, `C:\Customization`).
2. Copy your logo image to: `C:\Customization\common\artwork\logo.png`.
3. Rename `C:\Customization\catalog.xml.orig` to: `C:\Customization\catalog.xml`.
4. Open the `catalog.xml` in Oxygen XML Editor plugin and *uncomment* this line:

   ```
   <!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/-->
   ```

   It now looks like this:

   ```
   <uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
   ```
5. Rename the file: `C:\Customization\fo\xsl\custom.xsl.orig` to: `C:\Customization\fo\xsl\custom.xsl`
6. Open the `custom.xsl` file in Oxygen XML Editor plugin and create the template called **createFrontCoverContents** for DITA-OT 2.5.4.

   Tip: You can copy the same template from *`DITA-OT-DIR`*`\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl` and modify it in whatever way necessary to achieve your specific goal. This new template in the `custom.xsl` file will override the same template from *`DITA-OT-DIR`*`\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl`.

   Example:

For example, if you are using DITA OT 2.5.4, the `custom.xsl` could look like this:

```
<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:fo="http://www.w3.org/1999/XSL/Format"
    version="2.0">

<xsl:template name="createFrontCoverContents">
 <!-- set the title -->
 <fo:block xsl:use-attribute-sets="__frontmatter__title">
  <xsl:choose>
   <xsl:when test="$map/*[contains(@class,' topic/title ')][1]">
    <xsl:apply-templates select="$map/*[contains(@class,' topic/title ')][1]"/>
      </xsl:when>
      <xsl:when test="$map//*[contains(@class,' bookmap/mainbooktitle ')][1]">
        <xsl:apply-templates select="$map//*[contains
                                      (@class,' bookmap/mainbooktitle ')][1]"/>
      </xsl:when>
      <xsl:when test="//*[contains(@class, ' map/map ')]/@title">
        <xsl:value-of select="//*[contains(@class, ' map/map ')]/@title"/>
      </xsl:when>
      <xsl:otherwise>
        <xsl:value-of select="/descendant::*[contains
           (@class, ' topic/topic ')][1]/*[contains(@class, ' topic/title ')]"/>
   </xsl:otherwise>
  </xsl:choose>
 </fo:block>

 <!-- set the subtitle -->
 <xsl:apply-templates select="$map//*[contains
                                      (@class,' bookmap/booktitlealt ')]"/>
 <fo:block xsl:use-attribute-sets="__frontmatter__owner">
  <xsl:apply-templates select="$map//*[contains(@class,' bookmap/bookmeta ')]"/>
 </fo:block>

 <!-- Load the image logo -->
  <fo:block text-align="center" width="100%">
   <fo:external-graphic
      src="url({concat($artworkPrefix,
                       '/Customization/OpenTopic/common/artwork/logo.png')})"
    />
  </fo:block>
 </xsl:template>

</xsl:stylesheet>
```

7. Edit the **DITA Map PDF** transformation scenario and in the **Parameters** tab, set the **customization.dir** parameter to `C:\Customization`.

Tip: For other specific examples, see DITA-OT 2.x Documentation - PDF Customization Plugin.

DITA-OT 2.x Documentation - PDF Customization Plugin

Customizing the Header and Footer in PDF Output

The XSLT stylesheet *DITA-OT-DIR*`/plugins/org.dita.pdf2/xsl/fo/static-content.xsl` contains templates that output the static header and footers for various parts of the PDF such as the prolog, table of contents, front matter, or body.

The templates for generating a footer for pages in the body are called `insertBodyOddFooter` or `insertBodyEvenFooter`.

These templates get the static content from resource files that depend on the language used for generating the PDF. The default resource file is *DITA-OT-DIR*`/plugins/org.dita.pdf2/cfg/common/vars/en.xml`. These resource files contain variables (such as *Body odd footer*) that can be set to specific user values.

Instead of modifying these resource files directly, they can be overwritten with modified versions of the resources in a PDF customization directory as explained in Customizing the PDF Output on page 1117.

Adding a Watermark to PDF Output

To add a watermark to the PDF output of a *DITA map* transformation, create a DITA-OT customization directory and use it from a **DITA Map to PDF** transformation scenario, as in the following procedure:

1. Copy the entire directory: *DITA-OT-DIR*`\plugins\org.dita.pdf2\Customization` to another location (for instance, `C:\Customization`).

2. Copy your watermark image (for example, `watermark.png`) to: `C:\Customization\common\artwork\watermark.png`.
3. Rename the `C:\Customization\catalog.xml.orig` file to: `C:\Customization\catalog.xml`.
4. Open the `catalog.xml` in Oxygen XML Editor plugin and *uncomment* this line:

   ```
   <!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/-->
   ```

   The uncommented line should look like this:

   ```
   <uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
   ```

5. Rename the file: `C:\Customization\fo\xsl\custom.xsl.orig` to: `C:\Customization\fo\xsl\custom.xsl`
6. Open the `C:\Customization\fo\xsl\custom.xsl` file in Oxygen XML Editor plugin to overwrite two XSLT templates:

   - The first template is located in the XSLT stylesheet *DITA-OT-DIR*`\plugins\org.dita.pdf2\xsl\fo\static-content.xsl` and we override it specifying a watermark image for every page in the PDF content, using a *block-container* element that references the watermark image file:

     ```
     <fo:static-content flow-name="odd-body-header">
           <fo:block-container absolute-position="absolute"
              top="-2cm" left="-3cm" width="21cm" height="29.7cm"
              background-image="{concat($artworkPrefix,
     '/Customization/OpenTopic/common/artwork/watermark.png')}">
             <fo:block/>
           </fo:block-container>
          <fo:block xsl:use-attribute-sets="__body__odd__header">
              <xsl:call-template name="insertVariable">
                  <xsl:with-param name="theVariableID" select="'Body odd header'"/>
                  <xsl:with-param name="theParameters">
                     <prodname>
                         <xsl:value-of select="$productName"/>
                     </prodname>
                     <heading>
                   <fo:inline xsl:use-attribute-sets="__body__odd__header__heading">
                         <fo:retrieve-marker retrieve-class-name="current-header"/>
                   </fo:inline>
                    </heading>
                   <pagenum>
                  <fo:inline xsl:use-attribute-sets="__body__odd__header__pagenum">
                        <fo:page-number/>
                  </fo:inline>
                </pagenum>
             </xsl:with-param>
          </xsl:call-template>
       </fo:block>
     </fo:static-content>

     </xsl:template>
     ```

   - The second template that we override is located in the XSLT stylesheet *DITA-OT-DIR*`\plugins\org.dita.pdf2\xsl\fo\commons.xsl` and is used for styling the first page of the output. We also override it by copying the original template content in our `custom.xsl` and adding the `block-container` element that references the watermark image file:

     ```
     <xsl:template name="createFrontMatter_1.0">
           <fo:page-sequence master-reference="front-matter"
     xsl:use-attribute-sets="__force__page__count">
              <xsl:call-template name="insertFrontMatterStaticContents"/>
              <fo:flow flow-name="xsl-region-body">
                  <fo:block-container absolute-position="absolute"
                      top="-2cm" left="-3cm" width="21cm" height="29.7cm"
                      background-image="{concat($artworkPrefix,
     '/Customization/OpenTopic/common/artwork/watermark.png')}">
                      <fo:block/>
                  </fo:block-container>
       <fo:block xsl:use-attribute-sets="__frontmatter">
            <!-- set the title -->
         <fo:block xsl:use-attribute-sets="__frontmatter__title">
          <xsl:choose>
           <xsl:when test="$map/*[contains(@class,' topic/title ')][1]">
         <xsl:apply-templates select="$map/*[contains(@class,' topic/title ')][1]"/>
           </xsl:when>
           <xsl:when test="$map//*[contains(@class,' bookmap/mainbooktitle ')][1]">
         <xsl:apply-templates select="$map//*[contains
     (@class,' bookmap/mainbooktitle ')][1]"/>
              </xsl:when>
              <xsl:when test="//*[contains(@class, ' map/map ')]/@title">
                  <xsl:value-of select="//*[contains(@class, ' map/map ')]/@title"/>
              </xsl:when>
                <xsl:otherwise>
     ```

```
            <xsl:value-of select="/descendant::*[contains
(@class, ' topic/topic ')][1]/*[contains(@class, ' topic/title ')]"/>
          </xsl:otherwise>
      </xsl:choose>
    </fo:block>

   <!-- set the subtitle -->
   <xsl:apply-templates select="$map//*[contains
(@class,' bookmap/booktitlealt ')]"/>

      <fo:block xsl:use-attribute-sets="__frontmatter__owner">
         <xsl:apply-templates select="$map//*[contains
(@class,' bookmap/bookmeta ')]"/>
      </fo:block>

      </fo:block>

   <!--<xsl:call-template name="createPreface"/>-->

      </fo:flow>
        </fo:page-sequence>
        <xsl:if test="not($retain-bookmap-order)">
            <xsl:call-template name="createNotices"/>
        </xsl:if>
    </xsl:template>
```

7. Edit your **DITA Map PDF** transformation scenario. In the **Parameters** tab, set the **customization.dir** parameter to `C:\Customization`.

Related Information:

Adding a Watermark in DITA Map to XHTML Output on page 1591

Adding an Edit Link in PDF Output to Launch Oxygen XML Web Author

You can embed *Edit* links in the DITA Map PDF output that will automatically launch a particular document in Oxygen XML Web Author. A reviewer can then simply click the link and they will be redirected to the Oxygen XML Web Author editing page with that particular file open and editable.

To embed an *Edit* link in the DITA Map PDF output, follow these steps:

1. Edit a **DITA Map PDF** transformation scenario and open the **Parameters** tab.
2. Set values for the following parameters:
   - **editlink.remote.ditamap.url** - The URL of the DITA Map suitable for opening in Oxygen XML Web Author.
   - **editlink.web.author.url** - The URL of the Oxygen XML Web Author installation.
3. Run the transformation scenario.

Result: In the PDF output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

Force Page Breaks Between Two Block Elements in PDF Output

Suppose that in your DITA content you have two *block elements*, such as two paragraphs:

```
<p>First para</p>
<p>Second para</p>
```

and you want to force a page break between them in the PDF output.

Here is how you can implement a DITA Open Toolkit *plugin* that would achieve this:

1. Define your custom processing instruction that marks the place where a page break should be inserted in the PDF, for example:

   ```
   <p>First para</p>
     <?pagebreak?>
   <p>Second para</p>
   ```

2. Locate the **DITA Open Toolkit** distribution and in the `plugins` directory create a new *plugin* folder (for example, *`DITA-OT-DIR`*`/plugins/pdf-page-break`).
3. In this new folder, create a new `plugin.xml` file with the following content:

   ```
   <plugin id="com.yourpackage.pagebreak">
     <feature extension="package.support.name" value="Force Page Break Plugin"/>
     <feature extension="package.support.email" value="support@youremail.com"/>
     <feature extension="package.version" value="1.0.0"/>
     <feature extension="dita.xsl.xslfo" value="pageBreak.xsl" type="file"/>
   ```

```
</plugin>
```

The most important feature in the *plugin* is that it will add a new XSLT stylesheet to the XSL processing that produces the PDF content.

4. In the same folder, create an XSLT stylesheet named `pageBreak.xsl` with the following content:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                xmlns:fo="http://www.w3.org/1999/XSL/Format" version="1.0">
  <xsl:template match="processing-instruction('pagebreak')">
    <fo:block break-after="page"/>
  </xsl:template>
</xsl:stylesheet>
```

5. Install your *plugin* in the DITA Open Toolkit.

The source code for the plugin can be found on GitHub here: https://github.com/dita-community/org.dita-community.pdf-page-break.

Customizing `note` Images in PDF

To customize the images that appear next to each type of note in the PDF output, use a PDF customization folder with the following procedure:

1. Copy the *DITA-OT-DIR*`/plugins/org.dita.pdf2/cfg/common/vars/en.xml` file to the `[CUSTOMIZATION_DIR]\common\vars` folder.
2. Edit the copied `en.xml` file and modify, for example, the path to the image for `<note>` element with the `type` attribute set to `notice` from:

```
<variable id="notice Note Image
  Path">Configuration/OpenTopic/cfg/common/artwork/important.png</variable>
```

to:

```
<variable id="notice Note Image
  Path">Customization/OpenTopic/common/artwork/notice.gif</variable>
```

3. Add your custom **notice** image to `[CUSTOMIZATION_DIR]\common\artwork\notice.gif`.
4. Edit the **DITA Map PDF** transformation scenario and in the **Parameters** tab set the path for the **customization.dir** property to point to the customization folder. Also, set the **com.oxygenxml.use.custom.note.images** parameter to **no**.

Show Comments and Tracked Changes in PDF Output

To include comments and *tracked changes* (stored within your DITA topics) in the PDF output, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** toolbar.
2. Select **DITA Map PDF** and click the **Edit** button (or use the **Duplicate** button if your *framework* is read-only).
3. In the **Parameters** tab, set the value of the **show.changes.and.comments** parameter to `yes`.
4. Optionally, you can configure any of these other parameters to adjust the colors of the comments and tracked changes:
   - **ct.insert.color** - Specifies the color for insertion type tracked changes, as a plain color (i.e. red, yellow, blue), or with a hexadecimal equivalent (i.e. #FFFFFF). The default value is 'blue'.
   - **ct.delete.color** - Specifies the color for deletion type tracked changes, as a plain color (i.e. red, yellow, blue), or with a hexadecimal equivalent (i.e. #FFFFFF). The default value is 'red'.
   - **ct.comment.bg.color** - Specifies the background color for comment type tracked changes, as a plain color (i.e. red, yellow, blue), or with a hexadecimal equivalent (i.e. #FFFFFF). The default value is 'yellow'.
5. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

   Result: Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

Set a Font for PDF Output Generated with FO Processor

When a *DITA map* is transformed to PDF using an FO processor and it contains some Unicode characters that cannot be rendered by the default PDF fonts, a font that is capable of rendering these characters must be configured and embedded in the PDF result.

The settings that must be modified for configuring a font for the built-in FO processor are detailed in Add a Font to the Built-in FO Processor - Advanced Version on page 1124.

DITA OT PDF Font Mapping

The DITA OT contains a file *DITA-OT-DIR*`/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` that maps logical fonts used in the XSLT stylesheets to physical fonts that will be used by the FO processor to generate the PDF output.

The XSLT stylesheets used to generate the XSL-FO output contain code like this:

```
<xsl:attribute name="font-family">monospace</xsl:attribute>
```

The font-family is defined to be *monospace*, but *monospace* is just an alias. It is not a physical font name. Therefore, another stage in the PDF generation takes this *monospace* alias and looks in the `font-mappings.xml`.

If it finds a mapping like this:

```
<aliases>
      <alias name="monospace">Monospaced</alias>
 </aliases>
```

then it looks to see if the *Monospaced* has a *logical-font* definition and if so, it will use the *physical-font* specified there:

```
<logical-font name="Monospaced">
      <physical-font char-set="default">
        <font-face>Courier New, Courier</font-face>
      </physical-font>
.............
</logical-font>
```

Important:

If no alias mapping is found for a font-family specified in the XSLT stylesheets, the processing defaults to **Helvetica**.

Related Information:

DocBook to PDF Output Customization

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

1. Create a custom version of the DocBook title spec file.

   You should start from a copy of the file `[DocBook XSL directory]/fo/titlepage.templates.xml` and customize it. The instructions for the spec file can be found here.

   An example of spec file:

   ```
   <t:titlepage-content t:side="recto">
       <mediaobject/>
       <title
           t:named-template="book.verso.title"
           font-size="&hsize2;"
           font-weight="bold"
           font-family="{$title.font.family}"/>
       <corpauthor/>
         ...
   </t:titlepage-content>
   ```

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

   Apply `[DocBook XSL directory]/template/titlepage.xsl` to the title spec file. The result is an XSLT stylesheet (for example, `mytitlepages.xsl`).

3. Import `mytitlepages.xsl` in a DocBook customization layer.

The customization layer is the stylesheet that will be applied to the XML document. The `mytitlepages.xsl` should be imported with an element like this:

```
<xsl:import href="dir-name/mytitlepages.xsl"/>
```

4. Insert a logo image in the XML document.

   The path to the logo image must be inserted in the `book/info/mediaobject` element of the XML document.
5. Apply the customization layer to the XML document.

   A quick way is to duplicate the transformation scenario **DocBook PDF** that is included with Oxygen XML Editor plugin and set the customization layer in the **XSL URL** property of the scenario.

Related Information:

The book **DocBook XSL: The Complete Guide** by Bob Stayton contains more details about customizing the PDF output.

Video demonstration for creating a DocBook customization layer in Oxygen XML Editor plugin.

Show Comments and Tracked Changes in DocBook 5 PDF Output

To include comments and *tracked changes* (stored within your DocBook 5 documents) in the PDF output, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button.
2. Select **DocBook PDF (Show Change Tracking and Comments)** in the **DocBook 5** section.
3. If you need to configure the transformation, click the **Edit** or **Duplicate** button, make your changes to the scenario, and click **OK**.
4. Click the **Apply Associated** button to run the transformation scenario.

   Result: Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

Generating PDF Output Using an XSL-FO Processor

This section explains how to apply XSL-FO processors when transforming XML documents to PDF format in Oxygen XML Editor plugin.

Built-in XSL-FO Processor

The Oxygen XML Editor plugin installation package is distributed with the Apache FOP that is a Formatting Objects processor for rendering your XML documents to PDF. *FOP* is a print and output independent formatter driven by XSL Formatting Objects. *FOP* is implemented as a Java application that reads a formatting object tree and renders the resulting pages to a specified output.

To see the version of the built-in XSL-FO processor for your installation, go to **Help** > **About** > **Libraries** and search for *Apache FOP*.

Other FO processors can be configured in the **Preferences** dialog box.

Add a Font to the Built-in FO Processor - Simple Version

If the font that must be set to Apache FOP is one of the fonts that are installed in the operating system you should follow the next steps for creating and setting a FOP configuration file that looks for the font that it needs in the system fonts. It is a simplified version of the procedure for setting a custom font in Apache FOP.

1. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)
   a) Create a FOP configuration file that specifies that FOP should look for fonts in the installed fonts of the operating system.

```
<fop version="1.0">
  <renderers>
    <renderer mime="application/pdf">
      <fonts>
        <auto-detect/>
      </fonts>
```

```
    </renderer>
  </renderers>
</fop>
```

b) Open the **Preferences** dialog box , go to **XML** > **XSLT/FO/XQuery** > **FO Processors**, and enter the path of the FOP configuration file in the **Configuration file** text field.

2. Set the font on the document content.

   This is done usually with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

   - For DocBook documents you can start with the predefined scenario called **DocBook PDF**, edit the XSLT parameters and set the font name (in our example the font family name is **Arial Unicode MS**) to the parameters `body.font.family` and `title.font.family`.
   - For TEI documents you can start with the predefined scenario called **TEI PDF**, edit the XSLT parameters and set the font name (in our example **Arial Unicode MS**) to the parameters `bodyFont` and `sansFont`.
   - For DITA transformations to PDF using DITA-OT you should modify the following two files:
     - *`DITA-OT-DIR`*`/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` - The `font-face` element included in each element `physical-font` having the `attribute char-set="default"` must contain the name of the font (**Arial Unicode MS** in our example)
     - *`DITA-OT-DIR`*`/plugins/org.dita.pdf2/fop/conf/fop.xconf` - An element `auto-detect` must be inserted in the element `fonts`, which is inside the element `renderer` that has the attribute `mime="application/pdf"`:

```
<renderer mime="application/pdf">
  . . .
   <fonts>
       <auto-detect/>
   </fonts>
  . . .
</renderer>
```

Add a Font to the Built-in FO Processor - Advanced Version

If an XML document is transformed to PDF using the built-in Apache FOP processor but it contains some Unicode characters that cannot be rendered by the default PDF fonts, then a special font that is capable to render these characters must be configured and embedded in the PDF result.

Important: If this special font is installed in the operating system, there is a simple way of telling FOP to look for it. See the simplified procedure for adding a font to FOP.

1. Locate the font.

   First, find out the name of a font that has the glyphs for the special characters you used. One font that covers most characters, including Japanese, Cyrillic, and Greek, is Arial Unicode MS.

   On Windows the fonts are located into the `C:\Windows\Fonts` directory. On Mac, they are placed in `/Library/Fonts`. To install a new font on your system, is enough to copy it in the `Fonts` directory.

2. Generate a font metrics file from the font file.

   a) Open a terminal.

   b) Change the working directory to the Oxygen XML Editor plugin install directory.

   c) Create the following script file in the Oxygen XML Editor plugin installation directory.

   For OS X and Linux create a file `ttfConvert.sh`:

```
#!/bin/sh

export LIB=lib
export CP=$LIB/fop.jar
export CP=$CP:$LIB/avalon-framework-4.2.0.jar
export CP=$CP:$LIB/xercesImpl.jar
export CP=$CP:$LIB/commons-logging-1.1.3.jar
export CP=$CP:$LIB/commons-io-1.3.1.jar
export CP=$CP:$LIB/xmlgraphics-commons-1.5.jar
export CP=$CP:$LIB/xml-apis.jar
export CMD="java -cp $CP org.apache.fop.fonts.apps.TTFReader"
export FONT_DIR='.'

$CMD $FONT_DIR/Arialuni.ttf Arialuni.xml
```

For Windows create a file `ttfConvert.bat`:

```
@echo off
set LIB=lib
set CP=%LIB%\fop.jar
set CP=%CP%;%LIB%\avalon-framework-4.2.0.jar
set CP=%CP%;%LIB%\xercesImpl.jar
set CP=%CP%;%LIB%\commons-logging-1.1.3.jar
set CP=%CP%;%LIB%\commons-io-1.3.1.jar
set CP=%CP%;%LIB%\xmlgraphics-commons-1.5.jar
set CP=%CP%;%LIB%\xml-apis.jar
set CMD=java -cp "%CP%" org.apache.fop.fonts.apps.TTFReader
set FONT_DIR=C:\Windows\Fonts
%CMD% %FONT_DIR%\Arialuni.ttf Arialuni.xml
```

The paths specified in the file are relative to the Oxygen XML Editor plugin installation directory. If you decide to create it in other directory, change the file paths accordingly.

The `FONT_DIR` can be something different on your system. Check that it points to the correct font directory. If the Java executable is not in the PATH, specify the full path of the executable.

If the font has bold and italic variants, convert them too by adding two more lines to the script file:

- for OS X and Linux:

  ```
  $CMD $FONT_DIR/Arialuni-Bold.ttf Arialuni-Bold.xml
  $CMD $FONT_DIR/Arialuni-Italic.ttf Arialuni-Italic.xml
  ```

- for Windows:

  ```
  %CMD% %FONT_DIR%\Arialuni-Bold.ttf Arialuni-Bold.xml
  %CMD% %FONT_DIR%\Arialuni-Italic.ttf Arialuni-Italic.xml
  ```

d) Run the script.

On Linux and OS X, run the command `sh ttfConvert.sh` from the command line. On Windows, run the command `ttfConvert.bat` from the command line or double-click the file `ttfConvert.bat`.

3. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)

a) Create a FOP configuration file that specifies the font metrics file for your font.

```
<fop version="1.0">
  <base>./</base>
  <font-base>file:/C:/path/to/FOP/font/metrics/files/</font-base>
  <source-resolution>72</source-resolution>
  <target-resolution>72</target-resolution>
  <default-page-settings height="11in" width="8.26in"/>
  <renderers>
    <renderer mime="application/pdf">
      <filterList>
        <value>flate</value>
      </filterList>
      <fonts>
          <font metrics-url="Arialuni.xml" kerning="yes"
                embed-url="file:/Library/Fonts/Arialuni.ttf">
              <font-triplet name="Arialuni" style="normal"
                    weight="normal"/>
          </font>
      </fonts>
    </renderer>
  </renderers>
</fop>
```

The `embed-url` attribute points to the font file to be embedded. Specify it using the URL convention. The `metrics-url` attribute points to the font metrics file with a path relative to the `base` element. The triplet refers to the unique combination of name, weight, and style (italic) for each variation of the font. In our case is just one triplet, but if the font had variants, you would have to specify one for each variant. Here is an example for Arial Unicode if it had italic and bold variants:

```
<fop version="1.0">
  ...
    <fonts>
        <font metrics-url="Arialuni.xml" kerning="yes"
              embed-url="file:/Library/Fonts/Arialuni.ttf">
            <font-triplet name="Arialuni" style="normal"
                  weight="normal"/>
        </font>
        <font metrics-url="Arialuni-Bold.xml" kerning="yes"
```

```
            embed-url="file:/Library/Fonts/Arialuni-Bold.ttf">
            <font-triplet name="Arialuni" style="normal"
                weight="bold"/>
        </font>
        <font metrics-url="Arialuni-Italic.xml" kerning="yes"
            embed-url="file:/Library/Fonts/Arialuni-Italic.ttf">
            <font-triplet name="Arialuni" style="italic"
                weight="normal"/>
        </font>
    </fonts>
  ...
</fop>
```

More details about the FOP configuration file are available on the FOP website.

b) Open the **Preferences** dialog box , go to **XML** > **XSLT/FO/XQuery** > **FO Processors**, and enter the path of the FOP configuration file in the **Configuration file** text field.

4. Set the font on the document content.

   This is usually done with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

   DocBook Example: For DocBook documents, you can start with the predefined scenario called **DocBook PDF**, edit the XSLT parameters, and set the font name (in our example **Arialuni**) to the parameters `body.font.family` and `title.font.family`.

   TEI Example: For TEI documents, you can start with the predefined scenario called **TEI PDF**, edit the XSLT parameters, and set the font name (in our example **Arialuni**) to the parameters `bodyFont` and `sansFont`.

   DITA Example: For DITA to PDF transformations using DITA-OT modify the following two files:

   - *`DITA-OT-DIR`*`/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` - The `font-face` element included in each element `physical-font` having the `attribute char-set="default"` must contain the name of the font (*Arialuni* in our example)
   - *`DITA-OT-DIR`*`/plugins/org.dita.pdf2/fop/conf/fop.xconf` - An element `font` must be inserted in the element `fonts`, which is inside the element `renderer` that has the attribute `mime="application/pdf"`:

     ```
     <renderer mime="application/pdf">
       . . .
       <fonts>
           <font metrics-url="Arialuni.xml" kerning="yes"
               embed-url="file:/Library/Fonts/Arialuni.ttf">
               <font-triplet name="Arialuni" style="normal"
                   weight="normal"/>
           </font>
       </fonts>
       . . .
     </renderer>
     ```

Adding Libraries to the Built-in FO Processor (XML with XSLT and FO)

Starting with Oxygen XML Editor plugin version 20.0, both hyphenation and PDF image support are enabled by default in the built-in Apache FO processor. For older version of Oxygen XML Editor plugin, use the following procedures to enable such support.

Adding Hyphenation Support for XML with XSLT Transformation Scenarios

If you want to add newer hyphenation libraries or you are using an older version of Oxygen XML Editor plugin, follow this procedure:

1. Create a folder called `fop` in the *`[OXYGEN_INSTALL_DIR]`*`/lib` folder.
2. Download the compiled *JAR* from OFFO.
3. Copy the `fop-hyph.jar` file into the *`[OXYGEN_INSTALL_DIR]`*`/lib/fop` folder.
4. Restart Oxygen XML Editor plugin.

Adding Support for PDF Images

To add support for PDF imagesin an older version of Oxygen XML Editor plugin, follow these steps:

1. Create a folder called `fop` in the *`[OXYGEN_INSTALL_DIR]`*`/lib` folder.
2. Download the *fop-pdf-images JAR* libraries.

3. Copy the libraries into the *[OXYGEN_INSTALL_DIR]*`/lib/fop` folder.
4. Restart Oxygen XML Editor plugin.

Adding Libraries to the Built-in FO Processor (DITA-OT)

Starting with Oxygen XML Editor plugin version 20.0, both hyphenation and PDF image support are enabled by default in the built-in DITA-OT FO processor. For older version of Oxygen XML Editor plugin, use the following procedures to enable such support.

Adding Hyphenation Support for DITA-OT Transformation Scenarios

1. Download the pre-compiled *JAR* from OFFO.
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab. Click the **Libraries** button and add the path to the `fop-hyph.jar` library.

Adding Support for PDF Images

1. Download the *fop-pdf-images JAR* libraries.
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab. Click the **Libraries** button and add the path to the libraries.

How to Enable Debugging for FO Processor Transformations

If you encounter errors when running PDF transformations that use an FO processor, it is possible to enable debugging/logging to help you identify the problem. To enable debugging/logging for FO processing, follow this procedure:

1. Locate and edit the following configuration file: *[OXYGEN_INSTALL_DIR]*`/tools/config/log4j.xml`.

   Note: You need write access to this folder, so if you do not have administrator permissions, you may first need to copy the file to another location where you have write access.
2. Edit the `priority` element (inside the `root` element) and change its value to **debug**.
3. Save the file in the original location.
4. Restart Oxygen XML Editor plugin and re-run the transformation.

   Tip: It is recommended that you use a small input file when trying to reproduce the problem, to make it easier to analyze the data in the log.
5. Once you are finished with the debugging session, remember to edit the `log4j.xml` file and change the `priority` element back to its original value. Otherwise, performance could be affected.

Generating PDF Output Using a Calabash XProc Processor

To generate PDF output from your XProc pipeline (when using the Calabash XProc processor), follow these steps:

1. Open the *[OXYGEN_INSTALL_DIR]*`/lib/xproc/calabash/engine.xml` file.
2. Uncomment the `<system-property name="com.xmlcalabash.fo-processor" value="com.xmlcalabash.util.FoXEP"/>` system property.
3. Uncomment the `<system-property name="com.renderx.xep.CONFIG" file="../../../tools/xep/xep.xml"/>` system property. Edit the `file` attribute to point to the configuration file that is usually located in the XEP installation folder.
4. Uncomment the references to the XEP libraries. Edit them to point to the matching library names from the XEP installation directory.
5. Restart Oxygen XML Editor plugin.

Debugging PDF Transformations

To debug a DITA PDF transformation scenario using the XSLT Debugger follow these steps:

1. Open the **Preferences** dialog box , go to **XML** > **XML Catalog**, click **Add**, and select the file located at *DITA-OT-DIR*`\plugins\org.dita.pdf2\cfg\catalog.xml`.
2. Open the map in the **DITA Maps Manager** and create a **DITA Map PDF** transformation scenario.

3. Edit the scenario, go to the **Parameters** tab and change the value of the **clean.temp** parameter to **no**.
4. Run the transformation scenario.
5. Open the **stage1.xml** file located in the temporary directory and format and indent it.
6. Create a transformation scenario for this XML file by associating the `topic2fo_shell_fop.xsl` stylesheet located at *`DITA-OT-DIR`*`\plugins\org.dita.pdf2\xsl\fo\topic2fo_shell_fop.xsl`. If you are specifically using the RenderX XEP or Antenna House FO processors to build the PDF output, you should use the XSL stylesheets `topic2fo_shell_xep.xsl` or `topic2fo_shell_axf.xsl` located in the same folder.
7. In the transformation scenario edit the XSLT Processor combo box choose the Saxon EE XSLT processor (the same processor used when the DITA OT transformation is executed).
8. In the transformation scenario, edit the **Parameters** list and set the parameter `locale` with the value `en_GB` and the parameter `customizationDir.url` to point either to your customization directory or to the default DITA OT customization directory. Its value should have a URL syntax like this: `file://c:/path/to/`*`DITA-OT-DIR`*`/plugins/org.dita.pdf2/cfg`.
9. Debug the transformation scenario.

Working with XPath Expressions

11

Topics:

- XPath Builder View
- XPath Expression Results View
- XPath and XML Catalogs
- XPath Prefix Mapping

XPath is a language for addressing specific parts of an XML document. XPath, such as the Document Object Model (DOM), models an XML document as a tree of nodes. An XPath expression is a mechanism for navigating through and selecting nodes from the XML document. An XPath expression is, in a way, analogous to an SQL query used to select records from a database.

There are various types of nodes, including element nodes, attribute nodes, and text nodes. XPath defines a way to compute a string-value for each type of node.

XPath defines a library of standard functions for working with strings, numbers and boolean expressions.

Examples:

- **child::*** - Selects all children of the root node.
- **.//name** - Selects all elements having the name "name", descendants of the current node.
- **/catalog/cd[price>10.80]** - Selects all the cd elements that have a price element with a value larger than 10.80.

To find out more about XPath, go to http://www.w3.org/TR/xpath.

Related Information:

Content Completion in XPath Expressions on page 626

XPath Builder View

The **XPath/XQuery Builder** view allows you to compose complex XPath expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.0, you can use the doc( ) function to specify the source file for which the expressions are executed. When you connect to a database, the expressions are executed over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Editor plugin executes the expressions over the XML document in the associated scenario.

If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

The upper part of the view contains the following actions:

XPath version chooser drop-down menu

A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0SA, XPath 3.0, XPath 3.0SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

Note: The results returned by XPath 2.0 SA and XPath 3.0 SA have a location limited to the line number of the start element (there are no column information and no end specified).

Note: Oxygen XML Editor plugin uses Saxon to execute XPath 3.0 expressions. Since Saxon implements a part of the 3.0 functions, when using a function that is not implemented, Oxygen XML Editor plugin returns a compilation error.

Execute XPath button

Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the **Results** view.

Favorites button

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, press the star button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Editor plugin automatically groups favorites in folders named after the method of execution.

History drop-down menu

Keeps a list of the last 15 executed XPath expressions. Use the **Clear history** action from the bottom of the list to remove them.

Settings drop-down menu

Contains the following three options:

- **Update on cursor move** - When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed.
- **Evaluate as you type** - When you select this option, the XPath expression you are composing is evaluated in real time.

  Note: This option and the automatic validation are disabled when the scope is other than **Current file**.
- **Options** - Opens the Preferences page of the currently selected processing engine.

XPath scope menu

Oxygen XML Editor plugin allows you to define a scope for which the XPath operation will be executed. You can choose where the XPath expression will be executed:

- **Current file** - Current selected file only.
- **Enclosing project** - All the files of the project that encloses the current edited file.
- **Workspace selected files** - The files selected in the workspace. The files are collected from the last selected resource provider view (**Navigator**, **Project Explorer** or **Package Explorer**).
- **All opened files** - All files opened in the application.
- **Current DITA Map hierarchy** - All resources referenced in the currently selected *DITA map*, opened in the **DITA Maps Manager** view.
- **Opened archive** - Files open in the **Archive Browser** view.
- **Working sets** - The selected *working sets*.

At the bottom of the scope menu the following scope configuration actions are available:

- **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets*.
- **XPath file filter** - You can filter the files from the selected scope for which the XPath expression will be executed. By default, the XPath expression will be executed only on XML files, but you can also define a set of patterns that will filter out files from the current scope.

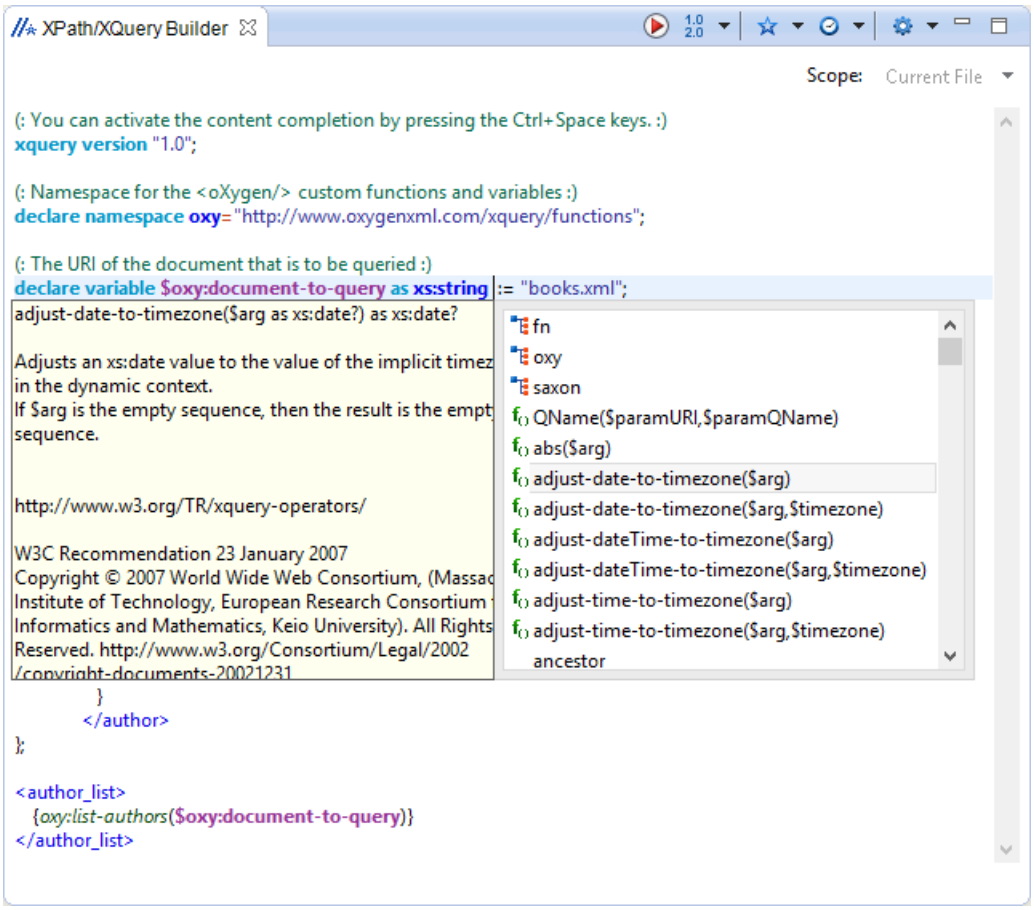

Figure 584: XPath/XQuery Builder View

When you hover your cursor over the version icon 1.0 2.0, a tooltip is displayed to let you know what engine Oxygen XML Editor plugin currently uses.

While you edit an XPath or XQuery expression, Oxygen XML Editor plugin assists you with the following features:

- *Content Completion Assistant* - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the *Content Completion Assistant* also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.
- Syntax Highlighting - Allows you to identify the components of an expression. To customize the colors of the components of the expression, open the **Preferences** dialog box and go to **Editor** > **Syntax Highlight**.
- Automatic validation of the expression as you type.

  Note: When you type invalid syntax a red serrated line underlines the invalid fragments.
- Function signature and documentation balloon, when the cursor is located inside a function.

Related Information:

XPath Expression Results View on page 1131

XPath Expression Results View

When you run an XPath expression, Oxygen XML Editor plugin displays the results of its execution in the **XPath Results** view.

This view contains the following columns:

- **Description** - The result thatOxygen XML Editor plugin displays when you run an XPath expression.
- **XPath location** - The path to the matched node.

- **Resource** - The name of the document that you run the XPath expression on.
- **System ID** - The path to the document itself.
- **Location** - The location of the result in the document.

To arrange the results depending on a column, click its header. If no information regarding location is available, Oxygen XML Editor plugin displays **Not available** in the **Location** column. Oxygen XML Editor plugin displays the results in a valid XPath expression format.

```
- /node[value]/node[value]/node[value] -
```

XPath Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

Select All

Extends the selection to all the messages from the view.

Copy

Copies information associated with the selected messages in case you want to paste it elsewhere.

Save Results

Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the **Copy** action.

Save Results as XML

Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the **Copy** action.

Save Results as HTML

Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the **Copy** action.

Example:

The following snippets are taken from a DocBook book based on the DocBook XML DTD. The book contains a number of chapters. To return all the chapter nodes of the book, enter `//chapter` in the XPath expression field and press **(Enter)**. This action returns all the `chapter` nodes of the DocBook book in the **Results View**. Click a record in the **Results View** to locate and highlight its corresponding chapter element and all its children nodes in the document you are editing.

To find all `example` nodes contained in the `sect2` nodes of a DocBook XML document, use the following XPath expression: `//chapter/sect1/sect2/example`. Oxygen XML Editor plugin adds a result in the **Results View** for each `example` node found in any `sect2` node.

For example, if the result of the above XPath expression is:

```
- /chapter[1]/sect1[3]/sect2[7]/example[1]
```

it means that in the edited file, the `example` node is located in the first chapter, third section level one, seventh section level 2.

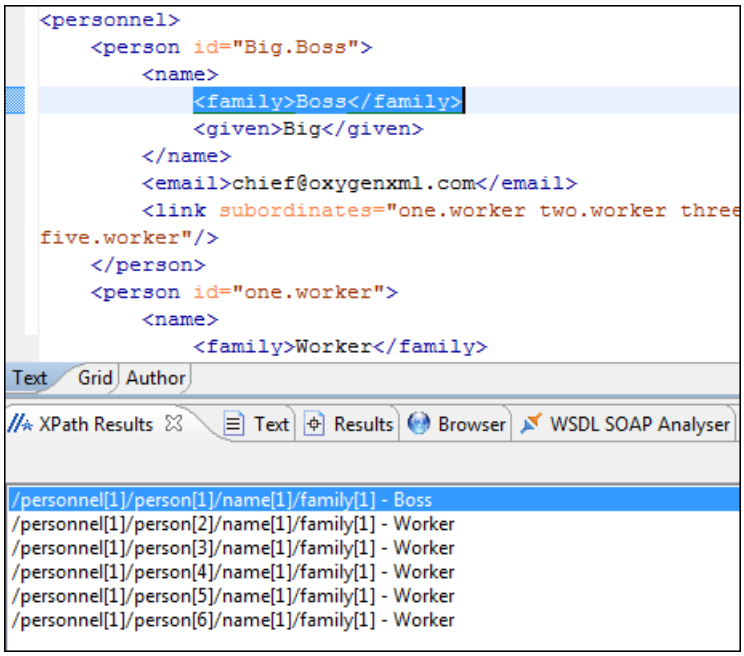

Figure 585: XPath Results Highlighted in Editor Panel with Character Precision

XPath and XML Catalogs

The evaluation of the XPath expression tries to resolve the locations of documents referenced in the expression through *XML Catalogs*. These catalogs are configured in the **XML Catalog** preferences pages and the **XML Parser** preferences.

Example:

As an example, consider the evaluation of the `collection(`**`URIofCollection`**`)` function (XPath 2.0). To resolve the references from the files returned by the `collection()` function with an *XML catalog*, specify the class name of the catalog-enabled parser for parsing these collection files. The class name is *ro.sync.xml.parser.CatalogEnabledXMLReader*. Specify it as it follows:

```
let $docs := collection(iri-to-uri(
   "file:///D:/temp/test/XQuery-catalog/mydocsdir?recurse=yes;select=*.xml;
   parser=ro.sync.xml.parser.CatalogEnabledXMLReader"))
```

XPath Prefix Mapping

To define default mappings between prefixes and namespace URIs go to the **XPath** preferences page and enter the mappings in the **Default prefix-namespace mappings** table. The same preferences panel allows you to configure the default namespace used in XPath 2.0 expressions.

Important: If you define a default namespace, Oxygen XML Editor plugin binds this namespace to the first free prefix from the list: `default`, `default1`, `default2`, and so on. For example, if you define the default namespace `xmlns="something"` and the prefix `default` is not associated with another namespace, you can match tags without prefix in an XPath expression typed in the XPath toolbar by using the prefix `default`. To find all the `level` elements when you define a default namespace in the root element, use this expression: `//default:level` in the XPath toolbar.

Working with Archives

12

Topics:

- Browsing Archives
- Working with Archive Files

Oxygen XML Editor plugin includes a useful **Archive Browser** view that offers the means to work with files directly from various types of archives (for example, opening and saving files directly in archives, or browsing and modifying archive structures). The archive support is available for all ZIP-type archives, including:

- ZIP archives
- EPUB books
- *JAR archives*
- Office Open XML (OOXML) files
- Open Document Format (ODF) files
- *IDML files*

You can transform, validate, and perform many other operations on files directly from an archive. For instance, you can transform, or validate files directly from OOXML or ODF packages, and the structure and content of the ZIP archives can be opened, edited, and saved, similar to any other ZIP archive browsing tool. Also, when browsing for a URL in various dialog boxes, you can use the **Browse for archived file** action to browse and select files from a particular archive.

For more information about working with an EPUB archive in Oxygen XML Editor plugin, watch our video demonstration:

https://www.youtube.com/embed/OIGTNQwOCl8

Browsing Archives

To view the contents and structure of an archive, use one of the following methods:

- Open an archive from the **Navigator** view. This will open the archive in the main editing pane. The archive will be unmounted when the editor is closed.
- Use the Eclipse File System (EFS) by right-clicking the archive in the **Navigator** view and choosing **Expand Zip Archive**. This will expand the archive in the **Navigator** view. All the standard **Navigator** actions are available on the mounted archive. To close the archive, you can use the **Collapse ZIP Archive** action and any file opened from the expanded archive will be closed when the archive in unmounted.

Tip: If a file is not recognized by Oxygen XML Editor plugin as a supported archive type, you can add it from the **Archive** preferences page.

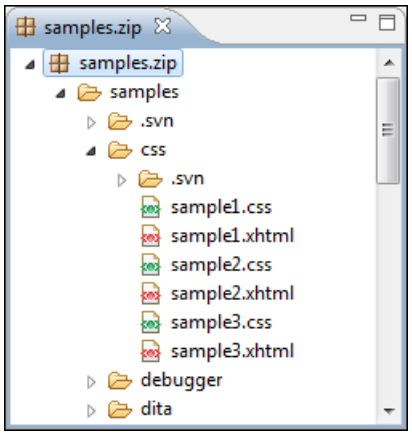

Figure 586: Browsing an Archive

Archive Contextual Menu Actions

The following additional actions are available from the contextual menu for archives:

Open

Opens a resource from the archive in the editor.

Extract

Extracts a resource from the archive in a specified folder.

New folder

Creates a folder as child of the selected folder in the browsed archive.

New file

Creates a file as child of the selected folder in the browsed archive.

Add files

Adds existing files as children of the selected folder in the browsed archive.

Note: On OS X, the **Add file** action is also available and it allows you to add one file at a time.

Rename

Renames a resource in the archive.

Cut

Cuts the selected archive resource.

Copy

Copies the selected archive resource.

Paste

Pastes a file or folder into the archive.

Delete

Removes a file or folder from archive.

Copy location

Copies the URL location of the selected resource.

Refresh

Refreshes the selected resource.

Properties

Shows the properties of the selected resource.

For more information, watch our video demonstration about working with an EPUB in the **Archive Browser** view:

https://www.youtube.com/embed/OIGTNQwOCl8

Working with Archive Files

Oxygen XML Editor plugin includes support for working with various types of archives, including the following:

- **EPUB** - An e-book file format that can be used on many types of devices, such as smart phones, tablets, e-readers, or computers.
- **OOXML** - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
- **ODF** - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.

When these types of files are opened in the **Navigator** view or the main editing pane, their internal components are expanded:

- Document content (XHTML and image files).
- Packaging files.
- Container files.

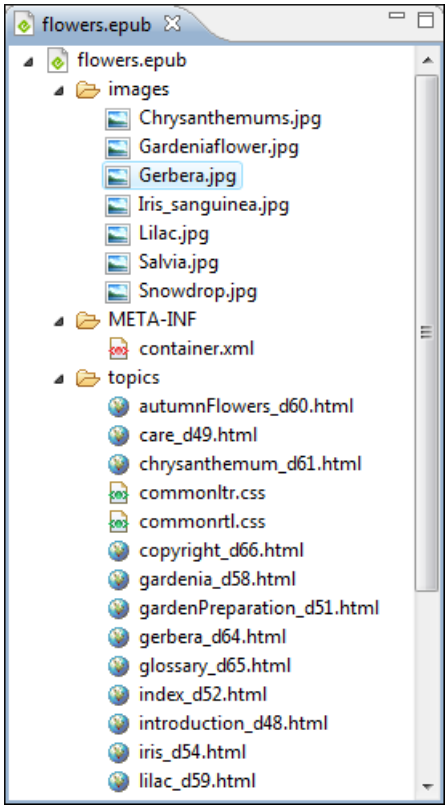

Figure 587: EPUB File Displayed in Eclipse

When an archive is expanded, you can add or delete files that compose the archive structure. All changes made to the structure of an archive are saved immediately. You can open files from within the archive to edit them in the main editing pane and save changes back to the archive. You can also use the **Open in System Application** action to open the archive in the default system application that is associated with that type of file.

EPUB-Specific Validation

When working with EPUB archives, Eclipse includes a **Validate** action on the toolbar that checks the EPUB archive to make sure the structure and content are valid. Oxygen XML Editor plugin uses the open-source

EpubCheck validator to perform the validation. This validator detects many types of errors, including OCF container structure, OPF and OPS mark-up, as well as internal reference consistency.

For more information about working with an EPUB archive in Oxygen XML Editor plugin, watch our video demonstration:

https://www.youtube.com/embed/OIGTNQwOCl8

Related Information:

The Archive Browser View on page 1134
EPUB Document Type (Framework) on page 881

Creating an Archive

To create an archive from scratch, follow these steps:

1. Go to **File** > **New** > **New from Templates**.
2. Choose your particular type of archive template. For example, select one of the **ODF**, **OOXML**, or **EPUB** templates.
3. Click **Next** and choose the name and location of the file.
4. Click **Finish**.
   A skeleton archive is saved on disk and opened in Eclipse.

   Tip: Use toolbar and contextual menu actions to edit, add, and remove resources from the archive. For EPUB archives, you can use the **Validate** action to verify the integrity of the EPUB archive.

Editing and Saving Files Inside an Archive

You can open files directly from an archive and then edit them in the main editor pane. To open a file, simply double-click it or select **Open** from the contextual menu.

When saving the file back to the archive, you are prompted to choose if you want the application to make a backup copy of the archive before saving the new content. If you choose **Never ask me again**, you will not be asked again to make backup copies. You can re-enable the pop-up message from the Archive preferences page.

Migrating Archives to DITA or TEI

Certain types of archives can be converted to DITA or TEI. For example, OOXML (Office Open XML) archive files with the DOCX file extension can be migrated to DITA or TEI.

To migrate DOCX files to DITA or TEI, follow these steps:

1. Open and expand the archive in Eclipse.
2. Open the **document.xml** file contained in the archive.
3. Run one of the following predefined transformation scenarios:
   a) **DOCX DITA** to migrate to DITA.
   b) **DOCX TEI P5** to migrate to TEI.
4. You may need to do some manual reconfiguring to map DOCX styles to DITA or TEI content.

   Tip: Oxygen XML Editor plugin also includes a predefined transformation scenario called **ODT TEI P5** for converting ODF archive files with the ODT file extension to TEI and a similar process can be used to migrate ODT files to TEI.

Databases and SharePoint

13

Topics:

- Working with Databases
- Integration with Microsoft SharePoint

Oxygen XML Editor plugin provides support for connecting and integrating with various databases and Microsoft SharePoint. This section includes information about the database-related features in Oxygen XML Editor plugin. It explains how to connect with the supported databases, presents the actions that are available for each type, and includes information about SharePoint integration.

Working with Databases

XML is a storage and interchange format for structured data and is supported by all major database systems. Oxygen XML Editor plugin offers the means for managing the interaction with some of the most commonly used databases (both *Relational* and *Native XML* databases). Through this interaction, Oxygen XML Editor plugin helps users with browsing, content editing, importing from databases, using XQuery with databases, SQL execution, and generating XML Schema from a database structure.

The types of connections that are supported in Oxygen XML Editor plugin include:

- IBM DB2
- Microsoft SQL Server
- Oracle Database
- PostgreSQL
- Berkeley DB XML
- eXist
- MarkLogic
- Documentum xDB (X-Hive/DB)
- MySQL
- Generic JDBC
- JDBC-ODBC
- BaseX
- WebDAV
- Microsoft SharePoint

Related Information:

Integration with Microsoft SharePoint on page 1191

Data Source Explorer View

The **Data Source Explorer** view displays your database connections. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

You can connect to a database simply by expanding the connection node (click the connection) . The database structure can be expanded to resource level, or even all the way to column level for tables inside relational databases. Oxygen XML Editor plugin supports multiple simultaneous database connections and the connection tree in the **Data Source Explorer** view provides an easy method for browsing them.

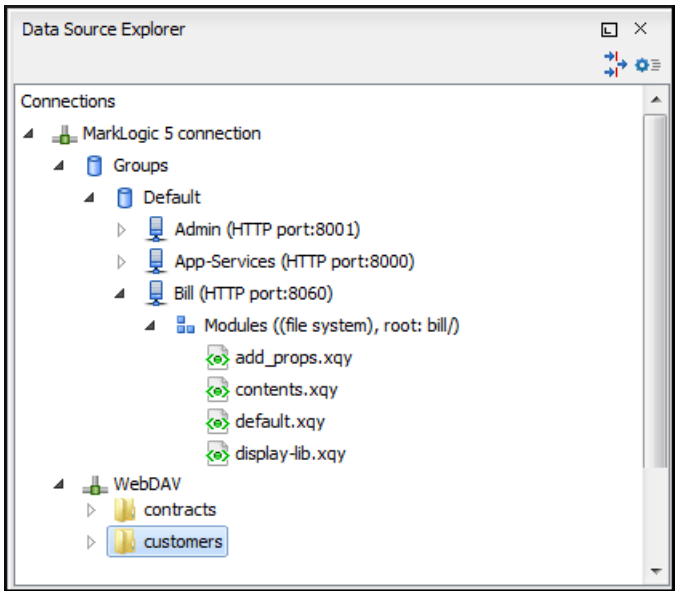

Figure 588: Data Source Explorer View

The objects (nodes) that are displayed in the **Data Source Explorer** view depend on the connection type and structure of the database. Various contextual menu actions are available for each hierarchical level and for some connections you can add or move resources in a container by simply dragging them from the **Navigator** view, a file browsing application, or another database.

Toolbar Actions

The following actions are available in the toolbar of this view:

Filters

Opens the **Data Sources / Table Filters** preferences page, allowing you to decide which table types are displayed in the **Data Source Explorer** view.

Configure Database Sources

Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Database-Specific Contextual Menu Actions

Each specific type of database will also include its own specific contextual menu actions in the **Data Source Explorer** view. The actions depend on the type of database, the type of node, or the hierarchical level of the node in which the contextual menu is invoked.

For more information on the specific actions that are available, see the topics in this section for each specific type of database.

Related Information:

Data Sources Preferences on page 40

Table Explorer View

Relational databases tables in the **Data Source Explorer** view can be displayed and edited in the **Table Explorer** view by selecting the **Edit** action from the contextual menu of a **Table** node or by double-clicking one of its fields. To modify the content of a cell, double-click it and start typing. When editing is complete, Oxygen XML Editor plugin attempts to update the database with the new cell content.

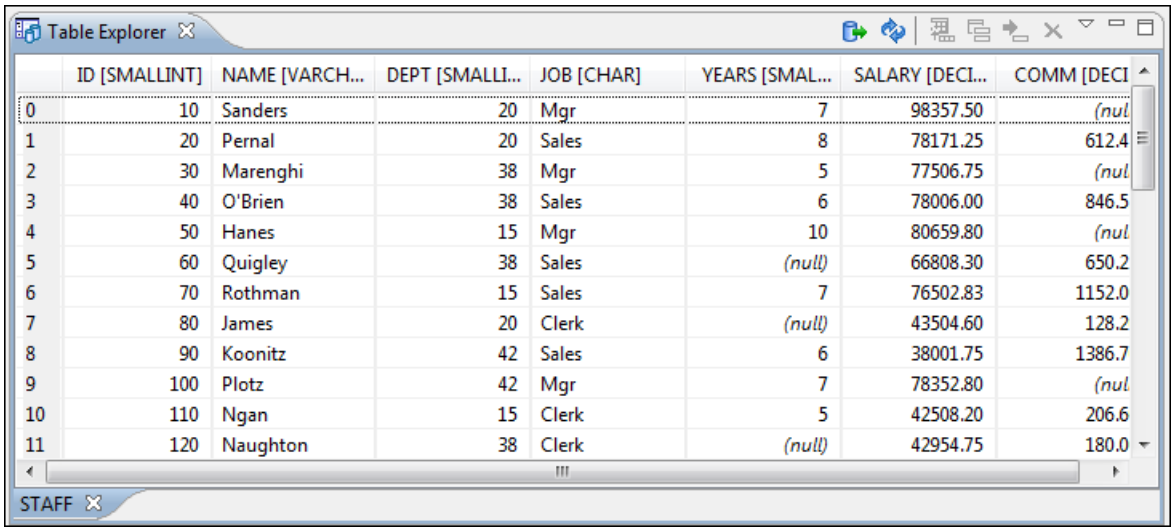

Figure 589: Table Explorer View

You can sort the content of a table by one of its columns by clicking its column header.

Note the following:

- The first column is an index (not part of the table structure).
- Every column header contains the field name and its data type.
- The primary key columns are marked with this symbol: .
- Multiple tables are presented in a tabbed manner.

For performance issues, you can set the maximum number of cells that are displayed in the **Table Explorer** view (using the **Limit the number of cells** option in the **Data Sources** Preferences page). If a table that has more cells than the value set in the options is displayed in the **Table Explorer** view, a warning dialog box informs you that the table is only partially shown.

You are notified if the value you have entered in a cell is not valid (and thus cannot be updated).

- If the content of the edited cell does not belong to the data type of the column, an information dialog box appears, notifying you that the value you have inserted cannot be converted to the SQL type of that field. For example, if you have a column that contains LONG (numerical) values, and a character or string is inserted into one of its cells, you would get the error message that a string value cannot be converted to the requested SQL type (NUMBER).
- If the constraints of the database are not met (for instance, primary key constraints), an information dialog box will appear, notifying you of the reason the database has not been updated. For example, in the table below, trying to set the second record in the primary key `propID` column to 8, results in a duplicate entry error since that value has already been used in the first record:

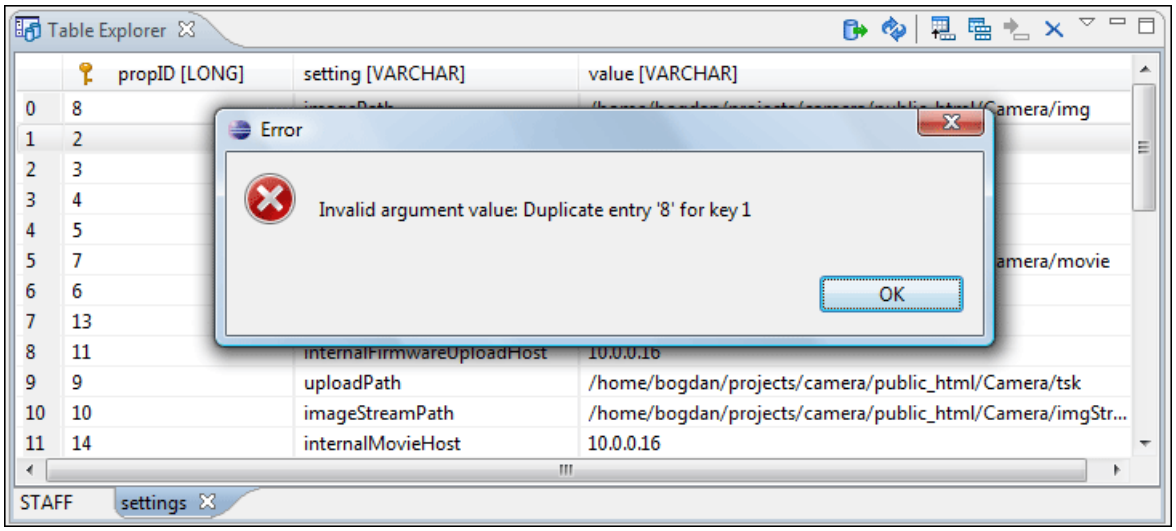

Figure 590: Duplicate Entry for Primary Key

Table Explorer Contextual Menu Actions

Common editing actions (**Cut**, **Copy**, **Paste**, **Select All**, **Undo**, **Redo**) are available in the contextual menu of an edited cell.

The contextual menu, available on every cell in the **Table Explorer** view, also includes the following actions:

Set NULL

Sets the content of the cell to **null**. This action is not available for columns that cannot have a value of **null**.

Insert row

Inserts an empty row in the table.

Duplicate row

Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

Commit row

Commits the selected row.

Delete row

Deletes the selected row.

Copy

Copies the content of the cell.

Paste

Pastes copied content into the selected cell.

Table Explorer Toolbar Actions

The toolbar of the **Table Explorer** view also includes the following actions:

Export to XML

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the Import from database chapter) .

Refresh

Performs a refresh for the sub-tree of the selected node.

Insert row

Inserts an empty row in the table.

Duplicate row

Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

Commit row

Commits the selected row.

Delete row

Deletes the selected row.

Database Connection Support

Oxygen XML Editor plugin offers support for a variety of *Relational* and *Native XML* database connections. The database drivers and connections for various types of database are configured in the **Data Sources** preferences page and once configured, the database connections can be viewed and managed in the **Data Source Explorer** view. Oxygen XML Editor plugin also includes a **Database** *perspective* that helps you to manage databases.

The database support in Oxygen XML Editor plugin offers a variety of capabilities, including:

- Browsing the structure of databases in the **Data Source Explorer** view.
- Viewing relational tables in the **Table Explorer** view.
- Executing SQL queries against databases.
- Calling stored procedures with input and output parameters.
- XQuery execution with databases.
- Exporting data from databases to XML.

Relational Database Support

Relational databases use a relational model and are based on tables linked by a common key. Oxygen XML Editor plugin offers support for the most commonly used relational databases, including:

- IBM DB2
- Oracle 11g
- Microsoft SQL Server
- PostgreSQL
- MySQL

Oxygen XML Editor plugin also offers generic support (table browsing and execution of SQL queries) for any JDBC-compliant database (for example, *MariaDB*).

Native XML Database Support

Native XML databases have an XML-based internal model and their fundamental unit of storage is XML. They use XML as an interface to specify documents as tree structured data that may contain unstructured text, but on disk the data is stored as optimized binary files. This makes query and retrieval processes faster. Oxygen XML Editor plugin offers support for the most commonly used native XML databases, including:

- Berkeley DB XML
- eXist
- MarkLogic
- Documentum xDB (X-Hive/DB) 10
- Oracle XML DB
- Base X

WebDAV Connections on page 1182
Integration with Microsoft SharePoint on page 1191

IBM DB2 Database Connections

Oxygen XML Editor plugin includes support for IBM DB2 database connections. Oxygen XML Editor plugin allows you to browse the structure of an IBM DB2 database in the **Data Source Explorer** view, open tables in the **Table Explorer** view, and perform various operations on the resources in the repository.

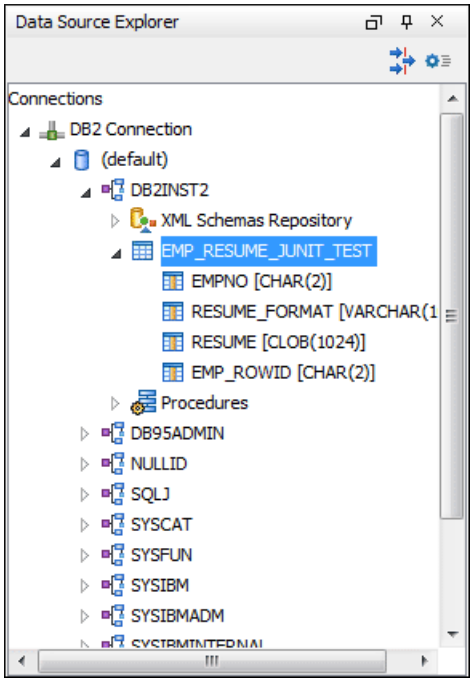

Figure 591: IBM DB2 Database Connection

Configuring an IBM DB2 Database Connection

To configure the support for the IBM DB2 database, follow this procedure:

1. Go to the IBM website and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file. Unzip the zip file and use the `db2jcc.jar` and `db2jcc_license_cu.jar` files in Oxygen XML Editor plugin for configuring a DB2 data source.
2. Configure IBM DB2 *Data Source* drivers.
3. Configure an IBM DB2 Server *Connection*.
4. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

How to Configure IBM DB2 Data Source Drivers

Available in the Enterprise edition only.

To configure a data source for connecting to an IBM DB2 server, follow these steps:

1. Go to the IBM website and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file.
2. Unzip the downloaded archive.
3. Open the **Preferences** dialog box and go to **Data Sources**.
4. Click the **New** button in the **Data Sources** panel.

   The dialog box for configuring a data source is opened.

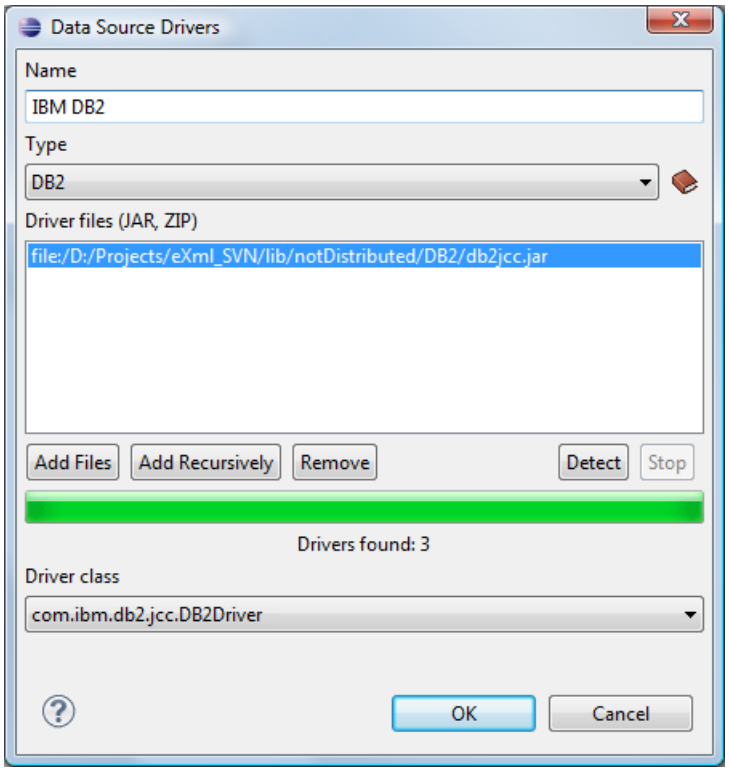

Figure 592: Data Source Drivers Configuration Dialog Box

5. Enter a unique name for the data source.
6. Select *DB2* in the driver **Type** drop-down menu.
7. Click the **Add Files** button and select the IBM DB2 driver files from the archive that you downloaded and unzipped.

   The IBM DB2 driver files are:

   - `db2jcc.jar`
   - `db2jcc_license_cisuz.jar`
   - `db2jcc_license_cu.jar`
8. Select the most appropriate **Driver class**.
9. Click the **OK** button to finish the data source configuration.
10. Continue on to configure your IBM DB2 connection.

How to Configure an IBM DB2 Connection

The support to create an IBM DB2 connection is available in the Enterprise edition only.

To configure a connection to an IBM DB2 server, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

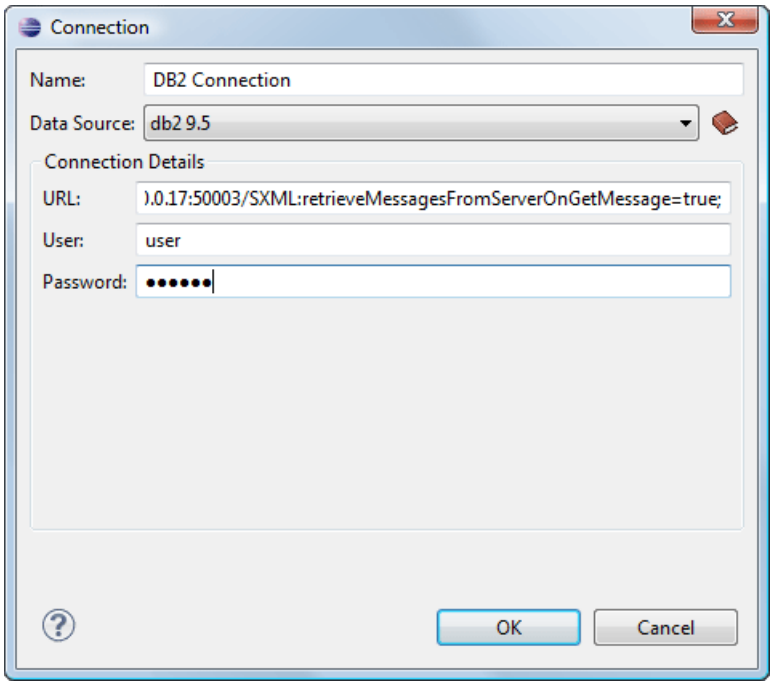

Figure 593: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select an *IBM DB2* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
   a) Enter the URL to the installed IBM DB2 engine.
   b) Enter the user name to access the IBM DB2 engine.
   c) Enter the password to access the IBM DB2 engine.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

IBM DB2 Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view, depending on the node in which it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on Connection nodes)

Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Edit (available on Table nodes)

Opens the selected table in the **Table Explorer** view.

Export to XML (available on Table nodes)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the Import from Database chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view, the various nodes in IBM DB2 connections include the following additional contextual menu actions:

XML Schema Repository Level Nodes

Register

Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the **Add** and **Remove** buttons.

Schema Level Nodes

Unregister

Removes the selected schema from the XML Schema Repository.

View

Opens the selected schema in Oxygen XML Editor plugin.

Microsoft SQL Server Database Connections

Oxygen XML Editor plugin includes support for Microsoft SQL Server database connections. Oxygen XML Editor plugin allows you to browse the structure of a SQL Server database in the **Data Source Explorer** view, open tables in the **Table Explorer** view, and perform various operations on the resources in the repository.

Configuring a Microsoft SQL Server Connection

To configure the support for a Microsoft SQL Server database, follow this procedure:

1. Download the appropriate MS SQL JDBC driver from the Microsoft website. For SQL Server 2008 R2 and older go to http://www.microsoft.com/en-us/download/details.aspx?id=21599. For SQL Server 2012 and 2014 go to http://www.microsoft.com/en-us/download/details.aspx?id=11774.
2. Configure MS SQL Server *Data Source* drivers.
3. Configure a MS SQL Server *Connection*.
4. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

How to Configure Microsoft SQL Server Data Source Drivers

Available in the Enterprise edition only.

To configure a data source for connecting to a Microsoft SQL server, follow these steps:

1. Download the appropriate MS SQL JDBC driver from the Microsoft website. For SQL Server 2008 R2 and older, go to http://www.microsoft.com/en-us/download/details.aspx?id=21599. For SQL Server 2012 and 2014, go to http://www.microsoft.com/en-us/download/details.aspx?id=11774.
2. Open the **Preferences** dialog box and go to **Data Sources**.
3. Click the **New** button in the **Data Sources** panel.

   The dialog box for configuring a data source is opened.

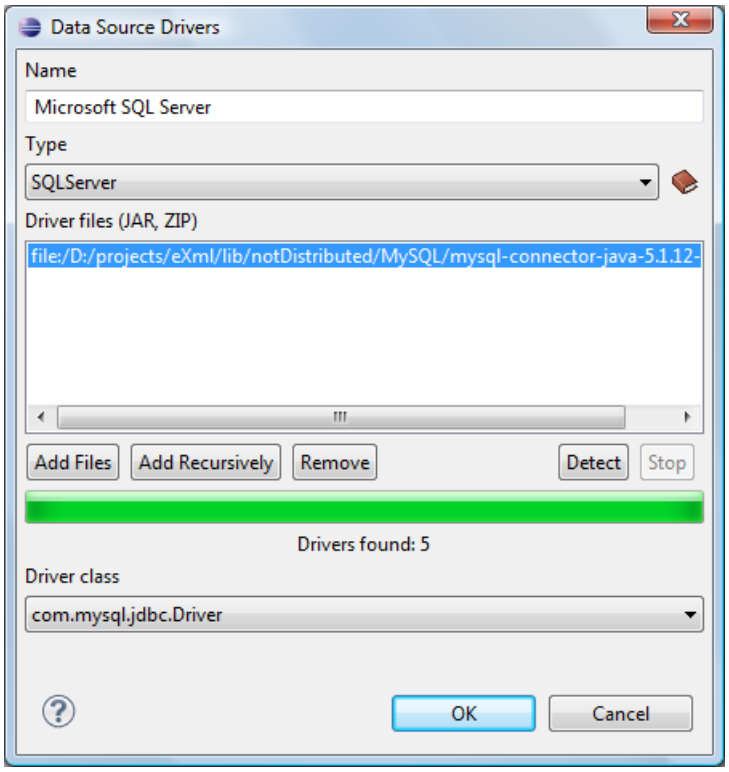

Figure 594: Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select *SQLServer* in the driver **Type** drop-down menu.
6. Click the **Add Files** button and select the Microsoft SQL Server driver file that you downloaded.
   The SQL Server driver file is called `sqljdbc.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure your Microsoft SQL Server connection.

How to Configure a Microsoft SQL Server Connection

The support to configure a Microsoft SQL Server connection is available in the Enterprise edition only.

To configure a connection to a Microsoft SQL Server, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.
   The dialog box for configuring a database connection is displayed.

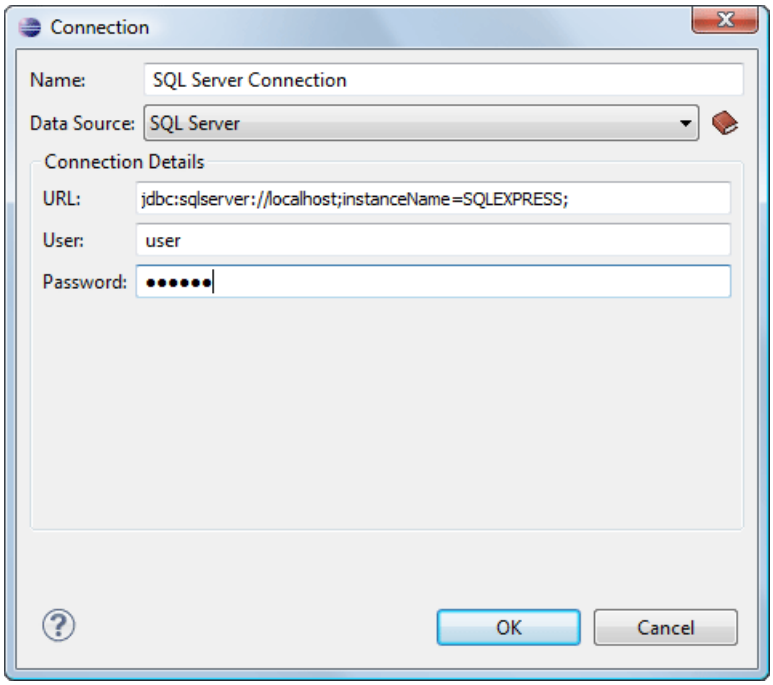

Figure 595: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *SQL Server* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
   a) Enter the URL of the SQL Server server.

      If you want to connect to the server using Windows integrated authentication, you must add **;integratedSecurity=true** to the end of the URL. The URL will look like this:

      ```
      jdbc:sqlserver://localhost;instanceName=SQLEXPRESS;integratedSecurity=true;
      ```

      Note: For integrated authentication, leave the **User** and **Password** fields empty.
   b) Enter the user name for the connection to the SQL Server.
   c) Enter the password for the connection to the SQL Server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

Microsoft SQL Server Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view, depending on the node in which it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on Connection nodes)

Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Edit (available on Table nodes)

Opens the selected table in the **Table Explorer** view.

Export to XML (available on Table nodes)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the Import from Database chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view, the resource level nodes in Microsoft SQL Server connections include the following additional contextual menu action:

XML Schema Repository Level Nodes

Register

Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the **Add** and **Remove** buttons.

Schema Level Nodes

Add

Adds a new schema to the XML Schema files.

Unregister

Removes the selected schema from the XML Schema Repository.

View

Opens the selected schema in Oxygen XML Editor plugin.

Oracle Database Connections

The Oracle database is a common relational type of database system. Oxygen XML Editor plugin comes with built-in support for the 11g version of the database system. The Oracle database also includes a Oracle XML DB component that adds native XML support. Oxygen XML Editor plugin allows you to browse Oracle repositories in the **Data Source Explorer** view, open tables in the **Table Explorer** view, and perform various operations on the resources in the repository.

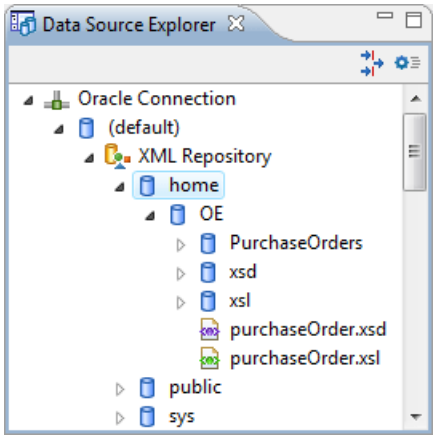

Figure 596: Oracle Database Connection

Related Information:
Using XQuery with Oracle XML DB

Configuring an Oracle 11g Database Connection

To configure the support for a Oracle 11g database, follow this procedure:

1. Go to http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html and download the Oracle 11g JDBC driver called `ojdbc6.jar`.
2. Configure Oracle 11g *Data Source* drivers.

3. Configure an Oracle 11g *Connection*.
4. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

How to Configure Oracle 11g Data Source Drivers

Available in the Enterprise edition only.

To configure a data source for connecting to an Oracle 11g server, follow these steps:

1. Go to http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html and download the Oracle 11g JDBC driver called `ojdbc6.jar`.
2. Open the **Preferences** dialog box and go to **Data Sources**.
3. Click the **New** button in the **Data Sources** panel.

   The dialog box for configuring a data source is opened.

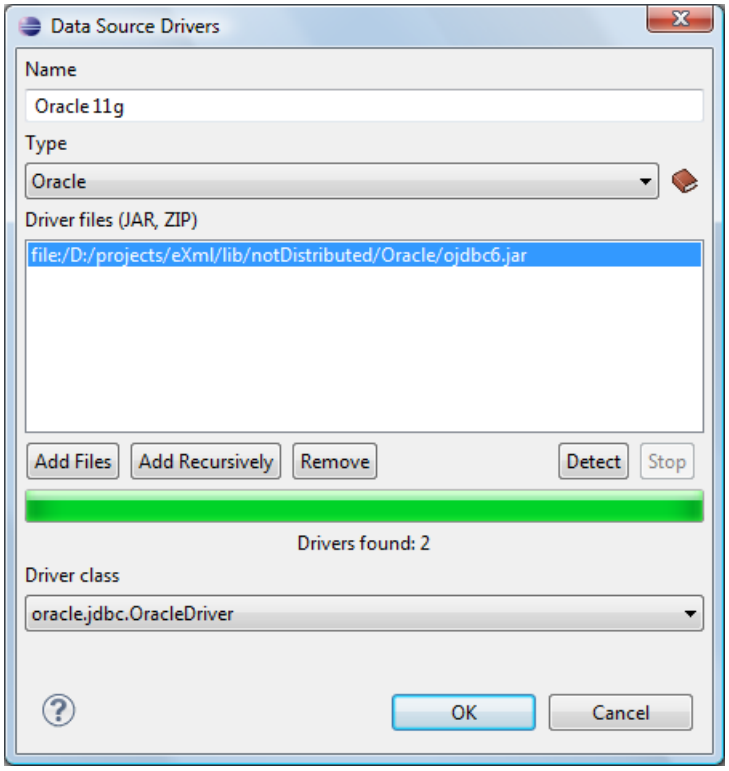

Figure 597: Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select *Oracle* in the driver **Type** drop-down menu.
6. Click the **Add Files** button and select the Oracle driver file that you downloaded.

   The Oracle driver file is called `ojdbc5.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure your Oracle connection.

How to Configure an Oracle 11g Connection

Available in the Enterprise edition only.

To configure a connection to an Oracle 11g server, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

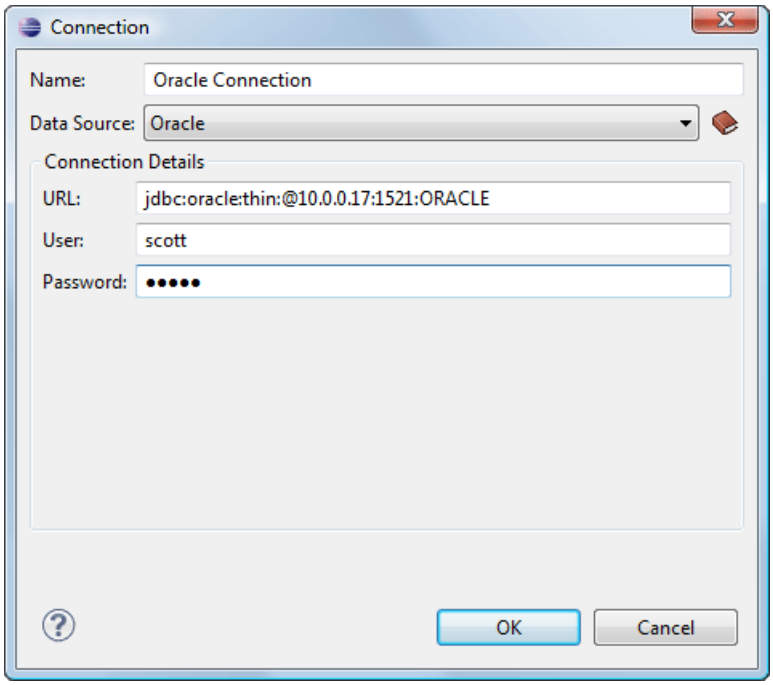

Figure 598: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *Oracle 11g* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
   a) Enter the URL of the Oracle server.
   b) Enter the user name for the connection to the Oracle server.
   c) Enter the password for the connection to the Oracle server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

Oracle Database Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view, depending on the node in which it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on Connection nodes)

Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Edit (available on Table nodes)

Opens the selected table in the **Table Explorer** view.

Export to XML (available on Table nodes)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the Import from Database chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view, the various nodes in Oracle database connections include the following additional contextual menu actions:

XML Schema Repository Level Nodes

Register

Opens a dialog box for adding a new schema file in the XML repository. To add an XML Schema, enter the schema URI and location on your file system. *Local* scope means that the schema is visible only to the user who registers it. *Global* scope means that the schema is public.

Note: Registering a schema may involve dropping/creating types. Hence you need type-related privileges such as DROP TYPE, CREATE TYPE, and ALTER TYPE. You need privileges to delete and register the XML schemas involved in the registering process. You need all privileges on XMLType tables that conform to the registered schemas. For XMLType columns, the ALTER TABLE privilege is needed on corresponding tables. If there are schema-based XMLType tables or columns in other database schemas, you need privileges such as the following:

- `CREATE ANY TABLE`
- `CREATE ANY INDEX`
- `SELECT ANY TABLE`
- `UPDATE ANY TABLE`
- `INSERT ANY TABLE`
- `DELETE ANY TABLE`
- `DROP ANY TABLE`
- `ALTER ANY TABLE`
- `DROP ANY INDEX`

To avoid having to grant all these privileges to the schema owner, Oracle recommends that the registration be performed by a DBA if there are XML schema-based XMLType table or columns in other user database schemas.

XML Repository Level Nodes

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

Container Level Nodes

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

Delete

Deletes the current container.

Properties

Shows various properties of the current container.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default

application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Rename

Renames the current resource

Move

Moves the current resource to a new container (also available through drag and drop).

Delete

Deletes the current container.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Properties

Shows various properties of the current container.

Compare

Compares two selected resources.

PostgreSQL Database Connections

Oxygen XML Editor plugin includes support for PostgreSQL database connections. Oxygen XML Editor plugin allows you to browse the structure of a PostgreSQL database in the **Data Source Explorer** view, open tables in the **Table Explorer** view, and perform various operations on the resources in the repository.

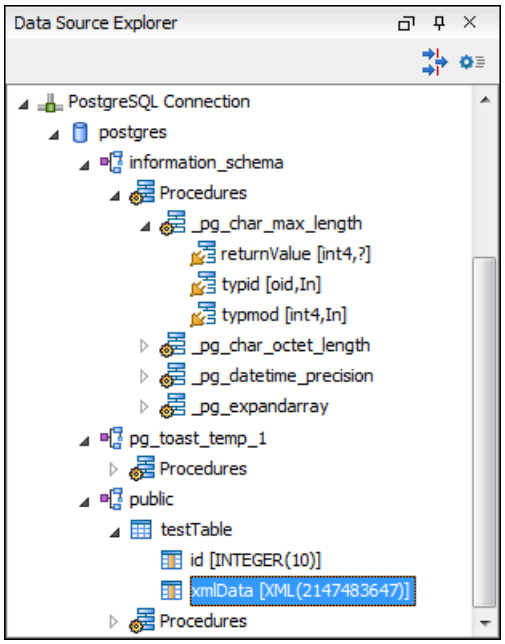

Figure 599: PostgreSQL Database Connection

Configuring a PostgreSQL Database Connection

To configure the support for a PostgreSQL database, follow this procedure:

1. Go to http://jdbc.postgresql.org/download.html and download the PostgreSQL 8.3 JDBC3 driver.
2. Configure PostgreSQL *Data Source* drivers.
3. Configure a PostgreSQL *Connection*.
4. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

How to Configure PostgreSQL 8.3 Data Source Drivers

To configure a data source for connecting to a PostgreSQL server, follow these steps:

1. Go to http://jdbc.postgresql.org/download.html and download the PostgreSQL 8.3 JDBC3 driver.
2. Open the **Preferences** dialog box and go to **Data Sources**.
3. Click the **New** button in the **Data Sources** panel.

   The dialog box for configuring a data source is opened.

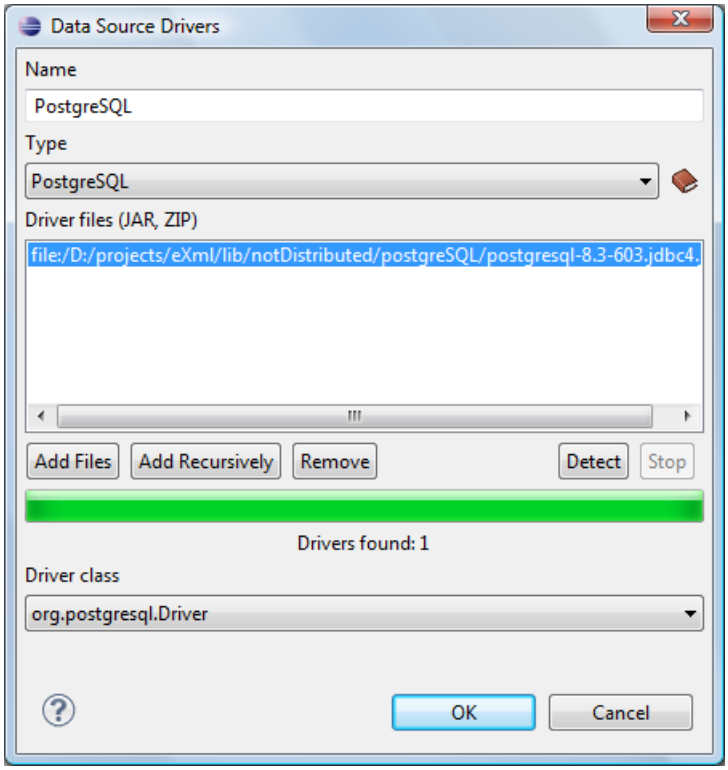

Figure 600: Data Source Drivers Configuration Dialog Box

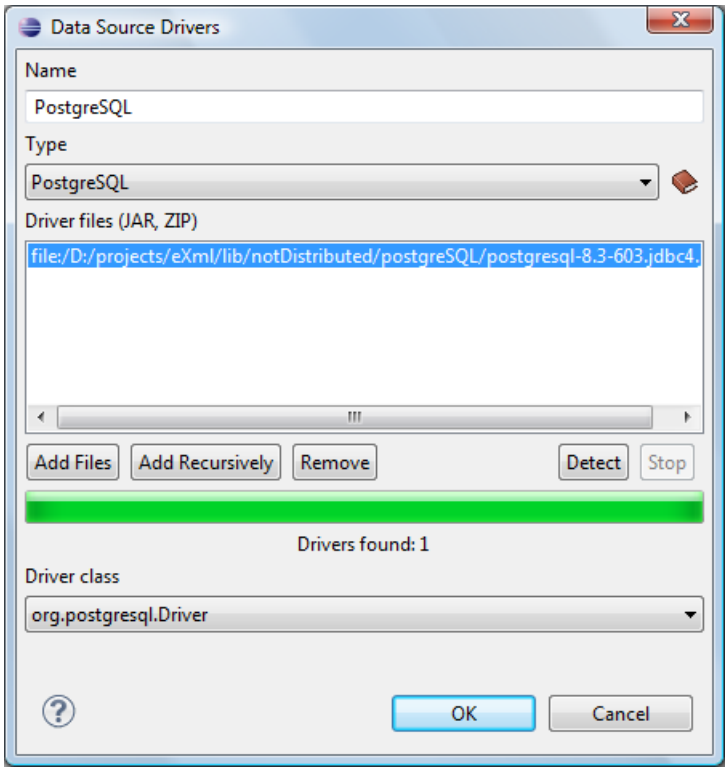

Figure 601: Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select *PostgreSQL* in the driver **Type** drop-down list.
6. Click the **Add Files** button and select the PostgreSQL driver file that you downloaded.
   The PostgreSQL driver file is called `postgresql-8.3-603.jdbc3.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure your PostgreSQL connection.

How to Configure a PostgreSQL 8.3 Connection

To configure a connection to a PostgreSQL 8.3 server, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.
   The dialog box for configuring a database connection is displayed.

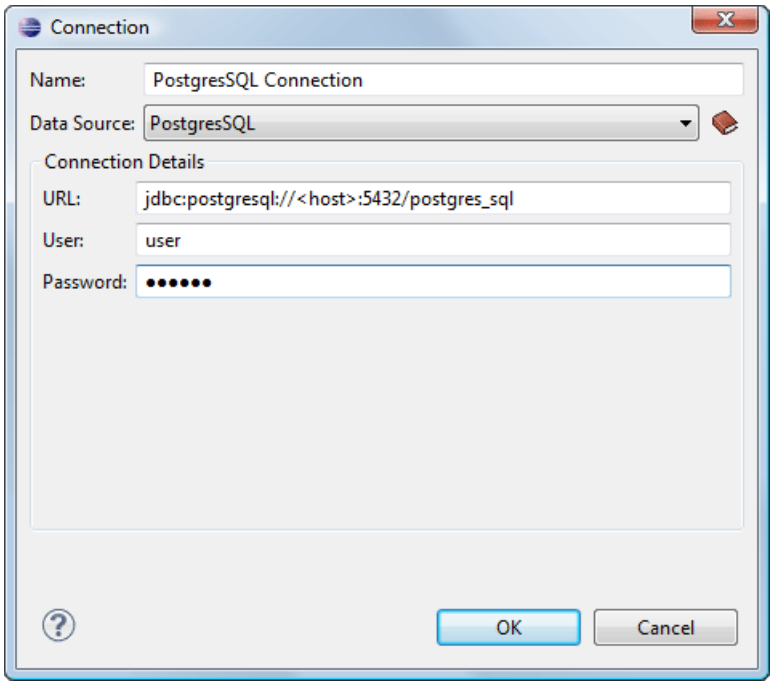

Figure 602: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *PostgreSQL 8.3* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
   a) Enter the URL of the PostgreSQL 8.3 server.
   b) Enter the user name for the connection to the PostgreSQL 8.3 server.
   c) Enter the password for the connection to the PostgreSQL 8.3 server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

PostgreSQL Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view, depending on the node in which it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on Connection nodes)

Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Edit (available on Table nodes)

Opens the selected table in the **Table Explorer** view.

Export to XML (available on Table nodes)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the Import from Database chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view, the resource level nodes in PostgreSQL connections include the following additional contextual menu action:

Resource Level Nodes

Compare

Compares two selected resources.

Berkeley DB XML Database Connections

Oxygen XML Editor plugin includes support for Berkeley DB XML database connections. Oxygen XML Editor plugin allows you to browse the structure of a Berkeley DB XML database in the **Data Source Explorer** view and perform various operations on the resources in the repository.

Oracle Berkeley DB XML is an open source, embeddable XML database with XQuery-based access to documents stored in containers and indexed based on their content. It is built on top of the Oracle Berkeley DB and inherits its features and attributes, along with native XML support. A detailed description can be found at: http://www.oracle.com/us/products/database/berkeley-db/xml/overview/index.html.

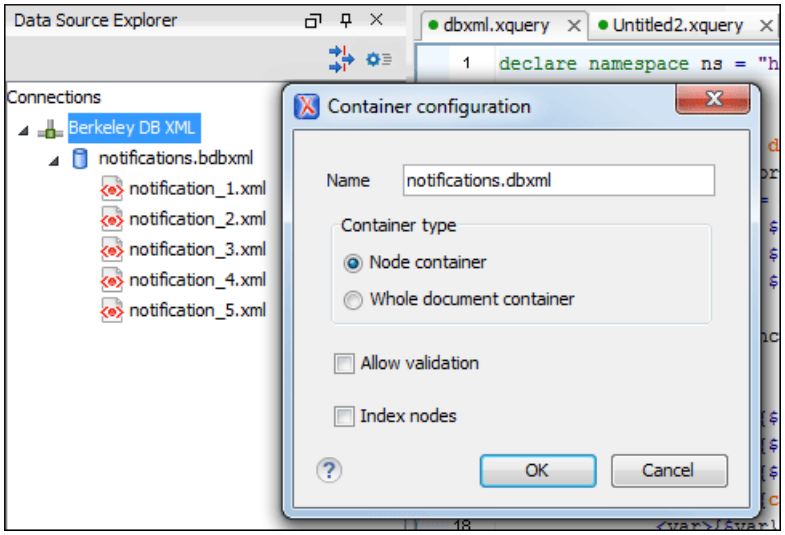

Figure 603: Berkeley DB XML Connection

Configuring a Berkeley DB XML Database Connection

Follow this procedure to configure the support for a Berkeley DB XML database:

1. Configure Berkeley DB XML *Data Source* drivers.
2. Configure a Berkeley DB XML *Connection*.
3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

How to Configure Berkeley DB XML Data Source Drivers

For this procedure, you need to already have a Berkeley DB XML database installed on your system.

Oxygen XML Editor plugin supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a data source for a Berkeley DB XML database, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *Berkeley DBXML* from the driver **Type** drop-down menu.
5. Click the **Add Files** button to add the Berkeley DB driver files.

   The driver files for the Berkeley DB database (and their locations) are as follows:

- `db.jar` (check for it in `[DBXML_DIR]/lib` or `[DBXML_DIR]/jar`)
- `dbxml.jar` (check for it in `[DBXML_DIR]/lib` or `[DBXML_DIR]/jar`)

Where `[DBXML_DIR]` is the Berkeley DB XML database root directory. For example, in Windows it is: `C:\Program Files\Oracle\Berkeley DB XML <version>`.

6. Click the **OK** button to finish the data source configuration.
7. Continue on to configure your Berkeley DB XML connection.

How to Configure a Berkeley DB XML Connection

Oxygen XML Editor plugin supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a connection to a Berkeley DB XML database, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select a previously configured Berkeley data source from the **Data Source** drop-down menu.
5. Enter the connection details.
   a) Set the path to the Berkeley DB XML `database` directory in the **Environment home directory field**. Use a directory with write access. DO NOT use the installation directory where Berkeley DB XML is installed if you do not have write access to that directory.
   b) Select the **Verbosity** level: *DEBUG*, *INFO*, *WARNING*, or *ERROR*.
   c) Optionally, you can select the **Join existing environment** checkbox.

      If selected, an attempt is made to join an existing environment in the specified home directory and all the original environment settings are preserved. If that fails, try reconfiguring the connection with this option unchecked.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

Berkeley DB XML Contextual Menu Actions

While browsing Berkeley DB XML connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Disconnect

Stops the connection.

New Collection

Opens a **Container configuration** dialog box that allows you to adds a new container in the repository.

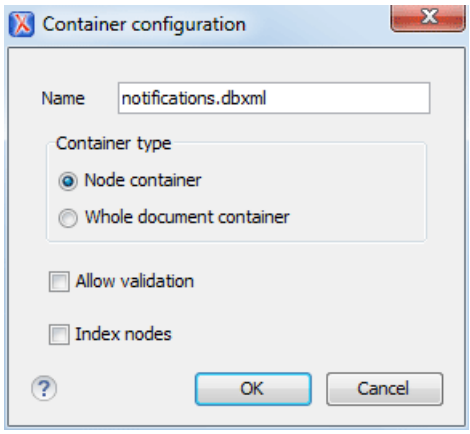

Figure 604: Container Configuration Dialog Box

This dialog box allows you to configure the following:

- **Name** - The name of the new container.
- **Container type** - At creation time, every container must have a type defined for it. This container type identifies how XML documents are stored in the container. As such, the container type can only be determined at container creation time. You cannot change it when subsequent container opens. You can select one of the following types:
  - **Node container** - XML documents are stored as individual nodes in the container. Each record in the underlying database contains a single leaf node, its attributes and attribute values (if any), and its text nodes (if any). Berkeley DB XML also keeps the information it requires to reassemble the document from the individual nodes stored in the underlying databases. This is the default selection and is the preferred container type.
  - **Whole document container** - The container contains entire documents. The documents are stored without any manipulation of line breaks or whitespace.
- **Allow validation** - If selected, documents will be validated when they are loaded into the container. The default behavior is to not validate documents.
- **Index nodes** - If selected, indices for the container will return nodes rather than documents. The default is to index at the document level. This property has no meaning if the container type is **Whole document container**.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Container Level Nodes

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

Delete

Deletes the current container.

Edit indices

Opens a **Container Indices** dialog box that allows you to configure indices properties for the selected Berkeley container.

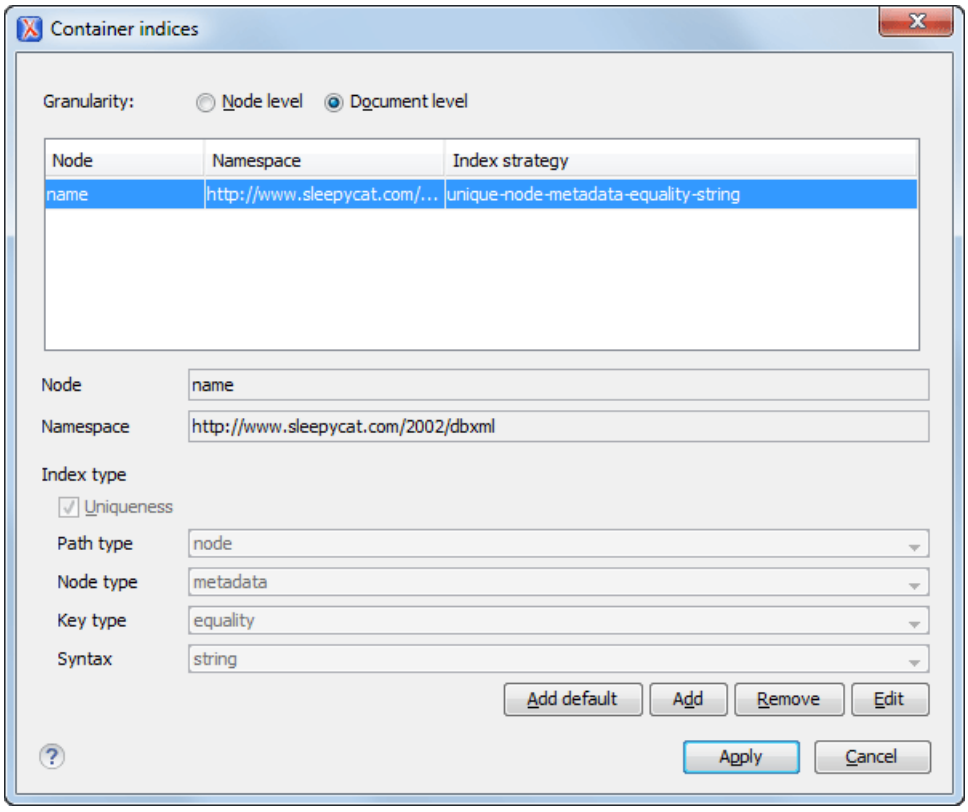

Figure 605: Container Indices Dialog Box

This dialog box allows you to configure the following properties:

- **Granularity** - A measure of the level of details of your data in the database. You can select one of the following:
  - **Document level** - Good option for retrieving large documents.
  - **Node level** - Good option for retrieving nodes from within documents.
- **Node** - The name of the node.
- **Namespace** - The index namespace.
- **Index type**:
  - **Uniqueness** - Indicates whether or not the indexed value must be unique within the container.
  - **Path type** - Drop-down menu that allows you to select from the following:
    - **node** - Indicates that you want to index a single node in the path.
    - **edge** - Indicates that you want to index the portion of the path where two nodes meet.
  - **Node type** - Drop-down menu that allows you to select from the following:
    - **element** - An element node in the document content.
    - **attribute** - An attribute node in the document content.
    - **metadata** - A node found only in the metadata content of a document.
  - **Key type** - Drop-down menu that allows you to select from the following:
    - **equality** - Improves the performances of tests that look for nodes with a specific value.
    - **presence** - Improves the performances of tests that look for the existence of a node regardless of its value.

- **substring** - Improves the performance of tests that look for a node whose value contains a given sub-string.
- **Syntax** - The syntax describes the type of data the index contains and is mostly used to determine how indexed values are compared. The default value is `string`.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Compare

Compares two selected resources.

Debugging with Berkeley DB XML

The Berkeley DB XML database added a debugging interface starting with version 2.5. The current version is supported in the Oxygen XML Editor plugin XQuery Debugger. The same restrictions and peculiarities apply for the Berkeley debugger as for the MarkLogic debugger.

eXist Database Connections

Oxygen XML Editor plugin includes support for eXist database connections. Oxygen XML Editor plugin allows you to browse the structure of a eXist database in the **Data Source Explorer** view and perform various operations on the resources in the repository.

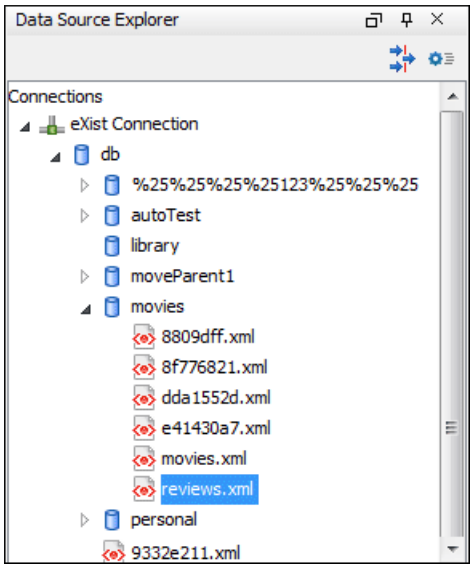

Figure 606: eXist Database Connection

Configuring an eXist Database Connection

There are two ways to configure the support for an eXist database:

- Use the dedicated **Create eXist-db XML connection** wizard.
  1. Open the **Preferences** dialog box , go to **Data Sources** and click the **Create eXist-db XML connection** link.
  2. Enter your connection details in the connection wizard and click **OK**.

     Important: To create an eXist connection using this wizard, Oxygen XML Editor plugin expects the `exist/webstart/exist.jnlp` path to be accessible at the provided **Host** and **Port**.
  3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.
- Use the **Data Sources** preferences page to configure your connection.
  1. Configure eXist *Data Source* drivers.
  2. Configure an eXist *Connection*.
  3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

How to Configure eXist Data Source Drivers

For this procedure, you need to already have an eXist database server installed.

Oxygen XML Editor plugin supports eXist database server versions up to and including version 3.0. To configure a data source for an eXist database, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *eXist* from the driver **Type** drop-down menu.
5. Click the **Add Files** button to add the eXist driver files.

   The following driver files should be added and they are found in the installation directory of the eXist database server. Make sure you copy the files from the installation of the eXist server where you want to connect from Oxygen XML Editor plugin.

   eXist 3.x

   - `exist.jar`
   - `lib/core/xmldb.jar`
   - `lib/core/xmlrpc-client-3.1.x.jar`

- `lib/core/xmlrpc-common-3.1.x.jar`
- `lib/core/ws-commons-util-1.0.x.jar`
- `lib/core/slf4j-api-1.x.x.jar` (if available)
- `lib/core/slf4j-log4j12-1.x.x.jar` (if available)

eXist 4.x

- `exist.jar`
- `lib/core/log4j-api-*.jar`
- `lib/core/log4j-jul-*.jar`
- `lib/core/log4j-slf4j-impl-*.jar`
- `lib/core/slf4j-api-*.jar`
- `lib/core/ws-commons-util-*.jar`
- `lib/core/xmldb.jar`
- `lib/core/xmlrpc-client-*.jar`
- `lib/core/xmlrpc-common-*.jar`

The `*` represents the version number.

6. Click the **OK** button to finish the data source configuration.
7. Continue on to configure your eXist connection.

   For more information about running XQuery against an eXist XML database, watch our video demonstration:

   https://www.youtube.com/embed/Yoc5h1zSddA

How to Configure an eXist Connection

To configure a connection to an eXist database, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select a previously configured eXist data source from the **Data Source** drop-down menu.
5. Enter the connection details.
   a) Set the URI to the installed eXist engine in the **XML DB URI** field.
   b) Set the user name in the **User** field.
   c) Set the password in the **Password** field.
   d) Enter the start collection in the **Collection** field.

   eXist organizes all documents in hierarchical collections. Collections are like directories. They are used to group related documents together. This text field allows the user to set the default collection name.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

   For more information about running XQuery against an eXist XML database, watch our video demonstration:

   https://www.youtube.com/embed/Yoc5h1zSddA

eXist Contextual Menu Actions

While browsing eXist database connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Disconnect

Stops the connection.

Refresh

Performs a refresh on the selected node.

Container Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Collection

Creates a new collection on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Paste

Pastes the copied selection.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Save As

Allows you to save the selected resource as a file on disk.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Compare

Compares two selected resources.

MarkLogic Database Connections

Oxygen XML Editor plugin Enterprise edition includes support for MarkLogic database connections. Once you configure a MarkLogic connection, you can use the **Data Source Explorer** view to display all the application servers that are configured on the MarkLogic server. You can expand each application server and view all of its configured modules, and the **Data Source Explorer** view allows you to open and edit these modules.

Note: To browse modules located in a database, directory properties must be associated with them. These directory properties are generated automatically if the *directory creation* property of the database is set to automatic. If this property is set to **manual** or **manual-enforced**, add the directory properties of the modules manually, using the XQuery function `xdmp:directory-create()`. For example, for two documents with the `/code/modules/main.xqy` and `/code/modules/imports/import.xqy` IDs, run the following query:

```
(xdmp:directory-create('/code/modules/'), xdmp:directory-create('/code/modules/imports/'))
```

For more information about directory properties, go to: http://blakeley.com/blogofile/2012/03/19/directory-assistance/.

MarkLogic and XQuery

MarkLogic connections can be used in conjunction with XQuery scripts to debug and solve problems with XQuery transformations. XQuery modules can also be validated using a MarkLogic server to allow to you to spot possible issues without the need of actually executing the XQuery script.

When debugging XQuery files with MarkLogic, you can use the **Data Source Explorer** view to open the files from the application server that is involved in the debugging process. By using the **Data Source Explorer** view, any imported modules are better identified by the MarkLogic server. You can also use step actions and breakpoints in the modules to help identify problems.

Modules Container

For each Application server (for example: *Bill (HTTP port:8060)*), you have access to the XQuery modules that are visible to that server. When editing, executing, or debugging XQuery it is recommended to open the XQuery files from this **Modules** container.

Note: You can also manage resources for a MarkLogic database through a WebDAV connection, although it is not recommended if you work with XQuery files since imported modules may not be resolved correctly.

Requests Container

Each MarkLogic application server includes a **Requests** container. In this container, Oxygen XML Editor plugin displays both queries that are stopped for debugging purposes and queries that are still running. To clean up the entire **Requests** container at the end of your session, right-click it and use the **Cancel all requests** action.

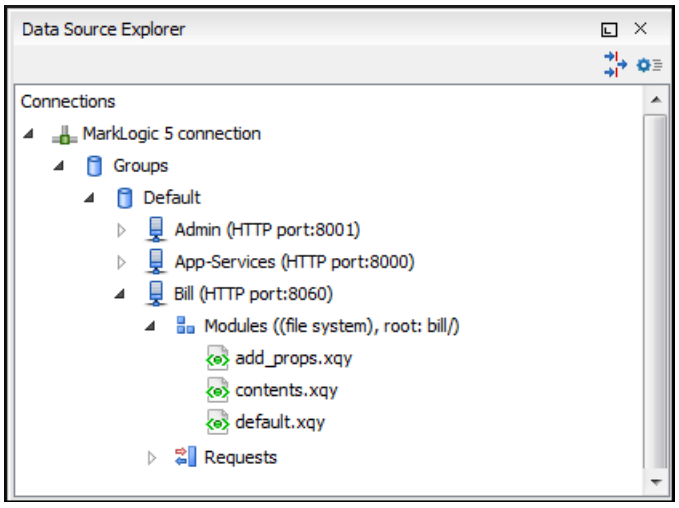

Figure 607: MarkLogic Connection in Data Source Explorer

Configuring a MarkLogic Database Connection

Note that this feature is available in Oxygen XML Editor plugin Enterprise edition only.

Follow this procedure to configure the support for a MarkLogic database connection:

1. Download the MarkLogic driver from MarkLogic Community site.
2. Configure MarkLogic *Data Source* drivers.
3. Configure a MarkLogic *Connection*.
4. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

Related Information:

MarkLogic Development in Oxygen XML Editor plugin on page 1167

How to Configure MarkLogic Data Source Drivers

Available in the Enterprise edition only.

Note: Oxygen XML Editor plugin supports MarkLogic version 4.0 or later.

To configure a data source for MarkLogic, follow this procedure:

1. Download the **XCC Java distribution** zip file from: http://developer.marklogic.com/products/xcc.
2. Unzip the downloaded archive.
3. Open the **Preferences** dialog box and go to **Data Sources**.
4. Click the **New** button in the **Data Sources** panel.
5. Enter a unique name for the data source.
6. Select *MarkLogic* from the driver **Type** drop-down list.
7. Click the **Add Files** button and select the MarkLogic driver file from the `lib` folder of the archive that you downloaded and unzipped. The driver file name is `marklogic-xcc-{server_version}.jar`, where *{server_version}* is the MarkLogic server version.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure your MarkLogic Connection.

How to Configure a MarkLogic Connection

Available in the Enterprise edition only.

Note: Oxygen XML Editor plugin supports MarkLogic version 4.0 or later.

To configure a connection to a MarkLogic database, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.

2. Click the **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select a previously configured MarkLogic data source from the **Data Source** drop-down menu.
5. Enter the connection details.
   a) The host name or IP address of the installed MarkLogic engine in the **XDBC Host** field.

      Oxygen XML Editor plugin uses XCC connector to interact with MarkLogic XDBC server and requires the basic authentication schema to be set. Starting with version MarkLogic 4.0 the default authentication method when you create an HTTP or WebDAV Server is *digest*, so make sure to change it to *basic*.
   b) Set the port number of the MarkLogic engine in the **Port** field. A MarkLogic XDBC application server must be configured on the server on this port. This XDBC server will be used to process XQuery expressions against the server. Later, if you want to change the XDBC server, instead of editing the configuration just use the **Use it to execute queries** action from Data Source Explorer.
   c) Set the user name to access the MarkLogic engine in the **User** field.
   d) Set the password to access the MarkLogic engine in the **Password** field.
   e) Optionally, in the **WebDAV URL** field, set the URL used for browsing the MarkLogic database in the **Data Source Explorer** view.

      The **Database** field specifies the database for which the XQuery expressions are executed. If you set this option to default, the database associated to the application server of the configured port is used.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

MarkLogic Development in Oxygen XML Editor plugin

The Oxygen XML Editor plugin support for MarkLogic includes features designed for developers, such as debugging XQuery transformations, remote and collaborative debugging, XQuery editing and validation, and an XQuery builder that helps to improve productivity.

Working with XQuery Files

MarkLogic supports working with XQuery files to create queries over stored XML content. You can open an XQuery file, configure a transformation scenario to match your MarkLogic connection, write the XQuery, and then execute it.

When editing XQuery modules stored on the MarkLogic server, the **Outline** view collects and displays all the functions from all imported modules. The *Content Completion Assistant* also presents all of these functions along with the latest built-in XQuery functions in accordance with the server version.

When developing queries for MarkLogic, it is best to open the resources from the **Data Source Explorer** view. When you execute or debug XQuery files opened from this view, imported modules can be resolved better by the MarkLogic server. Another advantage is that validation is automatically performed on the MarkLogic server, including any imported modules.

XQuery Debugging

Oxygen XML Editor plugin allows you to use MarkLogic connections to debug real applications that use XQuery (for example, web applications that trigger XQuery executions). By setting the server in debug mode, you can intercept all the XQuery scripts that run on that server. Oxygen XML Editor plugin connects to the MarkLogic server, shows you the running XQuery scripts, and allows you to debug them. The remote debugging support also allows you to debug collaboratively. Multiple users can participate in the same debugging session. You can start a debugging session and another user can continue it, and vice versa.

Working with Modules

MarkLogic has a concept of two types of XQuery modules, *library* and *main* modules. A *library* module is used to define functions. Library modules cannot be evaluated directly. They are imported, either from other library modules or from main modules. A *main* module is used as an entry point that can be executed as an XQuery program. For more information on these types of modules, see XQuery Library Modules and Main Modules.

When working with *library* modules, you need to create a validation scenario and associate it with the module. In the validation scenario you need to specify a main module as the entry point for validation. The modules need to be deployed on a MarkLogic server because Oxygen XML Editor plugin will request the server to validate the modules.

To validate *library* modules stored on a MarkLogic server, follow these steps:

1. Configure a MarkLogic database connection.
2. Expand the MarkLogic connection in the **Data Source Explorer** view and open the *library* modules. The *main* module must also be opened from the **Data Source Explorer** view.
3. Configure a validation scenario for each *library* module. Specify the *main* module in the **URL of the file to validate** field.

   Result: Validation is done on the server that contains the *main* module. The *main* module and all other *library* modules involved in the validation must be saved. Otherwise, the server will validate what was saved on the server, without the uncommitted changes. Also, the *Content Completion Assistant* and the **Outline** view should now present the functions from all the modules.

Related Information:

Debugging with MarkLogic on page 1168
Configuring a MarkLogic Database Connection on page 1166

Debugging with MarkLogic

Oxygen XML Editor plugin includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a MarkLogic data source and a MarkLogic connection.
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Editor plugin accesses. On the server side, debugging must be activated in the XDBC server and in the *Task Server* section of the server control console (the switch *debug allow*). If the debugging is not activated, the MarkLogic server reports a **DBG-TASKDEBUGALLOW** error.

   Note: An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Editor plugin uses to process XQuery expressions by selecting the **Use it to execute queries** action from the contextual menu in the **Data Source Explorer** view.
3. Open the XQuery file and start the debugging process.
   - If you want to debug an XQuery file stored on the MarkLogic server, we recommend you to use the **Data Source Explorer** view and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.
   - The MarkLogic XQuery debugger integrates seamlessly into the XQuery Debugger *perspective*. If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to debug the scenario directly.
   - Otherwise, switch to the **XQuery Debugger** *perspective*, open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the debug control toolbar.

     For general information about how a debugging session is started and controlled, see the Working with the Debugger section.

     Note: Before starting a debugging session, it is recommend that you link the MarkLogic connection with an Eclipse project. To do this, go to the **Data Source Explorer** view and select **Link to project** in the contextual menu of the MarkLogic connection. The major benefit of linking a debugging session with a project is that you can add *breakpoints* in the XQuery modules stored on the server. You are also able to access these modules from the Eclipse **Navigator** view and run debugging sessions from them.

In a MarkLogic debugging session, you can use step actions and *breakpoints* to help identify problems. When you add a *breakpoint* on a line where the debugger never stops, Oxygen XML Editor plugin displays a warning message. These warnings are displayed for *breakpoints* you add either in the main XQuery (which you can open locally or from the server) or for *breakpoints* you add in any XQuery that is opened from the connection that

participates in the debugging session. For more information, see Using Breakpoints for Debugging Queries that Import Modules with MarkLogic on page 1169.

Remote Debugging with MarkLogic

Oxygen XML Editor plugin allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Editor plugin connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.

Oxygen XML Editor plugin also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

Important: When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

For more information about the XQuery debugger for MarkLogic, watch our video demonstration:

https://www.youtube.com/embed/eQ4ThDZq1bk

Related Information:

MarkLogic Development in Oxygen XML Editor plugin on page 1167
Configuring a MarkLogic Database Connection on page 1166

Using Breakpoints for Debugging Queries that Import Modules with MarkLogic

When debugging queries that imports modules stored in the database, it is recommended to place *breakpoints* in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the *breakpoints* in all the modules will be considered. Also, make sure that there are no other opened modules that are not involved in the current debugging session.

To place *breakpoints* in the modules, use the following procedure:

1. In the **Data Source Explorer** view, open all the modules from the **Modules** container of the XDBC application server that performs the debugging.
2. Set *breakpoints* in the module as needed.
3. Continue debugging the query.

If you get a warning that the *breakpoints* failed to initialize, try the following solutions:

- Check the **Breakpoints** view and make sure there are no older *breakpoints* (set on resources that are not part of the current debugging context).
- Make sure you open the modules from the context of the application server that does the debugging and place *breakpoints* there.

MarkLogic Database Connections on page 1165
MarkLogic Development in Oxygen XML Editor plugin on page 1167

Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

- Debugging support is only available for MarkLogic server versions 4.0 or newer.
- For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: *'0.9-ml' (inherited from MarkLogic 3.2)*, *'1.0-ml'*, and *'1.0'*.
- All declared variables are presented as strings. The **Value** column of the **Variables** view contains the expression from the variable declaration. It can be evaluated by copying the expression with the **Copy value** action from the contextual menu of the **Variables** view and pasting it in the **XWatch** view.
- There is no support for output to source mapping.
- There is no support for showing the trace.

- You can only set breakpoints in imported modules in one of the following cases:
  - When you open the module from the context of the application server involved in the debugging, using the **Data Source Explorer** view.
  - When the debugger automatically opens the modules in the Editor.
- No *breakpoints* are set in modules from the same server that are not involved in the current debugging session.
- No support for profiling when an XQuery transformation is executed in the debugger.

MarkLogic Contextual Menu Actions

While browsing MarkLogic connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Disconnect

Stops the connection.

Link to Project

Links the connection to a project. This is helpful for MarkLogic debugging sessions.

Refresh

Performs a refresh on the selected node.

Container Level Nodes

Enable Debug Mode

Switches the server to a debugging mode. For more information, see MarkLogic debugging sessions.

Use it to Execute Queries

The server will be used to process XQuery expressions against it.

Refresh

Performs a refresh on the selected node.

Module or Folder Level Nodes

Export

Allows you to export the folder on the remote connection to a local folder.

Refresh

Performs a refresh on the selected node.

Requests Level Nodes

Refresh

Performs a refresh on the selected node.

Cancel all requests

Cancels all queries that are either running or stopped on the application server. You can use this action to clean up the entire **Requests** container at the end of your sessions.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default

application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Refresh

Performs a refresh on the selected node.

Compare

Compares two selected resources.

Debugging with MarkLogic on page 1168

Documentum xDB (X-Hive/DB) 10 Database Connections [Deprecated]

Oxygen XML Editor plugin includes support for Documentum xDB (X-Hive/DB) 10 database connections. Oxygen XML Editor plugin allows you to browse the structure of a Documentum xDB (X-Hive/DB) 10 database in the **Data Source Explorer** view and perform various operations on the resources in the repository.

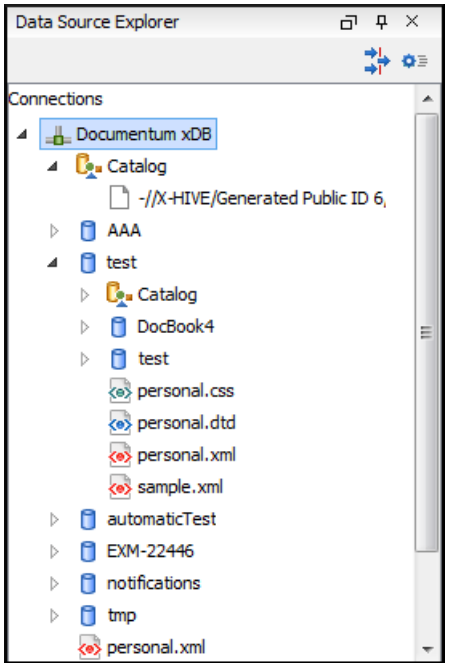

Figure 608: Documentum xDB (X-Hive/DB) 10 Connection

Configuring a Documentum xDB (X-Hive/DB) 10 Database Connection [Deprecated]

Follow this procedure to configure the support for a Documentum xDB (X-Hive/DB) 10 database:

1. Configure Documentum xDB *Data Source* drivers.
2. Configure a Documentum xDB *Connection*.
3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

How to Configure Documentum xDB (X-Hive/DB) 10 Data Source Drivers [Deprecated]

Available in the Enterprise edition only. For this procedure, you need to already have a Documentum xDB server installed.

To configure a data source for Documentum xDB (X-Hive/DB) 10, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *Documentum xDB* from the driver **Type** drop-down menu.
5. Click the **Add** button to add the driver files.

   The driver files for the Documentum xDB (X-Hive/DB) 10 database are found in the Documentum xDB (X-Hive/DB) 10 lib directory from the server installation folder:

   - `antlr-runtime.jar`
   - `aspectjrt.jar`
   - `icu4j.jar`
   - `xhive.jar`
   - `google-collect.jar`
6. Click the **OK** button to finish the data source configuration.
7. Continue on to configure your Documentum xDB (X-Hive/DB) 10 connection.

How to Configure an Documentum xDB (X-Hive/DB) 10 Connection [Deprecated]

To configure a connection to a Documentum xDB (X-Hive/DB) 10 database, follow these steps:

Note: The bootstrap type of X-Hive/DB connections is not supported in Oxygen XML Editor plugin. The following procedure explains the `xhive://` protocol connection type.

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select a previously configured data source from the **Data Source** drop-down menu.
5. Enter the connection details.
   a) Set the URL property of the connection in the **URL** field.

      If the property is a URL of the form *xhive://host:port*, the Documentum xDB (X-Hive/DB) 10 connection will attempt to connect to a Documentum xDB (X-Hive/DB) 10 server running behind the specified TCP/IP port.
   b) Set the user name to access the Documentum xDB (X-Hive/DB) 10 engine in the **User** field.
   c) Set the password to access the Documentum xDB (X-Hive/DB) 10 engine in the **Password** field.
   d) Set the name of the database to access from the Documentum xDB (X-Hive/DB) 10 engine in the **Database** field.
   e) Select the **Run XQuery in read / write session (with committing)** checkbox if you want to end the session with a commit. Otherwise, the session ends with a rollback.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

Documentum xDB (X-Hive/DB) 10 Contextual Menu Actions [Deprecated]

While browsing Documentum xDB (X-Hive/DB) 10 connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Disconnect

Stops the connection.

Add Library

Allows you to add a new library.

Insert XML Instance

Allows you to add a new XML resource directly into the database root. See Documentum xDB (X-Hive/DB) 10 Parser Configuration for more details.

Insert non-XML Instance

Allows you to add a new non-XML resource directly in the database root.

Refresh

Performs a refresh on the selected node.

Catalog Level Nodes

Add AS Models

Allows you to add a new abstract schema model to the selected catalog.

Export

Allows you to export the folder on the remote connection to a local folder.

Set Default Schema

Allows you to set a default DTD to be used for parsing. It is not possible to set a default XML Schema.

Clear Default Schema

Allows you to clear the default DTD. The action is available only if there is a DTD set as default.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Container (Library) Level Nodes

New File

Creates a new file on the connection, in the current folder.

Add Library

Allows you to add a new library.

Import Folders

Imports folders on the server.

Add Local Catalog

Adds a catalog to the selected library. By default, only the root-library has a catalog, and all models are stored there.

Insert XML Instance

Allows you to add a new XML resource directly into the database root. See Documentum xDB (X-Hive/DB) 10 Parser Configuration for more details.

Insert non-XML Instance

Allows you to add a new non-XML resource directly in the database root.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Save As

Allows you to save the selected resource as a file on disk.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Add AS model

Allows you to add an XML schema to the selected XML resource.

Set AS model

Allows you to set an active AS model for the selected XML resource.

Clear AS model

Allows you to clear the active AS model of the selected XML resource.

Properties

Displays the resource properties. Available only for XML resources.

Set Default Schema

Allows you to set the selected DTD to be used as default for parsing. The action is available only for DTD.

Clear Default Schema

Allows you to unset the selected DTD. The action is available only if the selected DTD is the current default to be used for parsing.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Compare

Compares two selected resources.

Documentum xDB (X-Hive/DB) 10 Parser Configuration for Adding XML Instances [Deprecated]

When an XML instance document is added to a Documentum xDB (X-Hive/DB) 10 connection or library, it is parsed with an internal XML parser of the database server. The following options are available for configuring this parser:

- DOM Level 3 parser configuration parameters. More about each parameter can be found here: DOM Level 3 Configuration.
- Documentum xDB (X-Hive/DB) 10 specific parser parameters (for more information, consult the Documentum xDB (X-Hive/DB) 10 manual):
  - **xhive-store-schema** - If selected, the corresponding DTD or XML schemas are stored in the catalog during validated parsing.
  - **xhive-store-schema-only-internal-subset** - Stores only the internal sub-set of the document (not an external sub-set). This option modifies the **xhive-store-schema** (only has a function when that parameter is set to true, and when a DTD is involved). Select this option if you only want to store the internal sub-set of the document (not the external sub-set).
  - **xhive-ignore-catalog** - Ignores the corresponding DTD and XML schemas in the catalog during validated parsing.
  - **xhive-psvi** - Stores **psvi** information about elements and attributes. Documents parsed with this feature turned on give access to **psvi** information and enable support of data types by XQuery queries.
  - **xhive-sync-features** - With this convenience setting turned on, parameter settings of **XhiveDocumentIf** are synchronized with the parameter settings of **LSParser**. Note that parameter settings **xhive-psvi** and **schema-location** are always synchronized.

Troubleshooting Documentum xDB [Deprecated]

Question:

I am able to access my XML Database in the **Data Source Explorer** and open files for reading but when I try to save changes to a file back into the database, I receive the following error: **"Cannot save the file. DTD factory class org.apache.xerces.impl.dv.dtd.DTDDVFactoryImpl does not extend from DTDDVFactory"**. How can I fix this?

Answer:

`xhive.jar` contains a MANIFEST.MF with a classpath:

```
Class-Path: core/antlr-runtime.jar core/aspectjrt.jar core/fastutil-shrinked.jar
    core/google-collect.jar core/icu4j.jar core/lucene-regex.jar core/lucene.jar
    core/serializer.jar core/xalan.jar core/xercesImpl.jar
```

Since the driver was configured to use `xhive.jar` directly from the *xDB* installation (where many other *JARS* are located), `core/xercesImpl.jar` from the *xDB* installation directory is loaded even though it is not specified in the list of *JARS* from the data source driver configuration (it is in the classpath from `xhive.jar` - `MANIFEST.MF`). A simple workaround for this issue is to copy **ONLY** the *JAR* files used in the driver configuration to a separate folder and configure the data source driver to use them from there.

MySQL Database Connections

Oxygen XML Editor plugin includes support for MySQL database connections. Oxygen XML Editor plugin allows you to browse the structure of a SQL Server database in the **Data Source Explorer** view, open tables in the **Table Explorer** view, and perform various operations on the resources in the repository.

Configuring a MySQL Database Connection

To configure the support for a MySQL database, follow this procedure:

1. Configure MySQL *Data Source* drivers.
2. Configure a MySQL *Connection*.

3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

How to Configure MySQL Data Source Drivers

To connect to a MySQL server, you need to create a generic JDBC type data source based on the MySQL JDBC driver available on the MySQL website.

To configure this data source, follow these steps:

1. Go to https://www.oxygenxml.com/database_drivers.html and download the appropriate MySQL driver.
2. Open the **Preferences** dialog box and go to **Data Sources**.
3. Click the **New** button in the **Data Sources** panel.

   The dialog box for configuring a data source is opened.

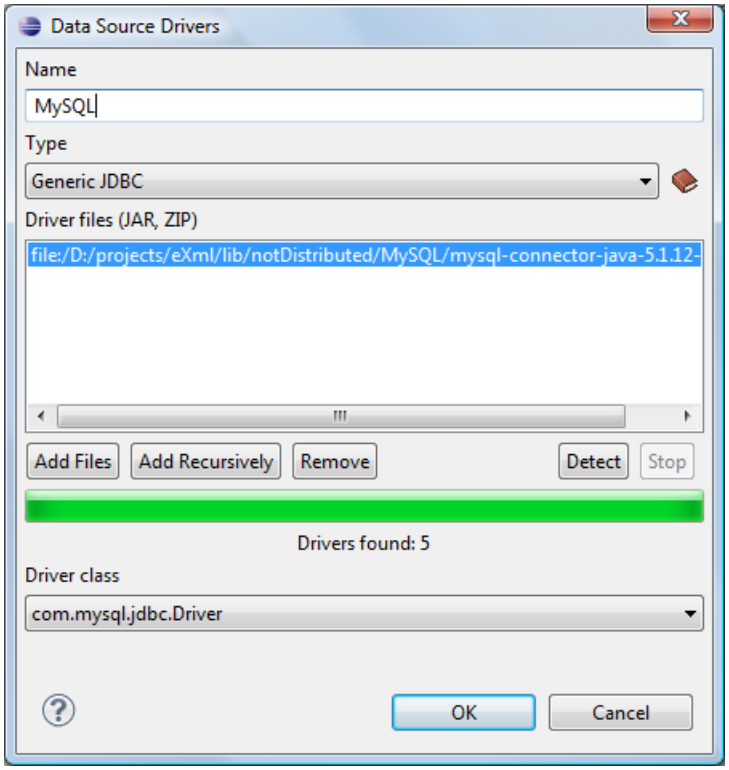

Figure 609: Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select *Generic JDBC* in the driver **Type** drop-down list.
6. Click the **Add Files** button and select the MySQL driver file that you downloaded.
   The driver file for the MySQL server is called `mysql-com.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure your MySQL connection.

How to Configure a MySQL Connection

To configure a connection to a MySQL server, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

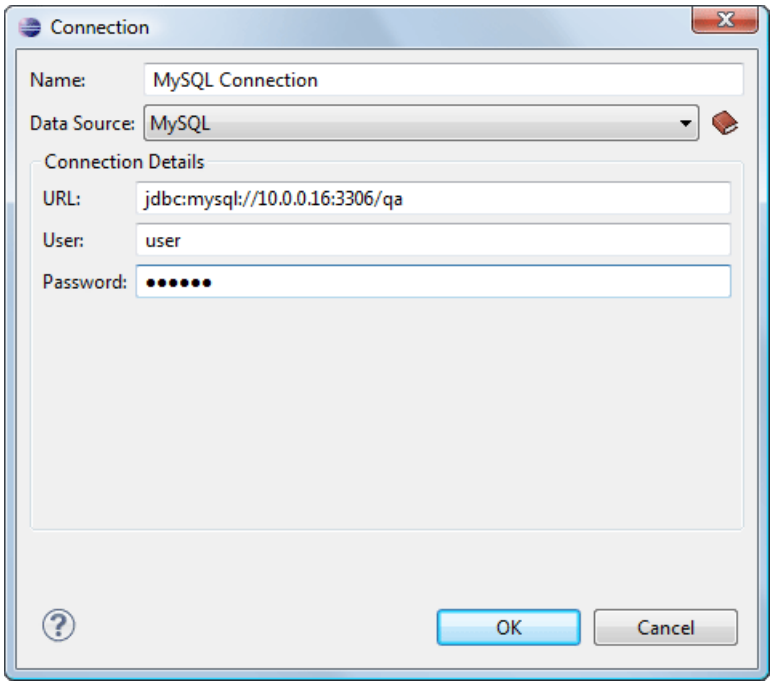

Figure 610: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *MySQL* data source in the **Data Source** drop-down list.
5. Enter the connection details.
   a) Enter the URL of the MySQL server.
   b) Enter the user name for the connection to the MySQL server.
   c) Enter the password for the connection to the MySQL server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

Generic JDBC Database Connections

Oxygen XML Editor plugin includes support for Generic JDBC database connections.

Configuring a Generic JDBC Database Connection

To configure the support for a generic JDBC database, follow this procedure:

1. Configure Generic JDBC *Data Source* drivers.
2. Configure a Generic JDBC *Connection*.
3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

How to Configure Generic JDBC Data Source Drivers

Starting with version 17, Oxygen XML Editor plugin comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Editor plugin along with a Java VM version 7 or 6.

To configure a generic JDBC data source, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *Generic JDBC* in the driver **Type** drop-down list.
5. Add the driver file(s) using the **Add Files** button.

6. Select the most appropriate **Driver class**.
7. Click the **OK** button to finish the data source configuration.
8. Continue on to configure a generic JDBC connection.

How to Configure a Generic JDBC Connection

To configure a connection to a generic JDBC database, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select the *Generic JDBC* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
   a) Enter the URL of the generic JDBC database, with the following format:`jdbc: <subprotocol>: <subname>`.
   b) Enter the user name for the connection to the generic JDBC database.
   c) Enter the password for the connection to the generic JDBC database.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

JDBC-ODBC Database Connections

Oxygen XML Editor plugin includes support for JDBC-ODBC database connections.

How to Configure a JDBC-ODBC Connection

Starting with version 17, Oxygen XML Editor plugin comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Editor plugin along with a Java VM version 7 or 6.

To configure a connection to an ODBC data source, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

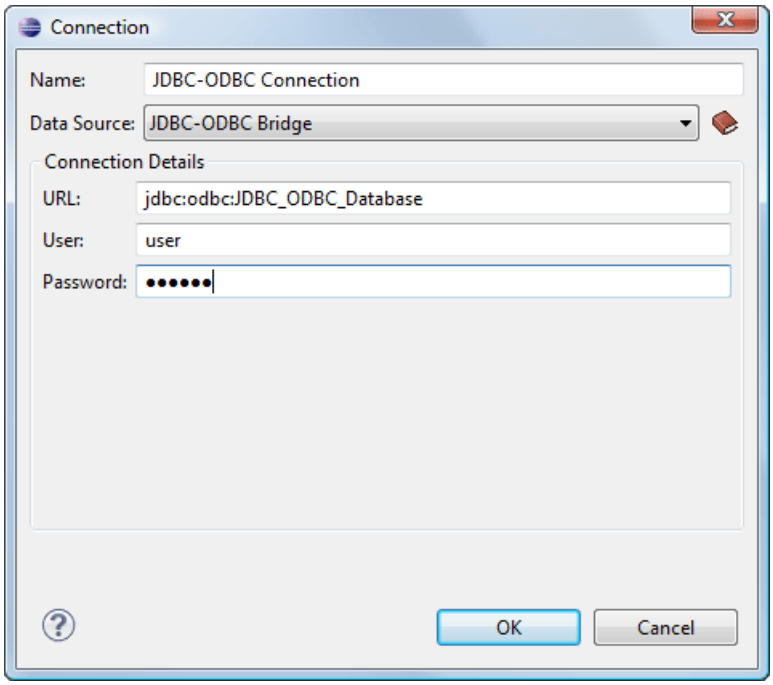

Figure 611: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select *JDBC-ODBC Bridge* in the **Data Source** drop-down list.
5. Enter the connection details.
   a) Enter the URL of the ODBC source.
   b) Enter the user name of the ODBC source.
   c) Enter the password of the ODBC source.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

BaseX Database Connections

Oxygen XML Editor plugin includes support for BaseX database connections using a WebDAV connection. BaseX is a light-weight XML database engine and XQuery processor. Oxygen XML Editor plugin allows you to browse the structure of a BaseX database in the **Data Source Explorer** view and perform XQuery executions.

How to Configure a BaseX Connection

To configure a BaseX connection, follow these steps:

1. First of all, make sure the BaseX HTTP Server is started. For details about starting the BaseX HTTP server, go to http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server. The configuration file for the HTTP server is named `.basex` and is located in the BaseX installation directory. This file helps you to find out which port the HTTP server using. The default port for BaseX WebDAV is 8984.
2. To ensure that everything is functioning, open a WebDAV URL inside a browser and check to see if it works. For example, the following URL retrieves a document from a database named TEST: `http://localhost:8984/webdav/TEST/etc/factbook.xml`.
3. Once you are sure that the BaseX WebDAV service is working, you can configure the WebDAV connection in Oxygen XML Editor plugin as described in How to Configure a WebDAV Connection on page 1182. The WebDAV URL should resemble this: `http://{hostname }:{port}/webdav/`. If the BaseX server is running on your own machine and it has the default configuration, the data required by the WebDAV connection is:
   - WebDAV URL: `http://localhost:8984/webdav`
   - User: `admin`

- Password: `admin`

4. Once the WebDAV connection is created, to view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

BaseX Contextual Menu Actions

While browsing BaseX connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Disconnect

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

Folder Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Compare

Compares two selected resources.

Base X XQJ Connection

XQuery execution is possible in a BaseX connection through an XQJ connection.

Important: The XQJ connector is only capable of running XQuery 1.0 scrips, therefore XQuery 3.0 and 3.1 scripts are not supported.

BaseX XQJ Data Source

First of all, create an XQJ data source as described in How to Configure an XQJ Data Source on page 1182. The BaseX XQJ API-specific files that must be added in the configuration dialog box are `xqj-api-1.0.jar`, `xqj2-0.1.0.jar` and `basex-xqj-1.2.3.jar` (the version names of the *JAR* file may differ). These libraries can be downloaded from *xqj.net/basex/basex-xqj-1.2.3.zip*. As an alternative, you can also find the libraries in the BaseX installation directory, in the **lib** sub-directory.

BaseX XQJ Connection

The next step is to create an XQJ connection.

For a default BaseX configuration, the following connection details apply (you can modify them when necessary):

- **Port**: 1984
- **serverName**: localhost
- **user**: admin
- **password**: admin

XQuery Execution

Now that the XQJ connection is configured, open the XQuery file you want to execute in Oxygen XML Editor plugin and create an XQuery Transformation on page 974. In the **Transformer** drop-down menu, select the name of the XQJ connection you created. Apply the transformation scenario and the XQuery will be executed.

How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is Zorba.

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to **PATH** - on Windows, to **LD_LIBRARY_PATH** - on Linux, or to **DYLD_LIBRARY_PATH** - on OS X. Restart Oxygen XML Editor plugin after configuring the environment variables.
2. Open the **Preferences** dialog box and go to **Data Sources**.
3. Click the **New** button in the **Data Sources** panel.
4. Enter a unique name for the data source.
5. Select **XQuery API for Java (XQJ)** in the **Type** combo box.
6. Press the **Add** button to add XQJ API-specific files.

   You can manage the driver files using the **Add**, **Remove**, **Detect**, and **Stop** buttons.

   Oxygen XML Editor plugin detects any implementation of *javax.xml.xquery.XQDataSource* and presents it in **Driver class** field.
7. Select the most suited driver in the **Driver class** combo box.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure the XQJ connection.

How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured XQJ data sources in the **Data Source** combo box.
5. Fill-in the connection details.

   The properties presented in the connection details table are automatically detected depending on the selected data source.
6. Click the **OK** button to finish the connection configuration.

WebDAV Connections

Oxygen XML Editor plugin includes support for WebDAV server connections. Oxygen XML Editor plugin allows you to browse the structure of a WebDAV connection in the **Data Source Explorer** view and perform various operations on the resources in the repository.

How to Configure a WebDAV Connection

By default, Oxygen XML Editor plugin contains built-in data source drivers for **WebDAV** connections. Based on this data source, you can create a WebDAV connection for browsing and editing data from a database that provides a WebDAV interface. The connection is available in the **Data Source Explorer** view.

To configure a WebDAV connection, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the WebDAV data sources in the **Data Source** drop-down menu.

5. Enter the connection details:
   a) Set the URL to the WebDAV repository in the field **WebDAV URL**.
   b) Set the user name that is used to access the WebDAV repository in the **User** field.
   c) Set the password that is used to access the WebDAV repository in the **Password** field.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

   For more information about the WebDAV support in Oxygen XML Editor plugin, watch our video demonstration:

   https://www.youtube.com/embed/vDXO36CqbvM

WebDAV Contextual Menu Actions

While browsing WebDAV connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources
Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Disconnect
Stops the connection.

New Folder
Creates a new folder on the connection.

Import Files
Allows you to add a new file on the connection, in the current folder.

Refresh
Performs a refresh on the selected node.

Folder Level Nodes

New File
Creates a new file on the connection, in the current folder.

New Folder
Creates a new folder on the connection.

Import Folders
Imports folders on the server.

Import Files
Allows you to add a new file on the connection, in the current folder.

Export
Allows you to export the folder on the remote connection to a local folder.

Cut
Removes the current selection and places it in the clipboard.

Copy
Copies the current selection into the clipboard.

Paste
Pastes the copied selection.

Rename
Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Compare

Compares two selected resources.

SQL Execution Support

The database support in Oxygen XML Editor plugin includes support for writing SQL statements, syntax highlighting, *folding*, and dragging and dropping from the **Data Source Explorer** view. It also includes transformation scenarios for executing the statements, and the results are displayed in the **Table Explorer** view.

Drag and Drop from Data Source Explorer View

Dragging operations from the **Data Source Explorer** view and dropping them in the SQL Editor allows you to create SQL statements quickly by inserting the names of tables and columns in the SQL statements.

1. Configure a database connection (see the specific procedure for your database server in the Database Connection Support section).
2. Browse to the table you will use in your statement.
3. Drag the table or a column of the table into the editor where a SQL file is open.

   Drag and drop actions are available both on the table and on its fields. A pop-up menu is displayed in the SQL editor.

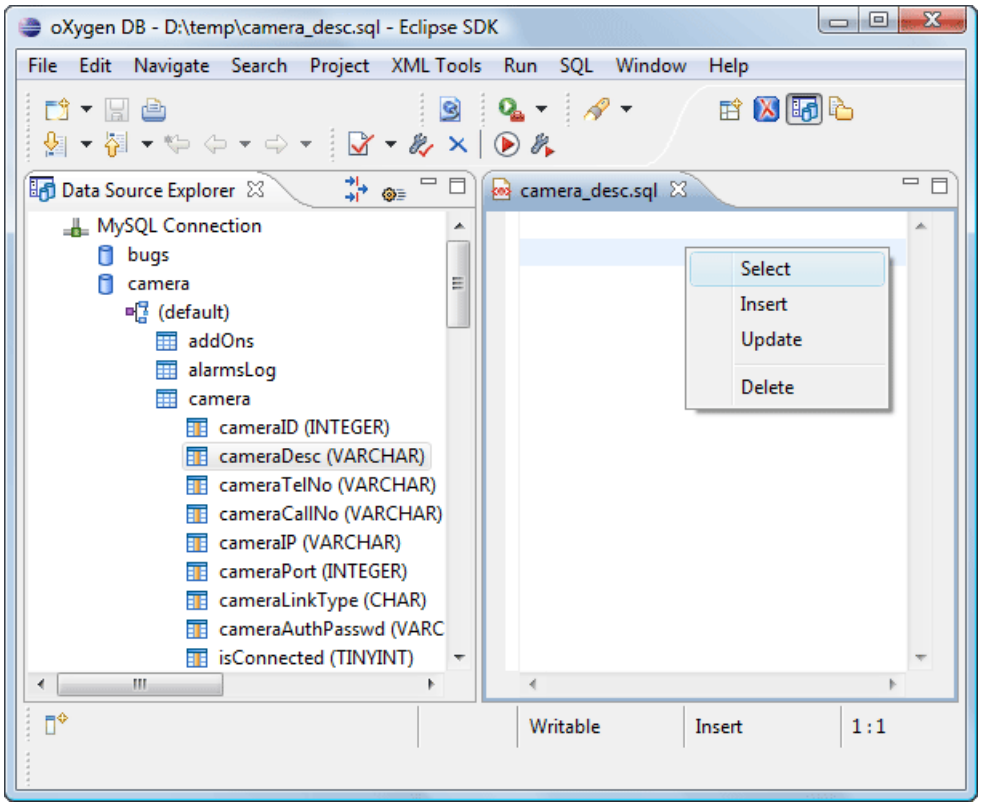

Figure 612: SQL Statement Editing with Drag and Drop

4. Select the type of statement from the pop-up menu.

   Depending on your choice, dragging a table results in one of the following statements being inserted into the document:

   - **SELECT `*field1*`,`*field2*`, ... FROM `*catalog*`. `*table*`** (for example: `SELECT` `` `DEPT`,`DEPTNAME`,`LOCATION` FROM `camera`.`cameraDesc` ``)
   - **UPDATE `*catalog*`. `*table*` SET `*field1*`=, `*field2*`=,....** (for example: `UPDATE` `` `camera`.`cameraDesc` SET `DEPT`=, `DEPTNAME`=, `LOCATION`= ``)
   - **INSERT INTO `*catalog*`. `*table*` (`*field1*`,`*field2*`, ...) VALUES (, ,)** (for example: `INSERT INTO` `` `camera`.`cameraDesc` (`DEPT`,`DEPTNAME`,`LOCATION`) VALUES (, , )) ``)
   - **DELETE FROM `*catalog*`. `*table*`** (for example: `DELETE FROM` `` `camera`.`cameraDesc` ``)

   Depending on your choice, dragging a column results in one of the following statements being inserted into the document:

   - **SELECT `*field*` FROM `*catalog*`. `*table*`** (for example: `SELECT` `` `DEPT` FROM `camera`.`cameraDesc` ``)
   - **UPDATE `*catalog*`. `*table*` SET `*field*`=** (for example: `UPDATE` `` `camera`.`cameraDesc` SET `DEPT`= ``)
   - **INSERT INTO `*catalog*`. `*table*` (`*field1*`) VALUES ()** (for example: `INSERT INTO` `` `camera`.`cameraDesc` (`DEPT`) VALUES ()) ``)
   - **DELETE FROM `*catalog*`. `*table*`** (for example: `DELETE FROM` `` `camera`.`cameraDesc` WHERE `DEPT`= ``)

SQL Validation

SQL validation support is offered for IBM DB2. Note that if you choose a connection that does not support SQL validation, you will receive a warning when trying to validate. The SQL document is validated using the connection from the associated transformation scenario.

Executing SQL Statements

The steps for executing an SQL statement on a relational database are as follows:

1. Configure a transformation scenario using the **Configure Transformation Scenario(s)** action from the toolbar or the **XML** menu.

   A SQL transformation scenario needs a database connection. You can configure a connection using the **Preferences** button from the SQL transformation dialog box.

   The dialog box contains the list of existing scenarios that apply to SQL documents.
2. Set parameter values for SQL placeholders using the **Parameters** button from the SQL transformation dialog box.

   For example, in `SELECT * FROM `test`.`department` where DEPT = ? or DEPTNAME = ?` the two parameters can be configured for the place holders (?) in the transformation scenario.

   When the SQL statement is executed, the first placeholder is replaced with the value set for the first parameter in the scenario, the second placeholder is replaced by the second parameter value, and so on.

   Restriction: When a stored procedure is called in an SQL statement executed on an SQL Server database, mixing inline parameter values with values specified using the **Parameters** button of the scenario dialog box is not recommended. This is due to a limitation of the SQL Server driver for Java applications. An example of stored procedure that is not recommended: `call dbo.Test(22, ?)`.
3. Execute the SQL scenario by clicking the **OK** or **Apply associated** button.

   The result of a SQL transformation is displayed in a view at the bottom of the Oxygen XML Editor plugin window.
4. View more complex return values of the SQL transformation in a separate editor panel.

   A more complex value returned by the SQL query (for example, an *XMLTYPE* or *CLOB* value) cannot be displayed entirely in the result table.

   a) Right-click the cell containing the complex value.
   b) Select the action **Copy cell** from the contextual menu.
   The action copies the value in the clipboard.
   c) Paste the value into an appropriate editor.

   For example, you can paste the value in an opened XQuery editor panel of Oxygen XML Editor plugin.

XQuery and Databases

XQuery is a native XML query language that is useful for querying XML views of relational data to create XML results. It also provides the mechanism to efficiently and easily extract information from Native XML Databases (NXD) and relational data. The following database systems supported in Oxygen XML Editor plugin offer XQuery support:

- *Native XML Databases:*
  - Berkeley DB XML
  - eXist
  - MarkLogic (validation support available starting with version 5)
  - Documentum xDB (X-Hive/DB) 10
- *Relational Databases:*
  - IBM DB2
  - Microsoft SQL Server (validation support not available)
  - Oracle (validation support not available)

Related Information:

Editing XQuery Documents on page 721

Build Queries with Drag and Drop from the Data Source Explorer View

When a query is edited in the XQuery editor, the XPath expressions can be composed quickly by dragging them from the **Data Source Explorer** view and dropping them into the editor panel.

1. Configure the data source drivers for the particular relational database in the **Data Sources** preferences page.
2. Configure the connection for the particular relational database in the **Data Sources** preferences page.

3. Browse the connection in the **Data Source Explorer** view, expanded to the table or column that you want to insert in the query.
4. Drag the table or column name to the XQuery editor panel.
5. Drop the table or column name where the XPath expression is needed.

An XPath expression that selects the dragged name is inserted in the XQuery document at the cursor position.

XQuery Validation When Connected to a Database

With Oxygen XML Editor plugin, you can validate your XQuery documents when connected to a database. When you open an XQuery document from a connection that supports validation (for example, MarkLogic, or eXist), by default Oxygen XML Editor plugin uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation resolves imports better.

Related Information:

XQuery Validation on page 721

XQuery Transformation for Databases

XQuery is designed to retrieve and interpret XML data from any source, whether it is a database or document. Data is stored in relational databases but it is often required that the data be extracted and transformed as XML when interfacing to other components and services. Also, it is an XPath-based querying language supported by most NXD vendors. To perform a query, you need an XQuery transformation scenario.

1. Configure the data source drivers and the connection for the particular database.
2. Configure an XQuery transformation scenario.
   a) Click the **Configure Transformation Scenario** toolbar button or go to menu **Document** > **Transformation** > **Configure Transformation Scenario**.

      The **Configure Transformation Scenario** dialog box is opened.
   b) Click the **New** button toward the bottom of the dialog box.
   c) Select **XML Transformation with XQUERY**.

      The **New Scenario** dialog box for configuring an XQuery scenario is opened.

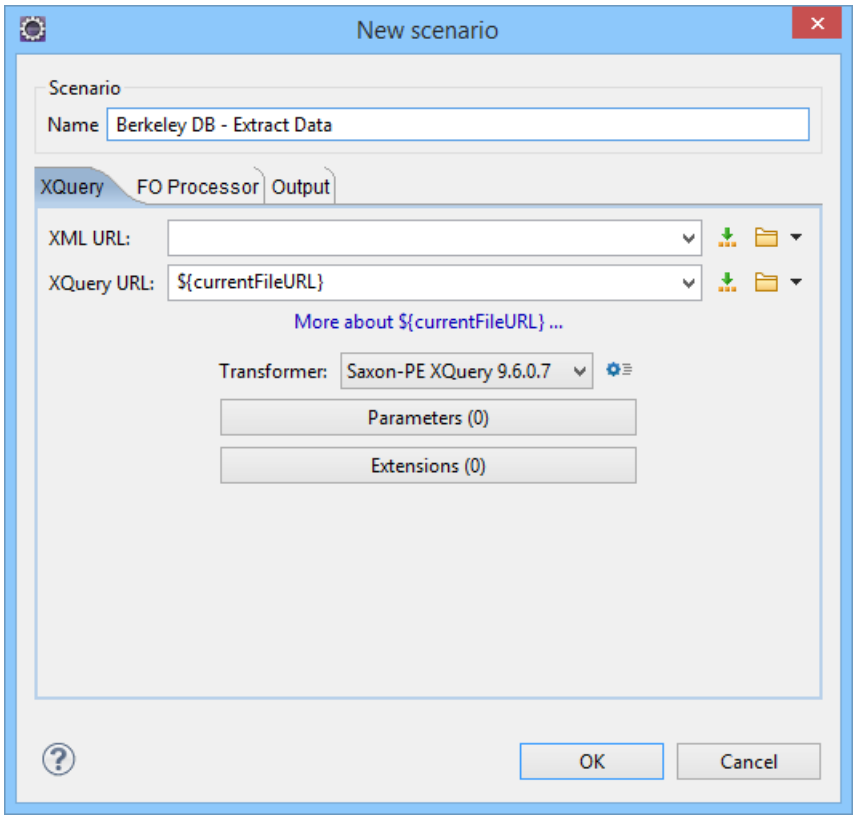

Figure 613: New Scenario Dialog Box

d) Insert the scenario name in the dialog box for editing the scenario.

e) Choose the database connection in the **Transformer** drop-down list.

f) Configure any other parameters as needed.

For an XQuery transformation, the output tab has an option called **Sequence** that allows you to run an XQuery in lazy mode. The amount of data extracted from the database is controlled from the **Size limit on Sequence view** option in the **XQuery** preferences page. If you choose **Perform FO Processing** in the **FO Processor** tab, the **Sequence** option is ignored.

g) Click the **OK** button to finish editing the scenario.

Once the scenario is associated with the XQuery file, the query can include calls to specific XQuery functions that are implemented by that engine. The available functions depend on the target database engine selected in the scenario. For example, for eXist and Berkeley DB XML, the *Content Completion Assistant* lists the functions supported by that database engine. This is useful for only inserting calls to the supported functions (standard XQuery functions or extension ones) into the query .

Note: An XQuery transformation is executed against a Berkeley DB XML server as a transaction using the query transaction support of the server.

3. Run the transformation scenario.

To view a more complex value returned by the query that cannot be entirely displayed in the XQuery query result table at the bottom of the Oxygen XML Editor plugin window (for example, an XMLTYPE or CLOB value), do the following:

- Right-click that table cell.
- Select the **Copy cell** action from the contextual menu to copy the value into the clipboard.
- Paste the value wherever you need it (for example, in an opened XQuery editor panel of Oxygen XML Editor plugin).

Related Information:

XML Transformation with XQuery on page 946
This type of transformation specifies the transform parameters and location of an XQuery file that is applied to the edited XML document.

XQuery XQJ Transformation on page 1189

XQuery XQJ Transformation

XQuery API for Java (XQJ) refers to the common Java API for the W3C XQuery 1.0 specification. The XQJ API enables you to execute XQuery against an XML data source.

Important: The XQJ connector is only capable of running XQuery 1.0 scrips, therefore XQuery 3.0 and 3.1 scripts are not supported.

Oxygen XML Editor plugin supports any transformer that offers an XQJ API implementation and it be used for validating XQuery or transforming XML documents.

To configure the support for XQJ, do the following:

1. Configure an XQJ *Data Source*.
2. Configure an XQJ *Connection*.
3. To view your connection, go to the **Data Source Explorer** view (if the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu) or switch to the **Database** *perspective*.

How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is Zorba.

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to **PATH** - on Windows, to **LD_LIBRARY_PATH** - on Linux, or to **DYLD_LIBRARY_PATH** - on OS X. Restart Oxygen XML Editor plugin after configuring the environment variables.
2. Open the **Preferences** dialog box and go to **Data Sources**.
3. Click the **New** button in the **Data Sources** panel.
4. Enter a unique name for the data source.
5. Select **XQuery API for Java (XQJ)** in the **Type** combo box.
6. Press the **Add** button to add XQJ API-specific files.

   You can manage the driver files using the **Add**, **Remove**, **Detect**, and **Stop** buttons.

   Oxygen XML Editor plugin detects any implementation of *javax.xml.xquery.XQDataSource* and presents it in **Driver class** field.
7. Select the most suited driver in the **Driver class** combo box.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure the XQJ connection.

How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured XQJ data sources in the **Data Source** combo box.
5. Fill-in the connection details.

   The properties presented in the connection details table are automatically detected depending on the selected data source.
6. Click the **OK** button to finish the connection configuration.

XQuery Database Debugging

Oxygen XML Editor plugin includes a debugging interface that helps you to detect and solve problems with XQuery transformations that are executed against MarkLogic and Berkeley DB XML databases.

For more information about the debugging support in Oxygen XML Editor plugin, see Debugging XSLT Stylesheets and XQuery Documents on page 1205.

Debugging with MarkLogic

Oxygen XML Editor plugin includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a MarkLogic data source and a MarkLogic connection.
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Editor plugin accesses. On the server side, debugging must be activated in the XDBC server and in the *Task Server* section of the server control console (the switch *debug allow*). If the debugging is not activated, the MarkLogic server reports a **DBG-TASKDEBUGALLOW** error.

   Note: An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Editor plugin uses to process XQuery expressions by selecting the **Use it to execute queries** action from the contextual menu in the **Data Source Explorer** view.
3. Open the XQuery file and start the debugging process.

   - If you want to debug an XQuery file stored on the MarkLogic server, we recommend you to use the **Data Source Explorer** view and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.
   - The MarkLogic XQuery debugger integrates seamlessly into the XQuery Debugger *perspective*. If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to debug the scenario directly.
   - Otherwise, switch to the **XQuery Debugger** *perspective*, open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the debug control toolbar.

     For general information about how a debugging session is started and controlled, see the Working with the Debugger section.

     Note: Before starting a debugging session, it is recommend that you link the MarkLogic connection with an Eclipse project. To do this, go to the **Data Source Explorer** view and select **Link to project** in the contextual menu of the MarkLogic connection. The major benefit of linking a debugging session with a project is that you can add *breakpoints* in the XQuery modules stored on the server. You are also able to access these modules from the Eclipse **Navigator** view and run debugging sessions from them.

In a MarkLogic debugging session, you can use step actions and *breakpoints* to help identify problems. When you add a *breakpoint* on a line where the debugger never stops, Oxygen XML Editor plugin displays a warning message. These warnings are displayed for *breakpoints* you add either in the main XQuery (which you can open locally or from the server) or for *breakpoints* you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see Using Breakpoints for Debugging Queries that Import Modules with MarkLogic on page 1169.

Remote Debugging with MarkLogic

Oxygen XML Editor plugin allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Editor plugin connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.

Oxygen XML Editor plugin also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

Important: When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

For more information about the XQuery debugger for MarkLogic, watch our video demonstration:

https://www.youtube.com/embed/eQ4ThDZq1bk

Related Information:

MarkLogic Development in Oxygen XML Editor plugin on page 1167

Configuring a MarkLogic Database Connection on page 1166

Using Breakpoints for Debugging Queries that Import Modules with MarkLogic

When debugging queries that imports modules stored in the database, it is recommended to place *breakpoints* in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the *breakpoints* in all the modules will be considered. Also, make sure that there are no other opened modules that are not involved in the current debugging session.

To place *breakpoints* in the modules, use the following procedure:

1. In the **Data Source Explorer** view, open all the modules from the **Modules** container of the XDBC application server that performs the debugging.
2. Set *breakpoints* in the module as needed.
3. Continue debugging the query.

If you get a warning that the *breakpoints* failed to initialize, try the following solutions:

- Check the **Breakpoints** view and make sure there are no older *breakpoints* (set on resources that are not part of the current debugging context).
- Make sure you open the modules from the context of the application server that does the debugging and place *breakpoints* there.

Related Information:

MarkLogic Database Connections on page 1165

MarkLogic Development in Oxygen XML Editor plugin on page 1167

Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

- Debugging support is only available for MarkLogic server versions 4.0 or newer.
- For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: *'0.9-ml' (inherited from MarkLogic 3.2)*, *'1.0-ml'*, and *'1.0'*.
- All declared variables are presented as strings. The **Value** column of the **Variables** view contains the expression from the variable declaration. It can be evaluated by copying the expression with the **Copy value** action from the contextual menu of the **Variables** view and pasting it in the **XWatch** view.
- There is no support for output to source mapping.
- There is no support for showing the trace.
- You can only set breakpoints in imported modules in one of the following cases:
  - When you open the module from the context of the application server involved in the debugging, using the **Data Source Explorer** view.
  - When the debugger automatically opens the modules in the Editor.
- No *breakpoints* are set in modules from the same server that are not involved in the current debugging session.
- No support for profiling when an XQuery transformation is executed in the debugger.

Debugging with Berkeley DB XML

The Berkeley DB XML database added a debugging interface starting with version 2.5. The current version is supported in the Oxygen XML Editor plugin XQuery Debugger. The same restrictions and peculiarities apply for the Berkeley debugger as for the MarkLogic debugger.

Integration with Microsoft SharePoint

Oxygen XML Editor plugin provides support for browsing and managing SharePoint connections in the **Data Source Explorer** view. You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, or edit and transform the documents in the editor.

Note: You can access documents stored on SharePoint Online for Office 365 sites that use either **Cloud identity (default)** or **Federated identity (ADFS)** as the authentication method.

Restriction: The SharePoint connection is only available in the Enterprise edition of Oxygen XML Editor plugin.

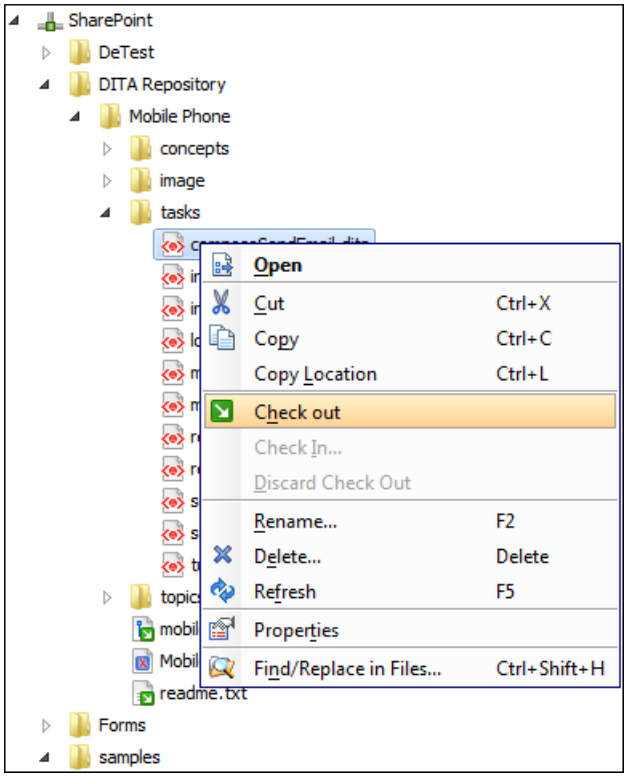

Figure 614: SharePoint Connection

Related Information:
Working with Databases on page 1138

How to Configure a SharePoint Connection

By default, Oxygen XML Editor plugin contains built-in data source drivers for **SharePoint**. Use this data source to create a connection to a SharePoint server that will be available in the **Data Source Explorer** view.

To configure a SharePoint connection, follow these steps:

1. Open the **Preferences** dialog box and go to **Data Sources**.
2. In the **Connections** panel click the **New** button.
3. Enter a unique name for the connection.
4. Select SharePoint in the **Data Source** combo box.
5. Fill-in the connection details:
   a) Set the URL to the SharePoint repository in the field **SharePoint URL**.
   b) Set the server domain in the **Domain** field. If you are using a SharePoint 365 account, leave this field empty.
   c) Set the user name to access the SharePoint repository in the **User** field.
   d) Set the password to access the SharePoint repository in the **Password** field.

SharePoint Contextual Menu Actions

While browsing SharePoint connections in the **Data Source Explorer** view, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources** preferences page where you can configure both data sources and connections.

Disconnect

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

Folder Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Check Out

Checks out the selected document on the server.

Check In

Checks in the selected document on the server. This action opens the **Check In** dialog box. In this dialog box, the following options are available:

- **Minor Version** - Increments the minor version of the file on the server.
- **Major Version** - Increments the major version of the file on the server.
- **Overwrite** - Overwrites the latest version of the file on the server.
- **Comment** - Allows you to comment on a file that you check in.

Discard Check Out

Discards the previous checkout operation, making the file available for editing to other users.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Compare

Compares two selected resources.

Importing Data

14

Topics:

- Import from Text Files
- Import from MS Excel Files
- Import Database Data as an XML Document
- Import from HTML Files
- Import Content Dynamically

Computer systems and databases contain data in incompatible formats and exchanging data between these systems can be very time consuming. Converting the data to XML can greatly reduce the complexity and create data that can be read by various types of applications.

Oxygen XML Editor plugin offers support for importing text files, MS Excel files, Database Data, and HTML files into XML documents. The XML documents can be further converted into other formats using the Transform features.

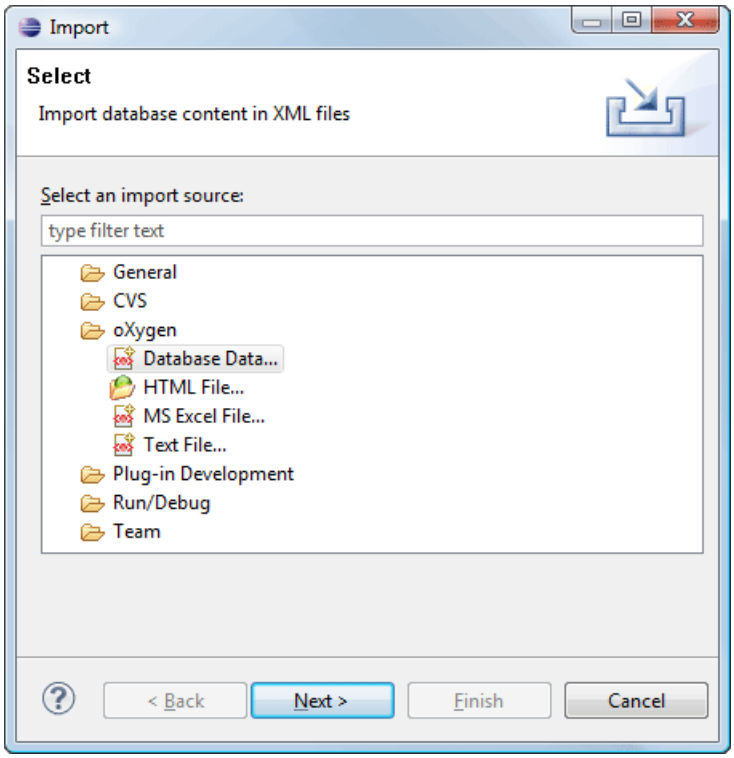

Figure 615: Import Wizards of the Oxygen XML Editor plugin Plugin

Import from Text Files

To import a text file into an XML file, follow these steps:

1. Go to **File** > **Import** > **Oxygen XML Editor plugin** > **Text File** and click **Next**.
   A **Select text file** dialog box is displayed.
2. Select the URL of the text file.
3. Select the encoding of the text file.

4. Click the **Next** button.
   The **Import from text file** dialog box is displayed.

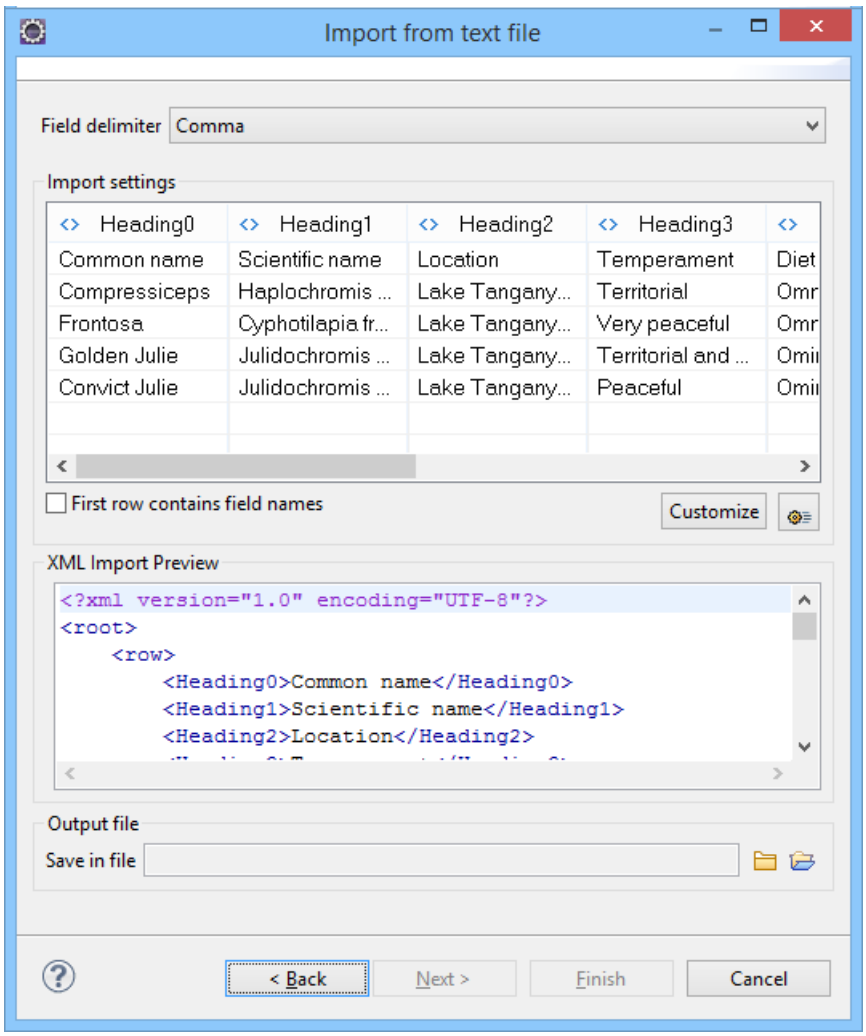

Figure 616: Import from Text File Dialog Box

5. Configure the settings for the conversion.
   a) Select the **Field delimiter** for the import settings. You can choose between the following: `Comma`, `Semicolon`, `Tab`, `Space`, or `Pipe`.
   b) The **Import settings** section presents the input data in a tabular form. By default, all data items are converted to element content (<> symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (× symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
   c) **First row contains field names** - If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.
   d) **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: `ELEMENT`, `ATTRIBUTE`, or `SKIPPED`.
   e) **Import Settings** - Clicking this button opens the **Import** preferences page that allows you to configure more import options.
   f) The **XML Import Preview** panel contains an example of what the generated XML document looks like.
   g) **Save in file** - If selected, the new XML document is saved in the specified path.

6. Click **Finish** to generate the XML document.

Import from MS Excel Files

Oxygen XML Editor plugin provides several methods for importing MS Excel files into an XML file. The first method is to use the Oxygen XML Editor plugin **Smart Paste** mechanism by simply copying data from Excel and pasting it into a document in **Author** mode (note that this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents). You can also copy data from Excel and paste it into inserted cells in **Grid** mode, but this is a more manual process. If you want to import an entire Excel file, Oxygen XML Editor plugin also offers a configurable import wizard that works with any type of XML document.

Smart Paste Method in Author Mode

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the Excel spreadsheet in your office application, copy its content, and simply paste it into your document in **Author** mode.

The Oxygen XML Editor plugin **Smart Paste** mechanism will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

Grid Mode Method

The **Grid** mode in Oxygen XML Editor plugin displays all content in an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. When importing Excel data into **Grid** mode, you first need to insert new cells in the particular nested table and then you can paste data from Excel the same as you would in any table or spreadsheet.

1. Copy the particular cells from your Excel spreadsheet that you want to import into an XML file.
2. Switch to **Grid** mode in Oxygen XML Editor plugin.
3. Expand the particular nodes and locate the nested table where you want to insert the copied cells.
4. Right-click a particular row or column where you want to insert the data and select **Insert row** or **Insert column**, depending on the structure of the copied cells.
5. Paste the copied cells from the clipboard into the newly inserted cells in **Grid** mode.
6. You may need to make some manual adjustments. For example, if the selection of copied cells contained an empty cell, Oxygen XML Editor plugin might ignore that cell.

Import Wizard Method

By default, this method supports importing Excel 97/2000/XP/2003 formats out-of-the-box. To import spreadsheet data from Excel 2007 or newer, additional libraries are needed before using this procedure. See Import Data from MS Excel 2007 or Newer on page 1199 for instructions on adding more libraries.

To use the **Import** wizard to import an Excel file into an XML file, follow these steps:

1. Go to **File** > **Import** > **Oxygen XML Editor plugin** > **MS Excel file**.
2. Select the URL of the Excel file.

   The sheets of the document you are importing are presented in the **Available Sheets** section of this dialog box.
3. Click the **Next** button to proceed to the next stage of the wizard.

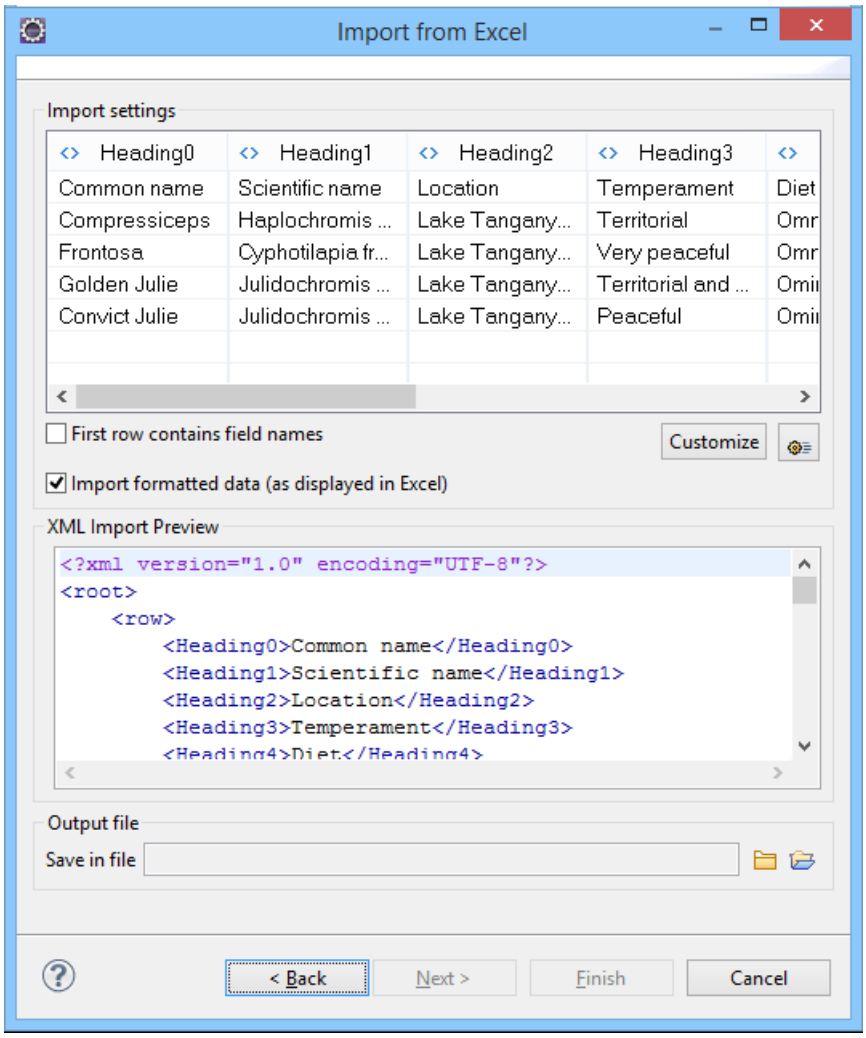

Figure 617: Import Wizard

4. Configure the settings for the conversion. This stage of the wizard offers the following options:

Import settings section

Presents the input data in a tabular form. By default, all data items are converted to element content (‹› symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (× symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

First row contains field names

If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.

Customize

This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: `ELEMENT`, `ATTRIBUTE`, or `SKIPPED`.

Import Settings

Clicking this button opens the **Import** preferences page that allows you to configure more import options.

Import formatted data (as displayed in Excel)

If this option is selected, the imported data retains the Excel data formatting (such as the representation of numeric values or dates). If deselected, the data formatting is not imported.

XML Import Preview panel

Contains an example of what the generated XML document will look like.

Save in file

If selected, the new XML document is saved in the specified path.

5. Click **Finish** to generate the XML document.

For more information about exchanging data between Oxygen XML Editor plugin and spreadsheet applications, watch our video demonstration:

https://www.youtube.com/embed/8VwsF58zLkU

Related Information:

Exporting XML Content to Excel on page 441

Import Data from MS Excel 2007 or Newer

To import spreadsheet data from Excel 2007 or newer (`.xlsx`), Oxygen XML Editor plugin needs additional libraries from the release 3.10 of the Apache POI project.

Manually Add the Libraries

To manually add the libraries, follow these steps:

1. Download version 3.10 of the Apache POI project from http://archive.apache.org/dist/poi/release/bin/. The specific ZIP file that you need is: `poi-bin-3.10-FINAL-20140208.zip`.
2. Unpack `poi-bin-3.10-FINAL-20140208.zip`.
3. Copy the following `.jar` files in the `plugin.xml` file of the Oxygen XML Editor plugin Eclipse plugin (if you installed the plugin via the Eclipse update site, you will find it in the `eclipse/plugins/com.oxygenxml...` folder, and if you installed it via the dropins ZIP distribution, it is located in the `eclipse/dropins/plugins/com.oxygenxml...` folder):
   - `dom4j-1.6.1.jar`
   - `poi-ooxml-3.10-FINAL-20140208.jar`
   - `poi-ooxml-schemas-3.10-FINAL-20140208.jar`
   - `xmlbeans-2.3.0.jar`

Result: You can now use the **Import** wizard to import data from Excel 2007 or newer.

Exporting XML Content to Excel on page 441

Import Database Data as an XML Document

To import the data from a relational database table as an XML document, follow these steps:

1. Go to **File** > **Import** > **Oxygen / Database Data** and click **Next** to start the **Import** wizard.

   This opens a **Select database table** dialog box that lists all the defined database connections:

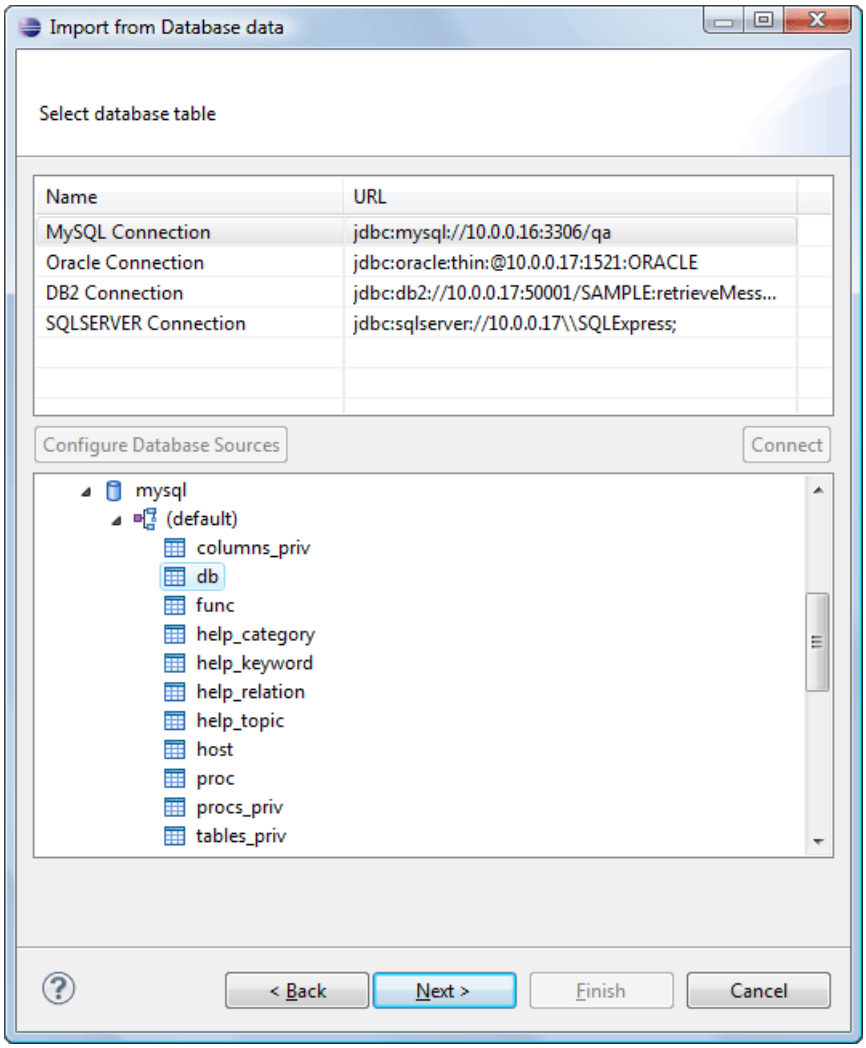

Figure 618: Select Database Table Dialog Box

2. Select the connection to the database that contains the appropriate data.

   Only connections configured in relational data sources can be used to import data.
3. If you want to edit, delete, or add a data source or connection, click the **Configure Database Sources** button. The **Preferences**/**Data Sources** option page is opened.
4. Click **Connect**.
5. In the list of sources, expand a schema and choose the required table.
6. Click the **Next** button.

   The **Import Criteria** dialog box is opened with a default query string in the **SQL Query** pane.

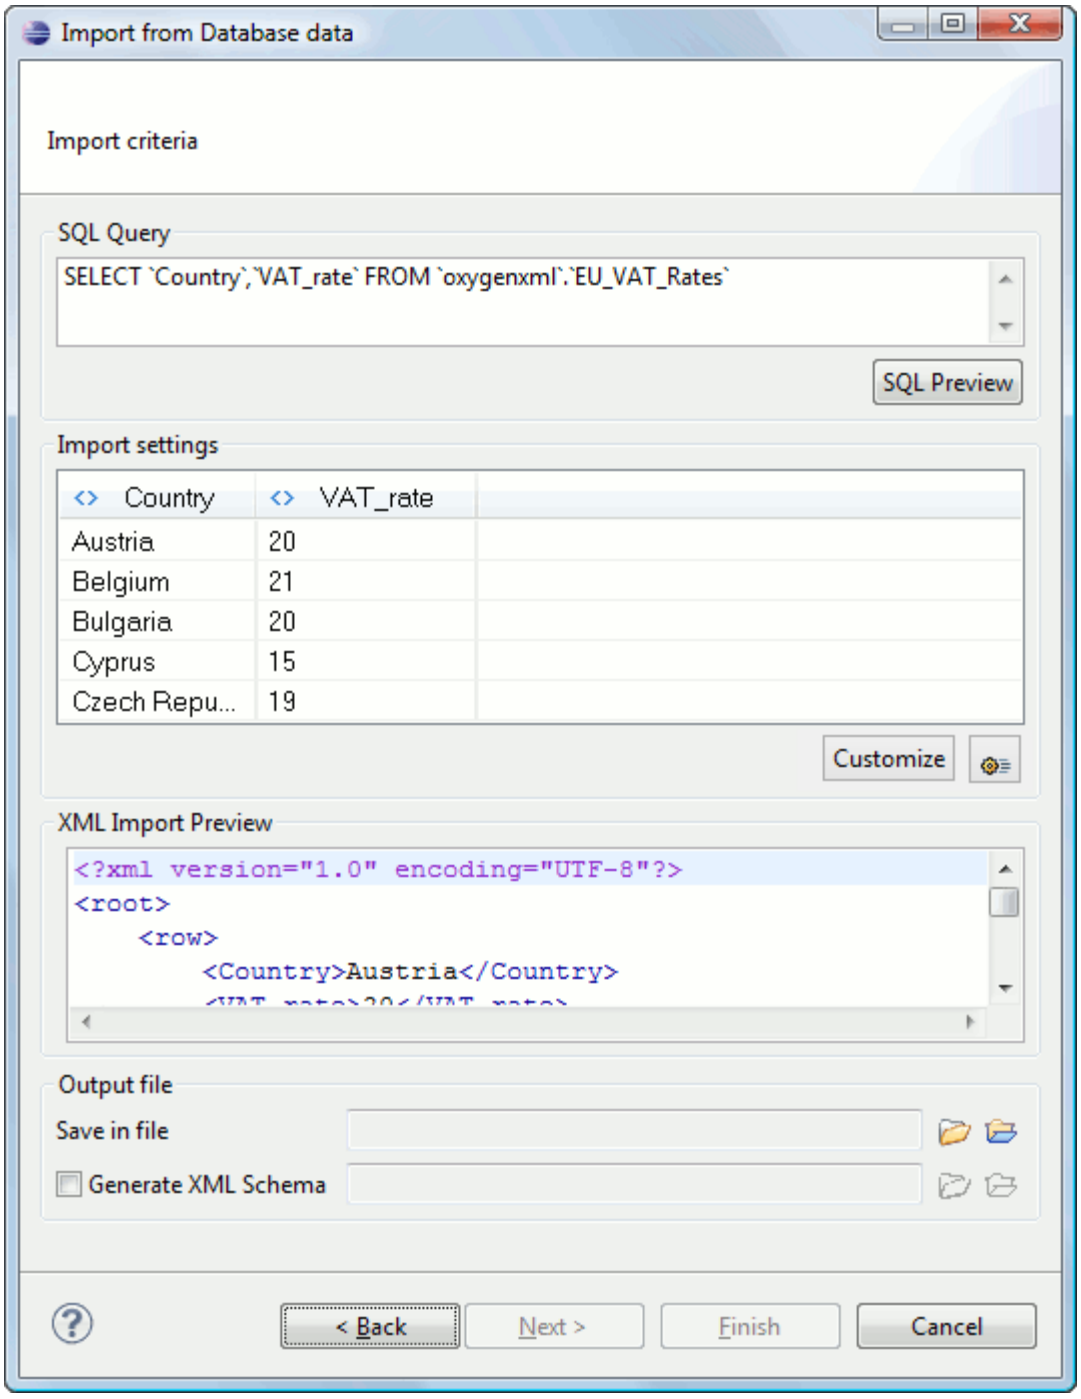

Figure 619: Import from Database Criteria Dialog Box

7. Configure the settings for the conversion.
   a) **SQL Preview** - If this button is pressed, the **Import settings** pane displays the labels that are used in the XML document and the first five lines from the database. By default, all data items are converted to element content (‹› symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (× symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
   b) **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: `ELEMENT`, `ATTRIBUTE`, or `SKIPPED`.

c) **Import Settings** - Clicking this button opens the **Import** preferences page that allows you to configure more import options.
d) The **XML Import Preview** panel contains an example of what the generated XML document looks like.
e) **Save in file** - If selected, the new XML document is saved in the specified path.
f) **Generate XML Schema** - Allows you to specify the path of the generated XML Schema file.

8. Click **Finish** to generate the XML document.

Import from HTML Files

Oxygen XML Editor plugin offers two methods for importing HTML files into an XML document. The first method is to simply copy data from an HTML document and paste it into a document in **Author** mode, but this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents. Oxygen XML Editor plugin also offers a configurable import wizard that works with any type of XML document.

Smart Paste Method

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the HTML document in your web browser, copy its content, and paste it into your document in **Author** mode.

The Oxygen XML Editor plugin **Smart Paste** mechanism will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

Import Wizard Method

To use the **Import** wizard to import from HTML files, follow these steps:

1. Go to **File** > **Import** > **Oxygen XML Editor plugin** > **HTML File**. The **Import HTML** wizard is displayed.
2. Select a parent folder and file name for the resulting XHTML document.
3. Enter the URL of the HTML document.
4. Select the type of the resulting XHTML document:
   - XHTML5
   - XHTML 1.0 Transitional
   - XHTML 1.0 Strict
5. Click the **Finish** button.

Result: The resulting document is an XHTML file containing a DOCTYPE declaration that references the XHTML DTD definition on the Web. The parsed content of the imported file is transformed to XHTML5, XHTML Transitional, or XHTML Strict depending on the option you chose.

Import Content Dynamically

Along with the built-in support for various useful URL protocols (such as HTTP or FTP), Oxygen XML Editor plugin also provides special support for a *convert* protocol that can be used to chain predefined processors to dynamically import content from various sources.

A *dynamic conversion URL* chains various processors that can be applied, in sequence, on a target resource and has the following general syntax:

```
convert:/processor=xslt;ss=urn:processors:excel2d.xsl/processor=excel!/urn:files:my.xls
```

The previous example first applies a processor (`excel`) on a target identified by the identifier (`urn:files:sample.xls`) and converts the Excel™ resource to XML. The second applied processor (`xslt`) applies an XSLT stylesheet identified using the identifier (`urn:processors:excel2d.xsl`) over the resulting

content from the first applied processor. These identifiers are all mapped to real resources on disk via an *XML catalog* that is configured in the application, as in the following example:

```
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <rewriteURI uriStartString="urn:files:" rewritePrefix="./resources/"/>
  <rewriteURI uriStartString="urn:processors:" rewritePrefix="./processors/"/>
</catalog>
```

The target resource part of the conversion URL must always follow the `!/` pattern. It can be any of the following:

- An absolute URL that points to a resource.
- An identifier that will be resolved to an actual resource via the *XML Catalog* support in the application. In the example above, the **urn:files:sample.xls** target resource is resolved via the *XML catalog*.
- A relative location. This location can only be resolved to an actual resource URL when the application has enough information about the location where the URL is referenced.

  For example, for a *DITA map* with a `topicref` such as:

  ```
  <topicref href="convert:/.../processor=excel!/resources/sample.xls"/>
  ```

  the `resources/sample.xls` path will be resolved relative to the *DITA map* location.

This type of URL can be opened in the application by using the **Open URL** action from the **File** menu. It can also be referenced from existing XML resources via `xi:include` or as a topic reference from a *DITA map*.

A *GitHub* project that contains various dynamic conversion samples for producing DITA content from various sources (and then publishing it) can be found here: https://github.com/oxygenxml/dita-glass.

Conversion Processors

A set of predefined conversion processors is provided in Oxygen XML Editor plugin. Each processor has its own parameters that can be set to control the behavior of the conversion process. All parameters that are resolved to resources are passed through the *XML catalog* mapping.

The following predefined conversion processors are included:

- **`xslt` Processor** - Converts an XML input using the Saxon EE XSLT processor. The `ss` parameter indicates the stylesheet resource to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

  ```
  convert:/processor=xslt;ss=urn:processors:convert.xsl;p1=v1!/urn:files:sample.xml
  ```

- **`xquery` Processor** - Converts an XML input using the Saxon EE XQuery processor. The `ss` parameter indicates the XQuery script to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

  ```
  convert:/processor=xquery;ss=urn:processors:convert.xquery;p1=v1!/urn:files:sample.xml
  ```

- **`excel` Processor** - Converts an Excel™ input to an XML format that can later be converted by other piped processors. It has a single parameter `sn`, which indicates the name of the sheet that needs to be converted. If this parameter is missing, the XML will contain the combined content of all sheets included in the Excel™ document.

  ```
  convert:/processor=excel;sn=test!/urn:files:sample.xls
  ```

- **`java` Processor** - Converts an input to another format by applying a specific Java method. The `jars` parameter is a comma-separated list of *JAR* libraries, or folders that libraries will be loaded from. The `ccn` parameter is the fully qualified name of the conversion class that will be instantiated. The conversion class needs to have a method with the following signature:

  ```
    public void convert(String systemID, String originalSourceSystemID,
  InputStream is, OutputStream os, LinkedHashMap<String, String> properties)
  throws IOException
  ```

  ```
  convert:/processor=java;jars=libs;ccn=test.JavaToXML!/
  urn:files:java/WSEditorBase.java
  ```

- **`js` Processor** - Converts an input to another format by applying a JavaScript method. The `js` parameter indicates the script that will be used. The `fn` parameter is the name of the method that will be called from the

script. The method must take a string as an argument and return a string. If any of the parameters are missing, an error is thrown and the conversion stops.

```
convert:/processor=js;js=urn:processors:md.js;fn=convertExternal!/urn:files:sample.md
```

- **`json` Processor** - Converts a JSON input to XML. It has no parameters.

  ```
  convert:/processor=json!/urn:files:personal.json
  ```

- **`xhtml` Processor** - Converts HTML content to well-formed XHTML. It has no parameters.

  ```
  convert:/processor=xhtml!/urn:files:test.html
  ```

- **`wrap` Processor** - Wraps content in a tag name making it well-formed XML. The `rn` parameter indicates the name of the root tag to use. By default, it is `wrapper`. The `encoding` parameter specifies the encoding that should be used to read the content. By default, it is UTF8. As an example, this processor can be used if you want to process a comma-separated values file with an XSLT stylesheet to produce XML content. The CSV file is first wrapped as well-formed XML, which is then processed with an `xslt` processor.

  ```
  convert:/processor=wrap!/urn:files:test.csv
  ```

- **`cache` Processor** - Caches the converted content obtained from the original document to a temporary file. The cache will be used on subsequent uses of the same URL, thus increasing the speed for the application returning the converted content. If the original URL points to the local disk, the cache will be automatically invalidated when the original file content gets modified. Otherwise, if the original URL points to a remote resource, the cache will need to be invalidated by reloading (**File** > **Reload (F5)**) the URL content that is opened in the editor.

  ```
  convert:/processor=cache/processor=xslt;…..!/urn:files:test.csv
  ```

Reverse Conversion Processors

All processors defined above can also be used for saving content back to the target resource if they are defined in the URL as reverse processors. Reverse processors are evaluated right to left. These reverse processors allow *round-tripping* content to and from the target resource.

As an example, the following URL converts HTML to DITA when the URL is opened using the `h2d.xsl` stylesheet and converts DITA to HTML when the content is saved in the application using the `d2h.xsl` stylesheet.

```
convert:/processor=xslt;ss=h2d.xsl/rprocessor=xslt;ss=d2h.xsl!/urn:files:sample.html
```

Important: If you are publishing a *DITA map* that has such conversion URL references inside, you need to edit the transformation scenario and set the value of the parameter *fix.external.refs.com.oxygenxml* to **true**. This will instruct Oxygen XML Editor plugin to resolve such references during a special pre-processing stage. Depending on the conversion, you may also require additional libraries to be added using the **Libaries** button in the **Advanced** tab of the transformation scenario.

Debugging XSLT Stylesheets and XQuery Documents 15

Topics:

- Debugger Layout
- Steps in a Typical Debugging Process
- Identify the XSLT / XQuery Expression that Generated Particular Output
- Using Breakpoints
- Performance Profiling of XSLT Stylesheets and XQuery Documents
- Debugging XSLT that Call Java Extensions
- Supported Processors for XSLT / XQuery Debugging

Oxygen XML Editor plugin includes a powerful debugging interface that helps you to detect and solve problems with XSLT and XQuery transformations.

XSLT Debugger Perspective

The **XSLT Debugger** *perspective* allows you to detect problems in an XSLT transformation by executing the process step by step. To switch the focus to this *perspective*, select **Window** > **Open Perspective** > **Other** > **Oxygen XSLT Debugger**.

XQuery Debugger Perspective

The **XQuery Debugger** *perspective* allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this *perspective*, select **Window** > **Open Perspective** > **Other** > **Oxygen XQuery Debugger**.

XSLT/XQuery Debugging Overview

The **XSLT Debugger** and **XQuery Debugger** *perspectives* allows you to test and debug XSLT 1.0 / 2.0 / 3.0 stylesheets and XQuery 1.0 / 3.0 documents including complex XPath 2.0 / 3.0 expressions. The interface presents simultaneous views of the source XML document, the XSLT/XQuery document and the result document. As you go step by step through the XSLT/XQuery document the corresponding output is generated step by step, and the corresponding position in the XML file is highlighted. At the same time, special views provide various types of debugging information and events useful to understand the transformation process.

The following set of features allow you to test and solve XSLT/XQuery problems:

- Support for XSLT 1.0 stylesheets (using Saxon 6.5.5 and Xalan XSLT engines), XSLT 2.0 / 3.0 stylesheets and XPath 2.0 / 3.0 expressions that are included in the stylesheets (using Saxon 9.8.0.8 XSLT engine) and XQuery 1.0 / 3.0 (using Saxon 9.8.0.8 XQuery engine).
- Stepping capabilities: step in, step over, step out, run, run to cursor, run to end, pause, stop.
- Output to source mapping between every line of output and the instruction element / source context that generated it.
- *Breakpoints* on both source and XSLT/XQuery documents.
- Call stack on both source and XSLT/XQuery documents.
- Trace history on both source and XSLT/XQuery documents.
- Support for XPath expression evaluation during debugging.
- Step into imported/included stylesheets as well as included source entities.
- Available templates and hits count.
- Variables view.
- Dynamic output generation.

For even more information, watch our video demonstration:

https://www.youtube.com/embed/m9d8c4V-LJw

Debugger Layout

The XML and XSL files are displayed in **Text** mode. The other modes (**Author** mode, **Grid** mode) are available only in the **Editor** *perspective*.

The **XSLT/XQuery Debugger** *perspective* contains the following components:

- **Source Document View (XML)** - Displays and allows the editing of XML files (documents).
- **XSLT/XQuery Document View (XSLT/XQuery)** - Displays and allows the editing of XSL files (stylesheets) or XQuery documents.
- **Output View** - Displays the output that results from inputting a document (XML) and a stylesheet (XSL) or XQuery document in the transformer. The transformation result is written dynamically while the transformation is processed (using the **Run** button on the Control toolbar). Several actions are available in the contextual menu for this view, including **Find/Replace**, **Copy**, and **Format and Indent**. There are two types of output views: a text-based **Output** view (with XML syntax highlights) and **HTML** view.
- **Control Toolbar** - Contains a variety of actions to help you configure and control the debugging process.
- **Information Views** - The information views at the bottom of the editor display various types of information to help you understand the transformation process.

Tip: The **Output** view and the various other information views are dockable so that you can configure the workspace according to your preferences.

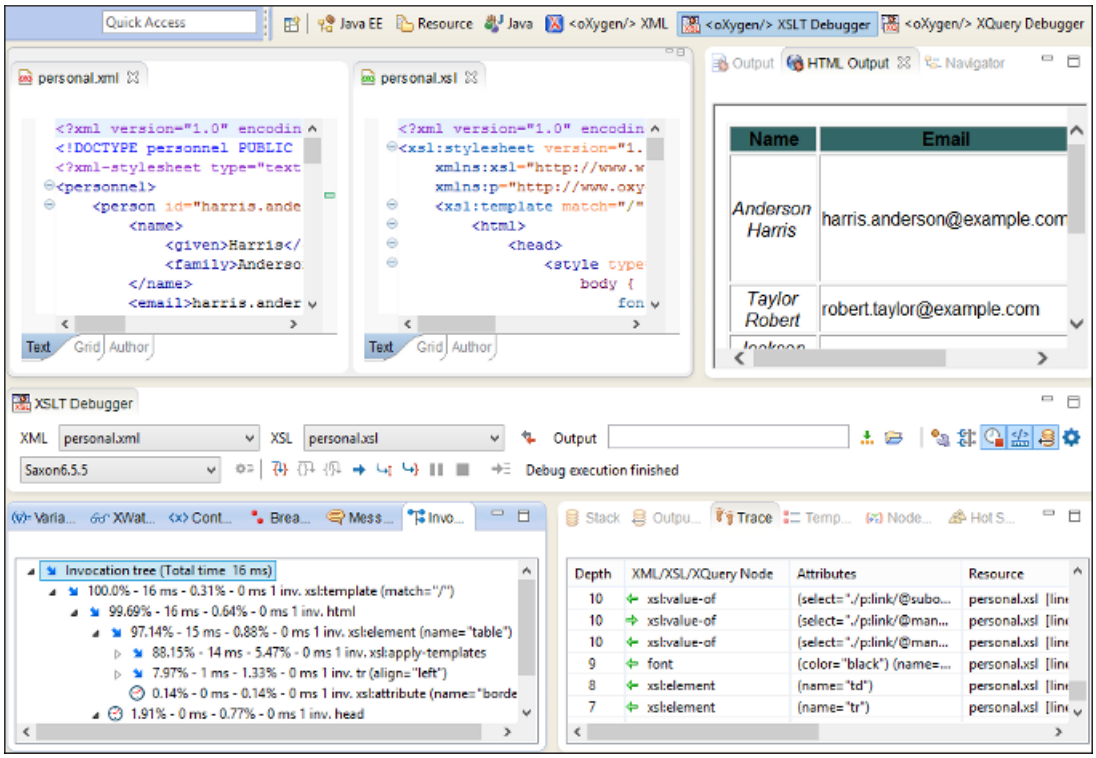

Figure 620: Debugger Interface

XML documents and XSL stylesheets or XQuery documents that were opened in the **Editor** *perspective* are automatically sorted into the first two panes. When multiple files of each type are opened, the individual documents and stylesheets are separated using the familiar tab management system that you are used to in the **Editor** *perspective*. Selecting a tab brings the document or stylesheet into focus and enables editing without the need to go back to the **Editor** *perspective*.

During debugging, the current execution node is highlighted in both document (XML) and XSLT/XQuery views.

Related Information:

Steps in a Typical Debugging Process on page 1217
Identify the XSLT / XQuery Expression that Generated Particular Output on page 1218
Supported Processors for XSLT / XQuery Debugging on page 1224
Performance Profiling of XSLT Stylesheets and XQuery Documents on page 1220

Control Toolbar

The **Control** toolbar contains all the actions that you need to configure and control the debugging process. The following actions are described as they appear in the toolbar from left to right.

Figure 621: Control Toolbar

XML source selector

The current selection represents the source document used as input by the transformation engine. The selection list contains all opened files (XML files being emphasized). This option allows you to use other file types also as source documents. In an XQuery debugging session this selection field can be set to the default value NONE, because usually XQuery documents do not require an input source.

XSL / XQuery selector

The current selection represents the stylesheet or XQuery document to be used by the transformation engine. The selection list contains all opened files (XSLT / XQuery files being emphasized).

Link with editor

When selected, the XML and XSLT/XQuery selectors display the names of the files opened in the central editor panels. This button is toggled off by default.

Output selector

The selection represents the output file specified in the associated transformation scenario. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Configure parameters

Opens a dialog box that allows you to configure the XSLT / XQuery parameters to be used by the transformation.

Edit extensions

Allows you to add and remove the Java classes and *JARS* used as XSLT extensions.

Turn on/off profiling

Enables / Disables current transformation profiling.

Enable XHTML output

Enables the rendering of the output in the **HTML** output view during the transformation process. For performance issues, disable XHTML output when working with very large files. Note that only XHTML conformant documents can be rendered by this view. To view the output result of other formats, such as HTML, save the **Text output** area to a file and use an external browser for viewing.

When starting a debug session from the **Editor** *perspective* by using the **Debug Scenario** action, the state of this toolbar button reflects the state of the **Show as XHTML** output option from the scenario.

Turn on/off output to source mapping

Enables or disables the output to source mapping between every line of output and the instruction element / source context that generated it.

Debugger preferences

Quick link to Debugger preferences page.

XSLT / XQuery engine selector

Lists the processors available for debugging XSLT and XQuery transformations.

XSLT / XQuery engine advanced options

Advanced options available for Saxon 9.8.0.8.

Step into F7

Starts the debugging process and runs until the next instruction is encountered.

Step over F8 (Alt + F8 on OS X)

Run until the current instruction and its sub-instructions are over. Usually this will advance to the next sibling instruction.

Step out Shift + F7 (Command + F8 on OS X)

Run until the parent of the current instruction is over. Usually this will advance to the next sibling of the parent instruction.

Run Shift + F5

Starts the debugging process. The execution of the process is paused when a breakpoint is encountered or the transformation ends.

Run to cursor Ctrl + F5

Starts the debugging process and runs until one of the following conditions occur: the line of cursor is reached, a valid *breakpoint* is reached or the execution ends.

Run to end Alt + F5

Runs the transformation until the end, without taking into account enabled *breakpoints*, if any.

Pause Shift + F6

Request to pause the current transformation as soon as possible.

Stop F6

Request to stop the current transformation without completing its execution.

Show current execution nodes

Reveals the current debugger context showing both the current instruction and the current node in the XML source. Possible displayed states:

- Entering ( ) or leaving ( ) an XML execution node.
- Entering ( ) or leaving ( ) an XSL execution node.
- Entering ( ) or leaving ( ) an XPath execution node.

  Note: When you set a MarkLogic server as a processor, the **Show current execution nodes** button is named **Refresh current session context from server**. Click this button to refresh the information in all the views.

Note: For some of the XSLT processors (Saxon-HE/PE/EE) the debugger could be configured to step into the XPath expressions affecting the behavior of the following debugger actions: **Step into**, **Step over** or **Step Out**.

Related Information:

Advanced Saxon HE/PE/EE XQuery Transformation Options on page 948

Debugging Information Views

The information views at the bottom of the editor is comprised of two panes that are used to display various types of information used to understand the transformation process. For each information type there is a

corresponding tab. While running a transformation, relevant events are displayed in the various information views. This enables the developer to obtain a clear view of the transformation progress. By using the debug controls, developers can easily isolate parts of stylesheet. Therefore, they may be more easily understood and modified.

The information types include the following:

Left side information views

- **Breakpoints** view
- **XWatch** view
- **Context** view
- **Messages** view (XSLT only)
- **Variables** view
- **Invocation Tree** view

Right side information views

- **Stack** view
- **Output Mapping Stack** view
- **Trace** view
- **Templates** view (XSLT only)
- **Nodes/Values Set** view
- **Hotspots** view

Tip: The information views are dockable so that you can configure the workspace according to your preferences.

Breakpoints View

The **Breakpoints** view lists all *breakpoints* that are set on opened documents. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu. *Breakpoints* can be inserted in the XML source document or the XSLT/XQuery document in debugging sessions.

Once you insert a *breakpoint*, it is automatically added to the list in the **Breakpoints** view and you can edit its associated *condition*. A *breakpoint* can have an associated break condition that represents an XPath expression evaluated in the current debugger context. In order to be processed, their evaluation result should be a boolean value. A *breakpoint* with an associated condition only stops the execution of the Debugger if the *breakpoint condition* is evaluated as **true**.

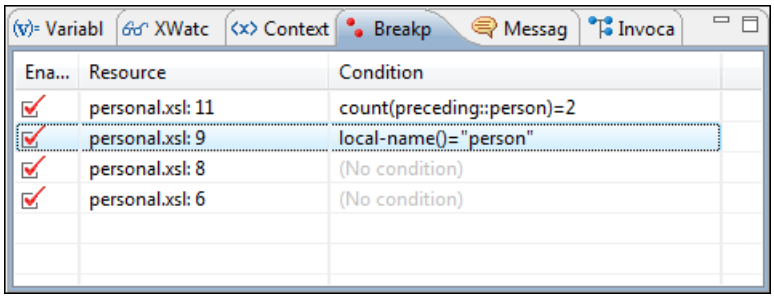

Figure 622: Breakpoints View

The **Breakpoints** view contains the following columns:

- **Enabled** - If selected, the current condition is evaluated and taken into account.
- **Resource** - Resource file and number of the line where the *breakpoint* is set.
- **Condition** - XSLT/XQuery expression to be evaluated during debugging. The expression will be evaluated at every debug step.

Clicking a record highlights the *breakpoint* line in the document.

Note: The *breakpoints* list is not deleted at the end of a transformation (it is preserved between debugging sessions).

The following actions are available in the contextual menu of the table:

Go to

Moves the cursor to the source of the *breakpoint*.

Run to Breakpoint

Runs the debugger up to the point of this particular *breakpoint* and ignores the others (regardless of whether they were previously enabled or disabled).

Enable

Enables the *breakpoint*.

Disable

Disables the *breakpoint*. A disabled *breakpoint* will not be evaluated by the Debugger.

Add

Allows you to add a new *breakpoint* and *breakpoint condition*.

Edit

Allows you to edit an existing *breakpoint*.

Remove

Deletes the selected *breakpoint*.

Enable all

Enables all *breakpoints*.

Disable all

Disables all *breakpoints*.

Remove all

Removes all *breakpoints*.

Related Information:

Using Breakpoints on page 1219

Context View

The context node is valid only for XSLT debugging sessions and is a source node corresponding to the XSL expression that is evaluated. It is also called the context of execution. The context node implicitly changes as the processor hits various steps (at the point where XPath expressions are evaluated). This node has the same value as evaluating '.' (dot) XPath expression in **XWatch** view. The value of the context node is presented as a tree in the **Context** view. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

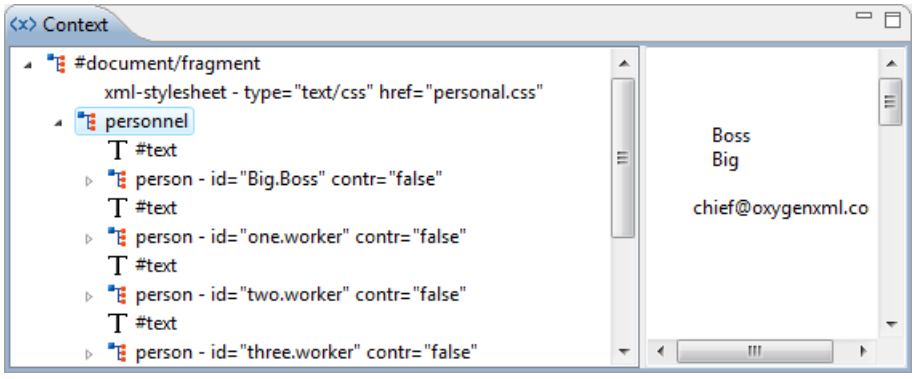

Figure 623: Context node view

The context nodes are presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel. The **Context** view also presents the current mode of the XSLT processor if this mode differs from the default one.

XPath Watch (XWatch) View

The **XWatch** view shows XPath expressions evaluated during the debugging process. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

Expressions are evaluated dynamically as the processor changes its source context. When you type an XPath expression in the **Expression** column, Oxygen XML Editor plugin supports you with syntax highlight and content completion assistance.

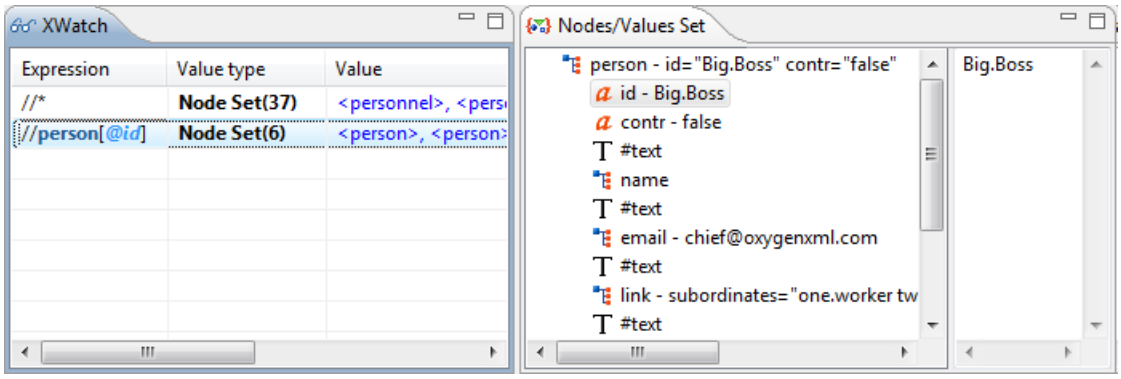

Figure 624: XPath Watch View

Table 66: XWatch columns

Column	Description
Expression	XPath expression to be evaluated (XPath 1.0 or 2.0 / 3.0 compliant).
Value	Result of XPath expression evaluation. Value has a type (see the possible values in the section Variables View on page 1216). For *Node Set* results, the number of nodes in the set is shown in parenthesis.

Important: Notes about working with the **XWatch** view:

- Expressions that reference variable names are not evaluated.
- The expression list is not deleted at the end of the transformation (it is preserved between debugging sessions).
- To insert a new expression, click the first empty line of the **Expression** column and start typing.
- To delete an expression, click its **Expression** column and delete its content.
- If the expression result type is a *Node Set*, click it (**Value** column) and its value is displayed in the **Nodes/Values Set** view.
-

Messages View

Using **xsl:message** instructions is one way to signal special situations encountered during transformation as well as a raw way of doing the debugging. The **Messages** view is available only for XSLT debugging sessions and shows all `xsl:message` calls executed by the XSLT processor during transformation. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

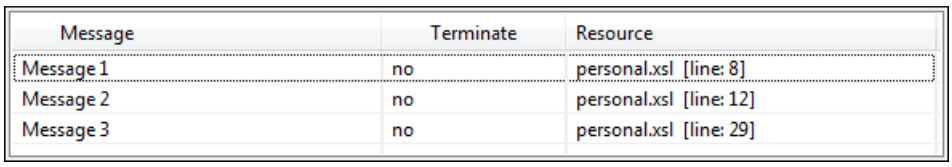

Figure 625: Messages View

Table 67: Messages columns

Column	Description
Message	Message content.
Terminate	Signals if processor terminates the transformation or not once it encounters the message (yes/no respectively).
Resource	Resource file where *xsl:message* instruction is defined and the message line number.

The following actions are available in the contextual menu:

Go to

Highlight the XSL fragment that generated the message.

Copy

Copies to clipboard message details (system ID, severity info, description, start location, terminate state).

Clear all

Removes all messages from the view.

Important:

- Clicking a record from the table highlights the `xsl:message` declaration line.
- Message table values can be sorted by clicking the corresponding column header. Clicking the column header switches the sorting order between: ascending, descending, no sort.

Stack View

The **Stack** view shows the current execution stack of both source and XSLT/XQuery nodes. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

During the transformation, two stacks are managed. One for source nodes being processed and the other for XSLT/XQuery nodes being processed. Oxygen XML Editor plugin shows both node types in one common stack. The source (XML) nodes are preceded by a red color icon while XSLT/XQuery nodes are preceded by a green color icon. The advantage of this approach is that you can always see the source scope on which an XSLT/XQuery instruction is executed (the last red color node on the stack). The stack is oriented upside down.

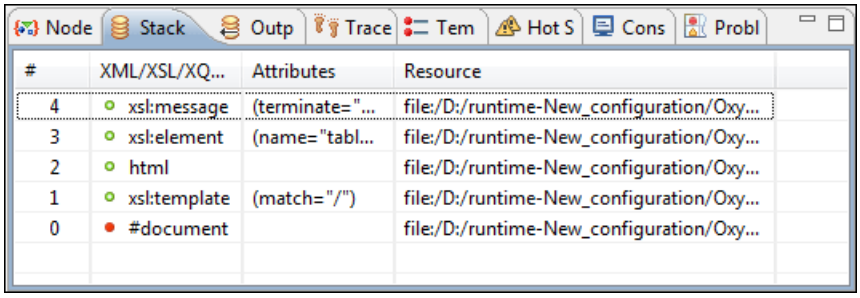

Figure 626: Stack View

The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line containing the XSLT element that is displayed on the selected line from the view.

Table 68: Stack Columns

Column	Description
#	Order number, represents the depth of the node (0 is the stack base).
XML/XSLT/XQuery Node	Node from source or stylesheet document currently being processed. One particular stack node is the document root, noted as **#document**.

Column	Description
Attributes	Attributes of the node (a list of *id="value"* pairs).
Resource	Resource file where the node is located.

Important: Remarks:

- Clicking a record from the stack highlights that node's location inside resource.
- Using Saxon, the stylesheet elements are qualified with XSL proxy, while using Xalan you only see their names. (example: `xsl:template` using Saxon and `template` using Xalan).
- Only the Saxon processor shows element attributes.
- The Xalan processor shows also the built-in rules.

Output Mapping Stack View

The **Output Mapping Stack** view displays context data and presents the XSLT templates/XQuery elements that generated specific areas of the output. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

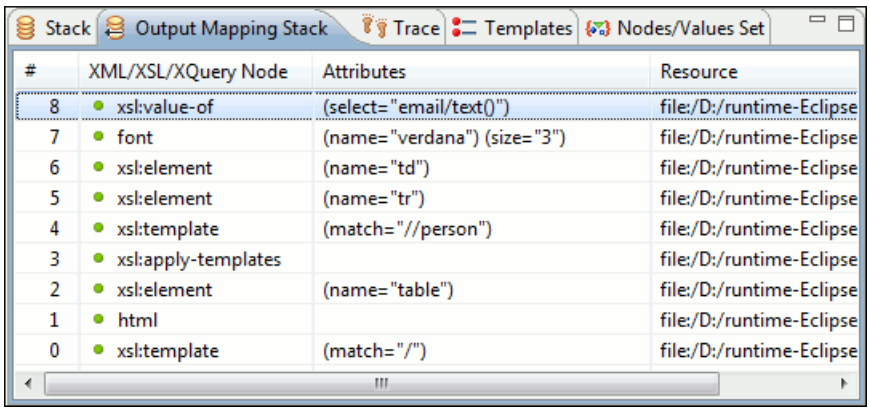

Figure 627: Output Mapping Stack view

The **Go to** action of the contextual menu takes you to the line that contains the XSLT element displayed in the **Output Mapping Stack** view.

Table 69: Output Mapping Stack Columns

Column	Description
#	The order number in the stack of XSLT templates/XQuery elements. Number 0 corresponds to the bottom of the stack in the status of the XSLT/XQuery processor. The highest number corresponds to the top of the stack.
XSL/XQuery Node	The name of an XSLT template/XQuery element that participated in the generation of the selected output area.
Attributes	The attributes of the XSLT template/XQuery node.
Resource	The name of the file containing the XSLT template/XQuery element.

Important: Remarks:

- Clicking a record highlights that XSLT template definition/XQuery element inside the resource (XSLT stylesheet file/XQuery file).
- Saxon only shows the applied XSLT templates having at least one hit from the processor. Xalan shows all defined XSLT templates, with or without hits.
- The table can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.

- Xalan shows also the built-in XSLT rules.

Related Information:

Identify the XSLT / XQuery Expression that Generated Particular Output on page 1218
Stack View on page 1212
Trace View on page 1214
Templates View on page 1215

Trace View

Usually, the XSLT/XQuery processors signal the following events during transformation:

- - Entering a source (XML) node.
- - Leaving a source (XML) node.
- - Entering an XSLT/XQuery node.
- - Leaving an XSLT/XQuery node.

The **Trace** view catches all of these events, so you can see how the process evolved. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

The red icon lines denote source nodes while the green icon lines denote XSLT/XQuery nodes. It is possible to save the element trace in a structured XML document (using the **Export to XML** action in the contextual menu). Thus, you have the possibility of comparing the trace results from multiple debug sessions.

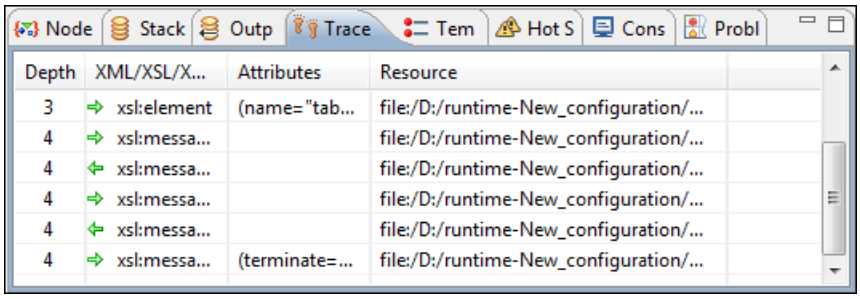

Figure 628: Trace History View

The contextual menu contains the following actions:

Go to

Moves the selection in the editor panel to the line containing the XSLT element or XML element that is displayed on the selected line from the view;

Export to XML

Saves the entire trace list in XML format.

Table 70: Trace History Columns

Column	Description
Depth	Shows you how deep the node is nested in the XML or stylesheet structure. The bigger the number, the more nested the node is. A depth 0 node is the document root.
XML/XSLT/XQuery Node	Represents the node from the processed source or stylesheet document. One particular node is the document root, noted as *#document*. Every node is preceded by an arrow that represents what action was performed on it (entering or leaving the node).
Attributes	Attributes of the node (a list of *id="value"* pairs).
Resource	Resource file where the node is located.

Important: Remarks:

- Clicking a record highlights that node's location inside the resource.
- Only the Saxon processor shows the element attributes.
- The Xalan processor shows also the built-in rules.

Templates View

The **xsl:template** is the basic element for stylesheets transformation. The **Templates** view is only available during XSLT debugging sessions and shows all *xsl:template* instructions used by the transformation. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

Being able to see the number of *hits* for each of the templates allows you to get an idea of the stylesheet coverage by template rules with respect to the input source.

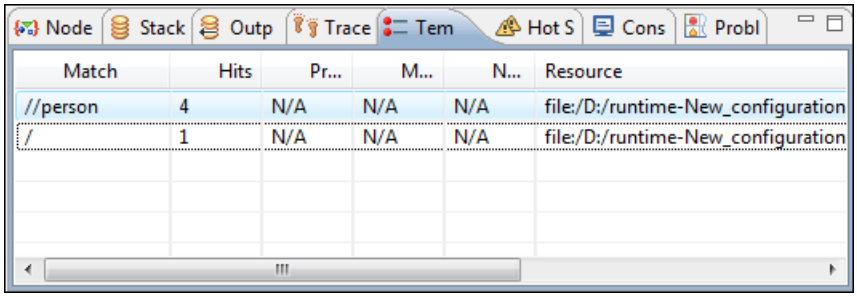

Figure 629: Templates view

The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line that contains the XSLT template displayed on the selected line from the view.

Table 71: Templates columns

Column	Description
Match	The *match* attribute of the *xsl:template*.
Hits	The number of hits for the *xsl:template*. Shows how many times the XSLT processor used this particular template.
Priority	The template priority as established by XSLT processor.
Mode	The *mode* attribute of the *xsl:template*.
Name	The *name* attribute of the *xsl:template*.
Resource	The resource file where the template is located.

Important: Remarks:

- Clicking a record highlights that template definition inside the resource.
- Saxon only shows the applied templates having at least one hit from the processor. Xalan shows all defined templates, with or without hits.
- Template table values can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in rules.

Nodes/Values Set View

The **Nodes/Values Set** view is always used in relation with the **Variables** view and **XWatch** view. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu. It shows an XSLT node set value in a tree form. This view is updated as a response to the following events:

- You click a variable that has a node set value in the **Variables** or **XWatch** view.
- You click a tree fragment in the **Variables** or **XWatch** view.
- You click an XPath expression evaluated to a node set in the **Variables** or **XWatch** view.

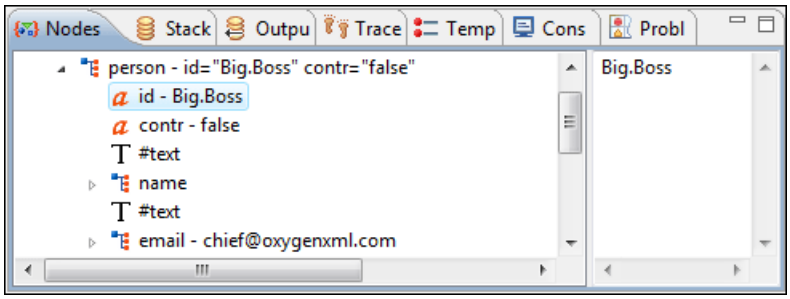

Figure 630: Node Set view

The nodes / values set is presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel.

Important: Remarks:

- For longer values in the right side panel, the interface displays it with an ellipsis (...) at the end. A more detailed value is available as a tooltip when hovering over it.
- Clicking a record highlights the location of that node in the source or stylesheet view.

Variables View

The **Variables** view displays variables and parameters (local and global), along with their values. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

Variables and parameters play an important role during an XSLT/XQuery transformation. Oxygen XML Editor plugin uses the following icons to differentiate variables and parameters:

- V - Global variable.
- {V} - Local variable.
- P - Global parameter.
- {P} - Local parameter.

The following value types are available:

- **Boolean**
- **String**
- **Date** - XSLT 2.0 / 3.0 only.
- **Number**
- **Set**
- **Object**
- **Fragment** - Tree fragment.
- **Any**
- **Undefined** - The value was not yet set, or it is not accessible.

  Note:

  When Saxon 6.5 is used, if the value is unavailable, then the following message is displayed in the **Value** field: "The variable value is unavailable".

  When Saxon 9 is used:

  - If the variable is not used, the **Value** field displays "The variable is declared but never used".
  - If the variable value cannot be evaluated, the **Value** field displays "The variable value is unavailable".
- **Document**
- **Element**
- **Attribute**
- **ProcessingInstruction**
- **Comment**
- **Text**

- **Namespace**
- **Evaluating** - Value under evaluation.
- **Not Known** - Unknown types.

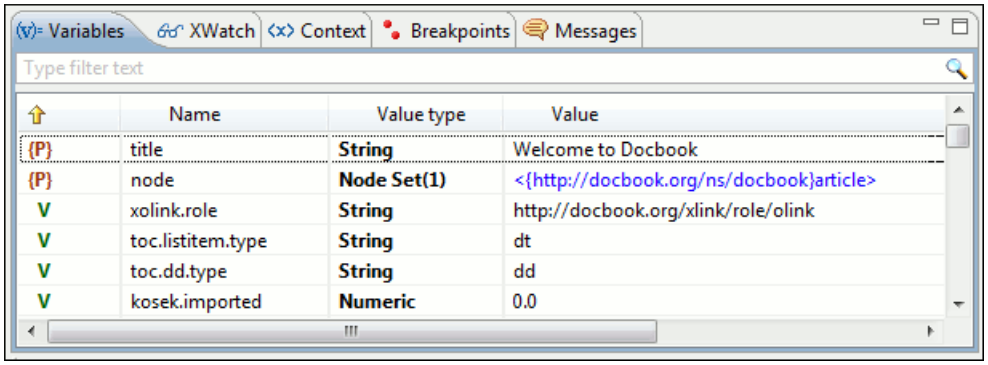

Figure 631: Variables View

Table 72: Variables Columns

Column	Description
Name	Name of variable / parameter.
Value Type	Type of variable/parameter.
Value	Current value of variable / parameter.

The value of a variable (the **Value** column) can be copied to the clipboard for pasting it to other editor areas with the **Copy value** action from the contextual menu. This is useful if you have long and complex values that cannot be easily remembered just by looking at them once.

Important: Remarks:

- Local variables and parameters are the first entries presented in the table.
- Clicking a record highlights the variable definition line.
- Variable values could differ depending on the transformation engine used or stylesheet version set.
- If the value of the variable is a node set or a tree fragment, clicking it causes the **Node Set** view to be shown with the corresponding set of values.
- Variable table values can be sorted by clicking the corresponding column header. Clicking the column header switches between the orders: ascending, descending, no sort.

Multiple Output Documents in XSLT 2.0 and XSLT 3.0

For XSLT 2.0 and XSLT 3.0 stylesheets that store the output in multiple files by using the `xsl:result-document` instruction, the content of the file created in this way is displayed dynamically while the transformation is running in an output view. There is one tab for each `xsl:result-document` instruction in the **Result Documents** view so that the output is not mixed while still being presented in multiple views.

Steps in a Typical Debugging Process

Depending on your situation and needs, the debugging process might be more complex, but the following procedure is an example of a typical debugging process:

1. Open the source XML document and the XSLT/XQuery document.
2. If you are in the **Editor** *perspective*, switch to the **XSLT Debugger** or **XQuery Debugger** *perspective* with one of the following actions:
   - Select **Window** > **Open Perspective** > **Other** > **Oxygen XSLT Debugger/XQuery Debugger**.

- Select the **Debug scenario** action on the toolbar.. This action initializes the Debugger *perspective* with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger *perspective*.

3. Select the source XML document in the XML source selector of the Control toolbar. In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to **NONE**.
4. Select the XSLT/XQuery document in the XSL/XQuery selector of the Control toolbar.
5. Set XSLT/XQuery parameters using the **Configure parameters** button on the Control toolbar.
6. Set one or more breakpoints.
7. Step through the stylesheet using the following buttons available on the Control toolbar:
   - **Step into**
   - **Step over**
   - **Step out**
   - **Run**
   - **Run to cursor**
   - **Run to end**
   - **Pause**
   - **Stop**
8. Examine the data in the information views to find the bug in the transformation process.

   For more information about fixing bugs in the transformation, see: Identify the XSLT / XQuery Expression that Generated Particular Output on page 1218.

Related Information:

Identify the XSLT / XQuery Expression that Generated Particular Output on page 1218

Identify the XSLT / XQuery Expression that Generated Particular Output

To quickly spot the XSLT templates or XQuery expressions with problems, it is important to know what XSLT template in the XSLT stylesheet (or XQuery expression in the XQuery document) and what element in the source XML document generated a specified area in the output.

Some of the debugging capabilities (for example, **Step in**) can be used for this purpose. Using **Step in**, you can see how output is generated and link it with the XSLT/XQuery element being executed in the current source context. However, this can become difficult on complex XSLT stylesheets or XQuery documents that generate a large output.

You can click particular text in the **Output** view and the editor will select the XML source context and the XSLT template/XQuery element that generated that text. Also, inspecting the whole stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the specified output area speeds up the debugging process.

This is an example of a typical procedure for identifying an expression that generated particular output:

1. Switch to the **XSLT Debugger** or **XQuery Debugger** *perspective* with one of the following actions:
   - Select **Window** > **Open Perspective** > **Other** > **Oxygen XSLT Debugger/XQuery Debugger**.
   - Select the **Debug scenario** action on the toolbar.. This action initializes the Debugger *perspective* with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger *perspective*.
2. Select the source XML document in the XML source selector of the Control toolbar. In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to **NONE**.
3. Select the XSLT/XQuery document in the XSL/XQuery selector of the Control toolbar.
4. Select the appropriate engine in the XSLT/XQuery engine selector of the Control toolbar.

5. Set XSLT/XQuery parameters using the **Configure parameters** button on the Control toolbar.
6. Apply the XSLT stylesheet or XQuery transformation using the **Run to end** button that is available on the Control toolbar.
7. Inspect the mapping by clicking a section of the output in the **Output** view.

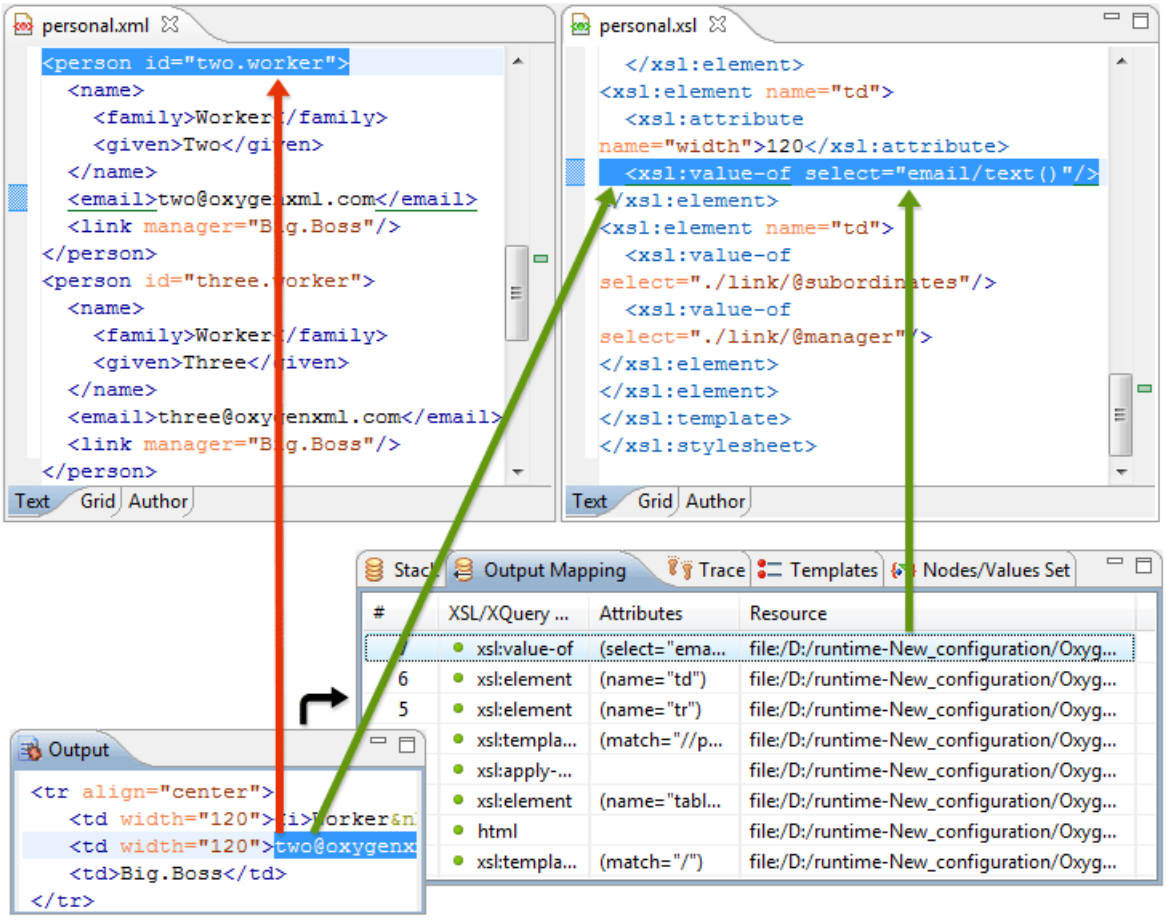

Figure 632: Text Output to Source Mapping

This action will highlight the XSLT / XQuery element and the XML source context. This XSLT template/XQuery element that is highlighted in the XSLT/XQuery editor represents only the top of the stack of XSLT templates/ XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the clicked output section. In the case of complex transformations, inspecting the whole stack of XSLT templates/ XQuery elements speeds up the debugging process. This stack is available in the **Output Mapping Stack** view.

Related Information:

Trace View on page 1214
Templates View on page 1215

Using Breakpoints

The Oxygen XML Editor plugin XSLT/XQuery Debugger allows you to interrupt XSLT/XQuery processing to gather information about variables and processor execution at particular points. To ensure *breakpoints* are persistent between work sessions, they are saved at project level. You can set a maximum of 100 *breakpoints* per project.

Inserting Breakpoints

To insert a *breakpoint*, follow these steps:

1. Click the line where you want to insert the *breakpoint* in the XML source document or the XSLT/XQuery document. *Breakpoints* are automatically created on the ending line of a start tag, even if you click a different line.
2. Right-click the vertical stripe on the left side of the editor panel and select **Add breakpoint**.

Result:

Once you insert a *breakpoint*, it is automatically added to the list in the **Breakpoints** view and you can edit its associated *condition*. A *breakpoint* can have an associated break condition that represents an XPath expression evaluated in the current debugger context. In order to be processed, their evaluation result should be a boolean value. A *breakpoint* with an associated condition only stops the execution of the Debugger if the *breakpoint condition* is evaluated as **true**.

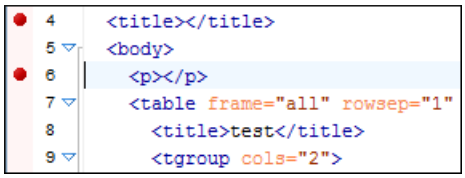

Figure 633: Example: Breakpoints

Tip: You can configure the color and how *breakpoints* are shown from the Eclipse **Annotations** preferences page (**Window ('Eclipse' on Mac OSX)** > **Preferences** > **General** > **Editors** > **Text Editors** > **Annotations**).

Removing Breakpoints

To remove a *breakpoint*, Right-click the *breakpoint* icon (●) in the vertical stripe on the left side of the editor panel and select **Remove breakpoint**.

Breakpoints View on page 1209

Performance Profiling of XSLT Stylesheets and XQuery Documents

Whether you are trying to identify a performance issue that is causing your production XSLT/XQuery transformation to not meet customer expectations or you are trying to proactively identify issues prior to deploying your XSLT/XQuery transformation, using the XSLT/XQuery profiler feature is essential to helping you save time and ultimately ensure a better performing, more scalable XSLT/XQuery transformation.

The XSLT/XQuery profiling feature can use any available XSLT/XQuery processor that can be used for debugging and it is available from the debugging *perspective*.

Enabling the Profiler

Enabling and disabling the profiler is controlled by the **Profiler** button from the debugger Control toolbar. The XSLT/XQuery profiler is off by default. This option is not available during a debugger session so you need to set it before starting the transformation. For information about a common debugging procedure, see Steps in a Typical Debugging Process on page 1217.

Profiling Information Views

Immediately after enabling the profiler, two new information views are added to the current debugger information views:

- **Invocation tree** view on left side
- **Hotspots** view on right side

Profiling data is available only after the transformation ends successfully.

On the left side (**Invocation tree** view), you can examine how style instructions are processed. This result view is also named call-tree, as it represents the order of style processing. The profiling result shows the duration time for each of the style-instruction including the time needed for its called children.

On the right side (**Hotspots** view), you can immediately spot the time the processor spent in each instruction. As an instruction usually calls other instructions, the used time of the called instruction is extracted from the duration time of the caller (the hotspot only presents the inherent time of the instruction).

Source Backmapping

In either the **Invocation tree** or **Hotspots** view, you can use the backmapping feature to find the XSLT stylesheet or XQuery expression definition. Clicking the selected item causes Oxygen XML Editor plugin to highlight the XSLT stylesheet or XQuery expression source line where the instruction is defined.

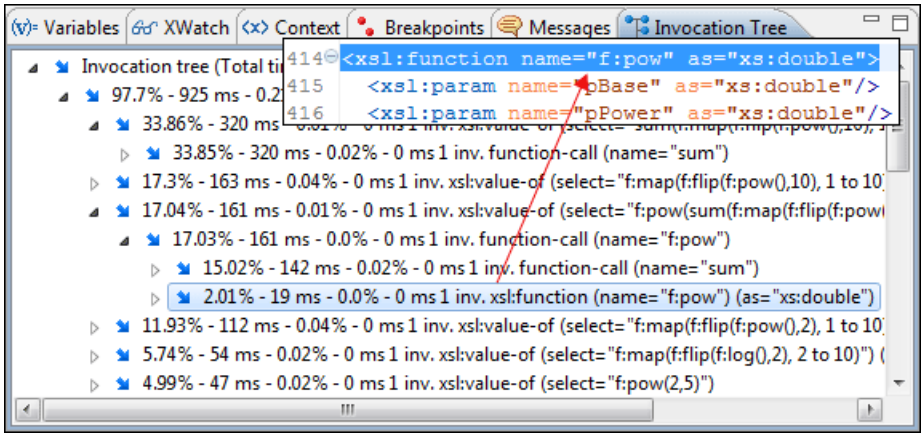

Figure 634: Source Backmapping

Saving and Customizing Profiling Data

The profiling data can be saved (exported) into XML and HTML format. In either the **Invocation tree** or **Hotspots** view, right-click anywhere in the view and select **Export to XML** or **Export to HTML**. The HTML report can be customized based upon the profiling raw data. When you select **Export to HTML**, Oxygen XML Editor plugin will save it as XML and apply an XSLT stylesheet to render the report as XML. You can customize these stylesheets to suit your needs. They are located in: *[OXYGEN_INSTALL_DIR]*`/frameworks/profiler/`.

Other Profiling Notes

- If you want to change the XSLT/XQuery profiler settings, use the contextual menu and choose the corresponding **View settings** entry.
- Profiling exhaustive transformations may run into an **OutOfMemory** error due to the large amount of information being collected. If this is the case, you can close unused projects when running the profiling or use high values for Java VM options `-Xms` and `-Xmx`. If this does not help you can shorten your source XML file and try again.
- For more information about the XSLT/XQuery Profiler, watch our video demonstration:

  https://www.youtube.com/embed/4ftHschjLqA

Invocation Tree View

The **Invocation Tree** view shows a top-down call tree that represents how XSLT instructions or XQuery expressions are processed. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

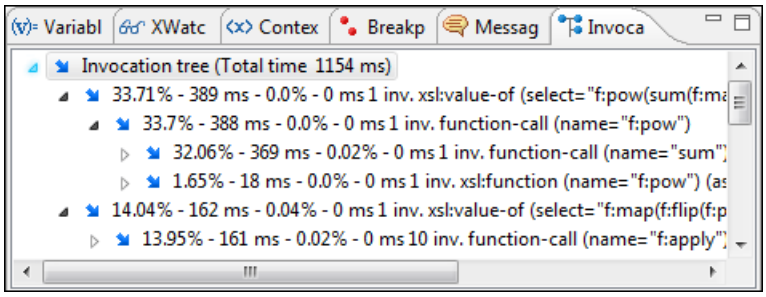

Figure 635: Invocation Tree View

The entries in the invocation tree include a few possible icons that indicate the following:

- - Points to a call whose inherent time is insignificant compared to its total time.
- - Points to a call whose inherent time is significant compared to its total time (greater than 1/3rd of its total time).

Every entry in the invocation tree includes textual information that depends on the **XSLT/XQuery profiler settings**:

- A percentage number of the total time that is calculated with respect to either the root of the tree or the calling instruction.
- A total time measurement in milliseconds or microseconds. This is the total execution time that includes calls into other instructions.
- A percentage number of the inherent time that is calculated with respect to either the root of the tree or the calling instruction.
- An inherent time measurement in milliseconds or microseconds. This is the inherent execution time of the instruction.
- An invocation count that shows how often the instruction has been invoked on this call-path.
- An instruction name that contains also the attributes description.

The **Invocation Tree** view also includes the following contextual menu actions:

Export to HTML

Selecting this option will save the profiling data as XML and then apply an XSLT stylesheet to render the report as HTML. These stylesheets are included in the subfolder: *[OXYGEN_INSTALL_DIR]*`/frameworks/profiler/`. You can use them to customize your own report based on the profiling raw data.

Export to XML

Use this option to save the profiling data as an XML file in a specified location.

View settings

Opens the XSLT/XQuery Profiler preferences page that allows you to configure various profiling settings.

Hotspots View

The **Hotspots** view displays a list of all instruction calls that lie above the threshold defined in the **XSLT/XQuery profiler settings**. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

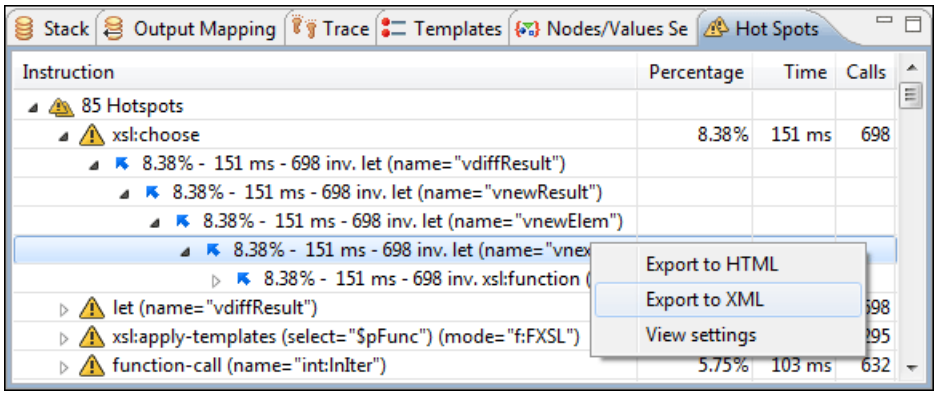

Figure 636: Hotspots View

By opening a hotspot instruction entry, the tree of back-traces leading to that instruction call are calculated and shown.

Every hotspot is described by the values from the following columns:

- **Instruction** - The name of the instruction.
- **Percentage** - The percentage number for this hotspot entry with respect to the total time.
- **Time** - The inherent time in milliseconds or microseconds of how much time has been spent in the hotspot. All calls into this instruction are summed up regardless of the particular call sequence.
- **Calls** - The invocation count of the hotspot entry.

If you click the ⚠ handle on the left side of a hotspot, a tree of back-traces will be shown.

Every entry in the backtrace tree has textual information attached to it that depends on the **XSLT/XQuery profiler settings**:

- A percentage number that is calculated with respect to either the total time or the called instruction.
- A time measured in milliseconds or microseconds of how much time has been contributed to the parent hotspot on this call-path.
- An invocation count that shows how often the hotspot has been invoked on this call-path.

  Note: This is not the number of invocations of this instruction.
- An instruction name that also contains its attributes.

The **Hotspots** view also includes the following contextual menu actions:

Export to HTML

Selecting this option will save the profiling data as XML and then apply an XSLT stylesheet to render the report as HTML. These stylesheets are included in the subfolder: *[OXYGEN_INSTALL_DIR]*`/frameworks/profiler/`. You can use them to customize your own report based on the profiling raw data.

Export to XML

Use this option to save the profiling data as an XML file in a specified location.

View settings

Opens the XSLT/XQuery Profiler preferences page that allows you to configure various profiling settings.

Debugging XSLT that Call Java Extensions

It is possible to debug XSLT that call Java extensions. This is achieved through a transformation scenario in which the Java extensions are specified, and the debugging can be done based upon the same scenario.

To debug XSLT with Java extensions, follow this procedure:

1. Create an XSLT transformation scenario for your XSLT document (select **Configure Transformation Scenario(s)** action from the toolbar, then click **New**, and select **XSLT transformation**).

2. In the **New scenario** dialog box, click the **Extensions** button (in the **XSLT** tab), specify the Java extensions (JAR libraries) that are needed, and click **OK**.
3. Once you are finished configuring the transformation scenario, click **OK**, then select **Save and close**.
4. Use the **Debug scenario** action on the toolbar and the debugging will be based upon the same transformation scenario you just configured and saved.

Tip: You could achieve this during a typical debugging process by specifying the Java extensions using the **Edit extensions** button on the debugger control toolbar.

Related Information:

Validating XSLT Stylesheets that Call Java Extensions on page 623

Debugging Java Extensions

The XSLT/XQuery debugger does not step into Java classes that are configured as XSLT/XQuery extensions of the transformation. To step into Java classes, inspect variable values, and set *breakpoints* in Java methods, you can set up a Java debug configuration in an IDE (such as the Eclipse SDK) as described in the following steps:

1. Create a debug configuration.
   a) Set at least 256 MB as heap memory for the Java virtual machine (recommended 512 MB) by setting the `-Xmx` parameter in the debug configuration (for example, "-Xmx512m").
   b) Make sure the *[OXYGEN_INSTALL_DIR]*`/lib/oxygen.jar` file and your Java extension classes are on the Java classpath.

      The Java extension classes should be the same classes that were set as an extension of the XSLT/XQuery transformation in the debugging *perspective*.
   c) Set the class *ro.sync.exml.Oxygen* as the main Java class of the configuration.

      The main Java class *ro.sync.exml.Oxygen* is located in the `oxygen.jar` file.
2. Start the debug configuration.

   Now you can set *breakpoints* and inspect Java variables as in any Java debugging process executed in the selected IDE (Eclipse SDK, and so on.).

Supported Processors for XSLT / XQuery Debugging

The following built-in XSLT processors are integrated in the debugger and can be selected in the Control Toolbar:

- **Saxon 9.8.0.8 HE (Home Edition)** - a limited version of the Saxon 9 processor, capable of running XSLT 1.0, XSLT 2.0 / 3.0 basic and XQuery 1.0 transformations, available in both the XSLT debugger and the XQuery one,
- **Saxon 9.8.0.8 PE (Professional Edition)** - capable of running XSLT 1.0 transformations, XSLT 2.0 basic ones and XQuery 1.0 ones, available in both the XSLT debugger and the XQuery one,
- **Saxon 9.8.0.8 EE (Enterprise Edition)** - a schema aware processor, capable of running XSLT 1.0 transformations, XSLT 2.0 /3.0 basic ones, XSLT 2.0 / 3.0 schema aware ones and XQuery 1.0 / 3.0 ones, available in both the XSLT debugger and the XQuery debugger,
- **Saxon 6.5.5** - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger,
- **Xalan 2.7.2** - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger.

Author Mode Customization

16

Topics:

- Author Mode Customization Guide
- CSS Support in Author Mode
- Creating and Running Automated Tests
- API Frequently Asked Questions (API FAQ)

This section contains an Author Mode Customization Guide on page 1225, CSS Support in Author Mode on page 1315, a collection of Frequently Asked Questions regarding the Oxygen XML Editor plugin API, and other topics in regards to customizing the **Author** mode.

Author Mode Customization Guide

The **Author** mode editor of Oxygen XML Editor plugin was designed to provide a user-friendly interface for editing XML documents. **Author** combines the power of source editing with the intuitive interface of a word processor. You can customize the **Author** mode editor to support new custom XML formats or to change how standard XML formats are edited.

Although Oxygen XML Editor plugin includes built-in, configured *frameworks* for DocBook, DITA, TEI, and XHTML you might need to create a customization of the editor to handle other types of documents. A common use case is when your organization holds a collection of XML document types used to define the structure of internal documents and they need to be visually edited by people with no experience working with XML files.

There are several ways to customize the editor:

1. Create a CSS file defining styles for the XML elements you will work with, and create XML files that reference the CSS through an `xml-stylesheet` processing instruction.
2. Fully configure a *framework*. This involves putting together the CSS stylesheets, XML schemas, actions, menus, bundling them, and distributing an archive. The CSS and GUI elements are settings for the Oxygen XML Editor plugin **Author** mode. The other settings such as the templates, catalogs, and transformation scenarios are general settings and are enabled whenever the association is active, regardless of the editing mode (**Text**, **Grid**, or **Author**).

Simple Customization Tutorial

The most important elements of a document type customization are represented by an XML Schema to define the XML structure, the CSS to render the information and the XML instance template that links the first two together.

XML Schema

To provide as-you-type validation and to compute valid insertion proposals, Oxygen XML Editor plugin needs an XML grammar (XML Schema, DTD, or RelaxNG) associated to the XML. The grammar specifies how the internal structure of the XML is defined. For information about associating a schema and how Oxygen XML Editor plugin detects the schema, see Associating a Schema to XML Documents on page 579.

Consider a use-case in which several users are testing a system and must send report results to a content management system. The customization should provide a visual editor for these kind of documents. The following XML Schema, `test_report.xsd` defines a report with results of a testing session. The report

consists of a title, few lines describing the test suite that was run, and a list of test results (each with a name and a boolean value indicating if the test passed or failed).

```
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
    <xs:element name="report">
        <xs:complexType>
            <xs:sequence>
                <xs:element ref="title"/>
                <xs:element ref="description"/>
                <xs:element ref="results"/>
            </xs:sequence>
        </xs:complexType>
    </xs:element>
    <xs:element name="title" type="xs:string"/>
    <xs:element name="description">
        <xs:complexType>
            <xs:sequence maxOccurs="unbounded">
                <xs:element name="line">
                    <xs:complexType mixed="true">
                        <xs:sequence minOccurs="0"
                            maxOccurs="unbounded">
                            <xs:element name="important"
                              type="xs:string"/>
                        </xs:sequence>
                    </xs:complexType>
                </xs:element>
            </xs:sequence>
        </xs:complexType>
    </xs:element>

    <xs:element name="results">
        <xs:complexType>
            <xs:sequence maxOccurs="unbounded">
                <xs:element name="entry">
                    <xs:complexType>
                        <xs:sequence>
                            <xs:element name="test_name"
                              type="xs:string"/>
                            <xs:element name="passed"
                               type="xs:boolean"/>
                        </xs:sequence>
                    </xs:complexType>
                </xs:element>
            </xs:sequence>
        </xs:complexType>
    </xs:element>
</xs:schema>
```

CSS Stylesheet

A set of rules must be defined for describing how the XML document is to be rendered in **Author** mode. This is done using Cascading Style Sheets (CSS). CSS is a language used to describe how an HTML or XML document should be formatted by a browser. CSS is widely used in the majority of websites.

The elements from an XML document are displayed in the layout as a series of boxes. Some of the boxes contain text and may flow one after the other, from left to right. These are called inline boxes. There are also other type of boxes that flow one below the other (such as paragraphs). These are called block boxes.

For example, consider the way a traditional text editor arranges the text. A paragraph is a block, because it contains a vertical list of lines. The lines are also blocks. However, blocks that contains inline boxes arrange its children in a horizontal flow. That is why the paragraph lines are also blocks, while the traditional "bold" and "italic" sections are represented as inline boxes.

The CSS allows us to specify that some elements are displayed as tables. In CSS, a table is a complex structure and consists of rows and cells. The `table` element must have children that have a *table-row* style. Similarly, the `row` elements must contain elements with a *table-cell* style.

To make it easy to understand, the following section describes how each element from a schema is formatted using a CSS file. Note that this is just one of infinite possibilities for formatting the content.

`report`

This element is the root element of a report document. It should be rendered as a box that contains all other elements. To achieve this the display type is set to **block**. Additionally, some margins are set for it. The CSS rule that matches this element is:

```
report{
    display:block;
    margin:1em;
```

```
}
```

`title`

The title of the report. Usually titles have a large font. The **block** display is used so that the subsequent elements will be placed below it, and its font is changed to double the size of the normal text.

```
title {
    display:block;
    font-size:2em;
}
```

`description`

This element contains several lines of text describing the report. The lines of text are displayed one below the other, so the description has the **block** display. Also, the background color is changed to make it standout.

```
description {
    display:block;
    background-color:#EEEEFF;
    color:black;
}
```

`line`

A line of text in the description. A specific aspect is not defined and it just indicates that the display should be **block** style.

```
line {
    display:block;
}
```

`important`

The `important` element defines important text from the description. Since it can be mixed with text, its display property must be set to **inline**. Also, the text is emphasized with **bold**to make it easier to spot.

```
important {
    display:inline;
    font-weight:bold;
}
```

`results`

The `results` element displays the list of *test_names* and the results for each one. To make it easier to read, it is displayed as a **table**, with a green border and margins.

```
results{
    display:table;
    margin:2em;
    border:1px solid green;
}
```

`entry`

An item in the results element. The results are displayed as a table so the entry is a row in the table. Thus, the display is **table-row**.

```
entry {
    display:table-row;
}
```

`test_name`, `passed`

The name of the individual test, and its result. They are cells in the results table with the display set to **table-cell**. Padding and a border are added to emphasize the table grid.

```
test_name, passed{
    display:table-cell;
    border:1px solid green;
    padding:20px;
}

passed{
    font-weight:bold;
```

```
}
```

The full content of the CSS file `test_report.css` is:

```
report {
    display:block;
    margin:1em;
}

description {
    display:block;
    background-color:#EEEEFF;
    color:black;
}

line {
    display:block;
}

important {
    display:inline;
    font-weight:bold;
}

title {
    display:block;
    font-size:2em;
}

results{
    display:table;
    margin:2em;
    border:1px solid green;
}

entry {
    display:table-row;
}

test_name, passed{
    display:table-cell;
    border:1px solid green;
    padding:20px;
}

passed{
    font-weight:bold;
}
```

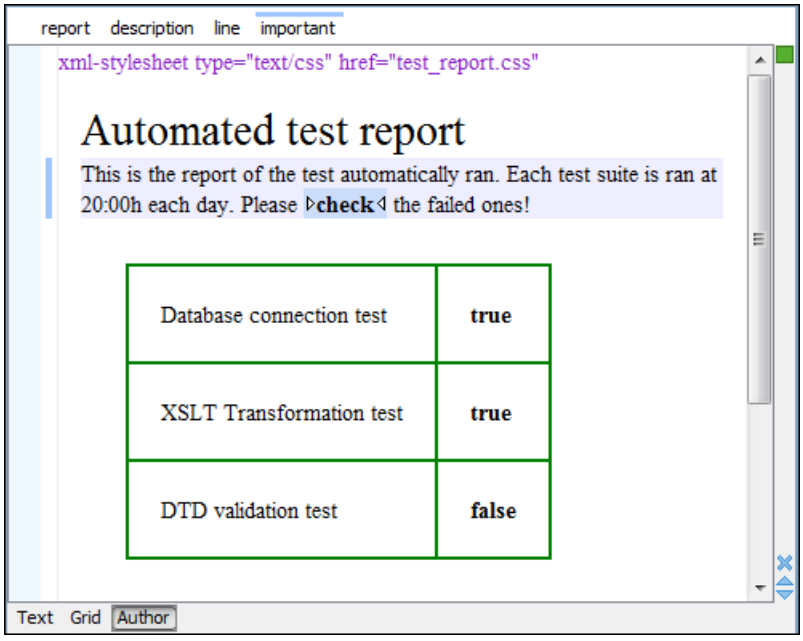

Figure 637: Report Rendered in Author Mode

Note: You can edit attributes in-place in the **Author** mode using form-based controls.

Associating a Stylesheet with an XML Document

The rendering of an XML document in the **Author** mode is driven by a CSS stylesheet that conforms to the version 2.1 of the CSS specification from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported.

There are several methods for associating a stylesheet (CSS) with an XML document:

1. Insert the `xml-stylesheet` processing instruction with the `type` attribute at the beginning of the XML document. If you do not want to alter your XML documents, you should create a new document type (*framework*).

   CSS example:

   ```
   <?xml-stylesheet type="text/css" href="test.css"?>
   ```

   Note: XHTML documents need a `link` element, with the `href` and `type` attributes in the `head` child element, as specified in the W3C CSS specification. XHTML example:

   ```
   <link href="/style/screen.css" rel="stylesheet" type="text/css"/>
   ```

   Tip: You can also insert the `xml-stylesheet` processing instruction by using the **Associate XSLT/CSS Stylesheet** action that is available on the toolbar or in the **XML** menu.
2. Add a new CSS file to a *framework* (document type). To do so, open the **Preferences** dialog box and go to **Document Type Association**. Edit the appropriate *framework*, open the **Author** tab, then the **CSS** subtab. Press the **New** button to add a new CSS file.

   Note: The predefined *frameworks* are read-only, so you need to **Extend** or **Duplicate** them to configure them as custom *frameworks*.

You can read more about associating a CSS to a document type in Customizing the Main CSS of a Framework on page 1297.

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.

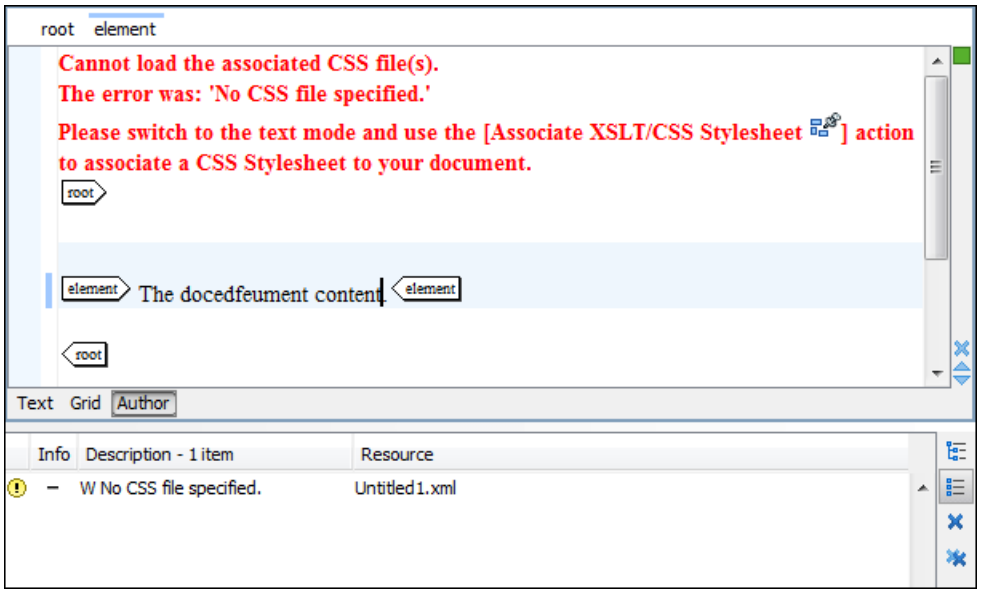

Figure 638: Document with no CSS association default rendering

XML Instance Template

Based on the XML Schema and CSS file Oxygen XML Editor plugin can help the content author in loading, editing, and validating the test reports. An XML document template must be created as a kind of skeleton that the users

can use as a starting point for creating new test reports. The template must be generic enough and reference the XML Schema file and the CSS stylesheet.

This is an example:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/css" href="test_report.css"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation="test_report.xsd">
  <title>Automated test report</title>
  <description>
    <line>This is the report of the test automatically ran.
      Each test suite is ran at 20:00h each day.
      Please <important>check</important> the failed ones!</line>
  </description>
  <results>
    <entry>
      <test_name>Database connection test</test_name>
      <passed>true</passed>
    </entry>
    <entry>
      <test_name>XSLT Transformation test</test_name>
      <passed>true</passed>
    </entry>
    <entry>
      <test_name>DTD validation test</test_name>
      <passed>false</passed>
    </entry>
  </results>
</report>
```

The processing instruction `xml-stylesheet` associates the CSS stylesheet to the XML file. The `href` pseudo attribute contains the URI reference to the stylesheet file. In our case the CSS is in the same directory as the XML file.

The next step is to place the XSD file and the CSS file on a web server and modify the template to use the HTTP URLs, like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/css"
        href="http://www.mysite.com/reports/test_report.css"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
        xsi:noNamespaceSchemaLocation=
        "http://www.mysite.com/reports/test_report.xsd">
    <title>Test report title</title>
    <description>
.......
```

If you want to share the files with other team members, you could create an archive containing the *`test_report.xml`*, *`test_report.css`*, and *`test_report.xsd`* and send it to the other users.

Advanced Framework Customization

Oxygen XML Editor plugin supports individual document types and classes of document types through *frameworks*. A *framework* associates a document type or a class of documents with CSS stylesheets, validation schemas, catalog files, new files templates, transformation scenarios, and custom actions.

In this tutorial, we create a *framework* for a set of documents. As an example, we create a light documentation *framework* (similar to DocBook), then we set up a complete customization of the **Author** mode.

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

Built-in XML Frameworks on page 826
Predefined Document Types (Frameworks) on page 826

Creating the Basic Association

Let us go through an example of creating a custom document type (*framework*) and editing an XML document of this type.

First Step - XML Schema

To illustrate an example of creating an XML Schema a custom DocBook *framework*, suppose the documents are either `articles` or books, both composed of `sections`. The `sections` may contain `titles`, `paragraphs`,

`figures`, `tables`, and other `sections`. To complete the picture, each section includes a `def` element from another namespace.

The first schema file:

```
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
    targetNamespace="http://www.oxygenxml.com/sample/documentation"
    xmlns:doc="http://www.oxygenxml.com/sample/documentation"
    xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts"
    elementFormDefault="qualified">

    <xs:import namespace=
    "http://www.oxygenxml.com/sample/documentation/abstracts"
     schemaLocation=
    "abs.xsd"/>
```

The namespace of the documents will be `http://www.oxygenxml.com/sample/documentation`. The namespace of the `def` element is `http://www.oxygenxml.com/sample/documentation/abstracts`.

Next, we define the structure of the sections. They all start with a title, then have the optional `def` element then either a sequence of other sections, or a mixture of paragraphs, images and tables.

```
<xs:element name="book" type="doc:sectionType"/>
<xs:element name="article" type="doc:sectionType"/>
<xs:element name="section" type="doc:sectionType"/>

<xs:complexType name="sectionType">
    <xs:sequence>
        <xs:element name="title" type="xs:string"/>
        <xs:element ref="abs:def" minOccurs="0"/>
        <xs:choice>
            <xs:sequence>
                <xs:element ref="doc:section" maxOccurs="unbounded"/>
            </xs:sequence>
            <xs:choice maxOccurs="unbounded">
                <xs:element ref="doc:para"/>
                <xs:element ref="doc:image"/>
                <xs:element ref="doc:table"/>
            </xs:choice>
        </xs:choice>
    </xs:sequence>
</xs:complexType>
```

The paragraph contains text and other styling markup, such as bold (b) and italic (i) elements.

```
<xs:element name="para" type="doc:paragraphType"/>

<xs:complexType name="paragraphType" mixed="true">
    <xs:choice minOccurs="0" maxOccurs="unbounded">
        <xs:element name="b"/>
        <xs:element name="i"/>
    </xs:choice>
</xs:complexType>
```

The `image` element has an attribute with a reference to the file containing image data.

```
<xs:element name="image">
    <xs:complexType>
        <xs:attribute name="href" type="xs:anyURI" use="required"/>
    </xs:complexType>
</xs:element>
```

The `table` contains a header row and then a sequence of rows (`tr` elements) each of them containing the cells. Each cell has the same content as the paragraphs.

```
 <xs:element name="table">
    <xs:complexType>
      <xs:sequence>
        <xs:element name="header">
            <xs:complexType>
               <xs:sequence>
                   <xs:element name="td" maxOccurs="unbounded"
                        type="doc:paragraphType"/>
               </xs:sequence>
            </xs:complexType>
        </xs:element>
        <xs:element name="tr" maxOccurs="unbounded">
            <xs:complexType>
               <xs:sequence>
                   <xs:element name="td" type="doc:tdType"
                         maxOccurs="unbounded"/>
```

```
                </xs:sequence>
            </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
</xs:element>

<xs:complexType name="tdType">
    <xs:complexContent>
        <xs:extension base="doc:paragraphType">
            <xs:attribute name="row_span" type="xs:integer"/>
            <xs:attribute name="column_span" type="xs:integer"/>
        </xs:extension>
    </xs:complexContent>
</xs:complexType>
```

The `def` element is defined as a text only element in the imported schema `abs.xsd`:

```
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
    targetNamespace=
     "http://www.oxygenxml.com/sample/documentation/abstracts">
    <xs:element name="def" type="xs:string"/>
</xs:schema>
```

Now the XML data structure will be styled.

Schema Settings

In the bottom section of the **Document Type** configuration dialog box, there are a series of tabs. The first one refers to the schema that is used for validation of the documents that match the defined **Association Rules**.

Important: If the document references a schema using a `DOCTYPE` declaration or a `xsi:schemaLocation` attribute, the schema from the document type configuration will not be used when validating.

Schema Type

Select from the combo box the value **XML Schema**.

Schema URI

Enter the value of the schema location (for example, `${frameworks}/sdf/schema/sdf.xsd`). Use the **${frameworks}** editor variable in the schema URI path instead of a full path to be valid for multiple Oxygen XML Editor plugin installations.

Important: The **${frameworks}** variable is expanded at the time of validation into the absolute location of the directory containing the *framework*.

Second Step - CSS

If you read the Simple Customization Tutorial then you already have some basic notions about creating simple styles. The example document contains elements from various namespaces, so you need to use CSS Level 3 extensions (supported by the **Author** mode layout engine) to associate specific properties with that element.

Defining the General Layout

Now the basic layout of the rendered documents is created.

Elements that are stacked one on top of the other are: `book`, `article`, `section`, `title`, `figure`, `table`, `image`. These elements are marked as having `block` style for display. Elements that are placed one after the other in a flowing sequence are: `b`, `i`. These will have `inline` display.

```
/* Vertical flow */
book,
section,
para,
title,
image,
ref {
    display:block;
}

/* Horizontal flow */
b,i {
    display:inline;
}
```

Important: Having `block` display children in an `inline` display parent results in Oxygen XML Editor plugin changing the style of the parent to `block` display.

Styling the `section` Element

The title of any section must be bold and smaller than the title of the parent section. To create this effect, a sequence of CSS rules must be created. The `*` operator matches any element, it can be used to match titles having progressive depths in the document.

```
title{
    font-size: 2.4em;
    font-weight:bold;
}
* * title{
    font-size: 2.0em;
}
* * * title{
    font-size: 1.6em;
}
* * * * title{
    font-size: 1.2em;
}
```

It's useful to have before the title a constant text, indicating that it refers to a section. This text can include also the current section number. The `:before` and `:after` pseudo elements will be used, plus the CSS counters.

First declare a counter named `sect` for each book or `article`. The counter is set to zero at the beginning of each such element:

```
book,
article{
    counter-reset:sect;
}
```

The `sect` counter is incremented with each `section`, that is a direct child of a book or an `article` element.

```
book > section,
article > section{
    counter-increment:sect;
}
```

The "static" text that will prefix the section title is composed of the constant "Section ", followed by the decimal value of the `sect` counter and a dot.

```
book > section > title:before,
article > section > title:before{
    content: "Section " counter(sect) ". ";
}
```

To make the documents easy to read, you add a margin to the sections. In this way the higher nesting level, the larger the left side indent. The margin is expressed relatively to the parent bounds:

```
section{
    margin-left:1em;
    margin-top:1em;
}
```

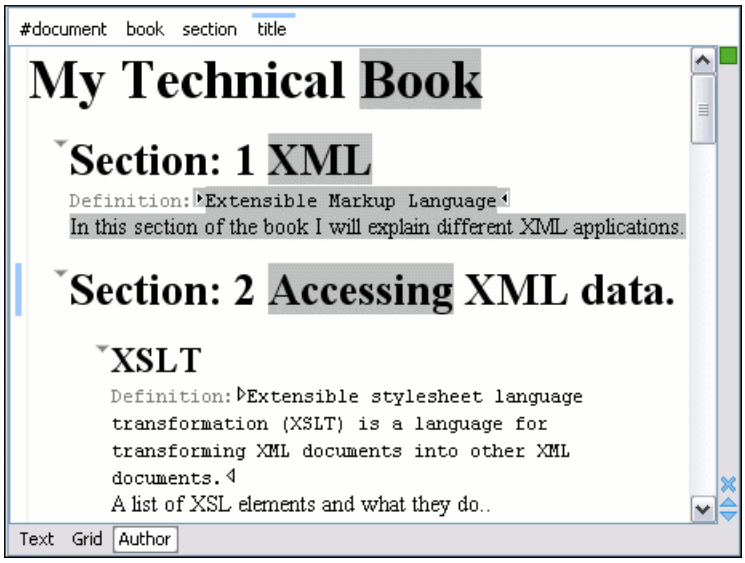

Figure 639: A sample of nested sections and their titles.

In the above screenshot you can see a sample XML document rendered by the CSS stylesheet. The selection "avoids" the text that is generated by the CSS "content" property. This happens because the CSS generated text is not present in the XML document and is just a visual aid.

Styling the Inline Elements

The "bold" style is obtained by using the `font-weight` CSS property with the value `bold`, while the "italic" style is specified by the `font-style` property:

```
b {
    font-weight:bold;
}

i {
    font-style:italic;
}
```

Styling Images

The CSS 2.1 does not specify how an element can be rendered as an image. To overpass this limitation, Oxygen XML Editor plugin supports a CSS Level 3 extension allowing to load image data from a URL. The URL of the image must be specified by one of the element attributes and it is resolved through the catalogs specified in Oxygen XML Editor plugin.

```
image{
    display:block;
    content: attr(href, url);
    margin-left:2em;
}
```

Our `image` element has the required attribute `href` of type `xs:anyURI`. The `href` attribute contains an image location so the rendered content is obtained by using the function:

```
attr(href, url)
```

The first argument is the name of the attribute pointing to the image file. The second argument of the `attr` function specifies the type of the content. If the type has the `url` value, then Oxygen XML Editor plugin identifies the content as being an image. If the type is missing, then the content will be the text representing the attribute value.

Oxygen XML Editor plugin handles both absolute and relative specified URLs. If the image has an *absolute* URL location (for example: "http://www.oasis-open.org/images/standards/oasis_standard.jpg") then it is loaded directly from this location. If the image URL is *relative* specified to the XML document (for example: "images/my_screenshot.jpg") then the location is obtained by adding this value to the location of the edited XML document.

An image can also be referenced by the name of a DTD entity that specifies the location of the image file. For example, if the document declares an entity **graphic** that points to a JPEG image file:

```
<!ENTITY graphic SYSTEM "depo/keyboard_shortcut.jpg" NDATA JPEG>
```

and the image is referenced in the XML document by specifying the name of the entity as the value of an attribute:

```
<mediaobject>
    <imageobject>
        <imagedata entityref="graphic" scale="50"/>
    </imageobject>
</mediaobject>
```

The CSS should use the functions `url`, `attr` and `unparsed-entity-uri` for displaying the image in the **Author** mode:

```
imagedata[entityref]{
    content: url(unparsed-entity-uri(attr(entityref)));
}
```

To take into account the value of the `width` attribute of the `imagedata` and use it for resizing the image, the CSS can define the following rule:

```
imagedata[width]{
  width:attr(width, length);
}
```

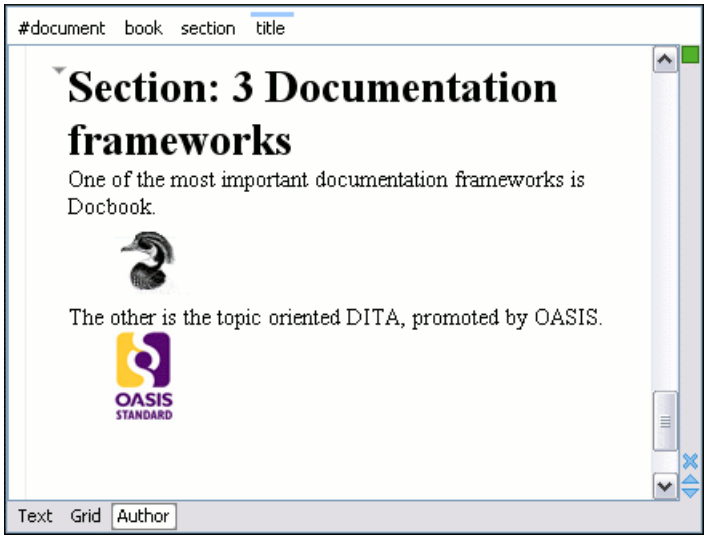

Figure 640: Samples of images in Author

Testing the Framework Customization

To test the new *framework* customization, create an XML instance that conforms with the association rules that you specified in your *framework* customization. You will not specify an XML Schema location directly in the document, using an `xsi:schemaLocation` attribute. Instead, Oxygen XML Editor plugin will detect its associated document type and use the specified schema.

```
<book xmlns="http://www.oxygenxml.com/sample/documentation"
      xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts">

    <title>My Technical Book</title>
    <section>
        <title>XML</title>
        <abs:def>Extensible Markup Language</abs:def>
        <para>In this section of the book I will
           explain different XML applications.</para>
    </section>
</book>
```

When trying to validate the document there should be no errors. Now modify the `title` to `title2`. Validate again. This time there should be as error.

```
Invalid content was found starting with element
'title2'. One of '{"http://www.oxygenxml.com/sample/documentation":title}'
is expected.
```

Undo the tag name change, go to **Author** mode, and Oxygen XML Editor plugin should load the CSS from the *document type association* and create a layout similar to this:

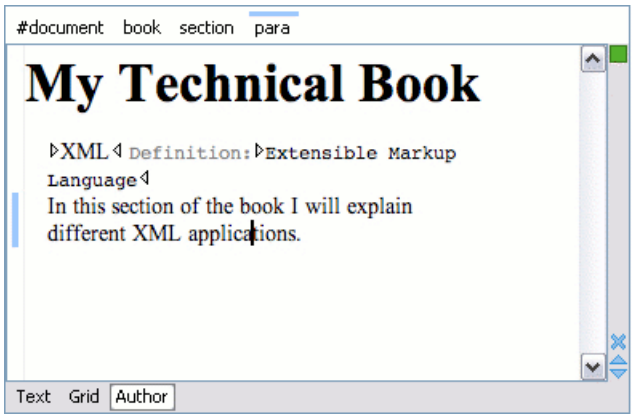

Figure 641: Example: Testing a Framework Customization

Organizing the Framework Files

First, create a new folder for your customized *framework* *[OXYGEN_INSTALL_DIR]*`/frameworks`. This folder will be used to store all files related to the documentation *framework*. The folder structure will look something like this:

```
oxygen
  frameworks
     sdf
       schema
       css
```

The `frameworks` directory is the container where all the Oxygen XML Editor plugin *framework* customizations are located. Each subdirectory contains files related to a specific type of XML documents (schemas, catalogs, stylesheets, CSS stylesheets, etc.) Distributing a *framework* means delivering a *framework* directory.

It is assumed that you have the right to create files and folders inside the Oxygen XML Editor plugin installation directory. If you do not have this right, you will have to install another copy of the program in a folder you have access to, the home directory for instance, or your desktop.

To test your *framework* distribution, copy it in the `frameworks` directory of the newly installed application and start Oxygen XML Editor plugin by running the provided start-up script files.

You should copy the created schema files `abs.xsd` and `sdf.xsd`, `sdf.xsd` being the master schema, to the `schema` directory and the CSS file `sdf.css` to the `css` directory.

Packaging and Deploying

Using a file explorer, go to the Oxygen XML Editor plugin *[OXYGEN_INSTALL_DIR]*`/frameworks` directory. Select the `sdf` directory and make an archive from it. Move it to another Oxygen XML Editor plugin installation (eventually on another computer). Extract it in the *[OXYGEN_INSTALL_DIR]*`/frameworks` directory. Start Oxygen XML Editor plugin and test the association as explained above.

When deploying your customized `sdf` directory, make sure that your `sdf` directory contains the `sdf.framework` file (that is the file defined as External Storage in the **Document Type Association** preferences page shall always be stored inside the `sdf` directory). If your external storage points somewhere else Oxygen XML Editor plugin will not be able to update the *Document Type Association* options automatically on the deployed computers.

Adding/Editing a Framework (Document Type)

To add or edit a *framework* (document type), open the **Preferences** dialog box and go to **Document Type Association**. From this **Document Type Association** preferences page you can use the **New**, **Edit**, **Duplicate**, or **Extend** buttons to open a **Document Type** configuration dialog box that allows you to customize a new or existing document type (*framework*).

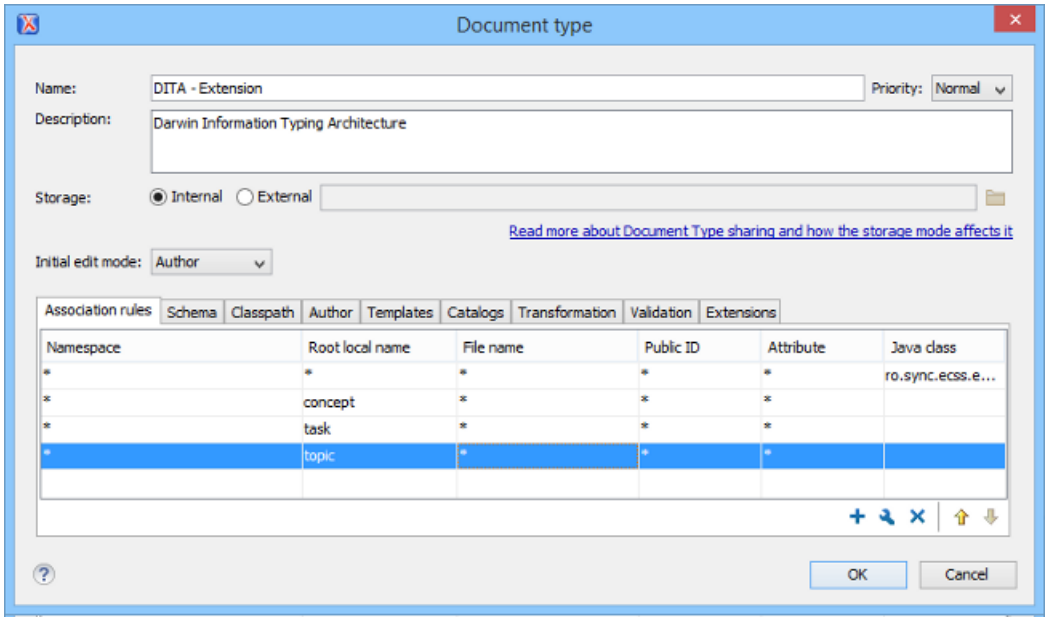

Figure 642: Document Type Configuration Dialog Box

You can specify the following properties for a document type:

- **Name** - The name of the document type.
- **Priority** - When multiple document types match the same document, the priority determines the order in which they are applied. It can be one of the following: Lowest, Low, Normal, High, Highest. The predefined document types that are already configured when the application is installed on the computer have the default Low priority.

  Note: *Frameworks* that have the same priority are sorted alphabetically.
- **Description** - The document type description displayed as a tool tip in the **Document Type Association** preferences page.
- **Storage** - The location where the document type is saved. If you select the **External** storage option, the document type is saved in the specified file with a mandatory `framework` extension, located in a subdirectory of the current `frameworks` directory. If you select the **Internal** storage option, the document type data is saved in the Oxygen XML Editor plugin internal options file.
- **Initial edit mode** - Allows you to select the initial editing mode for this document type: **Editor specific**, **Text**, **Author, Grid** and **Design** (available only for the W3C XML Schema editor). If the **Editor specific** option is selected, the initial editing mode is determined based upon the editor type. You can find the mapping between editors and edit modes in the **Edit modes** preferences page. You can impose an initial mode for opening files that match the association rules of the document type. For example, if the files are usually edited in the **Author** mode you can set it in the **Initial edit mode** combo box.

Note: You can also customize the initial mode for a document type in the **Edit modes** preferences page. Open the **Preferences** dialog box and go to **Editor** > **Edit modes**.

You can specify the **Association rules** used for determining a document type for an opened XML document. A rule can define one or more conditions. All conditions need to be fulfilled for a specific rule to be chosen. Conditions can specify:

- **Namespace** - The namespace of the document that matches the document type.
- **Root local name of document** - The local name of the document that matches the document type.
- **File name** - The file name (including the extension) of the document that matches the document type.

- **Public ID** (for DTDs) - The PUBLIC identifier of the document that matches the document type.
- **Attribute** - This field allows you to associate a document type depending on a certain value of the attribute in the root.
- **Java class** - Name of the Java class that is called to determine if the document type should be used for an XML document. Java class must either implement the *ro.sync.ecss.extensions.api.DocumentTypeCustomRuleMatcher* interface or extend the *ro.sync.ecss.extensions.api.DocumentTypeAdvancedCustomRuleMatcher* abstract class from the Author API.

In the **Schema** tab, you can specify the type and URI of schema used for validation and content completion of all documents from the document type, when there is no schema detected in the document.

You can choose one of the following schema types:

- DTD
- Relax NG schema (XML syntax)
- Relax NG schema (XML syntax) + Schematron
- Relax NG schema (compact syntax)
- XML Schema
- XML Schema + Schematron rules
- NVDL schema

Configuring and Managing Multiple CSS Styles on page 1315
Customizing the Main CSS of a Framework on page 1297

Configure Actions, Menus, and Toolbars for a Framework

You can configure actions, menus, and toolbars that are specific to a *framework* (document type) in the **Author** mode to gain a productive editing experience, by using the **Document Type** configuration dialog box.

To add or configure actions, menus, or toolbars follow this procedure:

1. Open the **Preferences** dialog box , go to **Document Types Association**, and select the *framework* for which you want to create an action.
2. Click **Edit** and in the **Document Type** configuration dialog box go to the **Author** tab, then go to **Actions**.
3. Click the **New** button and use the **Action** dialog box to create an action.

Configure the Insert Section Action for a Framework

This topic describes the procedure for defining the **Insert Section** action for a custom *framework*. It is assumed that the icon files, (`Section16.gif`) for the menu item and (`Section20.gif`) for the toolbar, are already available. Although you could use the same icon size for both the menu and toolbar, usually the icons from the toolbars are larger than the ones found in the menus. These files should be placed in your custom *framework* directory (*[OXYGEN_INSTALL_DIR]*`\frameworks\[CUSTOM_FRAMEWORK_DIR]`).

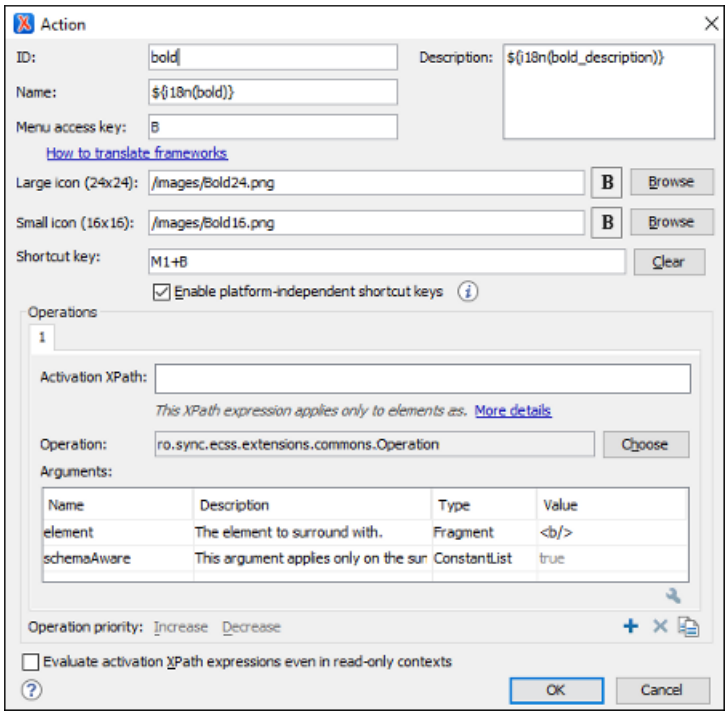

Figure 643: Action Dialog Box

1. Set the **ID** field to **insert_section**. This is a unique action identifier.
2. Set the **Name** field to **Insert Section**. This will be the action's name, displayed as a tooltip when the action is placed in the toolbar, or as the menu item name.
3. Set the **Menu access key** to **i**. On Windows, the menu items can be accessed using **Alt+letter** keys combination, when the menu is visible. The *letter* is visually represented by underlining the first letter from the menu item name having the same value.
4. Add a **Description**.
5. Set the **Large icon (20x20)** field to `${frameworks}/sdf/Section20.gif`. A good practice is to store the image files inside the *framework* directory and use editor variable **${framework}** to make the image relative to the *framework* location.

   If the images are bundled in a *JAR* archive together with some Java operations implementation, for instance, it might be convenient for you to reference the images not by the file name, but by their relative path location in the class-path.

   If the image file `Section20.gif` is located in the **images** directory inside the *JAR* archive, you can reference it by using **/images/Section20.gif**. The *JAR* file must be added into the **Classpath** list.
6. Set the **Small icon (16x16)** field to `${frameworks}/sdf/Section16.gif`.
7. Click the text field next to **Shortcut key** and set it to **Ctrl+Shift+S (Meta+Shift+S on Mac OS)**. This will be the key combination to trigger the action using the keyboard only.

   The shortcut is enabled only by adding the action to the main menu of **Author** mode, which contains all the actions that the author will have in a menu for the current document type.
8. At this time the action has no functionality added to it. Next you must define how this action operates. An action can have multiple operation modes. The first action mode enabled by the evaluation of its associated XPath expression will be executed when the action is triggered by the user. The Xpath expression needs to be version 2.0 and its scope must be only element and attribute nodes of the edited document. Otherwise, the expression will not return a match and will not trigger the action. If the expression is left empty, the action will be enabled anywhere in the scope of the root element. For this example we'll suppose you want allow the action to add a section only if the current element is either a `book`, `article` or another `section`.

   a) Set the XPath expression field to:

```
local-name()='section' or local-name()='book' or
 local-name()='article'
```

b) Set the **invoke operation** field to *InsertFragmentOperation* built-in operation, designed to insert an XML fragment at cursor position. This belongs to a set of built-in operations, a complete list of which can be found in the Author Default Operations section. This set can be expanded with your own Java operation implementations.
c) Configure the arguments section as follows:

```
<section xmlns=
"http://www.oxygenxml.com/sample/documentation">
     <title/>
</section>
```

`insertLocation` - leave it empty. This means the location will be at the cursor position.

`insertPosition` - select "**Inside**".

Configure the Insert Table Action for a Framework

This topic describes the procedure for defining the **Insert Table** action for a custom *framework*. Suppose that you want to create an action that inserts a table with three rows and three columns into a document and the first row is the table header. As with the insert section action, you will use the *InsertFragmentOperation* built-in operation.

Place the icon files for the menu item, and for the toolbar, in your custom *framework* directory (*[OXYGEN_INSTALL_DIR]*`\frameworks\[CUSTOM_FRAMEWORK_DIR]`).

1. Set **ID** field to **insert_table**.
2. Set **Name** field to **Insert table**.
3. Set **Menu access key** field to **t**.
4. Set **Description** field to **Adds a table element**.
5. Set **Toolbar icon** to **${framework} / toolbarIcon.png**.
6. Set **Menu icon** to **${framework} / menuIcon.png**.
7. Set **Shortcut key** to **Ctrl + Shift + T (Command + Shift + T on OS X)**.
8. Set up the action's functionality:
   a) Set **XPath expression** field to `true()`.
   `true()` is equivalent with leaving this field empty.
   b) Set **Invoke operation** to use **InsertFragmentOperation** built-in operation that inserts an XML fragment to the cursor position.
   c) Configure operation's arguments as follows:

   fragment - set it to:

   ```
   <table xmlns=
   "http://www.oxygenxml.com/sample/documentation">
     <header><td/><td/><td/></header>
     <tr><td/><td/><td/></tr>
     <tr><td/><td/><td/></tr>
   </table>
   ```

   `insertLocation` - to add tables at the end of the section use the following code:

   ```
   ancestor::section/*[last()]
   ```

   `insertPosition` - Select **After**.

Configure the Main Menu for a Framework

Defined actions can be grouped into customized menus in the Oxygen XML Editor plugin menu bar.

1. Open the **Document Type** configuration dialog box, select your custom *framework*, and go to the **Author** tab.
2. Go to the **Menu** subtab. In the left side you have the list of actions and some special entries:
   - **Submenu** - Creates a submenu. You can nest an unlimited number of menus.
   - **Separator** - Creates a separator into a menu. This way you can logically separate the menu entries.
3. The right side of the panel displays the current actions for that menu tree. To change its name, click this label to select it, then press the **Edit** button.

4. Select the **Submenu** label in the left panel section and the appropriate label in the right panel section, then press the **Add as child** button. Change the submenu name to **Table**, using the **Edit** button.
5. Select the **Insert section** action in the left panel section and the **Table** label in the right panel section, then press the **Add as sibling** button.
6. Now select the **Insert table** action in the left panel section and the **Table** in the right panel section. Press the **Add as child** button.

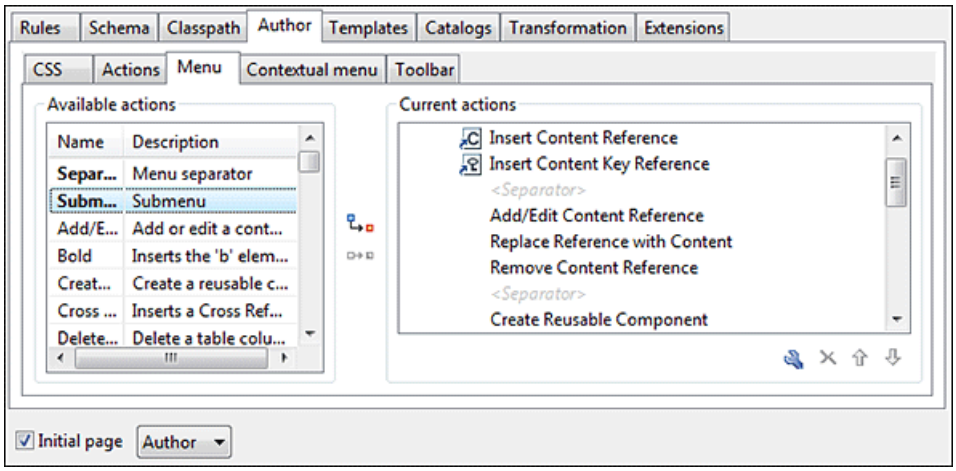

Figure 644: Configuring the Menu

When opening a test document for a custom *framework* in **Author** mode, the menu you created is displayed in the editor menu bar, between the **Tools** and the **Document** menus. The upper part of the menu contains generic **Author** mode actions (common to all document types) and the two actions created previously (with **Insert table** under the **Table** submenu).

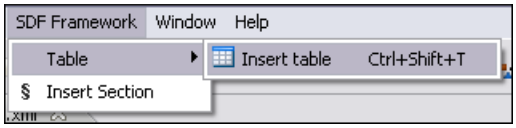

Figure 645: Author Mode Menu

Configure the Contextual Menu for a Framework

The contextual menu is displayed when you right-click in the **Author** editing area. You can only configure the bottom part of the menu, since the top part is reserved for a list of generic actions (such as Copy, Paste, Undo, etc.)

1. Open the **Document Type** configuration dialog box for the particular *framework* and go to the **Author** tab. Next, go to the **Contextual Menu** subtab.
2. Follow the same steps as explained in the Configuring the Main Menu, except changing the menu name because the contextual menu does not have a name.

   Note: You can choose to reuse a submenu that contains general authoring actions. In this case, all actions (both general and *framework*-specific ones) are grouped together under the same submenu.

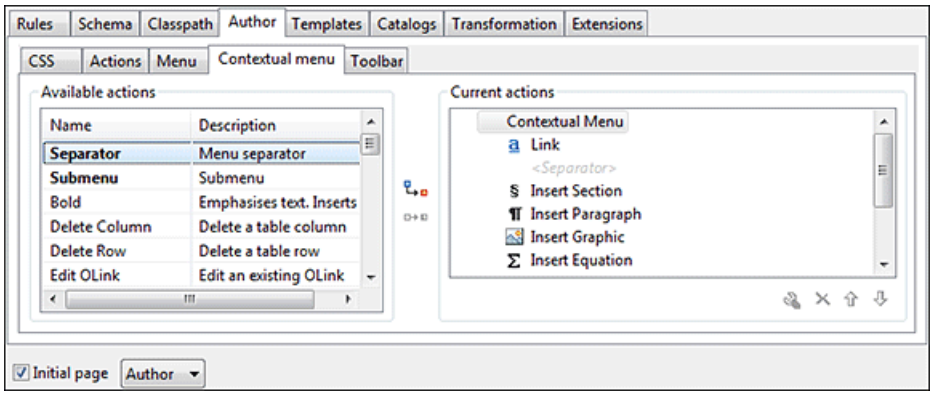

Figure 646: Configuring the Contextual Menu

To test it, open the test file, and open the contextual menu. In the lower part there is shown the **Table** sub-menu and the **Insert section** action.

Configure the Toolbars for a Framework

The procedure below describes how to add defined actions to a toolbar for a custom *framework*. These steps use examples from the two previous help topics that described how to define the **Insert Section** and **Insert Table** actions. You can also configure additional toolbars to add other custom actions.

1. Open the **Document Type** configuration dialog box for your custom *framework* and select the **Author** tab. Next, go to the **Toolbar** subtab.

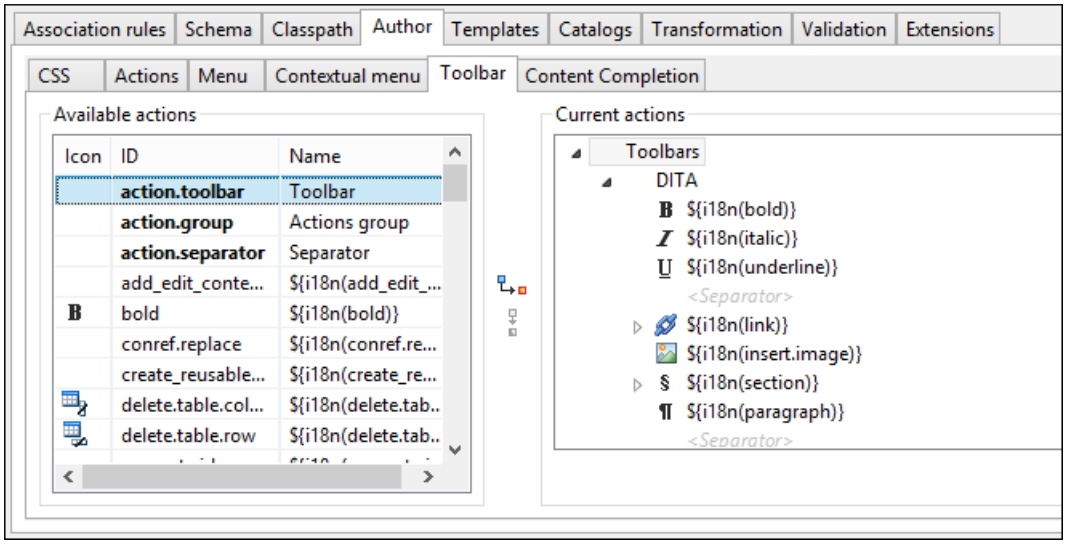

Figure 647: Configuring the Toolbar

The panel is divided in two sections: the left side contains a list of actions, while the right one contains an action tree, displaying the list of actions added in the toolbar. The special entry called *Separator* allows you to visually separate the actions in the toolbar.

2. Select the **Insert section** action in the left panel section and the **Toolbar** label in the right panel section, then press the **Add as child** button.
3. Select the **Insert table** action in the left panel section and the **Insert section** in the right panel section. Press the **Add as sibling** button.
   When opening a document of the particular *framework* in **Author** mode, the toolbar with the new buttons will be displayed in the toolbar area.

   Tip: If you have many custom toolbar actions, or want to group actions according to their category, add more toolbars with custom names and split the actions to better suit your purpose. If your toolbar is not displayed

when switching to the **Author** mode, right-click the main toolbar, select **Configure Toolbars**, and make sure the appropriate toolbar (such as the **Author Custom Actions** toolbar) is selected.

Configure Content Completion for a Framework

You can customize the content of the following **Author** controls, adding items (which, when invoked, perform custom actions) or filtering the default contributed ones:

- *Content Completion Assistant* window
- **Elements** view
- **Insert Element** menus (from the **Outline** view or breadcrumb contextual menus)

You can use the content completion customization support in a custom *framework* by following this procedure:

1. Open the **Document type** configuration dialog box for your custom *framework* and select the **Author** tab. Next, go to the **Content Completion** tab.

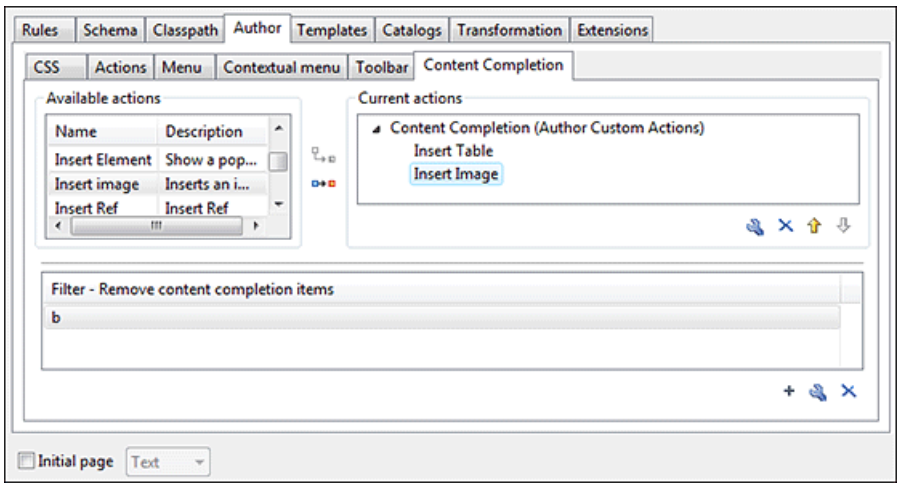

Figure 648: Customize Content Completion

The top side of the **Content Completion** section contains the list with all the actions defined within the custom *framework* and the list of actions that you decided to include in the *Content Completion Assistant* list of proposals. The bottom side contains the list with all the items that you decided to remove from the *Content Completion Assistant* list of proposals.

2. If you want to add a custom action to the list of current **Content Completion** proposals, select the action item from the **Available actions** list and press the **Add as child** or **Add as sibling** button to include it in the **Current actions** list. An **Insert Action** dialog box appears, giving you the possibility to select where to provide the selected action.

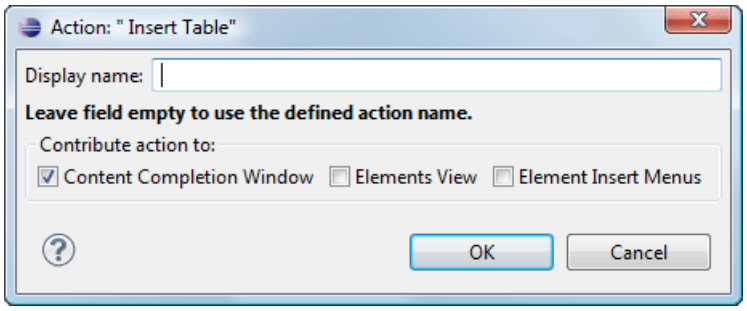

Figure 649: Insert Action Dialog Box

3. If you want to exclude a certain item from the **Content Completion** proposals, you can use the **Add** button from the **Filter - Remove content completion items** list. The **Remove item** dialog box is displayed, allowing you to input the item name and to choose the controls that filter it. The **Item name** combo box accepts wildcards.

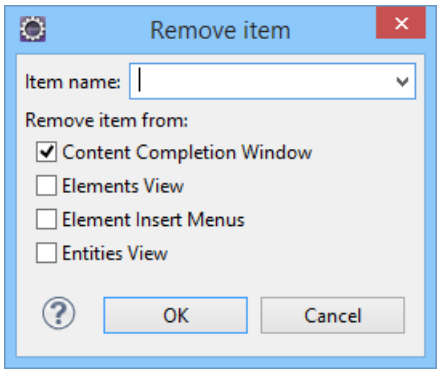

Figure 650: Remove Item Dialog Box

Author Mode Default Operations

The default operations for the **Author** mode, along with their arguments are as follows:

- **ChangeAttributeOperation**

  This operation allows you to add/modify/remove an attribute. You can use this operation in your own custom **Author** mode action to modify the value for a certain attribute on a specific XML element. The arguments of the operation are:

  - **name** - The attribute local name.
  - **namespace** - The attribute namespace.
  - **elementLocation** - The XPath location that identifies the element.
  - **value** - The new value for the attribute. If empty or null the attribute will be removed.
  - **editAttribute** - If an in-place editor exists for this attribute, it will automatically activate the in-place editor and start editing.
  - **removeIfEmpty** - The possible values are `true` and `false`. True means that the attribute should be removed if an empty value is provided. The default behavior is to remove it.
- **ChangePseudoClassesOperation**

  Operation that sets a list of pseudo-class values to nodes identified by an XPath expression. It can also remove a list of values from nodes identified by an XPath expression. The operation accepts the following parameters:

  - **setLocations** - An XPath expression indicating a list of nodes for which the specified list of pseudo-classes will be set. If it is not defined, then the element at the cursor position will be used.
  - **setPseudoClassNames** - A space-separated list of pseudo-class names that will be set on the matched nodes.
  - **removeLocations** - An XPath expression indicating a list of nodes from which the specified list of pseudo-classes will be removed. If it is not defined, then the element at the cursor position will be used.
  - **removePseudoClassNames** - A space-separated list of pseudo-class names that will be removed from the matched nodes.
  - **includeAllNodes** - The possible values are `yes` and no. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.
- **DeleteElementOperation**

  Deletes the node indicated by the `elementLocation` parameter XPath expression. If missing, the operation will delete the node at the cursor location.
- **DeleteElementsOperation**

  Deletes the nodes indicated by the `elementLocations` parameter XPath expression. If missing, the operation will delete the node at the cursor location.
- **ExecuteCommandLineOperation**

  This operation allows you to start a process executing a given command line. It has the following arguments:

  - **name** - The name of the operation (or name of the console panel that corresponds to the process run by an action built over this operation).

- **workingDirectory** - The path to the directory where the command line is executed. The default value is `"."` (current directory).
- **cmdLine** - The command line to be executed (accepts editor variables).
- **showConsole** - If set to `true`, the console panel will be displayed in Oxygen XML Editor plugin. The default value is `false`.

- **ExecuteMultipleActionsOperation**

  This operation allows the execution of a sequence of actions, defined as a list of action IDs. The actions must be defined by the corresponding *framework*, or one of the common actions for all *frameworks* supplied by Oxygen XML Editor plugin.

  - **actionIDs** - The action IDs list that will be executed in sequence, the list must be a string sequence containing the IDs separated by commas or new lines.
- **ExecuteMultipleWebappCompatibleActionsOperation**

  An implementation of an operation that runs a sequence of Oxygen XML Web Author-compatible actions, defined as a list of IDs.
- **ExecuteTransformationScenariosOperation**

  This operation allows running one or more transformation scenarios defined in the current *document type association*. It is useful to add to the toolbar buttons that trigger publishing to various output formats. The argument of the operation is:

  - **scenarioNames** - The list of scenario names that will be executed, separated by new lines.
- **InsertEquationOperation**

  Inserts a fragment containing a MathML equation at the cursor offset. The argument of this operation is:

  - **fragment** - The XML fragment containing the MathML content that should be inserted.
- **InsertFragmentOperation**

  Inserts an XML fragment at the current cursor position. The selection, if there is one, remains unchanged. The fragment will be inserted in the current context of the cursor position meaning that if the current XML document uses some namespace declarations then the inserted fragment must use the same declarations. The namespace declarations of the inserted fragment will be adapted to the existing namespace declarations of the XML document. For more details about its list of parameters, see Arguments of InsertFragmentOperation Operation on page 1254.
- **InsertOrReplaceFragmentOperation**

  Similar to **InsertFragmentOperation**, except it removes the selected content before inserting the fragment. Also, the **insertPosition** parameter has another possible value: **Replace**. If this value is used, the operation deletes the node selected by the XPath expression denoted by the **insertLocation** parameter. For more details about its list of parameters, see Arguments of InsertFragmentOperation Operation on page 1254.
- **InsertOrReplaceTextOperation**

  Inserts a text at current position removing the selected content, if any. The argument of this operation is:

  - **text** - The text section to insert.
- **InsertXIncludeOperation**

  Insert an `XInclude` element at the cursor offset. Opens a dialog box that allows you to browse and select content to be included in your document and automatically generates the corresponding XInclude instruction.
- **JSOperation**

  Allows you to call the Java API from custom JavaScript content. For some sample **JSOperation** implementations, see https://github.com/oxygenxml/javascript-sample-operations.

  Notice: For the Oxygen XML Web Author, this operation cannot be invoked using the JavaScript API.

  This operation accepts the following parameter:

  - **script**

The JavaScript content to execute. It must have a function called `doOperation()`, which can use the predefined `authorAccess` variable. The `authorAccess` variable has access to the entire *ro.sync.ecss.extensions.api.AuthorAccess* Java API.

The following example is a script that retrieves the current value of the **type** attribute on the current element, allows the end user to edit its new value and sets the new value in the document:

```
function doOperation(){
 //The current node is either entirely selected...
 currentNode = authorAccess.getEditorAccess().getFullySelectedNode();
 if(currentNode == null){
 //or the cursor is placed in it
 caretOffset = authorAccess.getEditorAccess().getCaretOffset();
 currentNode = authorAccess.getDocumentController().getNodeAtOffset
                          (caretOffset);
 }
 //Get current value of the @type attribute
  currentTypeValue = "";
  currentTypeValueAttr = currentNode.getAttribute("type");
  if(currentTypeValueAttr != null){
    currentTypeValue = currentTypeValueAttr.getValue();
  }
 //Ask user for new value for attribute.
 newTypeValue = javax.swing.JOptionPane.showInputDialog
                         ("Input @type value", currentTypeValue);
 if(newTypeValue != null){
   //Create and set the new attribute value for the @type attribute.
   attrValue = new Packages.ro.sync.ecss.extensions.api.node.AttrValue
                         (newTypeValue);
   authorAccess.getDocumentController().setAttribute
                         ("type", attrValue, currentNode);
 }
}
```

Tip: You can call functions defined inside a script called `commons.js` from your custom script content so that you can use that external script file as a library of functions. Note that this `commons.js` file must be placed in the root of the *framework* directory (for example, *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/commons.js`) because that is the only location where Oxygen XML Editor plugin will look for it.

- **MoveCaretOperation**

  Flexible operation for moving the cursor within a document and it is also capable of performing a selection. The operation accepts the following arguments:

  - **xpathLocation** - An XPath expression that identifies the node relative to where the cursor will be moved. If the expression identifies more than one node, only the first one will be taken into account.
  - **position** - The position relative to the node obtained from the XPath expression where the cursor will be moved. When also choosing to perform a selection, you can use the following possible values:
    - `Before` - Places the cursor at the beginning of the selection.
    - `Inside, at the beginning` - Places the cursor at the beginning of the selection.
    - `After` - Places the cursor at the end of the selection.
    - `Inside, at the end` - Places the cursor at the end of the selection.
  - **selection** - Specifies if the operation should select the element obtained from the XPath expression, its content, or nothing at all. The possible values of the argument are: `None`, `Element`, and `Content`.
- **MoveElementOperation**

  Flexible operation for moving an XML element to another location from the same document. XPath expressions are used to identify the source element and the target location. The operation takes the following parameters:

  - **sourceLocation** - XPath expression that identifies the content to be moved.
  - **deleteLocation** - XPath expression that identifies the node to be removed. This parameter is optional. If missing, the **sourceLocation** parameter will also identify the node to be deleted.
  - **surroundFragment** - A string representation of an XML fragment. The moved node will be wrapped in this string before moving it in the destination.
  - **targetLocation** - XPath expression that identifies the location where the node must be moved to.
  - **insertPosition** - Argument that indicates the insert position.
  - **moveOnlySourceContentNodes** - When `true`, only the content of the source element is moved.

- **processTrackedChangesForXpathLocations** - When nodes are located via an XPath expression and the nodes are deleted with *Change Tracking* enabled, they are considered as being present by default (thus, the *change tracking* is ignored). If you set this argument to `true` and *change tracking* is enabled, deleted nodes will be ignored when the XPath locations are computed (thus, the *change tracking* is NOT ignored).

- **OpenInSystemAppOperation**

  Opens a resource in the system application that is associated with the resource in the operating system. The arguments of this operation is:

  - **resourcePath** - An XPath expression that, when executed, returns the path of the resource to be opened. Editor variables are expanded in the value of this parameter, before the expression is executed.
  - **isUnparsedEntity** - Possible values are `true` or `false`. If the value is `true`, the value of the **resourcePath** argument is treated as the name of an unparsed entity.

- **RemovePseudoClassOperation**

  An operation that removes a pseudo-class from an element. Accepts the following parameters:

  - **name** - Name of the pseudo-class to be removed.
  - **includeAllNodes** - The possible values are `yes` and `no`. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to `no`, they are ignored.
  - **elementLocation** - The XPath location that identifies the element. Leave it empty for the current element. It can also identify multiple elements, in which case the pseudo class will be removed from all of them.

    Example:

    Suppose that there is a pseudo-class called `myClass` on the element `paragraph` and there are CSS styles matching the pseudo-class.

    ```
    paragraph:myClass{
      font-size:2em;
      color:red;
    }
    paragraph{
      color:blue;
    }
    ```

    In the previous example, by removing the pseudo-class, the layout of the `paragraph` is rebuilt by matching the other rules (in this case, the foreground color of the `paragraph` element will become blue.

- **RenameElementOperation**

  This operation allows you to rename all occurrences of the elements identified by an XPath expression. The operation requires two parameters:

  - **elementName** - The new element name
  - **elementLocation** - The XPath expression that identifies the element occurrences to be renamed. If this parameter is missing, the operation renames the element at current cursor position.

- **SetPseudoClassOperation**

  An operation that sets a pseudo-class to an element. The operation accepts the following parameters:

  - **elementLocation** - An XPath expression indicating the element for which the pseudo-class will be set. If it is not defined, then the element at cursor position will be used.
  - **name** - The pseudo-class local name.
  - **includeAllNodes** - The possible values are `yes` and `no`. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to `no`, they are ignored.

- **ShowElementDocumentationOperation**

  Opens the associated specification HTML page for the current element. The operation accepts as parameter a URL pattern that points to the HTML page containing the documentation.

- **SurroundWithFragmentOperation**

  Surrounds the selected content with a text fragment. Since the fragment can have multiple nodes, the surrounded content will be always placed in the first leaf element. If there is no selection, the operation will simply insert the fragment at the cursor position. For more details about the list of parameters go to Arguments of SurroundWithFragmentOperation on page 1256.

- **SurroundWithTextOperation**

  This operation has two arguments (two text values) that will be inserted before and after the selected content. If there is no selected content, the two sections will be inserted at the cursor position. The arguments of the operation are:

  - **header** - The text that is placed before the selection.
  - **footer** - The text that is placed after the selection.
- **TogglePseudoClassOperation**

  An implementation of an operation to toggle on/off the pseudo-class of an element. Accepts the following parameters:

  - **name** - Name of the pseudo-class to be toggled on/off.
  - **includeAllNodes** - The possible values are `yes` and no. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to no, they are ignored.
  - **elementLocation** - The XPath location that identifies one or more elements for which the pseudo class will be toggled. Leave it empty for the current element.

    Example:

    ```
    paragraph:myClass{
      color:red;
    }
    paragraph{
      color:blue;
    }
    ```

    By default, the paragraph content is rendered in blue. Suppose that we have a `TogglePseudoClassOperation` configured for the `myClass` pseudo-class. Invoking it the first time will set the `myClass` pseudo-class and the paragraph will be rendered in red. Invoking the operation again, will remove the pseudo-class and the visible result will be a blue rendered `paragraph` element.
- **ToggleSurroundWithElementOperation**

  This operation allows wrapping and unwrapping content in a specific wrapper element that can have certain attributes specified on it. It is useful to implement toggle actions such as highlighting text as bold, italic, or underline. The operation supports processing multiple selection intervals, such as multiple cells within a table column selection. The arguments of the operation are:

  - **element** - The element to wrap or unwrap content.
  - **schemaAware** - This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a *paragraph* element with a *bold* element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.
- **UnwrapTagsOperation**

  This operation allows removing the element tags either from the current element or for an element identified with an XPath location. The argument of the operation is

  - **unwrapElementLocation** - An XPath expression indicating the element to unwrap. If it is not defined, the element at the cursor position is unwrapped.
- **XQueryUpdateOperation**

  Allows you to execute an XQuery Update script directly over content in **Author** mode.

  Notice: This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author.

  It supports the following arguments:

  - **script** - The XQuery Update script to be executed. The value can either be an XQuery script or a URL that points to the XQuery Update script. You can use the *${framework}* or *${frameworkDir}* editor variables to refer the scripts from the *framework* directory.

The script will be executed in the context of the node at the cursor position. If the script declares the following variable, it will also receive the selected nodes (assuming that entire nodes are selected):

```
declare variable $oxyxq:selection external;
```

In the example below, you can see how this argument is used.

- **externalParams** - A string that can assign multiple key-value pairs separated by a comma or a new line character.

  For example, if an XQuery script declares two external parameters like this:

  ```
  declare variable $param1 external;
  declare variable $param2 external;
  ```

  You can pass custom values for each parameter by setting the **externalParams** to `param1=value1,param2=value2`.
- **expandXincludeReferences** - Makes all *Xinclude* elements transparent to the XQuery transformer. When the *Xinclude* references are transparent, the **XQueryUpdateOperation** can use the referenced elements for further processing in the current document, but it cannot change their values in the original document. The default value is `false`, which means the *Xinclude* elements are not transparent.

An example of an XQuery Update Script that converts paragraphs to list items:

```
declare namespace oxyxq = "http://www.oxygenxml.com/ns/xqu";
(: This variable will be linked to the selected nodes assuming that there are
actually fully selected nodes. For example this selection will return null:
<p>{SEL_START}text{SEL_END} in para</p>
but this will give two "p" elements:
{SEL_END}<p>text</p><p>text2</p>{SEL_END}

If a multiple selection exists it will also be processed and forwarded.
 Again, only fully selected nodes will be passed.
:)
declare variable $oxyxq:selection external;

(: We will process either the selection or the context node :)
let $toProcess := if (empty($oxyxq:selection)) then
    (.)
else
    ($oxyxq:selection)

returnif (not(empty($toProcess))) then
        (
        (: Create the list :)
        let $ul :=
        <ul>
            {
                for $sel in $toProcess
                return
                    <li>{$sel}</li>
            }
        </ul>

        return
            (
            (: Delete the processed nodes :)
            for $sel in $toProcess
            return
                delete node $sel,
            (: Inserts the constructed list :)
            insert node $ul
                before $toProcess[1]
            )
        )
    else
        ()
```

- **XSLTOperation** and **XQueryOperation**

  Applies an XSLT or XQuery script on a source element and then replaces or inserts the result in a specified target element.

  Notice: For the Oxygen XML Web Author, these operations cannot be invoked using the JavaScript API.

  These operations accept the following parameters:

  - **sourceLocation**

An XPath expression indicating the element that the script will be applied on. If it is not defined, then the element at the cursor position will be used.

There may be situations in which you want to look at an ancestor of the current element and take decisions in the script based on this. To do this, you can set the **sourceLocation** to point to an ancestor node then declare a parameter called **currentElementLocation** in your script and use it to re-position in the current element, as in the following example:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0"
  xpath-default-namespace="http://docbook.org/ns/docbook"
  xmlns:saxon="http://saxon.sf.net/" exclude-result-prefixes="saxon">
    <!-- This is an XPath location to be sent by the operation to the script -->
    <xsl:param name="currentElementLocation"/>

    <xsl:template match="/">
        <!-- Evaluate the XPath of the current element location -->
        <xsl:apply-templates
        select="saxon:eval(saxon:expression($currentElementLocation))"/>
    </xsl:template>

    <xsl:template match="para">
        <!-- And the context is again inside the current element,
        but we can use information from the entire XML -->
        <xsl:variable
            name="keyImage" select="//imagedata[@fileref='images/lake.jpeg']
              /ancestor::inlinemediaobject/@xml:id/string()"/>
                <xref linkend="{$keyImage}" role="key_include"
                  xmlns="http://docbook.org/ns/docbook">
                    <xsl:value-of
                          select="$currentElementLocation"></xsl:value-of>
        </xref>
    </xsl:template>
</xsl:stylesheet>
```

- **targetLocation**

  An XPath expression indicating the insert location for the result of the transformation. If it is not defined then the insert location will be at the cursor location.
- **script**

  The script content (XSLT or XQuery). The base system ID for this will be the *framework* file, so any include/import reference will be resolved relative to the `.framework` file that contains this action definition.

  For example, for the following script, the imported `xslt_operation.xsl` needs to be located in the current *framework* directory.

  ```
  <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                  version="1.0">
      <xsl:import href="xslt_operation.xsl"/>
  </xsl:stylesheet>
  ```

  You can also use a path for an included or imported reference. When using a path, the following apply:

  - A relative path is resolved to the *framework* directory.
  - The *${framework}* editor variable can also be used to reference resources from the *framework* directory.
  - The path is passed through the catalog mappings. It helps to use an absolute URL (for instance, `http://www.oxygenxml.com/fr/testy.xsl`) and map it in the `catalog.xml` file from the *framework* directory to a resource from the *framework*.
- **action**

  The insert action relative to the node determined by the target XPath expression. It can be: Replace, At cursor position, Before, After, Inside as first child or Inside as last child.
- **caretPosition**

  The position of the cursor after the action is executed. It can be: `Preserve`, `Before`, `Start`, `First editable position`, `End`, or `After`. If this parameter is not set, you can still indicate the position of the cursor by using the *${caret}* editor variable in the inserted content.
- **expandEditorVariables**

  Parameter controlling the expansion of editor variables returned by the script processing. Expansion is enabled by default.
- **suspendTrackChanges**

It has 2 possible values (`true` and `false`). The default value is `false`. When set to `true`, the *Track Changes* feature is deactivated. When using this argument, after the action is finished, the state of the *Track Changes* feature is restored to its initial value.

- **externalParams** - A string that can assign multiple key-value pairs separated by a comma or a new line character.

  For example, if an XQuery script declares two external parameters like this:

  ```
  declare variable $param1 external;
  declare variable $param2 external;
  ```

  You can pass custom values for each parameter by setting the **externalParams** to `param1=value1,param2=value2`.

XSLTOperation Example: Sort a list with respect to the language declared on the root element-

Suppose we want an action that will sort a list with respect to the language declared on the root element and we have an XML file like this:

```
<article xml:lang="en">
  <ul>
     <li>B</li>
     <li>C</li>
     <li>A</li>
  </ul>
</article>
```

The **XSLTOperation** needs to be configured as follows:

- **sourceLocation** is set to /* so that the script has access to the root element and its children.
- **targetLocation** is left untouched (assuming that the action is active only when the cursor is inside the list).

The XSLT script would look like this:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:saxon="http://saxon.sf.net/"
  xmlns:lds="http://www.lds.org/schema/lds-meta/v1"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs saxon" version="2.0">

  <xsl:param name="currentElementLocation"/>

  <xsl:template match="/">
      <!--
          sourceLocation parameter was set to /* to have a larger context.
          We can pinpoint the element that contained the caret
          using $currentElementLocation
      -->
     <xsl:apply-templates select="saxon:eval(saxon:expression($currentElementLocation))"/>
  </xsl:template>

  <xsl:template match="ul">

    <!-- Because the sourceLocation parameter was set to /* we now have access to
         the root element and its attributes. -->
    <xsl:variable name="lang" select="/*/@xml:lang"/>
    <xsl:variable name="collationURI">
      <xsl:value-of select="concat('http://www.w3.org/2013/collation/UCA?lang=', $lang)"/>
    </xsl:variable>

      <xsl:copy>
          <xsl:copy-of select="@*"/>

          <!-- Copy the list items, but sorted. -->
          <xsl:apply-templates select="li">
              <xsl:sort collation="{$collationURI}" select="text()"/>
          </xsl:apply-templates>
      </xsl:copy>
  </xsl:template>

  <!-- This copy template will handle the contents of the list items. -->
  <xsl:template match="@* | node()">
      <xsl:copy>
          <xsl:apply-templates select="@* | node()"/>
      </xsl:copy>
  </xsl:template>
</xsl:stylesheet>
```

Editor Variables in Author Mode Operations

Author mode operations can include parameters that contain the following editor variables:

- **${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a **selection** *plugin*.

Note: The **${caret}** editor variable is available only for parameters that take XML content as values. It is replaced with the **${UNIQUE_CARET_MARKER_FOR_AUTHOR}** macro. The default Author operations process this macro and position the cursor at the designated offset.

- **${selection}** - The current selected text content in the current edited document. This variable can be used in a code template, in **Author** mode operations, or in a **selection** *plugin*.
- **${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value')}** - To prompt for values at runtime, use the *ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default-value")* editor variable. You can set the following parameters:
  - **'message'** - The displayed message. Note the quotes that enclose the message.
  - **'default-value'** - Optional parameter. Provides a default value.
  - **type** - Optional parameter, with one of the following values:

    Note: The title of the dialog box will be determined by the type of parameter and as follows:

    - For *url* and *relative_url* parameters, the title will be the name of the parameter and the value of the *'message'*.
    - For the other parameters listed below, the title will be the name of that respective parameter.
    - If no parameter is used, the title will be "Input".

Parameter	
url	**Format:** *${ask('message', url, 'default_value')}*
	Description: Input is considered a URL. Oxygen XML Editor plugin checks that the provided URL is valid.
	Example: • *${ask('Input URL', url)}* - The displayed dialog box has the name *Input URL*. The expected input type is URL. • *${ask('Input URL', url, 'http://www.example.com')}* - The displayed dialog box has the name *Input URL*. The expected input type is URL. The input field displays the default value *http://www.example.com*.
password	**Format**: *${ask('message', password, 'default')}*
	Description: The input is hidden with bullet characters.
	Example: • *${ask('Input password', password)}* - The displayed dialog box has the name *'Input password'* and the input is hidden with bullet symbols. • *${ask('Input password', password, 'abcd')}* - The displayed dialog box has the name *'Input password'* and the input hidden with bullet symbols. The input field already contains the default **abcd** value.
generic	**Format**: *${ask('message', generic, 'default')}*
	Description: The input is considered to be generic text that requires no special handling.
	Example: • *${ask('Hello world!')}* - The dialog box has a *Hello world!* message displayed. • *${ask('Hello world!', generic, 'Hello again!')}* - The dialog box has a *Hello world!* message displayed and the value displayed in the input box is *'Hello again!'*.

Parameter	
relative_url	**Format:** *${ask('message', relative_url, 'default')}*
	Description: Input is considered a URL. Oxygen XML Editor plugin tries to make the URL relative to that of the document you are editing. **Note:** If the *$ask* editor variable is expanded in content that is not yet saved (such as an *untitled* file, whose path cannot be determined), then Oxygen XML Editor plugin will transform it into an absolute URL.
	Example: • *${ask('File location', relative_url, 'C:/example.txt')}* - The dialog box has the name *'File location'*. The URL inserted in the input box is made relative to the current edited document location.
combobox	**Format:** *${ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}*
	Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given *rendered_value* values. Choosing such a value will return its associated value (*real_value*). **Note:** The *'default'* parameter specifies the default selected value and can match either a key or a value.
	Example: • *${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}* - The dialog box has the name *'Operating System'*. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection. **Note:** In this example, the default value is indicated by the *osx* key. However, the same result could be obtained if the default value is indicated by *Mac OS X*, as in the following example: *${ask('Operating System', combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'Mac OS X')}* • *${ask('Mobile OS', combobox, ('win':'Windows Mobile';'ios':'iOS';'and':'Android'), 'Android')}*
editable_combobox	**Format:** *${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}*
	Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given *rendered_value* values. Choosing such a value will return its associated real value (*real_value*) or the value inserted when you edit a list entry. **Note:** The *'default'* parameter specifies the default selected value and can match either a key or a value.
	Example: • *${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}* - The dialog box has the name *'Operating System'*. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input.
radio	**Format:** *${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}*

Parameter	
	Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a *'rendered_value* and will return an associated *real_value*. **Note:** The *'default'* parameter specifies the default selected value and can match either a key or a value.
	Example: • *${ask('Operating System', radio, ('win':'Microsoft Windows';'osx':'Mac OS X';'lnx':'Linux/UNIX'), 'osx')}* - The dialog box has the name *'Operating System'*. The radio button group allows you to choose between the three operating systems. **Note:** In this example `Mac OS X` is the default selected value and if selected it would return *osx* for the output.

- **${timeStamp}** - Time stamp, that is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- **${uuid}** - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java UUID class.
- **${id}** - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- **${cfn}** - Current file name without extension and without parent folder. The current file is the one currently opened and selected.
- **${cfne}** - Current file name with extension. The current file is the one currently opened and selected.
- **${cf}** - Current file as file path, that is the absolute file path of the current edited document.
- **${cfd}** - Current file folder as file path, that is the path of the current edited document up to the name of the parent folder.
- **${frameworksDir}** - The path (as file path) of the *[OXYGEN_INSTALL_DIR]*`/frameworks` directory.
- **${pd}** - The file path to the folder that contains the current project file (`.xpr`).
- **${oxygenInstallDir}** - Oxygen XML Editor plugin installation folder as file path.
- **${homeDir}** - The path (as file path) of the user home folder.
- **${pn}** - Current project name.
- **${env(VAR_NAME)}** - Value of the *VAR_NAME* environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **${system(var.name)}** editor variable.
- **${system(var.name)}** - Value of the *var.name* Java System Property. The Java system properties can be specified in the command line arguments of the Java runtime as *-Dvar.name=var.value*. If you are looking for operating system environment variables, use the **${env(VAR_NAME)}** editor variable instead.
- **${date(pattern)}** - Current date. The allowed patterns are equivalent to the ones in the Java SimpleDateFormat class. **Example:** *yyyy-MM-dd*;

  Note: This editor variable supports both the **xs:date** and **xs:datetime** parameters. For details about **xs:date**, go to http://www.w3.org/TR/xmlschema-2/#date. For details about **xs:datetime**, go to http://www.w3.org/TR/xmlschema-2/#dateTime.

Arguments of InsertFragmentOperation Operation on page 1254
Arguments of SurroundWithFragmentOperation on page 1256

Arguments of `InsertFragmentOperation` Operation

fragment

This argument has a textual value. This value is parsed by Oxygen XML Editor plugin as it was already in the document at the cursor position. You can use entity references declared in the document and it is namespace aware. The fragment may have multiple roots.

You can even use namespace prefixes that are not declared in the inserted fragment, if they are declared in the document where the insertion is done. For the sake of clarity, you should always prefix and declare namespaces in the inserted fragment!

If the fragment contains namespace declarations that are identical to those found in the document, the namespace declaration attributes will be removed from elements contained by the inserted fragment.

There are two possible scenarios:

1. **Prefixes that are not bound explicitly**

   For instance, the fragment:

   ```
   <x:item id="dty2"/>
   &ent;
   <x:item id="dty3"/>
   ```

   Can be correctly inserted in the document: ('|' marks the insertion point):

   ```
   <?xml version="1.0" encoding="UTF-8"?>
   <!DOCTYPE x:root [
       <!ENTITY ent "entity">
   ]>

   <x:root xmlns:x="nsp">
     |
   </x:root>
   ```

   Result:

   ```
   <?xml version="1.0" encoding="UTF-8"?>
   <!DOCTYPE x:root [
       <!ENTITY ent "entity">
   ]>
   <x:root xmlns:x="nsp">
       <x:item id="dty2"/>
       &ent;
       <x:item id="dty3"/>
   </x:root>
   ```

2. **Default namespaces**

If there is a default namespace declared in the document and the *document fragment* does not declare a namespace, the elements from the fragment are considered to be in **no namespace**.

For instance, the fragment:

```
<item id="dty2"/>
<item id="dty3"/>
```

Inserted in the document:

```
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
|
</root>
```

Gives the result document:

```
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
    <item xmlns="" id="dty2"/>
    <item xmlns="" id="dty3"/>
</root>
```

insertLocation

An XPath expression that is relative to the current node. It selects the reference node for the fragment insertion. When missing, the fragment will be inserted at the cursor position.

insertPosition

Specifies where the insertion is made relative to the reference node selected by the *insertLocation*. It can be one of the following constants:

- **Inside as first child** (default value) - The fragment is inserted as first child of the reference node.

- **Inside as last child** - The fragment is inserted as the last child of the reference node.
- **After** - The fragment is inserted after the reference node.
- **Before** - The fragment is inserted before the reference node.

goToNextEditablePosition

After inserting the fragment, the first editable position is detected and the cursor is placed at that location. It handles any in-place editors used to edit attributes. It will be ignored if the fragment specifies a cursor position using the **${caret}** editor variable. The possible values of this action are **true** and **false**.

schemaAware

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a *paragraph* element with a *bold* element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

Arguments of *SurroundWithFragmentOperation*

The **Author** mode operation *SurroundWithFragmentOperation* has only one argument:

- **fragment**

  The XML fragment that will surround the selection. For example, consider the fragment:

```
<F>
   <A></A>
   <B>
     <C></C>
   </B>
</F>
```

  and the document:

```
<doc>
  <X></X>
  <Y></Y>
  <Z></Z>
<doc>
```

  Considering the selected content to be surrounded is the sequence of elements X and Y, then the result is:

```
<doc>
   <F>
      <A>
         <X></X>
         <Y></Y>
      </A>
      <B>
        <C></C>
      </B>
   </F>
  <Z></Z>
<doc>
```

  Since the element A was the first leaf in the fragment, it received the selected content. The fragment was then inserted in the place of the selection.

Add a Custom Operation to an Existing Framework

This task explains how to add a custom **Author** mode operation to an existing *framework* (document type).

1. Setup a sample project by following the instructions for installing the SDK. Our sample *framework* project is `oxygen-sample-framework`.
2. A variety of classes in the *simple.documentation.framework.operations* package implement the *ro.sync.ecss.extensions.api.AuthorOperation* interface. Depending on your use-case, modify one of these classes.
3. Pack the operation class inside a Java *JAR* library.
4. Copy the *JAR* library to your framework directory (for example, *`[OXYGEN_INSTALL_DIR]`*`/frameworks/[FRAMEWORK_DIR]`).

5. Open the **Preferences** dialog box , go to **Document Type Association**, and edit the document type (you need write access to the *[OXYGEN_INSTALL_DIR]*) to open the **Document Type** configuration dialog box.
   a) In the **Classpath** tab, add a reference to your JAR library (for example, `${framework}/customAction.jar`).
   b) Go to the **Author** tab, then go to the **Actions** subtab.
   c) Click the **New** button and use the **Action** dialog box to create a new action that uses your custom operation.
   d) Mount the action to the toolbars or menus. You can also define a shortcut key.
6. Share the modifications with your colleagues. The files that should be shared are your `customAction.jar` library and the `.framework` configuration file from the *[OXYGEN_INSTALL_DIR]*`/frameworks/[FRAMEWORK_DIR]` directory.

AuthorOperation API

Adding Retina/HiDPI Icons in a Framework

Higher resolution icons can also be included in customized *frameworks* for rendering them in a Retina or HiDPI display. The icons can be referenced directly from the **Document Type Congifuration** dialog box (from the **Action** dialog box) or from an API (*ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer*).

As with any image, the higher resolution icons are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, icons with a Retina scaling factor of 2 will include *@2x* in the name (for example, `myIcon@2x.png`).

Developers should not specify the path of the alternate icons (*@2x* or *@3x*) in the **Action** dialog box or the *XMLNodeRendererCustomizer* API. When using a Retina or HiDPI display, Oxygen XML Editor plugin automatically searches the folder of the *normal* icon for a corresponding image file with a Retina scaling factor in the name. If the higher resolution icon file does not exist, the *normal* icon is scaled and used instead.

Retina/HiDPI Images in Author Mode on page 528

Java API - Extending Author Functionality through Java

Oxygen XML Editor plugin **Author** mode has a built-in set of operations covering the insertion of text and XML fragments (see the Author Default Operations) and the execution of XPath expressions on the current document edited in **Author** mode. However, there are situations in which you need to extend this set. The following examples are just a few of the possible situations:

- You need to enter an element whose attributes will be edited by the user through a graphical user interface.
- The user must send selected element content (or the whole document) to a server for some kind of processing.
- Content authors need to extract pieces of information from a server and insert it directly into the edited XML document.
- You need to apply an XPath expression on the current document and process the nodes of the resulting node set.

To extend the Oxygen XML Editor plugin **Author** mode functionality through Java, you will need the Oxygen SDK available on the Oxygen XML Editor plugin website. It includes the source code of the **Author** mode operations in the predefined document types and the full documentation (in Javadoc format) of the public API available for **Author** mode custom actions.

The subsequent Java examples make use of AWT classes. If you are developing extensions for the Oxygen XML Editor plugin XML Editor plugin for Eclipse, you will have to use their SWT counterparts.

Attention: Make sure the Java classes of your custom **Author** mode operations are compiled with the same Java version used by Oxygen XML Editor plugin. Otherwise, the classes may not be loaded by the Java virtual machine. For example, if you run Oxygen XML Editor plugin with a Java 1.6 virtual machine but the Java classes of your custom **Author** mode operations are compiled with a Java 1.7 virtual machine then the custom operations cannot be loaded and used by the Java 1.6 virtual machine.

Related Information:

Example 1- Simple Use of a Dialog Box from an Author Mode Operation

In this example, we start adding functionality for inserting images in a custom *framework*. The images are represented by the `image` element. The location of the image file is represented by the value of the `href` attribute. In the Java implementation, a dialog box will be displayed with a text field, in which the user can enter a full URL or browse for a local file.

1. Setup a sample project following this set of instructions. The *framework* project is **oxygen-sample-framework**.
2. Modify the *simple.documentation.framework.InsertImageOperation* class that implements the *ro.sync.ecss.extensions.api.AuthorOperation* interface. This interface defines three methods: *doOperation*, *getArguments* and *getDescription*

   A short description of these methods follows:

   - The *doOperation* method is invoked when the action is performed either by pressing the toolbar button, by selecting the menu item or by pressing the shortcut key. The arguments taken by this methods can be one of the following combinations:
     - an object of type *ro.sync.ecss.extensions.api.AuthorAccess* and a map
     - argument names and values
   - The *getArguments* method is used by Oxygen XML Editor plugin when the action is configured. It returns the list of arguments (name and type) that are accepted by the operation.
   - The *getDescription* method is used by Oxygen XML Editor plugin when the operation is configured. It returns a description of the operation.

   Example:

   Here is the implementation of these three methods:

```
/**
 * Performs the operation.
 */
public void doOperation(
           AuthorAccess authorAccess,
           ArgumentsMap arguments)
    throws IllegalArgumentException,
              AuthorOperationException {

JFrame oxygenFrame = (JFrame) authorAccess.getWorkspaceAccess().getParentFrame()
;
    String href = displayURLDialog(oxygenFrame);
     if (href.length() != 0) {
       // Creates the image XML fragment.
       String imageFragment =
         "<image xmlns='http://www.oxygenxml.com/sample/documentation' href='"
          + href + "'/>";

       // Inserts this fragment at the cursor position.
       int caretPosition = authorAccess.getEditorAccess().getCaretOffset();
       authorAccess.getDocumentController().insertXMLFragment
(imageFragment, caretPosition);
 }
}

/**
 * Has no arguments.
 *
 * @return null.
 */
public ArgumentDescriptor[] getArguments() {
 return null;
}

/**
 * @return A description of the operation.
 */
public String getDescription() {
 return "Inserts an image element. Asks the user for a URL reference.";
}
```

   Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

   Important:

Make sure you always specify the namespace of the inserted fragments.

```
<image xmlns='http://www.oxygenxml.com/sample/documentation'
  href='path/to/image.png'/>
```

3. Package the compiled class into a *JAR* file. An example of an Ant script that packages the `classes` folder content into a *JAR* archive named `sdf.jar` is listed below:

```
<?xml version="1.0" encoding="UTF-8"?>
<project name="project" default="dist">
    <target name="dist">
   <jar destfile="sdf.jar" basedir="classes">
    <fileset dir="classes">
     <include name="**/*"/>
     </fileset>
   </jar>
    </target>
</project>
```

4. Copy the `sdf.jar` file into your custom *framework* directory (*[OXYGEN_INSTALL_DIR]*`\frameworks\[CUSTOM_FRAMEWORK_DIR]`).
5. Add the `sdf.jar` to the class path. To do this, open the **Preferences** dialog box , go to **Document Type Association**, select **SDF**, and press the **Edit** button.
6. Select the **Classpath** tab in the lower part of the **Document Type** configuration dialog box and press the **Add** button . In the displayed dialog box, enter the location of the *JAR* file, relative to the Oxygen XML Editor plugin `frameworks` folder.
7. We now create the action that will use the defined operation. Go to the **Actions** subtab.
   Copy the icon files for the menu item and for the toolbar in your custom *framework* directory (*[OXYGEN_INSTALL_DIR]*`\frameworks\[CUSTOM_FRAMEWORK_DIR]`).
8. Define the action's properties:
   - Set **ID** to **insert_image**.
   - Set **Name** to **Insert image**.
   - Set **Menu access key** to letter **i**.
   - Set **Toolbar action** to **${framework}/toolbarImage.png**.
   - Set **Menu icon** to **${framework}/menuImage.png**.
   - Set **Shortcut key** to **Ctrl (Meta on Mac OS)+Shift+i**.
9. Next, we set up the operation. You want to add images only if the current element is a `section`, book or `article`.
   - Set the value of **XPath expression** to

     ```
     local-name()='section' or local-name()='book'
      or local-name()='article'
     ```

   - Set the **Invoke operation** field to *simple.documentation.framework.InsertImageOperation*.

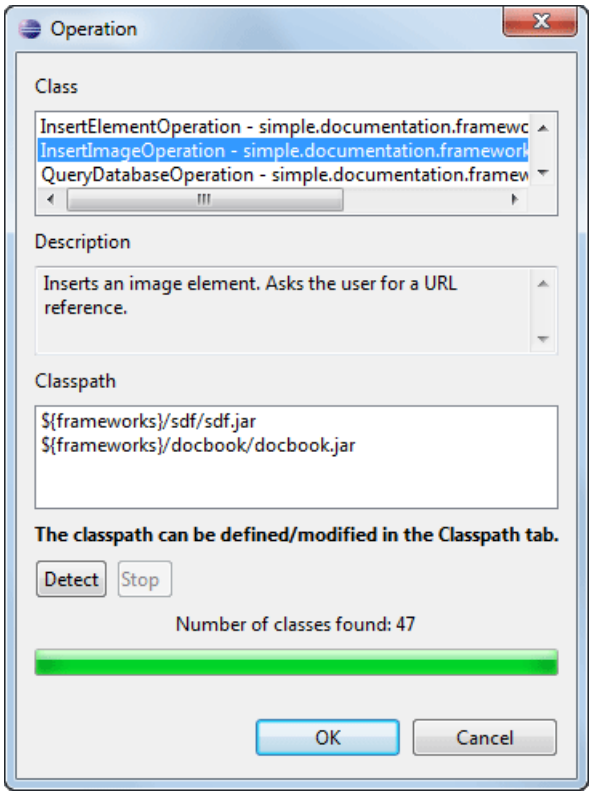

Figure 651: Selecting the Operation

10. Add the action to the toolbar, using the **Toolbar** panel.

To test the action, you can open the *sdf_sample.xml* sample, then place the cursor inside a `section` between two `para` elements (for instance). Press the button associated with the action from the toolbar. In the dialog box, select an image URL and press **OK**. The image is inserted into the document.

Example 2- Operations with Arguments. Report from Database Operation

In this example you will create an operation that connects to a relational database and executes an SQL statement. The result should be inserted in the edited XML document as a `table`. To make the operation fully configurable, it will have arguments for the *database connection string*, the *user name*, the *password* and the *SQL expression*.

1. Setup a sample project following this set of instructions. The *framework* project is **oxygen-sample-framework**.
2. Create the class *simple.documentation.framework.QueryDatabaseOperation*. This class must implements the *ro.sync.ecss.extensions.api.AuthorOperation* interface.

```
import ro.sync.ecss.extensions.api.ArgumentDescriptor;
import ro.sync.ecss.extensions.api.ArgumentsMap;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperation;
import ro.sync.ecss.extensions.api.AuthorOperationException;

public class QueryDatabaseOperation implements AuthorOperation{
```

3. Now define the operation's arguments. For each of them you will use a `String` constant representing the argument name:

```
private static final String ARG_JDBC_DRIVER ="jdbc_driver";
private static final String ARG_USER ="user";
private static final String ARG_PASSWORD ="password";
private static final String ARG_SQL ="sql";
private static final String ARG_CONNECTION ="connection";
```

4. You must describe each of the argument name and type. To do this, implement the *getArguments* method that will return an array of argument descriptors:

```
public ArgumentDescriptor[] getArguments() {
  ArgumentDescriptor args[] = new ArgumentDescriptor[] {
```

```
    new ArgumentDescriptor(
      ARG_JDBC_DRIVER,
      ArgumentDescriptor.TYPE_STRING,
      "The name of the Java class that is the JDBC driver."),
    new ArgumentDescriptor(
      ARG_CONNECTION,
      ArgumentDescriptor.TYPE_STRING,
      "The database URL connection string."),
    new ArgumentDescriptor(
      ARG_USER,
      ArgumentDescriptor.TYPE_STRING,
      "The name of the database user."),
    new ArgumentDescriptor(
      ARG_PASSWORD,
      ArgumentDescriptor.TYPE_STRING,
      "The database password."),
    new ArgumentDescriptor(
      ARG_SQL,
      ArgumentDescriptor.TYPE_STRING,
      "The SQL statement to be executed.")
  };
  return args;
 }
```

These names, types and descriptions will be listed in the **Arguments** table when the operation is configured.

5. When the operation is invoked, the implementation of the *doOperation* method extracts the arguments, forwards them to the method that connects to the database and generates the XML fragment. The XML fragment is then inserted at the cursor position.

```
public void doOperation(AuthorAccess authorAccess, ArgumentsMap map)
   throws IllegalArgumentException, AuthorOperationException {

  // Collects the arguments.
  String jdbcDriver =
   (String)map.getArgumentValue(ARG_JDBC_DRIVER);
  String connection =
   (String)map.getArgumentValue(ARG_CONNECTION);
  String user =
   (String)map.getArgumentValue(ARG_USER);
  String password =
   (String)map.getArgumentValue(ARG_PASSWORD);
  String sql =
   (String)map.getArgumentValue(ARG_SQL);

  int caretPosition = authorAccess.getCaretOffset();
  try {
   authorAccess.getDocumentController().insertXMLFragment(
     getFragment(jdbcDriver, connection, user, password, sql),
     caretPosition);
  } catch (SQLException e) {
   throw new AuthorOperationException(
     "The operation failed due to the following database error: "
     + e.getMessage(), e);
  } catch (ClassNotFoundException e) {
   throw new AuthorOperationException(
     "The JDBC database driver was not found. Tried to load ' "
     + jdbcDriver + "'", e);
  }
 }
```

6. The *getFragment* method loads the JDBC driver, connects to the database and extracts the data. The result is a `table` element from the `http://www.oxygenxml.com/sample/documentation` namespace. The `header` element contains the names of the SQL columns. All the text from the XML fragment is escaped. This means that the '<' and '&' characters are replaced with the '<' and '&' character entities to ensure the fragment is well-formed.

```
private String getFragment(
  String jdbcDriver,
  String connectionURL,
  String user,
  String password,
  String sql) throws
   SQLException,
   ClassNotFoundException {

      Properties pr = new Properties();
      pr.put("characterEncoding", "UTF8");
      pr.put("useUnicode", "TRUE");
      pr.put("user", user);
      pr.put("password", password);

      // Loads the database driver.
      Class.forName(jdbcDriver);
      // Opens the connection
      Connection connection =
         DriverManager.getConnection(connectionURL, pr);
      java.sql.Statement statement =
```

```
            connection.createStatement();
        ResultSet resultSet =
            statement.executeQuery(sql);

        StringBuffer fragmentBuffer = new StringBuffer();
        fragmentBuffer.append(
          "<table xmlns=" +
          "'http://www.oxygenxml.com/sample/documentation'>");

        //
        // Creates the table header.
        //
        fragmentBuffer.append("<header>");
        ResultSetMetaData metaData = resultSet.getMetaData();
        int columnCount = metaData.getColumnCount();
        for (int i = 1; i <= columnCount; i++) {
            fragmentBuffer.append("<td>");
            fragmentBuffer.append(
              xmlEscape(metaData.getColumnName(i)));
            fragmentBuffer.append("</td>");
        }
        fragmentBuffer.append("</header>");

        //
        // Creates the table content.
        //
        while (resultSet.next()) {
            fragmentBuffer.append("<tr>");
            for (int i = 1; i <= columnCount; i++) {
                fragmentBuffer.append("<td>");
                fragmentBuffer.append(
                  xmlEscape(resultSet.getObject(i)));
                fragmentBuffer.append("</td>");
            }
            fragmentBuffer.append("</tr>");
        }

        fragmentBuffer.append("</table>");

        // Cleanup
        resultSet.close();
        statement.close();
        connection.close();
        return fragmentBuffer.toString();
    }
```

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

7. Package the compiled class into a *JAR* file.
8. Copy the *JAR* file and the JDBC driver files into your custom *framework* directory (*[OXYGEN_INSTALL_DIR]*`\frameworks\[CUSTOM_FRAMEWORK_DIR]`).
9. Add the *JARS* to the class path. To do this, open the **Document Type Association** preferences page, select **SDF** and press the **Edit** button. Select the **Classpath** tab in the lower part of the **Document Type** configuration dialog box and press the **Add** button . In the displayed dialog box, enter the location of the *JAR* file, relative to the Oxygen XML Editor plugin `frameworks` folder.
10. Go to the **Actions** subtab. The action properties are:
    - Set **ID** to **clients_report**.
    - Set **Name** to **Clients Report**.
    - Set **Menu access key** to letter **r**.
    - Set **Description** to **Connects to the database and collects the list of clients**.
    - Set **Toolbar icon** to **${framework}/TableDB20.png** (image `TableDB20.png` is already stored in the `frameworks / sdf` folder).
    - Leave empty the **Menu icon**.
    - Set **shortcut key** to **Ctrl + Shift + C (Command + Shift + C on OS X)**.
11. The action will work only if the current element is a **section**. Set up the operation as follows:
    - Set **XPath expression** to:

      ```
      local-name()='section'
      ```

    - Use the Java operation defined earlier to set the **Invoke operation** field. Press the **Choose** button, then select *simple.documentation.framework.QueryDatabaseOperation*. Once selected, the list of arguments

is displayed. In the figure below the first argument, *jdbc_driver*, represents the class name of the MySQL JDBC driver. The connection string has the URL syntax : *jdbc://<database_host>:<database_port>/<database_name>*.

The SQL expression used in the example follows, but it can be any valid SELECT expression that can be applied to the database:

```
SELECT userID, email FROM users
```

12. Add the action to the toolbar, using the **Toolbar** panel.

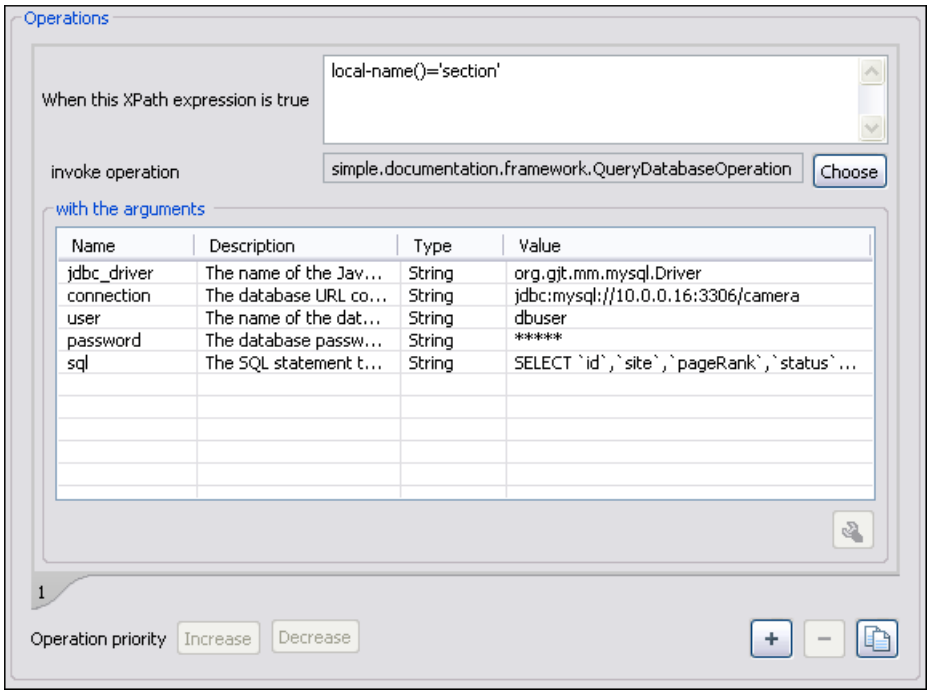

Figure 652: Java Operation Arguments Setup

To test the action, you can open the *sdf_sample.xml* sample and place the cursor inside a `section` between two `para` elements (for instance). Press the **Create Report** button from the toolbar. You can see below the toolbar with the action button and sample table inserted by the **Clients Report** action.

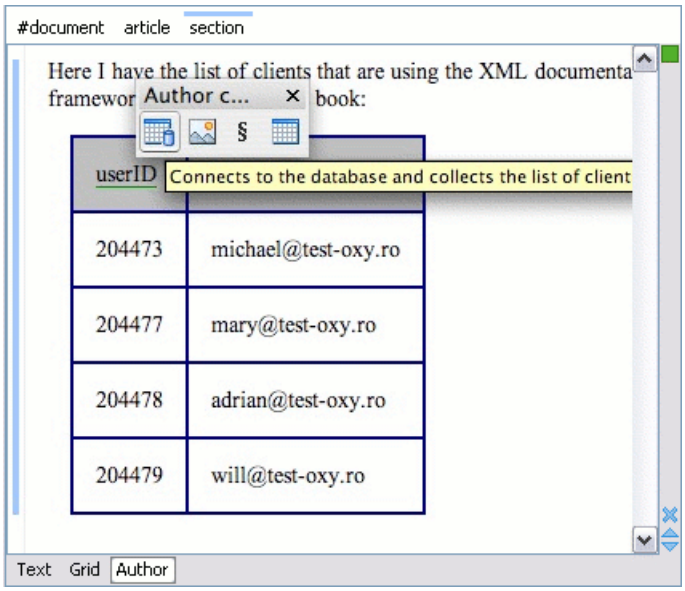

Figure 653: Table Content Extracted from the Database

Localizing Frameworks

Oxygen XML Editor plugin supports *framework* localization (translating *framework* actions, buttons, and menu entries to various languages). This lets you develop and distribute a *framework* to users that speak other languages without changing the distributed *framework*.

To localize the content of a *framework*, create a `translation.xml` file that contains all the translation (key, value) mappings. The `translation.xml` has the following format:

```
<translation>
    <languageList>
        <language description="English" lang="en_US"/>
        <language description="German" lang="de_DE"/>
        <language description="French" lang="fr_FR"/>
    </languageList>
    <key value="list">
        <comment>List menu item name.</comment>
        <val lang="en_US">List</val>
        <val lang="de_DE">Liste</val>
        <val lang="fr_FR">Liste</val>
    </key>
.....................
</translation>
```

Oxygen XML Editor plugin matches the GUI language with the language set in the `translation.xml` file. If this language is not found, the first available language declared in the `languagelist` tag for the corresponding *framework* is used.

Add the directory where this file is located to the **Classpath** list corresponding to the edited document type.

After you create this file, you can use the keys defined in it to customize the name and description of the following:

- Actions
- Menu entries
- Contextual menus
- Toolbars
- Static CSS content

For example, if you want to localize the bold action, open the **Preferences** dialog box and go to **Document Type Association**. Use the **New** or **Edit** button to open the **Document type** configuration dialog box, go to **Author** > **Actions**, and rename the bold action to `${i18n(translation_key)}`. Actions with a name format other than `${i18n(translation_key)}` are not localized. *Translation_key* corresponds to the key from the translation.xml file.

Now open the `translation.xml` file and edit the translation entry if it exists or create one if it does not exist. This example presents an entry in the translation.xml file:

```
<key value="translation_key">
        <comment>Bold action name.</comment>
        <val lang="en_US">Bold</val>
        <val lang="de_DE">Bold</val>
        <val lang="fr_FR">Bold</val>
    </key>
```

To use a description from the `translation.xml` file in the Java code used by your custom *framework*, use the new *ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle()* API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```
title:before{
    content:"${i18n(title.key)} : ";
}
```

Note: You can enter any language you want in the `languagelist` tag and any number of keys.

The `translation.xml` file for the DocBook *framework* is located here:*[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/i18n/translation.xml`. In the **Classpath** list corresponding to the DocBook document type the following entry was added: `${framework}/i18n/`.

To see how the DocBook actions are defined to use these keys for their name and description, open the **Preferences** dialog box and go to **Document Type Association** > **Author** > **Actions**. If you look in the Java class *ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog* available in the *oxygen-sample-framework* module of the Oxygen SDK Maven archetype, you can see how the new *ro.sync.ecss.extensions.api.AuthorResourceBundle* API is used to retrieve localized descriptions for various keys.

Configuring New Document Templates

A customized *framework* (document type) can point to a directory, usually named `templates`, that contains the document templates. All files found here are considered templates for the respective document type. The template name is taken from the file name, and the template type is detected from the file extension.

To customize new document templates for a *framework*, follow these steps:

1. Go to your custom *framework* directory (*`[OXYGEN_INSTALL_DIR]`*`\frameworks\[CUSTOM_FRAMEWORK_DIR]`) and create a directory named `templates`.
   The directory tree of the custom documentation *framework* should be something like this:

   ```
   [OXYGEN_INSTALL_DIR]
       frameworks
           [CUSTOM_FRAMEWORK_DIR]
               schema
               css
               templates
   ```

2. In the `templates` directory, create two files. A file for the *book* template and another one for the *article* template.

   An example for the Book `.xml` file:

   ```
   <?xml version="1.0" encoding="UTF-8"?>
   <book xmlns="http://www.oxygenxml.com/sample/documentation"
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
   xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts">
       <title>Book Template Title</title>
       <section>
           <title>Section Title</title>
           <abs:def/>
           <para>This content is copyrighted:</para>
           <table>
               <header>
                   <td>Company</td>
                   <td>Date</td>
               </header>
               <tr>
                   <td/>
                   <td/>
               </tr>
           </table>
       </section>
       </book>
   ```

   An example for the `Article.xml` file:

   ```
   <?xml version="1.0" encoding="UTF-8"?>
   <article
       xmlns="http://www.oxygenxml.com/sample/documentation"
       xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">
       <title></title>
       <section>
           <title></title>
           <para></para>
           <para></para>
       </section>
   </article>
   ```

   You can also use editor variables in the content of the template files and they will be expanded when the files are opened.

   Note: You should avoid using the `${cfd}`,`${cf}`,`${currentFileURL}`, and `${cfdu}` editor variables when you save your documents in a data base.

3. Open the **Document Type** configuration dialog box for your custom *framework* and click the **Templates** tab. In the **Templates directory** text field, introduce the `${frameworkDir}/templates` path. It is recommended that all the file references made from a *Document Type Association* to be relative to the **${frameworkDir}** directory. Binding to an absolute file (e. g.: `C:\some_dir\templates`) makes the association difficult to share between users.

4. To test the templates settings, go to **File** > **New** to display the **New** document dialog box. You should see the new templates in the folder for your custom *framework* (in the **Framework templates** section). The names of the two templates are prefixed with the name of the *framework*. Selecting one of them should create a new XML file with the content specified in the template file.

Editor Variables on page 125

Custom Editor Variables on page 130

Configuring XML Catalogs

For cases where you need to reference the location of a schema file from a remote web location and an Internet connection may not be available, an *XML Catalog* may be used to map the web location to a local file system entry. The following procedure presents an example of using an *XML catalog* in a custom *framework* by modifying an XML Schema file.

1. Create a catalog file that will help the parser locate the schema for validating the XML document. The file must map the location of the schema to a local version of the schema.

   Example:

   Create a new XML file called `catalog.xml` and save it in your custom *framework* directory (*[OXYGEN_INSTALL_DIR]*`\frameworks\[CUSTOM_FRAMEWORK_DIR]`). The content of the file should look like this:

   ```
   <?xml version="1.0"?>
   <catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
       <uri name="http://www.oxygenxml.com/SDF/abs.xsd"
               uri="schema/abs.xsd"/>
       <uri name="http://www.oxygenxml.com/SDF/abs.xsd"
                uri="schema/abs.xsd"/>
   </catalog>
   ```

2. Add catalog files to your custom *framework* using the **Catalogs** tab from the **Document Type** configuration dialog box.

To test the catalog settings, restart Oxygen XML Editor plugin and try to validate a new sample document for your custom *framework*. There should be no errors.

Example:

The schema that validates the document refers the other file `abs.xsd` through an **import** element:

```
<xs:import namespace=
 "http://www.oxygenxml.com/sample/documentation/abstracts"
 schemaLocation="http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The `schemaLocation` attribute references the `abs.xsd` file:

```
xsi:schemaLocation="http://www.oxygenxml.com/sample/documentation/abstracts"
    http://www.oxygenxml.com/SDF/abs.xsd"/>
```

The catalog mapping is:

```
http://www.oxygenxml.com/SDF/abs.xsd -> schema/abs.xsd
```

This means that all the references to http://www.oxygenxml.com/SDF/abs.xsd must be resolved to the `abs.xsd` file located in the `schema` directory (note that the `schema` directory needs to be in the same folder as the *XML Catalog*). The URI element is used by URI resolvers (for example, to resolve a URI reference used in an XSLT stylesheet).

Configuring Transformation Scenarios for a Framework

When distributing a *framework* to users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. By being contained in the *framework* configuration, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs.

These are the steps that allow you to create a transformation scenario for your *framework*.

1. Create an `xsl` folder inside your custom *framework* directory (*`[OXYGEN_INSTALL_DIR]`*`\frameworks\[CUSTOM_FRAMEWORK_DIR]`).

   The folder structure for the documentation *framework* should be:

   ```
   oxygen
     frameworks
        [CUSTOM_FRAMEWORK_DIR]
          schema
          css
          templates
          xsl
   ```

2. Create the `sdf.xsl` file in the `xsl` folder. The complete content of the `sdf.xsl` file is found in the Example Files Listings.
3. Open the **Preferences** dialog box and go to **Document Type Associations**. Select the particular *framework*, click the **Edit** button to open **Document Type** Configuration dialog box, and choose the **Transformation** tab.

   Click the **New** button and choose the appropriate type of transformation (for example, **XML transformation with XSLT**).

   In the **New scenario** dialog box, fill in the following fields:

   - Fill in the **Name** field with the name of your transformation scenario.
   - Set the **XSL URL** field to path of your custom stylesheet (for example, `${framework}/xsl/mycustom.xsl`).

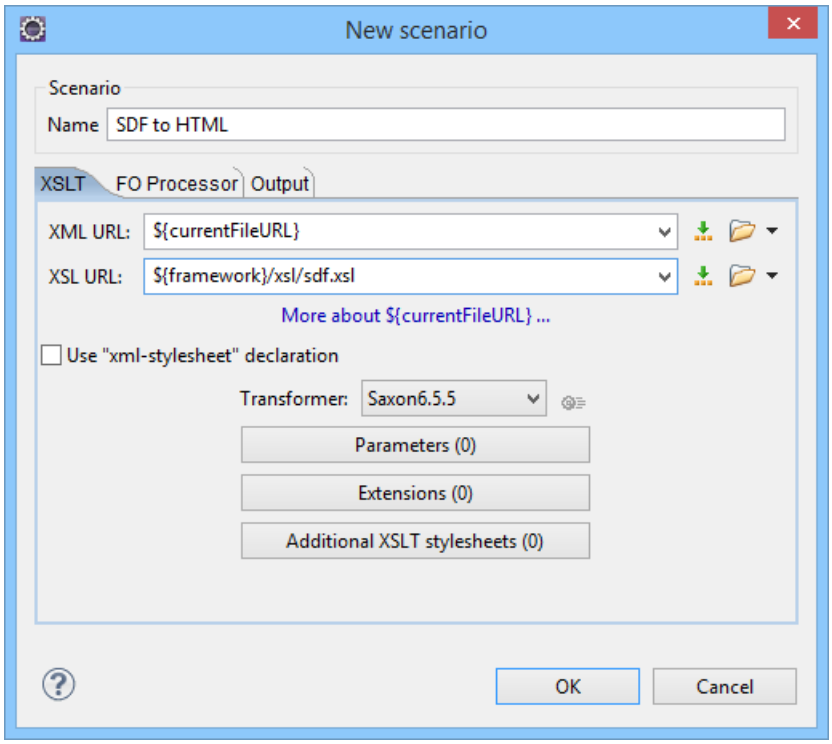

Figure 654: Configuring a New XSLT Transformation Scenario

4. Change to the **Output** tab. Configure the fields as follows:

   - Set the **Save as** field to `${cfd}/${cfn}.html`. This means the transformation output file will have the name of the XML file and the *html* extension and will be stored in the same folder.
   - Select the **Open in Browser/System Application** option.

     Note: To set the browser or system application that will be used, go to **Window** > **Preferences** > **General** > **Web Browser** and specify it there. This will take precedence over the default system application settings.
   - Select the **Saved file** option.
5. Click the **OK** button to save the new scenario.

Now the scenario is listed in the **Transformation** tab:

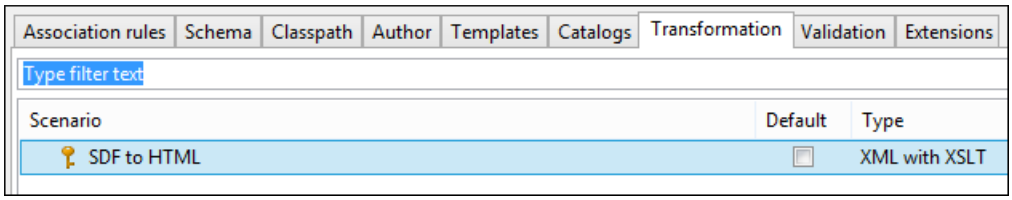

Figure 655: Transformation Tab

To test the transformation scenario that you just created, open the **SDF** XML sample from the Example Files Listings. Click the **Apply Transformation Scenario(s)** button to display the **Transform with** dialog box. The scenario list contains the scenario you defined earlier . Select the *SDF to HTML* scenario that you just defined and click the **Apply associated** button. The HTML file is saved in the same folder as the XML file and displayed in the browser.

Configuring Validation Scenarios for a Framework

You can distribute a *framework* with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation.

Note: If a *master file* is associated with the current file, the validation scenarios defined in the *master file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *master files*, see Master Files Support on page 381 or Working with Modular XML Files in the Master Files Context on page 588.

To associate a validation scenario with a specific *framework*, follow these steps:

1. Open the **Preferences** dialog box and go to **Document Type Association**.
2. Select the document type and click the **Edit** button to open the **Document Type Configuration** dialog box, then choose the **Validation** tab. This tab displays a list of document types in which you can define validation scenarios. To set one or more of the validation scenarios listed in this tab to be used as the default validation scenario (when another one is not specified in the validation process) for a specific document type, check the **Default** box for that specific document type.
3. To add a new scenario, press the **New** button.
   The **New scenarios** dialog box is displayed. It lists all the validation units for the scenario.

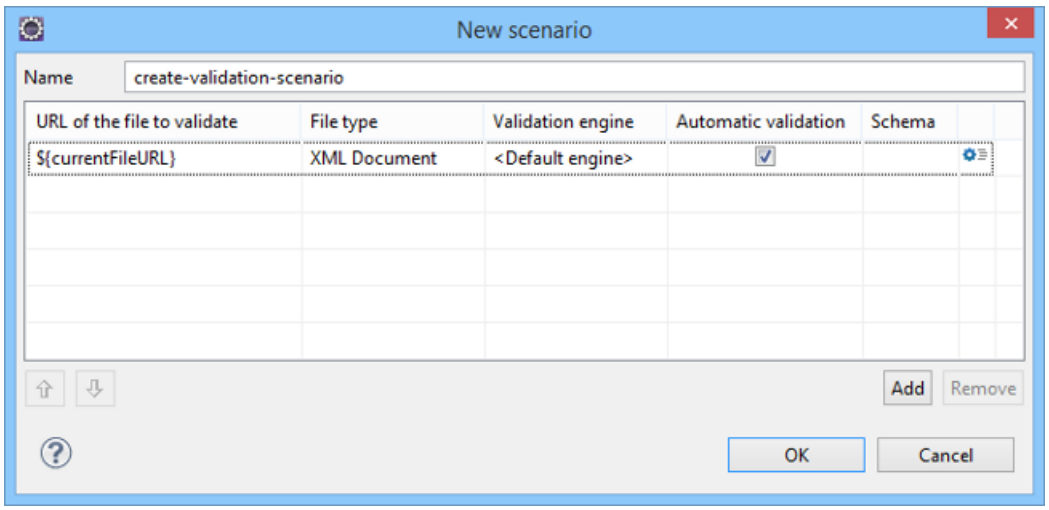

Figure 656: Create New Validation Scenario

This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an editor variable or a custom editor variable.

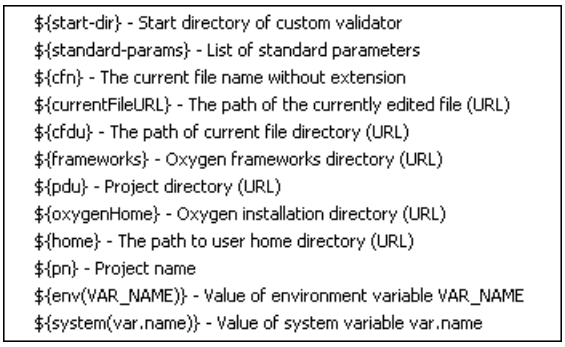

Figure 657: Insert an Editor Variable

File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor plugin automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can select one of the engines available in Oxygen XML Editor plugin for validation of the particular document type.

Default engine means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page, XQuery preferences page, XML Schema preferences page).

The **DITA Validation** engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the **DITA Maps Manager** **Validate and Check for Completeness** action, but for a local file rather than an entire *DITA map*).

The **Table Layout Validation** engine looks for table layout problems (for more information, see Report table layout problems on page).

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature. If the **Automatic validation** feature is disabled in the Document Checking preferences page, then this option is ignored, as the preference setting has a higher priority.

Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

Specify Schema

Opens the **Specify Schema** dialog box that allows you to set a schema to be used for validating XML documents.

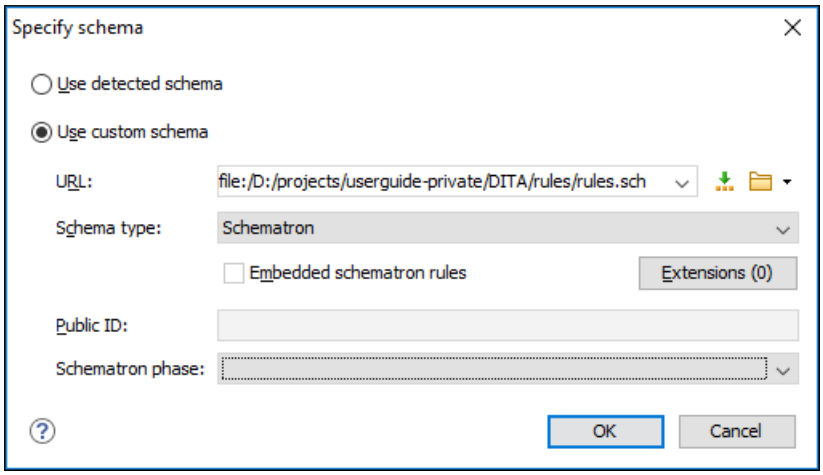

Figure 658: Specify Schema Dialog Box

The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the schema detected for the particular document.

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs* to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

Move Up

Moves the selected scenario up one spot in the list.

Move Down

Moves the selected scenario down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

4. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the **validation phase**.
5. Press **Ok**.

The newly created validation scenario is now included in the list of scenarios in the **Validation** tab. You can use the **Default** checkbox to specify that the new scenario be used as the default validation scenario when another specific scenario is not specified in the validation process.

Customizing Smart Paste Support

The *Smart Paste* feature preserves certain style and structure information when copying content from some of the most common applications and pasting into *frameworks* (document types) that support *Smart Paste* in Oxygen XML Editor plugin. For other document types, the default behavior of the paste operation is to keep only the text content without the styling.

The style of the pasted content can be customized by editing an XSLT stylesheet for a particular document type (*framework*). The XSLT stylesheet must accept an XHTML flavor of the copied content as input, and transform it to the equivalent XML markup that is appropriate for the target document type of the paste operation.

How to Customize the Smart Paste Mapping

To customize the mapping between the markup of the copied content and the markup of the pasted content for a particular document type, follow these steps:

1. Make sure the particular *framework* contains a folder named `resources` in the following path structure:

   [OXYGEN_INSTALL_DIR]`/frameworks/[Document Type]/resources`
2. Create an XSLT file named `xhtml2content.xsl` and save it in the `resources` folder for the particular *framework*.

   For example: *[OXYGEN_INSTALL_DIR]*`/frameworks/[Document Type]/resources/xhtml2content.xsl`
3. Add your customized styling in the XSLT file.
4. You can test modifications done in the stylesheet by pasting content without having to restart Oxygen XML Editor plugin.

Result: When you paste content from external applications (such as a web browser or and Office document) to a document that is opened in **Author** mode, and that matches the particular *framework*, the styling from the `xhtml2content.xsl` stylesheet will be applied on the clipboard contents.

Customized Smart Paste Stylesheet Sample:

```
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xhtml="http://www.w3.org/1999/xhtml"
  xmlns="urn:hl7-org:v3"
  exclude-result-prefixes="xsl xhtml">

  <xsl:output method="xml" indent="no" omit-xml-declaration="yes"/>

  <xsl:template match="xhtml:b | xhtml:strong">
    <content styleCode="bold" >
      <xsl:apply-templates select="@* | node()"/>
    </content>
  </xsl:template>

  <xsl:template match="*">
    <xsl:apply-templates select="@* | node()"/>
  </xsl:template>

  <xsl:template match="@* | node()">
    <xsl:copy>
      <xsl:apply-templates select="@* | node()"/>
    </xsl:copy>
  </xsl:template>

</xsl:stylesheet>
```

Tip: The built-in DITA framework includes a `xhtml2ditaDriver.xsl` file (in *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/resources`) that imports various other stylesheets that apply cleanup and handle the conversion from the pasted HTML content to DITA. If you are using a custom extension of the DITA framework, you can copy the entire contents of the built-in `dita/resources` folder and customize the stylesheets according to your needs.

Oxygen XML Blog: How Special Paste Works in Oxygen (DITA)

Configuring Extensions

You can add *extensions* to your custom *framework* (document type) by using the **Extensions** tab from the **Document Type** configuration dialog box.

Configuring an Extensions Bundle

All *extensions* that are provided by Oxygen XML Editor plugin are includes in a single bundle.

Note: The individual extensions can still be set (open the **Preferences** dialog box , go to **Document Type Association**, double-click a document type, and go to the extension tab), and if present, they take precedence over the single provider. However, this practice is discouraged and the single provider should be used instead.

The extensions bundle is represented by the *ro.sync.ecss.extensions.api.ExtensionsBundle* class. The provided implementation of the `ExtensionsBundle` is instantiated when the *Document Type Association* rules defined for the custom *framework* matches a document opened in the editor. Therefore, references to objects that need to be persistent throughout the application running session must not be kept in the bundle because the next detection event can result in creating another *ExtensionsBundle* instance.

To configure an extensions bundle, follow this procedure:

1. Create a new Java project in your IDE. Create a `lib` folder in the Java project folder and copy in it the `oxygen.jar` file from the *`[OXYGEN_INSTALL_DIR]`*`/lib` folder.
2. Create the class (for example, *simple.documentation.framework.SDFExtensionsBundle*) to extend the abstract class *ro.sync.ecss.extensions.api.ExtensionsBundle*.

   For example:

   ```
   public class SDFExtensionsBundle extends ExtensionsBundle {
   ```

3. A `Document Type ID` and a short description should be defined first by implementing the methods *getDocumentTypeID* and *getDescription*. The `Document Type ID` is used to uniquely identify the current *framework*. Such an ID must be provided especially if options related to the *framework* need to be persistently stored and retrieved between sessions.

   For example:

   ```
   public String getDocumentTypeID() {
        return "Simple.Document.Framework.document.type";
   }

   public String getDescription() {
        return "A custom extensions bundle used for the Simple Document" +
                     "Framework document type";
   }
   ```

4. To be notified about the activation of the custom *Author Extension* in relation with an opened document, *ro.sync.ecss.extensions.api.AuthorExtensionStateListener* should be implemented. The **activation** and **deactivation** events received by this listener should be used to perform custom initializations and to register or remove listeners such as *ro.sync.ecss.extensions.api.AuthorListener*, *ro.sync.ecss.extensions.api.AuthorMouseListener*, or *ro.sync.ecss.extensions.api.AuthorCaretListener*. The custom *Author Extension* state listener should be provided by implementing the *createAuthorExtensionStateListener* method.

   For example:

   ```
   public AuthorExtensionStateListener createAuthorExtensionStateListener() {
        return new SDFAuthorExtensionStateListener();
   }
   ```

   The `AuthorExtensionStateListener` is instantiated and notified about the activation of the *framework* when the rules of the *Document Type Association* match a document opened in the **Author** editing mode. The listener is notified about the deactivation when another *framework* is activated for the same document, the user switches to another mode or the editor is closed. A complete description and implementation of *ro.sync.ecss.extensions.api.AuthorExtensionStateListener* can be found in Implementing an Author Extension State Listener.

If Schema Aware mode is active in Oxygen XML Editor plugin, all actions that can generate invalid content will be redirected toward the *ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandler*. The handler can resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an *ro.sync.ecss.extensions.api.InvalidEditException*. The actions that are forwarded to this handler include typing, delete, or paste.

See Implementing a Schema-Aware Editing Handler Adapter on page 1275 for more details about this handler.

5. Customizations of the content completion proposals are permitted by creating a schema manager filter extension. The interface that declares the methods used for content completion proposals filtering is *ro.sync.contentcompletion.xml.SchemaManagerFilter*. The filter can be applied on elements, attributes, or on their values. The *createSchemaManagerFilter* method is responsible for creating the content completion filter. A new `SchemaManagerFilter` will be created each time a document matches the rules defined by the *Document Type Association* that contains the filter declaration.

   For example:

   ```
   public SchemaManagerFilter createSchemaManagerFilter() {
        return new SDFSchemaManagerFilter();
   }
   ```

   A detailed presentation of the schema manager filter can be found in the Configuring a Content Completion Handler section.

6. The **Author** mode supports link-based navigation between documents and document sections. Therefore, if the document contains elements defined as links to other elements (for example, links based on the `id` attributes), the extension should provide the means to find the referenced content. To do this, an implementation of the *ro.sync.ecss.extensions.api.link.ElementLocatorProvider* interface should be returned by the *createElementLocatorProvider* method. Each time an element pointed by a link needs to be located, the method is invoked.

   For example:

   ```
   public ElementLocatorProvider createElementLocatorProvider() {
        return new DefaultElementLocatorProvider();
   }
   ```

   For more information on how to implement an element locator provider, see the Configuring a Link Target Element Finder section.

7. The drag and drop functionality can be extended by implementing the *ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener* interface. Relevant methods from the listener are invoked when the mouse is dragged, moved over, or exits the **Author** editing mode, when the drop action changes, and when the drop occurs. Each method receives the `DropTargetEvent` containing information about the drag and drop operation. The drag and drop extensions are available in **Author** mode for both Oxygen XML Editor plugin Eclipse plugin and standalone application. The **Text** mode corresponding listener is available only for Oxygen XML Editor plugin Eclipse plugin. The methods corresponding to each implementation are: *createAuthorAWTDndListener*, *createTextSWTDndListener*, and *createAuthorSWTDndListener*.

   ```
   public AuthorDnDListener createAuthorAWTDndListener() {
        return new SDFAuthorDndListener();
   }
   ```

   For more details about the **Author** mode drag and drop listeners, see the Configuring a custom Drag and Drop Listener section.

8. Another extension that can be included in the bundle is the reference resolver. In our example, the references are represented by the **ref** element and the attribute indicating the referenced resource is **location**. To be able to obtain the content of the referenced resources you will have to implement a Java extension class that implements *ro.sync.ecss.extensions.api.AuthorReferenceResolver*. The method responsible for creating the custom references resolver is *createAuthorReferenceResolver*. The method is called each time a document opened in an **Author** editing mode matches the *Document Type Association* where the extensions bundle is defined. The instantiated references resolver object is kept and used until another extensions bundle corresponding to another document type is activated as result of the detection process.

For example:

```
public AuthorReferenceResolver createAuthorReferenceResolver() {
     return new ReferencesResolver();
}
```

A more detailed description of the references resolver can be found in the Configuring a References Resolver section.

9. To be able to dynamically customize the default CSS styles for a certain *ro.sync.ecss.extensions.api.node.AuthorNode*, an implementation of *ro.sync.ecss.extensions.api.StylesFilter* can be provided. The extensions bundle method responsible for creating the `StylesFilter` is *createAuthorStylesFilter*. The method is called each time a document opened in an **Author** editing mode matches the *Document Type Association* where the extensions bundle is defined. The instantiated filter object is kept and used until another extensions bundle corresponding to another document type is activated as a result of the detection process.

   For example:

   ```
   public StylesFilter createAuthorStylesFilter() {
        return new SDFStylesFilter();
   }
   ```

   See the Configuring CSS Styles Filter section for more details about the styles filter extension.

10. To edit data in custom tabular format, implementations of the *ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider* and the *ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider* interfaces should be provided. The two methods from the `ExtensionsBundle` specifying these two extension points are *createAuthorTableCellSpanProvider* and *createAuthorTableColumnWidthProvider*.

    For example:

    ```
    public AuthorTableCellSpanProvider createAuthorTableCellSpanProvider() {
         return new TableCellSpanProvider();
    }

    public AuthorTableColumnWidthProvider
             createAuthorTableColumnWidthProvider() {
         return new TableColumnWidthProvider();
    }
    ```

    The two table information providers are not reused for different tables. The methods are called for each table in the document so new instances should be provided every time. Read more about the cell span and column width information providers in Configuring a Table Cell Span Provider and Configuring a Table Column Width Provider sections.

    If the functionality related to one of the previous extension point does not need to be modified, then the developed *ro.sync.ecss.extensions.api.ExtensionsBundle* should not override the corresponding method and leave the default base implementation to return **null**.

11. An XML vocabulary can contain links to various areas of a document. If the document contains elements defined as links, you can choose to present a more relevant text description for each link. To do this, an implementation of the *ro.sync.ecss.extensions.api.link.LinkTextResolver* interface should be returned by the *createLinkTextResolver* method. This implementation is used each time the *oxy_link-text() function* is encountered in the CSS styles associated with an element.

    For example:

    ```
    public LinkTextResolver createLinkTextResolver() {
      return new DitaLinkTextResolver();
    }
    ```

    Oxygen XML Editor plugin offers built-in implementations for DITA and DocBook: *ro.sync.ecss.extensions.dita.link.DitaLinkTextResolver* and *ro.sync.ecss.extensions.docbook.link.DocbookLinkTextResolver* respectively.

12. Pack the compiled class into a *JAR* file.

13. Copy the *JAR* file into your custom *framework* directory (for example, `frameworks/sdf`).

14. Add the *JAR* file to the class path. To do this, open the **Preferences** dialog box , go to **Document Type Association**, select the document type (for example, *SDF*), press the **Edit** button, select the **Classpath** tab, and press the **Add** button . In the displayed dialog box, enter the location of the *JAR* file relative to the Oxygen XML Editor plugin `frameworks` folder.
15. Register the Java class by going to the **Extensions** tab. Press the **Choose** button and select the name of the class (for example, *SDFExtensionsBundle*).

    Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

Related Information:

Customizing Elements that Wrap Profiled Content

For each *framework* (document type), you can configure the phrase-type elements that wrap the profiled content by setting a custom *ro.sync.ecss.extensions.api.ProfilingConditionalTextProvider*. This configuration is set by default for DITA and DocBook *frameworks*.

Implementing a Schema-Aware Editing Handler Adapter

The *AuthorSchemaAwareEditingHandlerAdapter* extension point allows you to handle certain **Author** mode actions in various ways. For example, implementing the `AuthorSchemaAwareEditingHandlerAdapter` makes it possible to handle events such as typing, the keyboard delete event at a given offset (using Delete or Backspace keys), delete element tags, delete selection, join elements, or paste fragment. It also makes it possible to improve solutions that are proposed by the paste mechanism in Oxygen XML Editor plugin when pasting content (through the use of some specific methods).

How to Implement an *AuthorSchemaAwareEditingHandlerAdapter*

For this handler to be called, the **Schema Aware Editing** option must be set to **On** or **Custom** in the **Schema-Aware** preferences page. The handler can either resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an `InvalidEditException`.

To implement your own *AuthorSchemaAwareEditingHandlerAdapter*, follow this procedure:

1. Implement the *ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter* extension.
2. To instruct Oxygen XML Editor plugin to use this newly created implementation, configure an extensions bundle and return the *AuthorSchemaAwareEditingHandlerAdapter* implementation using the *ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorSchemaAwareEditingHandlerAdapter()* method.

Example

Typing events can be handled using the *handleTyping* method. For example, the `AuthorSchemaAwareEditingHandler` checks if the schema is not a learned one, was loaded successfully, and if the **Smart paste and drag and drop** option is selected. If these conditions are met, the event will be handled.

```
public class AuthorSchemaAwareEditingHandlerAdapter
             extends AuthorSchemaAwareEditingHandler {

/**
 * @see AuthorSchemaAwareEditingHandler#handleTyping
(int, char, ro.sync.ecss.extensions.api.AuthorAccess)
 */
public boolean handleTyping(int offset, char ch, AuthorAccess authorAccess)
throws InvalidEditException {
  boolean handleTyping = false;
  AuthorSchemaManager authorSchemaManager =
authorAccess.getDocumentController().getAuthorSchemaManager();
  if (!authorSchemaManager.isLearnSchema() &&
      !authorSchemaManager.hasLoadingErrors() &&
      authorSchemaManager.getAuthorSchemaAwareOptions().isEnableSmartTyping()) {
    try {
      AuthorDocumentFragment characterFragment =
authorAccess.getDocumentController().createNewDocumentTextFragment
(String.valueOf(ch));
      handleTyping = handleInsertionEvent
(offset, new AuthorDocumentFragment[] {characterFragment}, authorAccess);
    } catch (AuthorOperationException e) {
```

```
      throw new InvalidEditException
(e.getMessage(), "Invalid typing event: " + e.getMessage(), e, false);
    }
  }
  return handleTyping;
}
```

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

Methods for Improving the Paste Mechanism

getAncestorDetectionOptions

When pasting content in **Author** mode, if the result causes the document to become invalid, Oxygen XML Editor plugin will propose solutions to make it valid. As a possible solution, Oxygen XML Editor plugin might surround the pasted content in a sequence of ancestor elements. This *getAncestorDetectionOptions* method allows you to choose which parent elements might be a possible solution.

canBeReplaced

Allows you to improve solutions that might be proposed by the paste mechanism when pasting content in Oxygen XML Editor plugin. For example, when pasting an element inside an empty element with the same name, this *canBeReplaced* method allows Oxygen XML Editor plugin to replace the empty node rather than pasting it after or before the empty node. The callback could also reject this behavior if, for instance, the replacement node contains attributes.

AuthorDocumentFragment Class

Implementing an Edit Properties Handler for Author Mode

The *EditPropertiesHandler* extension point allows you to present a specialized dialog box when the action of double-clicking an element tag is intercepted in **Author** mode. For example, you could use it to present a dialog box that allows the user to editing the properties of an image.

How to Implement an *EditPropertiesHandler*

To implement your own *EditPropertiesHandler*, follow this procedure:

1. Implement the *ro.sync.ecss.extensions.api.EditPropertiesHandler* interface.
2. To instruct Oxygen XML Editor plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle, you can return the *EditPropertiesHandler* implementation using the *ro.sync.ecss.extensions.api.ExtensionsBundle.createEditPropertiesHandler()* method.
   b. Specify the *EditPropertiesHandler* in the **Author edit properties handler** individual extension in the **Extensions** tab of the **Document Type** configuration dialog box for your particular document type.

Example

The following example illustrates an implementation for presenting a simple properties editing dialog box when a user double-clicks an `image` tag in **Author** mode (with tags displayed from the **Tags display mode** drop-down menu):

```
public class CustomEditPropertiesHandler implements EditPropertiesHandler {

  /**
   * @see ro.sync.ecss.extensions.api.Extension#getDescription()
   */
  @Override
  public String getDescription() {
    return "Sample implementation that handles properties for a table element.";
  }

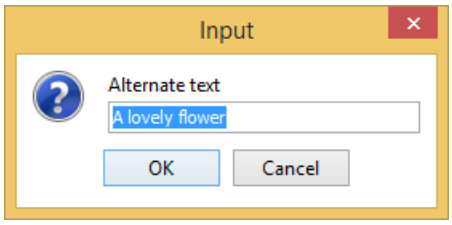
  /**
   * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#canEditProperties
(ro.sync.ecss.extensions.api.node.AuthorNode)
   */
  @Override
  public boolean canEditProperties(AuthorNode authorNode) {
    // If this node is an image element we can edit its properties.
```

```
    return "image".equals(authorNode.getDisplayName());
  }

  /**
   * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#editProperties
(ro.sync.ecss.extensions.api.node.AuthorNode,
 ro.sync.ecss.extensions.api.AuthorAccess)
   */
  @Override
  public void editProperties(AuthorNode authorNode, AuthorAccess authorAccess) {
    // If we receive this call then it surely an image.
    AuthorElement imageElement = (AuthorElement) authorNode;
    String currentValue = "";
    AttrValue altValue = imageElement.getAttribute("alt");
    if (altValue != null) {
      currentValue = altValue.getValue();
    }
    String newValue = JOptionPane.showInputDialog(
        (Component) authorAccess.getWorkspaceAccess().getParentFrame(),
        "Alternate text",
        currentValue);

    if (newValue != null) {
      authorAccess.getDocumentController().setAttribute
("alt", new AttrValue(newValue), imageElement);
    }
  }
}
```

Example result: If a user were to double-click an `image` tag icon ( ) in **Author** mode, the following dialog box would be displayed that allows the user to edit the *alternate text* property for the image:



Implementing a Custom Attribute Value Editor

The *CustomAttributeValueEditor* extension point allows you customize the attribute value editing mechanisms in Oxygen XML Editor plugin. It changes the **Browse** button found in the attribute editors to an **Edit** button. When a user clicks that **Edit** button, your custom attribute value editor will be presented.

The **Edit** button can be accessed in the following attribute editors:

- The **Attributes** view in **Author** mode (when the **Expand** button is used to reveal an expanded panel).
- The **Attributes** view in **Text** mode (when the **Expand** button is used to reveal an expanded panel).
- The **In-place Attributes Editor** when invoked in **Author** mode.
- The **In-place Attributes Editor** invoked in the **Outline** view when editing in **Author** mode.
- The **In-place Attributes Editor** invoked in the **Outline** view when editing in **Text** mode.

How to Implement a *CustomAttributeValueEditor*

To implement your own *CustomAttributeValueEditor*, follow this procedure:

1. Extend the *ro.sync.ecss.extensions.api.CustomAttributeValueEditor* abstract class.
2. To instruct Oxygen XML Editor plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle, you can return the *CustomAttributeValueEditor* implementation using the *ro.sync.ecss.extensions.api.ExtensionsBundle.createCustomAttributeValueEditor()* method.
   b. Specify the *CustomAttributeValueEditor* in the **Author custom attribute value editor** individual extension in the **Extensions** tab of the **Document Type** configuration dialog box for your particular document type.

Example

The following example creates a very simple custom attribute value editor:

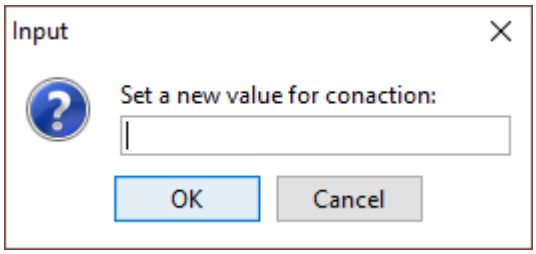
```
/**
 * A custom attribute value editor.
 */
public class MyCustomAttributeValueEditor extends CustomAttributeValueEditor {

  /**
   * @see ro.sync.ecss.extensions.api.Extension#getDescription()
   */
  @Override
  public String getDescription() {
    return "My custom attribute value editor";
  }

  /**
   * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#getAttributeValue
           (ro.sync.ecss.extensions.api.EditedAttribute, java.lang.Object)
   */
  @Override
  public String getAttributeValue(EditedAttribute attribute, Object parentComponent)
      throws CancelledByUserException {
    // Show an input dialog for collecting the new value
    return JOptionPane.showInputDialog
                    ("Set a new value for " + attribute.getAttributeQName() + ":");
  }

  /**
   * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#shouldHandleAttribute
                   (ro.sync.ecss.extensions.api.EditedAttribute)
   */
  @Override
  public boolean shouldHandleAttribute(EditedAttribute attribute) {
    // Handle all attributes
    return true;
  }
}
```

Example result: If a user were to click the **Edit** button in any of the attribute editors, the following dialog box would be displayed that allows the user to insert a value for the particular attribute:



Implementing an Author Mode Action Event Handler

The *AuthorActionEventHandler* extension point allows you to handle certain **Author** mode actions in a special way. For example, a specific use-case would be if you want to insert new lines when you press **Enter** instead of it opening the *Content Completion Assistant*.

How to Implement an *AuthorActionEventHandler*

To implement your own *AuthorActionEventHandler*, follow this procedure:

1. Implement the *ro.sync.ecss.extensions.api.AuthorActionEventHandler* interface.
2. To instruct Oxygen XML Editor plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle, you can return the *AuthorActionEventHandler* implementation using the *ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorActionEventHandler()* method.
   b. Specify the *AuthorActionEventHandler* in the **Author action event handler** individual extension in the **Extensions** tab of the **Document Type** configuration dialog box for your particular document type.

Example

The following example illustrates the use-case mentioned in the introduction, that is an implementation for inserting a new line when the user presses **Enter** in **Author** mode. It uses the *canHandleEvent* method to

make sure the insertion will be performed in an element that will preserve the `new-line` character. Then the *handleEvent* method inserts the new line at the current cursor position.

```
public class CustomAuthorActionEventHandler implements AuthorActionEventHandler
{

 /**
  * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#canHandleEvent
(AuthorAccess, AuthorActionEventType)
  */
  @Override
  public boolean canHandleEvent(AuthorAccess authorAccess,
AuthorActionEventType type) {
    boolean canHandle = false;

    if (type == AuthorActionEventType.ENTER) {
      AuthorDocumentController documentController =
authorAccess.getDocumentController();
    int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
    try {
      AuthorNode nodeAtOffset = documentController.getNodeAtOffset(caretOffset);
      if (nodeAtOffset instanceof AuthorElement) {
        AuthorElement elementAtOffset = (AuthorElement) nodeAtOffset;
        AttrValue xmlSpace = elementAtOffset.getAttribute("xml:space");
        if (xmlSpace != null && xmlSpace.getValue().equals("preserve")) {
          canHandle = true;
        }
      }
    } catch (BadLocationException ex) {
        if (logger.isDebugEnabled()) {
          logger.error(ex.getMessage(), ex);
        }
      }
    }

    return canHandle;
  }

 /**
  * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#handleEvent
(ro.sync.ecss.extensions.api.AuthorAccess,
ro.sync.ecss.extensions.api.AuthorActionEventHandler.AuthorActionEventType)
  */
  @Override
  public boolean handleEvent(AuthorAccess authorAccess,
 AuthorActionEventType eventType) {
    int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
    // Insert a new line
    authorAccess.getDocumentController().insertText(caretOffset, "\n");
    return true;
  }

  /**
   * @see ro.sync.ecss.extensions.api.Extension#getDescription()
   */
  @Override
  public String getDescription() {
    return "Insert a new line";
  }
}
```

Implementing an Image Decorator for Author Mode

The *AuthorImageDecorator* extension point allows you to add a custom decorator over images in **Author** mode. For example, you could use it to add a message over an image informing the user that they can double-click the image to edit it.

How to Implement an *AuthorImageDecorator*

To implement your own *AuthorImageDecorator*, follow this procedure:

1. Implement the *ro.sync.ecss.extensions.api.AuthorImageDecorator* interface.
2. To instruct Oxygen XML Editor plugin to use this newly created implementation, use either of the following methods:
   a. If you have configured an extensions bundle, you can return the *AuthorImageDecorator* implementation using the *ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorImageDecorator()* method.
   b. Specify the *AuthorImageDecorator* in the **Author image decorator** individual extension in the **Extensions** tab of the **Document Type** configuration dialog box for your particular document type.

Example

The following example illustrates an implementation for presenting a simple message over an image that informs the user that they can double-click the image to edit it:

```
/**
 * Custom Author image decorator for drawing string over images.
 */
public class CustomAuthorImageDecorator extends AuthorImageDecorator {

  /**
   * @see ro.sync.ecss.extensions.api.AuthorImageDecorator#paint
(ro.sync.exml.view.graphics.Graphics, int, int, int, int,
 ro.sync.exml.view.graphics.Rectangle,
 ro.sync.ecss.extensions.api.node.AuthorNode,
 ro.sync.ecss.extensions.api.AuthorAccess, boolean)
   */
  @Override
  public void paint(Graphics g, int x, int y, int imageWidth, int imageHeight,
      Rectangle originalSize, AuthorNode element,
 AuthorAccess authorAccess, boolean wasAnnotated) {
    if ("image".equals(CommonsOperationsUtil.getLocalName(element.getName()))) {
      g.drawString(
          "[Double-click to edit image]",
          // Draw near the top-left corner
          x + 15,
          y + 15);
    }
  }
```

Example result: In the top-left corner of the image, the following message will be displayed: `[Double-click to edit image]`.

Implementing a State Listener for Author Mode

The *ro.sync.ecss.extensions.api.AuthorExtensionStateListener* implementation is notified when the **Author** mode extension (where the listener is defined) is activated or deactivated in the document type detection process.

```
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorExtensionStateListener;

public class SDFAuthorExtensionStateListener implements
  AuthorExtensionStateListener {
  private AuthorListener sdfAuthorDocumentListener;
  private AuthorMouseListener sdfMouseListener;
  private AuthorCaretListener sdfCaretListener;
  private OptionListener sdfOptionListener;
```

When the association rules of the *framework* (document type) configuration match that of a document opened in the **Author** editing mode, the *activation* event received by this listener should be used to perform custom initializations and to register listeners such as *ro.sync.ecss.extensions.api.AuthorListener*, *ro.sync.ecss.extensions.api.AuthorMouseListener*, or *ro.sync.ecss.extensions.api.AuthorCaretListener*.

```
 public void activated(AuthorAccess authorAccess) {
   // Get the value of the option.
   String option = authorAccess.getOptionsStorage().getOption(
               "sdf.custom.option.key", "");
   // Use the option for some initializations...

   // Add an OptionListener.
   authorAccess.getOptionsStorage().addOptionListener(sdfOptionListener);

   // Add author DocumentListeners.
   sdfAuthorDocumentListener = new SDFAuthorListener();
   authorAccess.getDocumentController().addAuthorListener(
              sdfAuthorDocumentListener);

   // Add MouseListener.
   sdfMouseListener = new SDFAuthorMouseListener();
   authorAccess.getEditorAccess().addAuthorMouseListener(sdfMouseListener);

   // Add CaretListener.
   sdfCaretListener = new SDFAuthorCaretListener();
   authorAccess.getEditorAccess().addAuthorCaretListener(sdfCaretListener);

   // Other custom initializations...

 }
```

The **authorAccess** parameter received by the *activated* method can be used to gain access to specific **Author** mode actions and informations related to components such as the editor, document, workspace, tables, or the *change tracking* manager.

If options specific to the custom developed *Author Extension* need to be stored or retrieved, a reference to the *ro.sync.ecss.extensions.api.OptionsStorage* can be obtained by calling the *getOptionsStorage* method from the **authorAccess**. The same object can be used to register *ro.sync.ecss.extensions.api.OptionListener* listeners. An option listener is registered in relation with an option **key** and will be notified about the value changes of that option.

An *AuthorListener* can be used if events related to the **Author** mode document modifications are of interest. The listener can be added to the *ro.sync.ecss.extensions.api.AuthorDocumentController*. A reference to the document controller is returned by the *getDocumentController* method from the **authorAccess**. The document controller can also be used to perform operations involving document modifications.

To provide access to the **Author** mode component-related functionality and information, the **authorAccess** has a reference to the *ro.sync.ecss.extensions.api.access.AuthorEditorAccess* that can be obtained when calling the *getEditorAccess* method. At this level, *AuthorMouseListener* and *AuthorCaretListener* can be added to provide notification of mouse and cursor events that occur in the **Author** editor mode.

The *deactivation* event is received when another *framework* is activated for the same document, the user switches to another editor mode or the editor is closed. The *deactivate* method is typically used to unregister the listeners previously added on the *activate* method and to perform other actions. For example, options related to the deactivated *Author Extension* can be saved at this point.

```
public void deactivated(AuthorAccess authorAccess) {
  // Store the option.
  authorAccess.getOptionsStorage().setOption(
              "sdf.custom.option.key", optionValue);

  // Remove the OptionListener.
  authorAccess.getOptionsStorage().removeOptionListener(sdfOptionListener);

  // Remove DocumentListeners.
  authorAccess.getDocumentController().removeAuthorListener(
              sdfAuthorDocumentListener);

  // Remove MouseListener.
  authorAccess.getEditorAccess().removeAuthorMouseListener(sdfMouseListener);

  // Remove CaretListener.
  authorAccess.getEditorAccess().removeAuthorCaretListener(sdfCaretListener);

  // Other actions...

}
```

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

Configuring a Content Completion Handler

You can filter or contribute to proposals offered for content completion by implementing the *ro.sync.contentcompletion.xml.SchemaManagerFilter* interface.

```
import java.util.List;

import ro.sync.contentcompletion.xml.CIAttribute;
import ro.sync.contentcompletion.xml.CIElement;
import ro.sync.contentcompletion.xml.CIValue;
import ro.sync.contentcompletion.xml.Context;
import ro.sync.contentcompletion.xml.SchemaManagerFilter;
import ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatElementsCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatPossibleValuesHasAttributeContext;

public class SDFSchemaManagerFilter implements SchemaManagerFilter {
```

You can implement the various callbacks of the interface either by returning the default values given by Oxygen XML Editor plugin or by contributing to the list of proposals. The filter can be applied on elements, attributes or on their values. Attributes filtering can be implemented using the *filterAttributes* method and changing the default content completion list of *ro.sync.contentcompletion.xml.CIAttribute* for the element provided by the current *ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext* context. For example, the `SDFSchemaManagerFilter` checks if the element from the current context is the `table` element and adds the `frame` attribute to the `table` list of attributes.

```
/**
 * Filter attributes of the "table" element.
 */
```

```
public List<CIAttribute> filterAttributes(List<CIAttribute> attributes,
    WhatAttributesCanGoHereContext context) {
  // If the element from the current context is the 'table' element add the
  // attribute named 'frame' to the list of default content completion proposals
  if (context != null) {
    ContextElement contextElement = context.getParentElement();
    if ("table".equals(contextElement.getQName())) {
      CIAttribute frameAttribute = new CIAttribute();
      frameAttribute.setName("frame");
      frameAttribute.setRequired(false);
      frameAttribute.setFixed(false);
      frameAttribute.setDefaultValue("void");
      if (attributes == null) {
        attributes = new ArrayList<CIAttribute>();
      }
      attributes.add(frameAttribute);
    }
  }
  return attributes;
}
```

The elements that can be inserted in a specific context can be filtered using the *filterElements* method. The `SDFSchemaManagerFilter` uses this method to replace the `td` child element with the `th` element when `header` is the current context element.

```
public List<CIElement> filterElements(List<CIElement> elements,
    WhatElementsCanGoHereContext context) {
  // If the element from the current context is the 'header' element remove the
  // 'td' element from the list of content completion proposals and add the
  // 'th' element.
  if (context != null) {
    Stack<ContextElement> elementStack = context.getElementStack();
    if (elementStack != null) {
      ContextElement contextElement = context.getElementStack().peek();
      if ("header".equals(contextElement.getQName())) {
        if (elements != null) {
          for (Iterator<CIElement> iterator =
elements.iterator(); iterator.hasNext();) {
            CIElement element = iterator.next();
            // Remove the 'td' element
            if ("td".equals(element.getQName())) {
              elements.remove(element);
              break;
            }
          }
        } else {
          elements = new ArrayList<CIElement>();
        }
        // Insert the 'th' element in the list of content completion proposals
        CIElement thElement = new SDFElement();
        thElement.setName("th");
        elements.add(thElement);
      }
    }
  } else {
    // If the given context is null then the given list of content completion
    // elements contains global elements.
  }
  return elements;
}
```

The elements or attributes values can be filtered using the *filterElementValues* or *filterAttributeValues* methods.

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

Configuring a Link Target Element Finder

The link target reference finder represents the support for finding references from links that indicate specific elements inside an XML document. This support will only be available if a schema is associated with the document type.

If you do not define a custom link target reference finder, the *DefaultElementLocatorProvider* implementation will be used by default. The interface that should be implemented for a custom link target reference finder is *ro.sync.ecss.extensions.api.link.ElementLocatorProvider*. As an alternative, the *ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider* implementation can also be extended.

The used *ElementLocatorProvider* will be queried for an *ElementLocator* when a link location must be determined (when a link is clicked). Then, to find the corresponding (linked) element, the obtained *ElementLocator* will be queried for each element from the document.

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

DefaultElementLocatorProvider Implementation

The *DefaultElementLocatorProvider* implementation offers support for the most common types of links:

- Links based on ID attribute values.
- XPointer element() scheme.

The method *getElementLocator* determines what *ElementLocator* should be used. In the default implementation, it checks if the link is an XPointer element() scheme. Otherwise, it assumes it is an ID. A non-null *IDTypeVerifier* will always be provided if a schema is associated with the document type.

The `link` string argument is the *anchor* part of the of the URL that is composed from the value of the link property specified for the link element in the CSS.

```
public ElementLocator getElementLocator(IDTypeVerifier idVerifier,
              String link) {
  ElementLocator elementLocator = null;
  try {
    if(link.startsWith("element(")){
      // xpointer element() scheme
      elementLocator = new XPointerElementLocator(idVerifier, link);
    } else {
      // Locate link element by ID
      elementLocator = new IDElementLocator(idVerifier, link);
    }
  } catch (ElementLocatorException e) {
    logger.warn("Exception when create element locator for link: "
        + link + ". Cause: " + e, e);
  }
  return elementLocator;
}
```

XPointerElementLocator Implementation

XPointerElementLocator is an implementation of the abstract class *ro.sync.ecss.extensions.api.link.ElementLocator* for links that have one of the following XPointer element() scheme patterns:

element (*elementID*)

Locate the element with the specified ID.

element (*/1/2/3*)

A child sequence appearing alone identifies an element by means of stepwise navigation, which is directed by a sequence of integers separated by slashes (/). Each integer n locates the nth child element of the previously located element.

element (*elementID/3/4*)

A child sequence appearing after a *NCName* identifies an element by means of stepwise navigation, starting from the element located by the given name.

The constructor separates the ID/integers, which are delimited by slashes(/) into a sequence of identifiers (an XPointer path). It will also check that the link has one of the supported patterns of the XPointer element() scheme.

```
public XPointerElementLocator(IDTypeVerifier idVerifier, String link)
                    throws ElementLocatorException {
  super(link);
  this.idVerifier = idVerifier;

  link = link.substring("element(".length(), link.length() - 1);

  StringTokenizer stringTokenizer = new StringTokenizer(link, "/", false);
  xpointerPath = new String[stringTokenizer.countTokens()];
  int i = 0;
  while (stringTokenizer.hasMoreTokens()) {
    xpointerPath[i] = stringTokenizer.nextToken();
    boolean invalidFormat = false;

    // Empty xpointer component is not supported
    if(xpointerPath[i].length() == 0){
      invalidFormat = true;
    }
```

```
    if(i > 0){
      try {
        Integer.parseInt(xpointerPath[i]);
      } catch (NumberFormatException e) {
        invalidFormat = true;
      }
    }

    if(invalidFormat){
      throw new ElementLocatorException(
        "Only the element() scheme is supported when locating XPointer links."
        + "Supported formats: element(elementID), element(/1/2/3),
              element(elemID/2/3/4).");
    }
    i++;
  }

  if(Character.isDigit(xpointerPath[0].charAt(0))){
    // This is the case when xpointer have the following pattern /1/5/7
    xpointerPathDepth = xpointerPath.length;
  } else {
    // This is the case when xpointer starts with an element ID
    xpointerPathDepth = -1;
    startWithElementID  = true;
  }
}
```

The method *startElement* will be invoked at the beginning of every element in the XML document(even when the element is empty). The arguments it takes are

uri

The namespace URI, or the empty string if the element has no namespace URI or if namespace processing is disabled.

localName

Local name of the element.

qName

Qualified name of the element.

atts

Attributes attached to the element. If there are no attributes, this argument will be empty.

The method returns `true` if the processed element is found to be the one indicated by the link.

The *XPointerElementLocator* implementation of the *startElement* will update the depth of the current element and keep the index of the element in its parent. If the `xpointerPath` starts with an element ID then the current element ID is verified to match the specified ID. If this is the case the depth of the XPointer is updated taking into account the depth of the current element.

If the XPointer path depth is the same as the current element depth then the kept indices of the current element path are compared to the indices in the XPointer path. If all of them match then the element has been found.

```
public boolean startElement(String uri, String localName,
       String name, Attr[] atts) {
  boolean linkLocated = false;
  // Increase current element document depth
  startElementDepth ++;

  if (endElementDepth != startElementDepth) {
    // The current element is the first child of the parent
    currentElementIndexStack.push(new Integer(1));
  } else {
    // Another element in the parent element
    currentElementIndexStack.push(new Integer(lastIndexInParent + 1));
  }

  if (startWithElementID) {
    // This the case when xpointer path starts with an element ID.
    String xpointerElement = xpointerPath[0];
    for (int i = 0; i < atts.length; i++) {
      if(xpointerElement.equals(atts[i].getValue())){
        if(idVerifier.hasIDType(
            localName, uri, atts[i].getQName(), atts[i].getNamespace())){
          xpointerPathDepth = startElementDepth + xpointerPath.length - 1;
          break;
        }
      }
    }
  }
```

```
  if (xpointerPathDepth == startElementDepth){
    // check if xpointer path matches with the current element path
    linkLocated = true;
    try {
      int xpointerIdx = xpointerPath.length - 1;
      int stackIdx = currentElementIndexStack.size() - 1;
      int stopIdx = startWithElementID ? 1 : 0;
      while (xpointerIdx >= stopIdx && stackIdx >= 0) {
        int xpointerIndex = Integer.parseInt(xpointerPath[xpointerIdx]);
        int currentElementIndex =
          ((Integer)currentElementIndexStack.get(stackIdx)).intValue();
        if(xpointerIndex != currentElementIndex) {
          linkLocated = false;
          break;
        }

        xpointerIdx--;
        stackIdx--;
      }

    } catch (NumberFormatException e) {
      logger.warn(e,e);
    }
  }
  return linkLocated;
}
```

The method *endElement* will be invoked at the end of every element in the XML document (even when the element is empty).

The *XPointerElementLocator* implementation of the *endElement* updates the depth of the current element path and the index of the element in its parent.

```
public void endElement(String uri, String localName, String name) {
  endElementDepth = startElementDepth;
  startElementDepth --;
  lastIndexInParent = ((Integer)currentElementIndexStack.pop()).intValue();
}
```

IDElementLocator Implementation

The *IDElementLocator* is an implementation of the abstract class *ro.sync.ecss.extensions.api.link.ElementLocator* for links that use an **ID**.

The constructor only assigns field values and the method *endElement* is empty for this implementation.

The method *startElement* checks each of the element's attribute values and when one matches the link, it considers the element found if one of the following conditions is satisfied:

- The qualified name of the attribute is `xml:id`.
- The attribute type is ID.

The attribute type is checked with the help of the method *IDTypeVerifier.hasIDType*.

```
public boolean startElement(String uri, String localName,
        String name, Attr[] atts) {
  boolean elementFound = false;
  for (int i = 0; i < atts.length; i++) {
    if (link.equals(atts[i].getValue())) {
      if("xml:id".equals(atts[i].getQName())) {
        // xml:id attribute
        elementFound = true;
      } else {
        // check if attribute has ID type
        String attrLocalName =
          ExtensionUtil.getLocalName(atts[i].getQName());
        String attrUri = atts[i].getNamespace();
        if (idVerifier.hasIDType(localName, uri, attrLocalName, attrUri)) {
          elementFound = true;
        }
      }
    }
  }

  return elementFound;
}
```

Creating a Customized Link Target Reference Finder

If you need to create a custom link target reference finder you can do so by creating the class that will implement the *ro.sync.ecss.extensions.api.link.ElementLocatorProvider* interface. As an alternative, your class could extend *ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider*, the default implementation.

Note: The complete source code of the *ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider*, *ro.sync.ecss.extensions.commons.IDElementLocator* or *ro.sync.ecss.extensions.commons.XPointerElementLocator* can be found in the **oxygen-sample-framework** project.

Configuring a Custom Drag and Drop Listener

Sometimes it is useful to perform various operations when certain objects are dropped from outside sources in the editing area. You can choose from three interfaces to implement depending on whether you are using the Eclipse plugin or the standalone version of the application or if you want to add the handler for the **Text** or **Author** modes.

Interfaces for the Drag and Drop Listener

ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener

Receives callbacks from the standalone application for Drag And Drop in **Author** mode.

com.oxygenxml.editor.editors.author.AuthorDnDListener

Receives callbacks from the Eclipse plugin for Drag And Drop in **Author** mode.

com.oxygenxml.editor.editors.TextDnDListener

Receives callbacks from the Eclipse plugin for Drag And Drop in **Text** mode.

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

Configuring a References Resolver

This information is helpful if you need to provide a handler for resolving references and obtain the content they reference. For example, suppose the element that has references is **ref** and the attribute indicating the referenced resource is **location**. You need to implement a Java extension class for obtaining the referenced resources.

1. Create the class *simple.documentation.framework.ReferencesResolver*. This class must implement the *ro.sync.ecss.extensions.api.AuthorReferenceResolver* interface.

```
import ro.sync.ecss.extensions.api.AuthorReferenceResolver;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;
import ro.sync.ecss.extensions.api.node.AuthorNode;

public class ReferencesResolver
      implements AuthorReferenceResolver {
```

2. The *hasReferences* method verifies if the handler considers the node to have references. It takes *AuthorNode* as an argument that represents the node that will be verified. The method will return `true` if the node is considered to have references. For our example, to be a reference, the node must be an element with the name *ref* and it must have an attribute named *location*.

```
public boolean hasReferences(AuthorNode node) {
  boolean hasReferences = false;
  if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
    AuthorElement element = (AuthorElement) node;
    if ("ref".equals(element.getLocalName())) {
      AttrValue attrValue = element.getAttribute("location");
      hasReferences = attrValue != null;
    }
  }
  return hasReferences;
}
```

3. The method *getDisplayName* returns the display name of the node that contains the expanded referenced content. It takes *AuthorNode* as an argument that represents the node for which the display name is needed. The referenced content engine will ask this *AuthorReferenceResolver* implementation for the display name for each node that is considered a reference. For our example, the display name is the value of the *location* attribute from the *ref* element.

```
public String getDisplayName(AuthorNode node) {
  String displayName = "ref-fragment";
  if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
    AuthorElement element = (AuthorElement) node;
    if ("ref".equals(element.getLocalName())) {
      AttrValue attrValue = element.getAttribute("location");
      if (attrValue != null) {
```

```
        displayName = attrValue.getValue();
      }
    }
  }
  return displayName;
}
```

4. The method *resolveReference* resolves the reference of the node and returns a *SAXSource* with the parser and its input source. It takes *AuthorNode* as an argument that represents the node for which the reference needs resolving, the `systemID` of the node, the *AuthorAccess* with access methods to the **Author** mode data model and a SAX *EntityResolver* that resolves resources that are already opened in another editor or resolve resources through the *XML Catalog*. In the implementation, you need to resolve the reference relative to the `systemID`, and create a parser and an input source over the resolved reference.

```
public SAXSource resolveReference(
    AuthorNode node,
    String systemID,
    AuthorAccess authorAccess,
    EntityResolver  entityResolver) {
  SAXSource saxSource = null;

  if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
    AuthorElement element = (AuthorElement) node;
    if ("ref".equals(element.getLocalName())) {
      AttrValue attrValue = element.getAttribute("location");
      if (attrValue != null) {
        String attrStringVal = attrValue.getValue();
        try {
          URL absoluteUrl = new URL(new URL(systemID),
          authorAccess.getUtilAccess().correctURL(attrStringVal));

          InputSource inputSource = entityResolver.resolveEntity(null,
              absoluteUrl.toString());
          if(inputSource == null) {
            inputSource = new InputSource(absoluteUrl.toString());
          }

          XMLReader xmlReader = authorAccess.newNonValidatingXMLReader();
          xmlReader.setEntityResolver(entityResolver);

          saxSource = new SAXSource(xmlReader, inputSource);
        } catch (MalformedURLException e) {
          logger.error(e, e);
        } catch (SAXException e) {
          logger.error(e, e);
        } catch (IOException e) {
          logger.error(e, e);
        }
      }
    }
  }

  return saxSource;
}
```

5. The method *getReferenceUniqueID* should return a unique identifier for the node reference. The unique identifier is used to avoid resolving the references recursively. The method takes *AuthorNode* as an argument that represents the node with the reference. In our example, the unique identifier is the value of the *location* attribute from the *ref* element.

```
public String getReferenceUniqueID(AuthorNode node) {
  String id = null;
  if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
    AuthorElement element = (AuthorElement) node;
    if ("ref".equals(element.getLocalName())) {
      AttrValue attrValue = element.getAttribute("location");
      if (attrValue != null) {
        id = attrValue.getValue();
      }
    }
  }
  return id;
}
```

6. The method *getReferenceSystemID*should return the `systemID` of the referenced content. It takes *AuthorNode* as an argument that represents the node with the reference and the *AuthorAccess* with access methods to the **Author** mode data model. In our example, the value of the *location* attribute is used from the *ref* element and resolved relatively to the XML base URL of the node.

```
public String getReferenceSystemID(AuthorNode node,
                                    AuthorAccess authorAccess) {
  String systemID = null;
  if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
    AuthorElement element = (AuthorElement) node;
```

```
    if ("ref".equals(element.getLocalName())) {
      AttrValue attrValue = element.getAttribute("location");
      if (attrValue != null) {
        String attrStringVal = attrValue.getValue();
        try {
          URL absoluteUrl = new URL(node.getXMLBaseURL(),
              authorAccess.getUtilAccess().correctURL(attrStringVal));
          systemID = absoluteUrl.toString();
        } catch (MalformedURLException e) {
          logger.error(e, e);
        }
      }
    }
  }
  return systemID;
}
```

In the listing below, the XML document contains the **ref** element:

```
<ref location="referenced.xml">Reference</ref>
```

When no reference resolver is specified, the reference has the following layout:

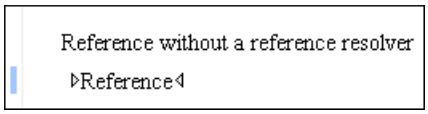


Figure 659: Reference with no specified reference resolver

When the above implementation is configured, the reference has the expected layout:

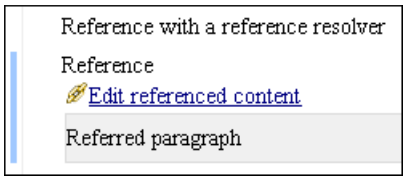

Figure 660: Reference with reference resolver

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

Configuring CSS Styles Filter

You can modify the CSS styles for each *ro.sync.ecss.extensions.api.node.AuthorNode* rendered in the **Author** mode using an implementation of *ro.sync.ecss.extensions.api.StylesFilter*. You can implement the various callbacks of the interface either by returning the default value given by Oxygen XML Editor plugin or by contributing to the value. The received styles *ro.sync.ecss.css.Styles* can be processed and values can be overwritten with your own. For example, you can override the KEY_BACKGROUND_COLOR style to return your own implementation of *ro.sync.exml.view.graphics.Color* or override the KEY_FONT style to return your own implementation of *ro.sync.exml.view.graphics.Font*.

For instance, in our simple document example the filter can change the value of the KEY_FONT property for the `table` element:

```
package simple.documentation.framework;

import ro.sync.ecss.css.Styles;
import ro.sync.ecss.extensions.api.StylesFilter;
import ro.sync.ecss.extensions.api.node.AuthorNode;
import ro.sync.exml.view.graphics.Font;

public class SDFStylesFilter implements StylesFilter {

     public Styles filter(Styles styles, AuthorNode authorNode) {
         if (AuthorNode.NODE_TYPE_ELEMENT == authorNode.getType()
           && "table".equals(authorNode.getName())) {
           styles.setProperty(Styles.KEY_FONT, new Font(null, Font.BOLD, 12));
         }
         return styles;
     }
}
```

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

Configuring Tables

There are standard CSS properties used to indicate what elements are tables, table rows and table cells. What CSS is missing is the possibility to indicate the cell spanning, row separators or the column widths. Oxygen XML Editor plugin offers support for adding extensions to solve these problems.

The table in this example is a simple one. The header must be formatted in a different way than the ordinary rows, so it will have a background color.

```
table{
    display:table;
    border:1px solid navy;
    margin:1em;
    max-width:1000px;
    min-width:150px;
}

table[width]{
  width:attr(width, length);
}

tr, header{
    display:table-row;
}

header{
    background-color: silver;
    color:inherit
}

td{
  display:table-cell;
  border:1px solid navy;
  padding:1em;
}
```

Since in the schema, the `td` tag has the attributes **row_span** and **column_span** that are not automatically recognized by Oxygen XML Editor plugin, a Java extension will be implemented that will provide information about the cell spanning. See the section Configuring a Table Cell Span Provider.

The column widths are specified by the attributes **width** of the elements `customcol` that are not automatically recognized by Oxygen XML Editor plugin. It is necessary to implement a Java extension that will provide information about the column widths. For more information, see Configuring a Table Column Width Provider.

The table from our example does not make use of the attributes `colsep` and `rowsep` (which are automatically recognized) but we still want the rows to be separated by horizontal lines. It is necessary to implement a Java extension that will provide information about the row and column separators. For more information, see Configuring a Table Cell Row and Column Separator Provider on page 1295.

Configuring a Table Column Width Provider

In a custom *framework*, the `table` element as well as the table columns can have specified widths. For these widths to be considered by **Author** mode we need to provide the means to determine them. As explained in Configuring Tables on page 1289, if you use the table element attribute **width** Oxygen XML Editor plugin can determine the table width automatically. In this example the table has `col` elements with **width** attributes that are not recognized by default. You will need to implement a Java extension class to determine the column widths.

1. Create the class *simple.documentation.framework.TableColumnWidthProvider*. This class must implement the *ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider* interface.

```
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperationException;
import ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider;
import ro.sync.ecss.extensions.api.WidthRepresentation;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableColumnWidthProvider
      implements AuthorTableColumnWidthProvider {
```

2. Method *init* is taking as argument an *ro.sync.ecss.extensions.api.node.AuthorElement* that represents the XML `table` element. In our case the column widths are specified in `col` elements from the `table` element. In such cases you must collect the span information by analyzing the `table` element.

```
public void init(AuthorElement tableElement) {
 this.tableElement = tableElement;
 AuthorElement[] colChildren = tableElement.getElementsByLocalName("customcol");
    if (colChildren != null && colChildren.length > 0) {
 for (int i = 0; i < colChildren.length; i++) {
   AuthorElement colChild = colChildren[i];
     if (i == 0) {
  colsStartOffset = colChild.getStartOffset();
 }
     if (i == colChildren.length - 1) {
  colsEndOffset = colChild.getEndOffset();
 }
     // Determine the 'width' for this col.
     AttrValue colWidthAttribute = colChild.getAttribute("width");
     String colWidth = null;
     if (colWidthAttribute != null) {
       colWidth = colWidthAttribute.getValue();
           // Add WidthRepresentation objects for the columns this 'customcol'
     //  specification spans over.
  colWidthSpecs.add(new WidthRepresentation(colWidth, true));
 }
     }
   }
}
```

3. The method *isTableAcceptingWidth* should check if the table cells are `td`.

```
public boolean isTableAcceptingWidth(String tableCellsTagName) {
  return "td".equals(tableCellsTagName);
}
```

4. The method *isTableAndColumnsResizable* should check if the table cells are `td`. This method determines if the table and its columns can be resized by dragging the edge of a column.

```
public boolean isTableAndColumnsResizable(String tableCellsTagName) {
  return "td".equals(tableCellsTagName);
}
```

5. Methods *getTableWidth* and *getCellWidth* are used to determine the table and column width. The table layout engine will ask this *ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider* implementation what is the table width for each table element and the cell width for each cell element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of the **width** attribute. The methods must return `null` for the tables / cells that do not have a specified width.

```
 public WidthRepresentation getTableWidth(String tableCellsTagName) {
  WidthRepresentation toReturn = null;
  if (tableElement != null && "td".equals(tableCellsTagName)) {
   AttrValue widthAttr = tableElement.getAttribute("width");
   if (widthAttr != null) {
    String width = widthAttr.getValue();
    if (width != null) {
     toReturn = new WidthRepresentation(width, true);
    }
   }
  }
  return toReturn;
 }
```

```
        public List<WidthRepresentation>
getCellWidth(AuthorElement cellElement, int colNumberStart,
   int colSpan) {
  List<WidthRepresentation> toReturn = null;
  int size = colWidthSpecs.size();
  if (size >= colNumberStart && size >= colNumberStart + colSpan) {
   toReturn = new ArrayList<WidthRepresentation>(colSpan);
   for (int i = colNumberStart; i < colNumberStart + colSpan; i ++) {
    // Add the column widths
    toReturn.add(colWidthSpecs.get(i));
   }
  }
  return toReturn;
 }
```

6. Methods *commitTableWidthModification* and *commitColumnWidthModifications* are used to commit changes made to the width of the table or its columns when using the mouse drag gestures.

```
 public void commitTableWidthModification
```

```
(AuthorDocumentController authorDocumentController,
 int newTableWidth, String tableCellsTagName) throws AuthorOperationException {
 if ("td".equals(tableCellsTagName)) {
  if (newTableWidth > 0) {
   if (tableElement != null) {
    String newWidth = String.valueOf(newTableWidth);

    authorDocumentController.setAttribute(
      "width",
      new AttrValue(newWidth),
      tableElement);
   } else {
 throw new AuthorOperationException("Cannot find the table element.");
    }
   }
  }
 }
```

```
public void commitColumnWidthModifications
 (AuthorDocumentController authorDocumentController,
   WidthRepresentation[] colWidths, String tableCellsTagName)
 throws AuthorOperationException {
   if ("td".equals(tableCellsTagName)) {
     if (colWidths != null && tableElement != null) {
 if (colsStartOffset >= 0 && colsEndOffset >= 0
&& colsStartOffset < colsEndOffset) {
  authorDocumentController.delete(colsStartOffset,
    colsEndOffset);
  }
  String xmlFragment = createXMLFragment(colWidths);
   int offset = -1;
  AuthorElement[] header = tableElement.getElementsByLocalName("header");
   if (header != null && header.length > 0) {
    // Insert the cols elements before the 'header' element
    offset = header[0].getStartOffset();
   }
   if (offset == -1) {
  throw new AuthorOperationException("No valid offset to insert column width");
    }
    authorDocumentController.insertXMLFragment(xmlFragment, offset);
   }
  }
 }

 private String createXMLFragment(WidthRepresentation[] widthRepresentations) {
  StringBuffer fragment = new StringBuffer();
  String ns = tableElement.getNamespace();
  for (int i = 0; i < widthRepresentations.length; i++) {
   WidthRepresentation width = widthRepresentations[i];
   fragment.append("<customcol");
   String strRepresentation = width.getWidthRepresentation();
   if (strRepresentation != null) {
    fragment.append(" width=\"" + width.getWidthRepresentation() + "\"");
   }
   if (ns != null && ns.length() > 0) {
    fragment.append(" xmlns=\"" + ns + "\"");
   }
   fragment.append("/>");
  }
  return fragment.toString();
 }
```

7. The following three methods are used to determine what type of column width specifications the table column width provider support. In our case all types of specifications are allowed:

```
 public boolean isAcceptingFixedColumnWidths(String tableCellsTagName) {
  return true;
 }

 public boolean isAcceptingPercentageColumnWidths(String tableCellsTagName) {
  return true;
 }

 public boolean isAcceptingProportionalColumnWidths(String tableCellsTagName) {
  return true;
 }
```

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

In the listing below, the XML document contains the table element:

```
<table width="300">
    <customcol width="50.0px"/>
    <customcol width="1*"/>
    <customcol width="2*"/>
```

```
    <customcol width="20%"/>
    <header>
        <td>C1</td>
        <td>C2</td>
        <td>C3</td>
        <td>C4</td>
    </header>
    <tr>
        <td>cs=1, rs=1</td>
        <td>cs=1, rs=1</td>
        <td row_span="2">cs=1, rs=2</td>
        <td row_span="3">cs=1, rs=3</td>
    </tr>
    <tr>
        <td>cs=1, rs=1</td>
        <td>cs=1, rs=1</td>
    </tr>
    <tr>
        <td column_span="3">cs=3, rs=1</td>
    </tr>
</table>
```

When no table column width provider is specified, the table has the following layout:

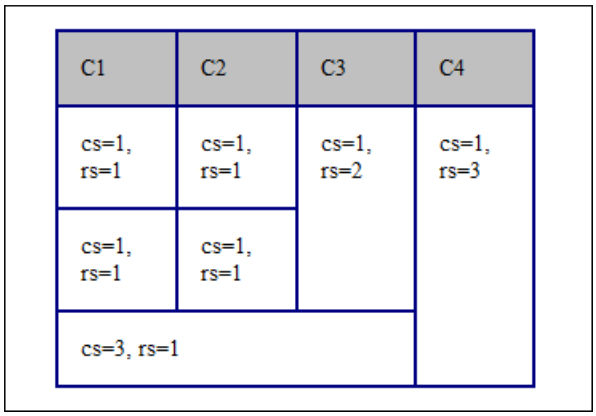

Figure 661: Table layout when no column width provider is specified

When the above implementation is configured, the table has the correct layout:

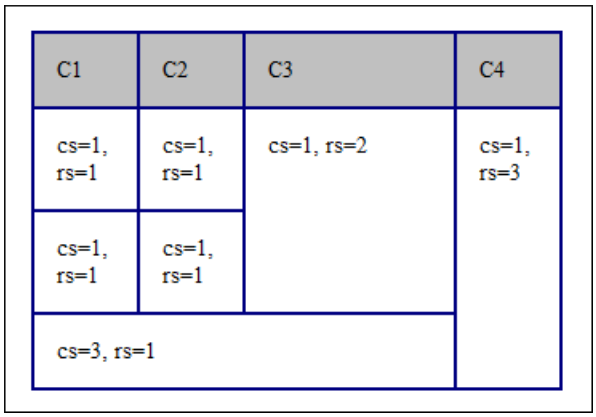

Figure 662: Columns with custom widths

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

Configuring a Table Cell Span Provider

In a custom *framework*, the `table` element can have cells that span over multiple columns and rows. As explained in Configuring Tables on page 1289, you need to indicate Oxygen XML Editor plugin a method to determine the cell spanning. If you use the cell element attributes `rowspan` and `colspan` or `rows` and `cols`, Oxygen XML Editor plugin can determine the cell spanning automatically. In our example the `td` element uses the attributes `row_span` and `column_span` that are not recognized by default. You will need to implement a Java extension class for defining the cell spanning.

1. Create the class *simple.documentation.framework.TableCellSpanProvider*. This class must implement the *ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider* interface.

```
import ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSpanProvider
      implements AuthorTableCellSpanProvider {
```

2. The *init* method is taking as argument the *ro.sync.ecss.extensions.api.node.AuthorElement* that represents the XML `table` element. In our case the cell span is specified for each of the cells so you leave this method empty. However, there are cases (such as the CALS table model) when the cell spanning is specified in the `table` element. In such cases, you must collect the span information by analyzing the `table` element.

```
public void init(AuthorElement table) {
}
```

3. The *getColSpan* method is taking as argument the table cell. The table layout engine will ask this *AuthorTableSpanSupport* implementation what is the column span and the row span for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of **column_span** attribute. The method must return `null` for all the cells that do not change the span specification.

```
public Integer getColSpan(AuthorElement cell) {
  Integer colSpan = null;

  AttrValue attrValue = cell.getAttribute("column_span");
  if(attrValue != null) {
    // The attribute was found.
    String cs = attrValue.getValue();
    if(cs != null) {
      try {
        colSpan = new Integer(cs);
      } catch (NumberFormatException ex) {
        // The attribute value was not a number.
      }
    }
  }
  return colSpan;
}
```

4. The row span is determined in a similar manner:

```
public Integer getRowSpan(AuthorElement cell) {
  Integer rowSpan = null;

  AttrValue attrValue = cell.getAttribute("row_span");
  if(attrValue != null) {
    // The attribute was found.
    String rs = attrValue.getValue();
    if(rs != null) {
      try {
        rowSpan = new Integer(rs);
      } catch (NumberFormatException ex) {
        // The attribute value was not a number.
      }
    }
  }
  return rowSpan;
}
```

5. The method *hasColumnSpecifications* always returns `true` considering column specifications always available.

```
public boolean hasColumnSpecifications(AuthorElement tableElement) {
  return true;
}
```

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

6. In the listing below, the XML document contains the table element:

```
<table>
    <header>
        <td>C1</td>
        <td>C2</td>
        <td>C3</td>
```

```
            <td>C4</td>
        </header>
        <tr>
            <td>cs=1, rs=1</td>
            <td column_span="2" row_span="2">cs=2, rs=2</td>
            <td row_span="3">cs=1, rs=3</td>
        </tr>
        <tr>
            <td>cs=1, rs=1</td>
        </tr>
        <tr>
            <td column_span="3">cs=3, rs=1</td>
        </tr>
    </table>
```

When no table cell span provider is specified, the table has the following layout:

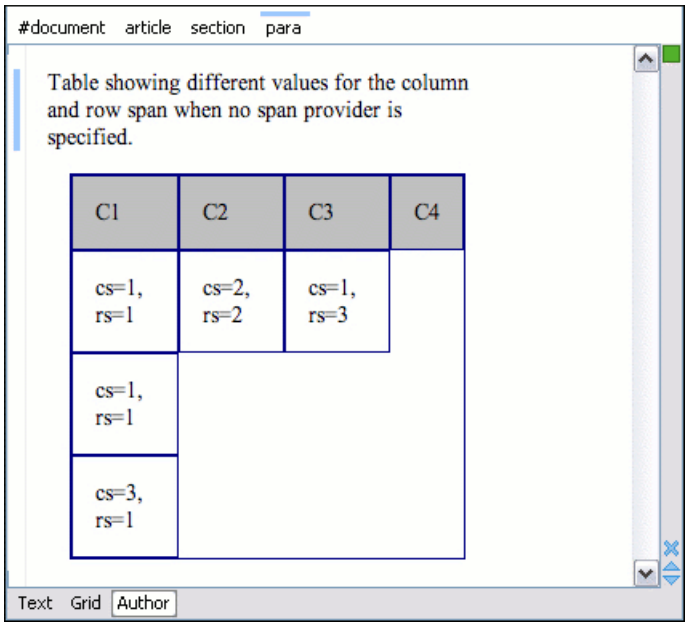

Figure 663: Table layout when no cell span provider is specified

When the above implementation is configured, the table has the correct layout:

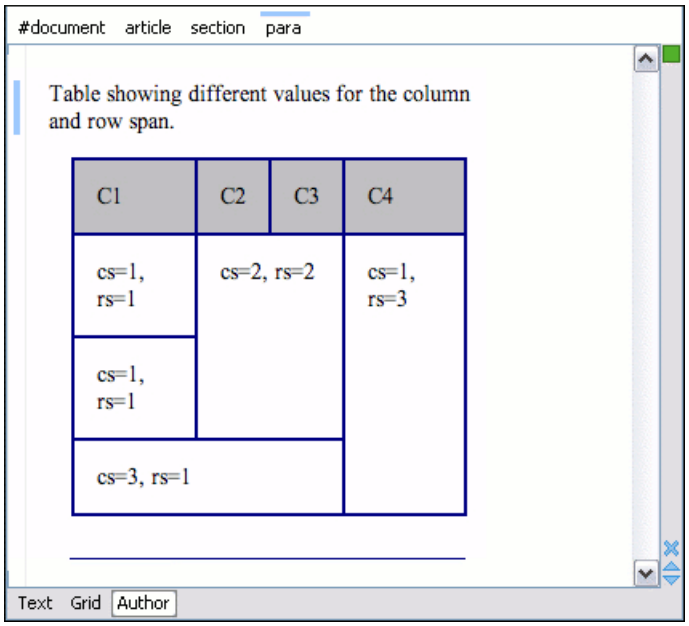

Figure 664: Cells spanning multiple rows and columns.

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

Configuring a Table Cell Row and Column Separator Provider

In a custom *framework*, the `table` element has separators between rows. As explained in Configuring Tables on page 1289, you need to indicate a method to determine the way rows and columns are separated. If you use the `rowsep` and `colsep` cell element attributes, or your table is conforming to the CALS table model, Oxygen XML Editor plugin can determine the cell separators. Even if there are no attributes that define the separators, you can still force a separator between rows by implementing a Java extension.

1. Create the class *simple.documentation.framework.TableCellSepProvider*. This class must implement the *ro.sync.ecss.extensions.api.AuthorTableCellSepProvider* interface.

```
import ro.sync.ecss.extensions.api.AuthorTableCellSepProvider;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSepProvider implements AuthorTableCellSepProvider{
```

2. The *init* method is taking as argument the *ro.sync.ecss.extensions.api.node.AuthorElement* that represents the XML `table` element. In our case the separator information is implicit, it does not depend on the current table, so you leave this method empty. However, there are cases (such as the CALS table model) when the cell separators are specified in the `table` element. In such cases, you should initialize your provider based on the given argument.

```
public void init(AuthorElement table) {
}
```

3. The *getColSep* method is taking as argument the table cell. The table layout engine will ask this *AuthorTableCellSepProvider* implementation if there is a column separator for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. In our case we choose to return **false** since we do not need column separators.

```
  /**
   * @return false - No column separator at the right of the cell.
   */
  @Override
  public boolean getColSep(AuthorElement cellElement, int columnIndex) {
    return false;
  }
```

4. The row separators are determined in a similar manner. This time the method returns **true**, forcing a separator between the rows.

```
  /**
   * @return true - A row separator below each cell.
   */
  @Override
  public boolean getRowSep(AuthorElement cellElement, int columnIndex) {
    return true;
  }
```

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

5. In the example below, the XML document contains the table element:

```
<table>
     <header>
       <td>H1</td>
       <td>H2</td>
       <td>H3</td>
       <td>H4</td>
     </header>
     <tr>
       <td>C11</td>
       <td>C12</td>
       <td>C13</td>
       <td>C14</td>
     </tr>
     <tr>
       <td>C21</td>
       <td>C22</td>
       <td>C23</td>
       <td>C24</td>
     </tr>
     <tr>
       <td>C31</td>
       <td>C32</td>
       <td>C33</td>
```

```
        <td>C34</td>
      </tr>
    </table>
```

When the borders for the `td` element are removed from the CSS, the row separators become visible:

H1	H2	H3	H4
C11	C12	C13	C14
C21	C22	C23	C24
C31	C32	C33	C34

Figure 665: Row separators provided by the Java implementation.

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

Configuring a Unique Attributes Recognizer

The *ro.sync.ecss.extensions.api.UniqueAttributesRecognizer* interface can be implemented if you want to provide for your *framework* the following features:

- **Automatic ID generation** - You can automatically generate unique IDs for newly inserted elements. Implementations are already available for the DITA and DocBook *frameworks*. The following methods can be implemented to accomplish this: *assignUniqueIDs(int startOffset, int endOffset)*, *isAutoIDGenerationActive()*
- **Avoiding copying unique attributes when "Split" is called inside an element** - You can split the current *block element* by pressing the "Enter" key and then choosing "Split". This is a very useful way to create new paragraphs, for example. All attributes are by default copied on the new element but if those attributes are IDs you sometimes want to avoid creating validation errors in the editor. Implementing the following method, you can decide whether or not an attribute should be copied during the split: *boolean copyAttributeOnSplit(String attrQName, AuthorElement element)*

  Tip: The *ro.sync.ecss.extensions.commons.id.DefaultUniqueAttributesRecognizer* class is an implementation of the interface that can be extended by your customization to provide easy assignation of IDs in your *framework*. You can also check out the DITA and DocBook implementations of *ro.sync.ecss.extensions.api.UniqueAttributesRecognizer* to see how they were implemented and connected to the extensions bundle.

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

Configuring an XML Node Renderer Customizer

You can use this API extension to customize the way an XML node is rendered in the **Outline** view in **Author** mode, breadcrumb navigation bar in **Author** mode, **Outline** view in **Text** mode, *Content Completion Assistant* window, or **DITA Maps Manager** view.

Note: Oxygen XML Editor plugin uses *XMLNodeRendererCustomizer* implementations for the following *frameworks*: DITA, DITA Map, DocBook 4, DocBook 5, TEI, XHTML, XSLT, and XML Schema.

There are two methods to provide an implementation of *ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer*:

- As a part of a bundle, returning it from the *createXMLNodeCustomizer()* method of the *ExtensionsBundle* associated with your document type in the **Document type** configuration dialog box (**Extensions bundle** field in the **Extensions** tab).
- As an individual extension, associated with your document type in the **Document type** configuration dialog box (**XML node renderer customizer** field in the **Individual extensions** section of the **Extensions** tab).

Support for Retina/HiDPI Displays

To support Retina or HiDPI displays, the icons provided by the *XMLNodeRendererCustomizer* should be backed up by a copy of larger size using the proper Retina/HiDPI naming convention.

For example, for the `title` element, if the *XMLNodeRendererCustomizer* returns the path `${framework}/images/myImg.png`, then to support Retina images with a scaling factor of 2, an extra file (`myImg@2x.png`)should be added to the same images directory (`${framework}/images/myImg@2x.png`). If the higher resolution icon (the *@2x* file) does not exist, the *normal* icon is scaled and used instead.

For more information about using Retina/HiDPI images, refer to the Using Retina/HiDPI Images in Author Mode section.

Note: The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the Oxygen SDK , available as a Maven archetype on the Oxygen XML Editor plugin website.

Customizing the Rendering of Elements on page 1307

Adding Custom Persistent Highlights

The *Author API* includes a class that allows you to create or remove custom persistent highlights, set new properties for the highlights, and customize their appearance. An example of a possible use case would be if you want to implement your own way of editing review comments. The custom persistent highlights get serialized in the XML document as processing instructions, with the following format:

```
<?oxy_custom_start prop1="val1"....?> xml content <?oxy_custom_end?>
```

This functionality is available through the *AuthorPersistentHighlighter* class that is accessible through the *AuthorEditorAccess#getPersistentHighlighter()* method.

For more information, see the JavaDoc details for this class at https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/highlights/AuthorPersistentHighlighter.html.

Customizing the Main CSS of a Framework

The easiest way to customize the *main* CSS stylesheet of a *framework* is to create a new stylesheet, save it as an *alternate* CSS file that will be applied as an additional layer to the *main* CSS, and then select it from the **Styles** drop-down menu in **Author** mode.

For example, suppose that you want to customize the *main* CSS for DITA documents. To do this, follow these steps:

1. First, create a new CSS stylesheet and save it in the *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/css/edit` folder (where the default *main* stylesheet named `style-basic.css` is located).
2. Edit the DITA *framework* and go to the **CSS** subtab:
   a) Open the **Preferences** dialog box and go to **Document Type Association**.
   b) Select the DITA document type and press the **Edit** button.

   Tip: If you do not have write permissions to modify the document type, use the **Extend** button to create an extension of the *framework*.

   a) Go to the **CSS** subtab of the **Author** tab.

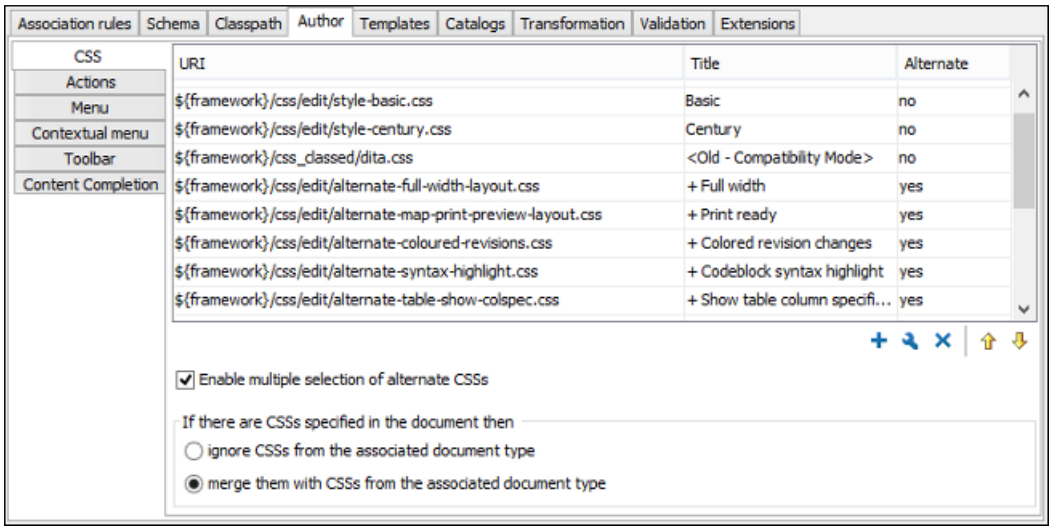

Figure 666: CSS Subtab of the Document Type Association Author Tab

3. Add the new stylesheet as an *alternate* CSS stylesheet:
   a) Click the **Add** button to open a dialog box that allows you to specify the URI and Title for your newly created stylesheet.
   b) Select the **Alternate** option to define it as an *alternate* stylesheet that will applied as an additional layer to the *main* CSS.

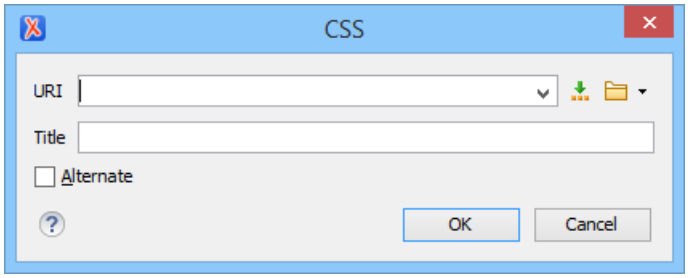

Figure 667: Add CSS Stylesheet Dialog Box

4. Press **OK** in all the dialog boxes to validate the changes.
5. Select your newly created CSS stylesheet from the **Styles** drop-down menu on the toolbar in **Author** mode. You can now edit DITA documents based on the new CSS stylesheet. You can also edit the new CSS stylesheet itself and see its effects on rendering DITA documents in the **Author** mode by using the **Refresh** action that is available on the **Author** toolbar and in the **DITA** menu.

Configuring and Managing Multiple CSS Styles on page 1315

Sharing a Framework (Document Type)

Oxygen XML Editor plugin allows you to share customizations of a specific XML document type by creating your own *framework* in the **Document Type Association** preferences page.

A *framework* (document type) can be shared with other authors by using the following method:

Save it in a Custom Folder

To share your customized *framework* with other members of your team, you can save it to a separate folder inside the *[OXYGEN_INSTALL_DIR]*`/frameworks` directory by following these steps:

Important: For this approach to work, the application must be installed in a folder with full write access.

1. Go to *[OXYGEN_INSTALL_DIR]*`/frameworks` and create a directory for your new *framework* (for example, `custom_framework`). This directory will contain the resources for your customized *framework*. See the **DocBook** *framework* structure from *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook` as an example.
2. Create your custom document type (*framework*) and specify the `custom_framework` directory for the **External** storage option.
3. Configure the custom document type according to your needs. Take special care to make all file references relative to the *[OXYGEN_INSTALL_DIR]*`/frameworks` directory by using the **${frameworks}** editor variable. See the Author Mode Customization section for more details on creating and configuring a new document type (*framework*).
4. Add any additional resources (CSS files, new document templates, schemas used for validation, catalogs, etc.) to the directory you created in step 1.
5. After completing your customizations in the **Document Type Association** preferences page, you should have a new configuration file saved in: *[OXYGEN_INSTALL_DIR]*`/frameworks/custom_framework/custom.framework`.
6. To share the new *framework* directory with other users, have them copy it to their *[OXYGEN_INSTALL_DIR]*`/frameworks` directory. The new *framework* will be available in the list of document types when Oxygen XML Editor plugin starts.

   Note: If you have a `frameworks` directory stored on your local drive, you can also go to the **Document Type Association** > **Locations** preferences page and add your `frameworks` directory in the **Additional frameworks directories** list.

Related Information:

Extending and Sharing a Framework (Document Type) on page 1299

Extending and Sharing a Framework (Document Type)

You can extend a predefined, built-in *framework* (document type), such as DITA or DocBook, using the **Document Type Association** preferences page, make modifications to it, and then share the extension with your team.

Extending a Framework

For the purpose of providing specific instructions for sharing an extended *framework*, suppose that you want to share an extension of the **DITA** *framework* in which you have removed certain elements from the content completion list. The following steps describe how you can create an extended *framework* that can be shared with others:

1. In a location where you have full write access, create a folder structure similar to this: `custom_frameworks/dita-extension`.
2. Open the **Preferences** dialog box and go to **Document Type Association** > **Locations**. In this preferences page, add the path to your `custom_frameworks` folder in the **Additional frameworks directories** list.
3. Go to the **Document Type Association** preferences page and select the **DITA** *framework* configuration and use the **Extend** button to create an extension for it.
4. Give the extension an appropriate name (for example, `DITA - Custom`), select **External** for the **Storage** option, and specify an appropriate path (for example, `path/to/.../custom_frameworks/dita-extension/dita-extension.framework`).
5. Make your changes to the extension. For example, you could go to the **Content Completion** subtab of the **Author** tab and in the **Filter - Remove content completion items** list, add elements that you do not want to be presented to the end users.
6. Click **OK** to close the dialog box and then **OK** or **Apply** to save the changes to the **Document Type Association** preferences page.

   Results: After you perform these steps you will have a fully functional *framework* in the `dita-extension` folder and it can be shared with others.

Sharing the Extended Framework

There are several ways that you can share the extended *framework* with others:

- Copy it to their *[OXYGEN_INSTALL_DIR]*`/frameworks` directory.

- Create a `custom_frameworks` folder (anywhere on disk) and copy the extended *framework* into it. Then add the path to your `custom_frameworks` folder in the **Additional frameworks directories** list in the **Document Type Association** > **Locations** preferences page.

After your team members install the *framework* they can check the list of document types in the **Document Type Association** preferences page to see if the *framework* is present and if it appears before the bundled **DITA** *framework* (meaning that it has higher priority).

Sharing a Framework (Document Type) on page 1298

Customizing the Content Completion Assistant

Oxygen XML Editor plugin gathers information from the associated schemas (DTDs, XML Schema, RelaxNG) to determine the proposals that appear in the *Content Completion Assistant*. Oxygen XML Editor plugin also includes support that allows you to customize the *Content Completion Assistant* to suit your specific needs.

There are two ways to customize the *Content Completion Assistant* in Oxygen XML Editor plugin:

- You can add, modify, or remove actions that are proposed for each particular document type (*framework*) by using the **Content Completion** subtab in the **Document Type Association** configuration dialog box. To access this subtab, open the **Preferences** dialog box , go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button, click on the **Author** tab, and then the **Content Completion** subtab.
- You can use a `cc_config.xml` configuration file that is specific to each document type (*framework*) to configure the values that are proposed in certain contexts, to customize the attributes or elements that are proposed, or to customize how certain aspects of the proposals are rendered in the interface. The rest of the topics in this section explain how you can use this configuration file to customize the content completion.

Configuring the Proposals for Elements and Attributes

There are many cases where elements have a relaxed content model and can accept a large number of child elements. For example, the DITA list item element (`li`) accepts more than 60 child elements. Oxygen XML Editor plugin includes support to allow the content architect to put some constraints on the possible elements or attributes, or to impose some best practices in the way content is edited.

For an example of a specific use-case, suppose that you want to restrict DITA list item elements (`li`) to only accept paragraph elements (p). In this case, the *Content Completion Assistant* should not offer any element other than a paragraph (p) when a list item (`li`) is inserted into a document. It would also be helpful if the required child element (p) was automatically inserted whenever a list item (`li`) is inserted.

One method of changing the content model is to alter the element definition in the associated schema (XML Schema, DTD, RelaxNG), but this may be quite complicated in some cases. Fortunately, Oxygen XML Editor plugin offers a simple, alternative method of using a configuration file to customize the content completion proposals for each element.

Setting up the Content Completion Configuration File

To customize the configuration file for the *Content Completion Assistant*, follow these steps:

1. Create a new `resources` folder (if it does not already exist) in the `frameworks` directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).
2. Open the **Preferences** dialog box and go to **Document Type Association**. Select the particular document type, click the **Edit** button, and in the **Classpath** tab add a link to that `resources` folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the *Content Completion Configuration* document template that is included in Oxygen XML Editor plugin (**File** > **New** > **New from Templates** > **Framework templates** > **Oxygen Extensions** > **Content Completion Configuration**). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the `resources` folder), you can modify this existing file.
4. Make the appropriate changes to your custom configuration file.

5. Save the file in the `resources` folder for the particular document type, using the fixed name: `cc_config.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml`).
6. Restart the application and open an XML document. In the *Content Completion Assistant* you should see your customizations.

   Tip: In some cases, you can simply use the **Refresh (F5)** action to test your customizations, without having to restart the application.

Configuring Elements or Attributes that are Proposed for Each Element

For the purposes of customizing the elements or attributes that are proposed for each individual element, the configuration file (`cc_config.xml`) uses `elementProposals` elements. This element allows you to customize or filter the child elements and attributes for an element.

Warning: Note that you can only choose elements or attributes that are already allowed by the schema in a particular context. For example, you cannot specify an element that is not allowed by the schema as a child of a particular node.

Elements:

To control the **elements** that are proposed for an element, you can use the following attributes for the `elementProposals` element:

- `path` - A path within the document that matches the element that will have its content completion proposals changed. For example, `"title"` matches all the `title` elements in the document, while `"chapter/title"` matches only the `title` elements that are direct children of the `chapter` element. You can use simplified forms of XPath in this attribute.

  The XPath expressions can accept multiple attribute conditions and inside each condition you can use *AND/OR* boolean operators and parentheses to override the priority.

  You can use one or more of the following attribute conditions (default attribute values are not taken into account):

  - *element[@attr]* - Matches all instances of the specified element that include the specified attribute.
  - *element[not(@attr)]* - Matches all instances of the specified element that do not include the specified attribute.
  - *element[@attr = "value"]* - Matches all instances of the specified element that include the specified attribute with the given value.
  - *element[@attr != "value"]* - Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

  Example: The following are examples of how you could use multiple boolean operators and parentheses inside an attribute condition:

  ```
  *[@a and @b or @c and @d]
  *[@a and (@b or @c) and @d]
  ```

  The following are just examples of how simplified XPath expressions might look like:

  - `elementName`
  - `//elementName`
  - `/elementName1/elementName2/elementName3`
  - `//xs:localName`

    Note: Using a namespace prefix requires that you declare it in the configuration file. For example: `<elementProposals xmlns:db5="http://docbook.org/ns/docbook" path="db5:listitem" insertElements="db5:para" />`
  - `//xs:documentation[@lang="en"]`

  Note: If the `path` attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use *possibleElements* or *rejectElements* to specify or restrict particular elements for a *framework*.

For example, suppose that in your DITA documents, you want to restrict your users from using `image` and `fig` elements because you do not want images to be included in your output. The configuration file should look like this:

```
<elementProposals rejectElements="image fig" />
```

Since the `path` attribute is missing, the specified element will be filtered out from the proposals for the entire *framework*.

- `insertElements` - A space-separated sequence of child element names. Each time the element specified in the `path` attribute is inserted into the document, these child elements will also be inserted in the order that they are listed. For example, `insertElements="b i"` will insert exactly one b element, followed by an `i` element. An empty value (`""`) means that no child elements should be inserted.

  Note: If this attribute is missing, the default required child elements will be inserted, as specified in the associated schema for the document.
- `possibleElements` - A space-separated list of element names that will be shown in the content completion list when invoked inside an element that is specified in the `path` attribute. For example, `"b i codeph ph"` means that the *Content Completion Assistant* will contain these four elements when invoked on the element specified in the `path` attribute. The following other possible values are also supported:
  - ***NONE*** - There will be no proposals in the content completion list.
  - ***ALL*** - All the possible elements specified in the associated schema will be presented in the content completion list. This is also the default behavior if this attribute is missing.
  - ***INSERTED*** - The proposals will be the same list of elements that are defined in the `insertElements` attribute.

  When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

  ```
  <elementProposals possibleElements="b i codeph ph" />
  ```
- `rejectElements` - A space-separated list of element names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the `path` attribute is inserted into the document, the list of proposals in the *Content Completion Assistant* will include the entries that are defined in the associated schema, minus the elements specified in this attribute.

  This setting also influences copy/paste and insertion behaviors. For example, if you reject the insertions of images in paragraphs and you try to paste an image inside a paragraph, by default the application will take your choice into account and try to insert the image in a place where it is allowed.

  When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

  ```
  <elementProposals rejectElements="image fig imagemap foreign" />
  ```

Attributes:

To control the **attributes** that are proposed for an element, you can use the following attributes for the `elementProposals` element:

- `path` - A path within the document that matches the element that will have its attribute proposals changed. For example, `"title"` matches all the `title` elements in the document, while `"chapter/title"` matches only the `title` elements that are direct children of the `chapter` element. You can use simplified forms of XPath in this attribute. For examples of such forms of XPath expressions, see the note in XML Preferences.

  Note: If this attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use *possibleAttributes* or *rejectAttributes* to specify or restrict attributes for an entire *framework*.

  For example, suppose that you only want to allow a limited set of attributes in a customized *framework*. The configuration file should look like this:

  ```
  <elementProposals possibleAttributes="
                id domains href scope format type conref
          props keyref class"/>
  ```

Since the `path` attribute is missing, this applies to the entire *framework* and only the specified attributes will be proposed.

- `insertAttributes` - A space-separated sequence of attribute names that will be inserted along with the element.

```
<elementProposals path="ol/li" insertAttributes="product platform"/>
```

- `insertAttribute` - This is similar to the preceding attribute, but this one also allows you to specify a value for the attribute that will be inserted. This attribute should be used like this:

```
<elementProposals path="ol/li">
    <insertAttribute name="platform" value="test"/>
</elementProposals>
```

- `possibleAttributes` - A space-separated list of attribute names that will be shown in the content completion list when invoked inside an element that is specified in the `path` attribute.

  When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```
<elementProposals possibleAttributes="scope format type" />
```

- `rejectAttributes` - A space-separated list of attribute names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the `path` attribute is inserted into the document, the list of proposals in the *Content Completion Assistant* will include the entries that are defined in the associated schema, minus the attributes specified in this attribute.

  When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```
<elementProposals rejectAttributes="importance platform product" />
```

Other Important Notes About the Configuration File

Important:

- By default, the element names that do not have a namespace prefix are considered from *no-namespace*. Consider declaring the namespace mapping on the root of the configuration file and prefixing the element names from the `elementPath` and `model` attributes.
- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the **Refresh (F5)** action to test your customizations.
- When an XML element from the document is matched against a list of configured `elementProposals`, the first one in sequence takes precedence. Therefore, make sure you place the more specific `elementProposals` (those with a longer path) first in your configuration file.
- Regular expression patterns can be used in the following attributes: `possibleElements`, `rejectElements`, `possibleAttributes`, and `rejectAttributes`. For example, `code*`, `*block`, `con*ref`, `_*`.
- Only simple recursion cases are detected and avoided by the editor, and logged to the console. Therefore, if complex `elementProposals` patterns are defined, you should avoid *infinite recursions*.

Examples: Configuring the Element Proposals

- **Example 1: Automatically Insert Elements**

  Suppose that you want to automatically insert a paragraph element (p) whenever a DITA ordered list item element (`ol/li`) is inserted, and also to not allow any other element besides a paragraph inside the ordered list items.

  To achieve this, the configuration file should include the following:

```
<elementProposals path="ol/li" insertElements="p"
       possibleElements="_INSERTED_"/>
```

- **Example 2: Insert Complex Element Structure**

For a more complex example, suppose that you want to insert a complex structure whenever a DITA `prolog` element is inserted.

For instance, if you need to insert the following structure inside `prolog` elements:

```
<prolog>
  <author></author>
  <metadata>
      <keywords>
          <keyword></keyword>
          <keyword></keyword>
      </keywords>
  </metadata>
</prolog>
```

The configuration file should include the following:

```
<elementProposals path="prolog" insertElements="author metadata"/>
<elementProposals path="prolog/metadata" insertElements="keywords"/>
<elementProposals path="prolog/metadata/keywords"
       insertElements="keyword, keyword"/>
```

- **Example 3: Limit Possible Elements**

  Suppose that you also want to limit the proposals for the `keywords` element to only allow the user to insert `audience` or `keyword` elements. The configuration file should include the following:

  ```
  <elementProposals path="prolog/metadata" insertElements="keywords"
            possibleElements="audience keywords"/>
  ```

  Suppose that you want to simply restrict your users from inserting `image` elements inside DITA list item elements (`li`), but still propose all the other elements that are defined in the associated schema. The configuration file should look like this:

  ```
  <elementProposals path="li" rejectElements="image" />
  ```

Examples: Configuring the Attributes Proposals

- **Example 1: Automatically Insert Attributes**

  Suppose that you want to insert an `id` attribute (with an empty value) whenever a DITA list item element (`li`) is inserted. The configuration file should include the following:

  ```
  <elementProposals path="li" insertAttributes="id"/>
  ```

- **Example 2: Limit Possible Attributes**

  Suppose that you also want to limit the number of choices for attributes that are presented to the user whenever a DITA list item element (`li`) is inserted. The configuration file should look like this:

  ```
  <elementProposals path="li" insertAttributes="id"
           possibleAttributes="id product platform audience"/>
  ```

  Suppose that you want to simply restrict your users from inserting `conref` attributes inside DITA topics (`topic` element), but still propose all the other attributes that are defined in the associated schema. The configuration file should look like this:

  ```
  <elementProposals path="topic" rejectAttributes="conref" />
  ```

Configuring the Proposals for Attribute and Element Values on page 1304
Customizing the Rendering of Elements on page 1307

Configuring the Proposals for Attribute and Element Values

Oxygen XML Editor plugin includes support for configuring the proposed values that appear in the *Content Completion Assistant*. To do so, a configuration file is used, along with the associated schema, to add or replace possible values for attributes or elements that are proposed in the *Content Completion Assistant*.

For an example of a specific use-case, suppose that you want the *Content Completion Assistant* to propose several possible values for the language code when you use an `xml:lang` attribute.

Setting up the Content Completion Configuration File

To customize the configuration file for the *Content Completion Assistant*, follow these steps:

1. Create a new `resources` folder (if it does not already exist) in the `frameworks` directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).
2. Open the **Preferences** dialog box and go to **Document Type Association**. Select the particular document type, click the **Edit** button, and in the **Classpath** tab add a link to that `resources` folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the *Content Completion Configuration* document template that is included in Oxygen XML Editor plugin (**File** > **New** > **New from Templates** > **Framework templates** > **Oxygen Extensions** > **Content Completion Configuration**). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the `resources` folder), you can modify this existing file.
4. Make the appropriate changes to your custom configuration file.
5. Save the file in the `resources` folder for the particular document type, using the fixed name: `cc_config.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml`).
6. Restart the application and open an XML document. In the *Content Completion Assistant* you should see your customizations.

   Tip: In some cases, you can simply use the **Refresh (F5)** action to test your customizations, without having to restart the application.

Configuring Proposed Values

For the purposes of adding or replacing the values that are proposed, the configuration file (`cc_config.xml`) includes a series of `match` instructions that will match an element or attribute name. You also have the possibility of using an attribute called `editable` on the `match` element to specify the editable state of the attribute values, as reflected in the **Attributes** view and the **In-place Attributes Editor**. The possible values for the `editable` attribute are:

- `true` - The attribute values can be edited by choosing from a combo box or manually providing a value.
- `false` - The attribute values cannot be edited.
- `onlyAllowedItems` - The attribute values can be edited, but only by choosing from a list of proposed values, in a non-editable combo box.

A new value is specified inside one or more `item` elements, which are grouped inside an `items` element. The behavior of the `items` element is specified with the help of the `action` attribute, which can have any of the following values:

- `append` - Adds new values to appear in the proposals list (default value).
- `addIfEmpty` - Adds new values to the proposals list only if no other values are contributed by the schema.
- `replace` - Replaces the values contributed by the schema with new values to appear in the proposals list.

The values in the configuration file can be specified either directly or by calling an external XSLT file that will extract data from an external source.

Other Important Notes About the Configuration File

Important:

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application.

Example: Specifying Values Directly

If you want to specify the values directly, the configuration file should look like this:

```
<!-- Replaces the values for an element with the local name "lg",
      from the given namespace -->
<match elementName="lg" elementNS="http://www.oxygenxml.com/ns/samples">
    <items action="replace">
        <item value="stanza"/>
        <item value="refrain"/>
    </items>
</match>

<!-- Adds two values for an attribute with the local name "type",
      from any namespace -->
<match attributeName="type" editable="onlyAllowedItems">
    <items>
        <item value="stanza"/>
        <item value="refrain"/>
    </items>
</match>
```

Example: Calling an External XSLT Script

If you want to collect values from an external XSLT script, the configuration file should include something like this:

```
<xslt href="../xsl/get_values_from_db.xsl" useCache="false" action="replace"/>
```

In this example, the `get_values_from_db.xsl` is executed to extract values from a database.

Tip: You can use `xsl:message` as a debugging mechanism. These messages are presented in the results area at the bottom of the application whenever the *Content Completion Assistant* is invoked.

Note: A comprehensive XSLT sample is included in the **Content Completion Configuration** document template (in the **Framework Templates** > **Oxygen Extensions** section of the **New from templates** wizard).

Configuring Proposed Values in the Context Where the Content Completion was Invoked

A more complex scenario is if you want to choose the possible values to propose, depending on the context of the element in which the content completion was invoked.

Suppose that you want to propose certain possible values for one property (for example, *color*) and other values for another property (for example, *shape*). If the property represents a color, then the values should represent applicable colors, while if the property represents a shape, then the values should represent applicable shapes. See the following code snippets:

Your main document:

```
<sampleArticle>
  <!-- The possible values for @value should be "red" and "blue" -->
  <property name="color" value=""/>
  <!-- The possible values for @value should be "square" and "rectangle" -->
  <property name="shape" value=""/>
</sampleArticle>
```

The content completion configuration file:

```
<config xmlns="http://www.oxygenxml.com/ns/ccfilter/config">
    <match elementName="property" attributeName="value">
      <xslt href="get_values.xsl" useCache="false" action="replace"/>
    </match>
</config>
```

The stylesheet that defines the possible values based on the context of the property on which the content completion was invoked:

```
<xsl:stylesheet
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:saxon="http://saxon.sf.net/"
  exclude-result-prefixes="xs"
  version="2.0">

  <xsl:param name="documentSystemID" as="xs:string"></xsl:param>
  <xsl:param name="contextElementXPathExpression" as="xs:string"></xsl:param>

  <xsl:template name="start">
```

```
    <xsl:apply-templates select="doc($documentSystemID)"/>
  </xsl:template>

  <xsl:template match="/">
   <xsl:variable name="propertyElement"
    select="saxon:eval(saxon:expression($contextElementXPathExpression, ./*))"/>

   <items>
     <xsl:if test="$propertyElement/@name = 'color'">
       <item value='red'/>
       <item value='blue'/>
     </xsl:if>
     <xsl:if test="$propertyElement/@name = 'shape'">
       <item value='rectangle'/>
       <item value='square'/>
     </xsl:if>
   </items>
  </xsl:template>
</xsl:stylesheet>
```

The `contextElementXPathExpression` parameter will be bound to an XPath expression that identifies the element in the context for which the content completion was invoked.

Configuring the Proposals for Elements and Attributes on page 1300

Customizing the Rendering of Elements on page 1307

Customizing the Rendering of Elements

In addition to the support for configuring the proposals that appear in the *Content Completion Assistant*, Oxygen XML Editor plugin also includes support for customizing how the elements are rendered. You can do this by using the *XMLNodeRendererCustomizer* API extension, but you can also use the same configuration file that is used to configure the content completion proposals.

For an example of a specific use-case, suppose that in DITA you want the names of paragraph elements (p) to be rendered as "**Paragraph**" instead of "**p**" in the various components in **Author** mode (such as in the **Outline** view, **Elements** view, **Attributes** view, and the breadcrumb navigation bar). To achieve this, you can use the `elementRenderings` element in the configuration file.

Setting up the Content Completion Configuration File

To customize the configuration file for the *Content Completion Assistant*, follow these steps:

1. Create a new `resources` folder (if it does not already exist) in the `frameworks` directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).
2. Open the **Preferences** dialog box and go to **Document Type Association**. Select the particular document type, click the **Edit** button, and in the **Classpath** tab add a link to that `resources` folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
   a. To easily create a new configuration file, you can use the *Content Completion Configuration* document template that is included in Oxygen XML Editor plugin (**File** > **New** > **New from Templates** > **Framework templates** > **Oxygen Extensions** > **Content Completion Configuration**). The document template includes details about how each element and attribute is used in the configuration file.
   b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the `resources` folder), you can modify this existing file.
4. Make the appropriate changes to your custom configuration file.
5. Save the file in the `resources` folder for the particular document type, using the fixed name: `cc_config.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml`).
6. Restart the application and open an XML document. In the *Content Completion Assistant* you should see your customizations.

   Tip: In some cases, you can simply use the **Refresh (F5)** action to test your customizations, without having to restart the application.

Changing the Rendering of Elements (Their Names, Annotations, and Icons)

For the purposes of customizing how the content completion elements are rendered, you can use the `render` element inside a `elementRenderings` element to specify how element names, their annotations, and their icons are rendered.

You can use the following attributes for the `render` element:

- `element` - Identifies the element to be customized, in the form of a qualified name. If it does not have a prefix, it is considered to be from *noNamespace*.
- `as` - Provides the name (label) that will be displayed for the element in various components in **Author** mode (such as in the *Content Completion Assistant*, the breadcrumb navigation bar, the **Full Tags** display mode, and the **Outline**, **Elements**, **Attributes** views). This attribute is optional. If it is missing, the name of the element is used.
- `iconPath` - Optional attribute that specifies the icon for the element. This is shown in the *Content Completion Assistant* and the **Outline** view in **Author** mode. If it is a relative path, the full path of the icon image file will be computed starting from the directory of the configuration file (for example, a value of `"myImg.png"` will cause Oxygen XML Editor plugin to load `"frameworks/${framework}/resources/myImg.png"`). If you want to access a built-in resource, the value can begin with a forward slash `"/"`, and the image file will be searched for in the Oxygen XML Editor plugin classpath resources (for example,`"/images/OrderedList16.png"` will load an icon from the built-in Oxygen XML Editor plugin *JAR* file resources.
- `xml:lang` - Optional attribute that could be used to render the same element differently, depending on the language. If there are multiple `render` elements for the same `element` attribute (element name) and the `xml:lang` attribute is missing on one of them, that one will be considered the default fallback value to be used if none of the others match the language specified in the interface.

  Note: The default entry should be listed first, since the application tries to match them in sequence and the last match found is the one that is used.

  For example, suppose that you want the name of DITA paragraph elements (p) to be rendered as "Paragraphe" if the language is French, "Absatz" if the language is German, and "Paragraph" if the language is English (or any other language). Your configuration file should look something like this:

```
<elementRenderings>
  <render element="p" as="Paragraph"/>
  <render element="p" as="Paragraphe" xml:lang="fr"/>
  <render element="p" as="Absatz" xml:lang="de"/>
</elementRenderings>
```

You can also use the configuration file to customize the annotations for elements. For this purpose, the `render` element also accepts the following element to change the tooltip annotations for an element (in both **Author** mode and **Text** mode):

- `annotation` - This element can be used within the `render` element to customize the tooltip annotations that are displayed for the element in various components in **Author** mode (such as tooltips shown in the *Content Completion Assistant* documentation window, the breadcrumb navigation bar, the **Full Tags** display mode, and the **Outline**, **Elements**, **Attributes** views), as well as the tooltips that are displayed when you hover over elements in **Text** mode. You can use HTML content to style the annotations (see the example below).

  Note: If this element is missing, the styling for the annotations for that element is collected from the associated schema.

Other Important Notes About the Configuration File for Rendering Elements

Important:

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the **Refresh (F5)** action to test your customizations.
- If the *framework* has an associated *style guide*, then the annotations defined in the configuration file will take precedence over those defined in the *style guide*. To check to see if your *framework* uses a *style guide*, look for the following folder: `${oXygenInstallDir}frameworks/${framework}/styleguide/`. If that folder exists, it is recommended that you make your annotation changes directly in the *style guide*, rather than in the configuration file.

- If an *XMLNodeRendererCustomizer* API extension has been implemented for the *framework* and a configuration file is also used, the rendering customization for an element will be the result of merging the two. For example, if the *XMLNodeRendererCustomizer* implementation customizes the element name, while the configuration file specifies an icon for the element, the properties of both customizations will be rendered. However, if both implementations define the same property (for example, both specify the rendering of an element name), the customizations defined in the configuration file take precedence.
- The rendering customizations defined in the configuration file also applies to aspects of the Oxygen XML Web Author interface.

Example: Changing the Rendering of an Element

Suppose that you want to render the name of the DITA `title` element to begin with a capital letter, use a custom icon for it, and provide specific documentation for that element in the various components in **Author** mode. The configuration file should look like this:

```
<elementRenderings>
   <render element="title"   as="Title"  iconPath="cimg/AcceptAll16.png">
      <annotation>
         <html xmlns="http://www.w3.org/1999/xhtml">
           <head>

Annotations for XML Elements and Attributes in Content Completion Assistant

Oxygen XML Editor plugin gathers documentation from the associated schemas (DTD, XML Schema, RelaxNG) and presents it for each element or attribute. For example, if you open the *Content Completion Assistant* for a recognized XML vocabulary, documentation is displayed for each element provided by the associated schema. Similar information is displayed when you hover over tag names presented in the **Elements** view. If you hover over attributes in the **Attributes** view you also see information about each attribute, gathered from the same schema.

If you have a *framework* configuration set up for your XML vocabulary, there is a special XML configuration file that can be added to provide additional documentation information or links to additional information for certain elements and attributes.

To provide this additional information in the *Content Completion Assistant*, follow these steps:

1. Create a new folder in the configuration directory for the document type.

   Example: `OXYGEN_INSTALL_DIR/frameworks/dita/styleguide`
2. Use the **New** document wizard to create a file using the **Content Completion Styleguide** document template (in the **Framework Templates** > **Oxygen Extensions** section).
3. Save the file in the folder created in step 1, using the fixed name: `contentCompletionElementsMap.xml`.
4. Open the **Preferences** dialog box , go to **Document Type Association**, and edit the document type configuration for your XML vocabulary. Now you need to indicate where Oxygen XML Editor plugin will locate your mapping file by doing one of the following:
   - In the **Classpath** tab add a link to the newly created folder.
   - In the **Catalogs** tab add a new catalog file. The selected file needs to contain the following:

     ```
     <?xml version="1.0" encoding="UTF-8"?>
     <!DOCTYPE catalog PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN"
         "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">
     ```

```
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
    <uri name="http://www.oxygenxml.com/{processed_dt_name}/styleguide/
contentCompletionElementsMap.xml" uri="contentCompletionElementsMap.xml"/>
</catalog>
```

where *{processed_dt_name}* is the name of the document type in lower case and with spaces replaced by underscores.

Note: If Oxygen XML Editor plugin finds a mapping file in both locations, the one in the **Catalogs** tab takes precedence.

5. Make the appropriate changes to your custom mapping file.

   Example: You can look at how the DITA mapping file is configured: `OXYGEN_INSTALL_DIR/frameworks/dita/styleguide/contentCompletionElementsMap.xml`

   The associated XML Schema contains additional details about how each element and attribute is used in the mapping file.
6. Re-open the application and open an XML document.

In the *Content Completion Assistant*, you should see the additional annotations for each element.

    </xsl:template>

</xsl:stylesheet>
```

CSS Support in Author Mode

Author editing mode supports most CSS 2.1 selectors, numerous CSS 2.1 properties, and some CSS 3 selectors. Also, some custom functions and properties that extend the W3C CSS specification, and are useful for URL and string manipulation, are available to developers who create **Author** editing *frameworks*.

Configuring and Managing Multiple CSS Styles

Oxygen XML Editor plugin provides a **Styles** drop-down menu on the toolbar that allows you to select one *main (non-alternate) CSS style* and multiple *alternate CSS styles*. This makes it easy to change the look of the document as it appears in **Author** mode and the output without having to continually edit the CSS stylesheets.

An example of a common use case is when content authors want to use custom styling within a document. You can select a *main* CSS stylesheet that styles the whole document and then apply *alternate* styles, as layers, to specific parts of the document.

Managing the CSS Styles

The *main* and *alternate* styles that are listed in the **Styles** drop-down menu can be controlled in the **Document Type** configuration dialog box. To access it, follow these steps:

1. Open the **Preferences** dialog box .
2. Go to **Document Type Association**.
3. Select the appropriate document type and press the **Edit** button.

   Important: If you do not have access rights to the folder where the *framework* files are stored, you can either elevate read/write permissions on that *framework* folder or you can extend the *framework* and customize the CSS stylesheets in the extension. If you want to share the customized extension with the rest of your team, see Sharing the Extended Framework on page 1299.

The CSS styles (CSS files) associated with the particular document type are listed in the **CSS** subtab of the **Author** tab.

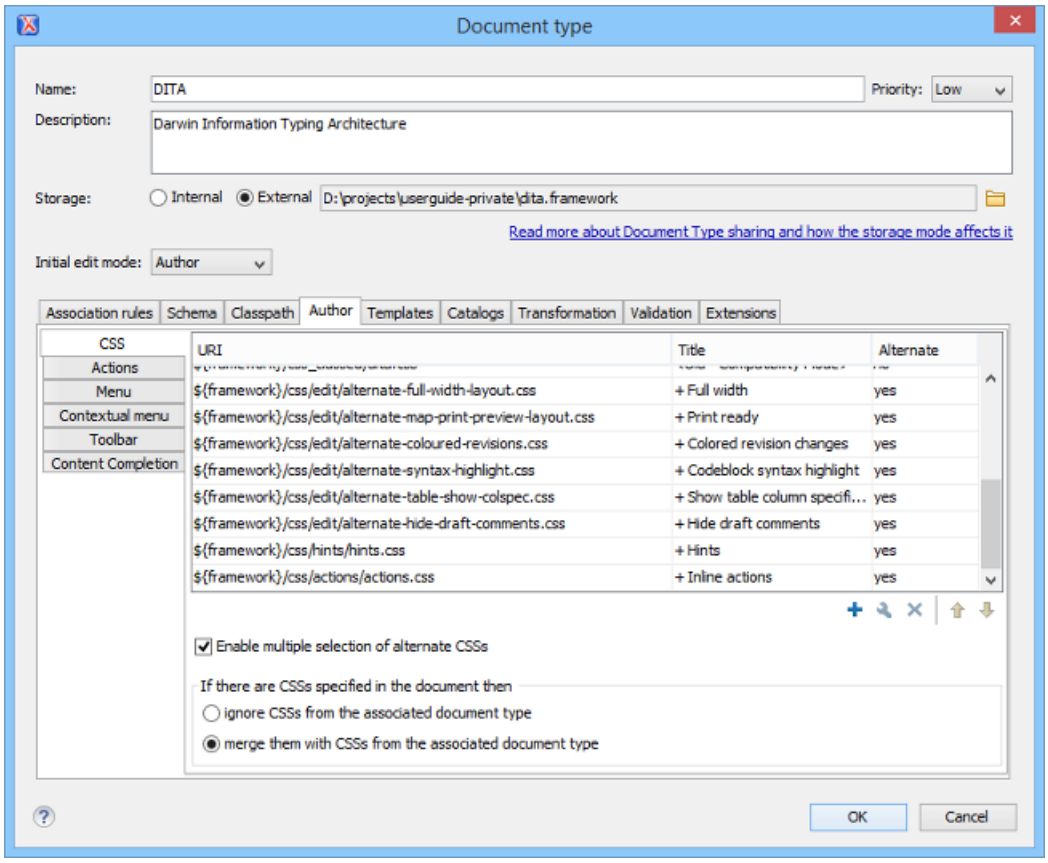

Figure 668: Main and Alternate CSS Styles in the Document Type Configuration Dialog Box

You can **Add**, **Edit**, or **Delete** styles from this dialog box to manage the *main* and *alternate* styles associated to the particular document type. You can also change the order of the styles by using the **Move Up** and **Move Down** buttons. This will also change the order that they appear in the **Styles** drop-down menu. The *alternate* styles are combined with the *main* CSS sequentially, in the order that they appear in this list. Therefore, if the same style rules are included in multiple CSS files, the rules that are defined in the last *alternate* style in this list will take precedence, since it is the last one to be combined (applied as a layer).

The **URI** column shows the path of each CSS file. The names listed in the **Styles** drop-down menu match the values in the **Title** column. The value in the **Alternate** column determines whether it is a *main* or *alternate* CSS. If the value is *no* it is a *main* CSS. If the value is *yes* it is an *alternate* CSS and the style can be combined with a *main* CSS or other *alternate* styles when using the **Styles** drop-down menu.

Note: To group alternate styles into categories (submenus), use a vertical bar character (|) in the **Title** column. You can use multiple vertical bars for multiple submenus. The text before each vertical bar will be rendered as the name of a submenu entry in the **Styles** drop-down menu, while the text after the final vertical bar will be rendered as the name of the style inside the submenu.

Example: Suppose that you want to add two alternate stylesheets in separate submenus, with the **Title** column set to `My Styles|User Assistance|Hints` and `My Styles|User Actions|Inline Actions`, respectively.

URI	Title	Alternate
${framework}/css/hints/hints.css	My Styles|User Assistance| Hints	yes
${framework}/css/actions/actions.css	My Styles|User Actions|Inline actions	yes

Oxygen XML Editor plugin will add a `My Styles` submenu with two submenus (`User Assistance` that contains the `Hints` style, and `User Actions` that contains the `Inline Actions` style) in the **Styles** drop-down menu.

The **Enable multiple selection of alternate CSSs** checkbox at the bottom of the pane must be selected for the *alternate styles*to be combined. They are applied like layers and you can activate any number of them. If this option is not selected, the *alternate* styles are treated like *main CSS styles* and you can only select one at a time. By default, this option is selected. There are also a few options that allow you to specify how to handle the CSS if there are CSS styles specified in the document. You can choose to *ignore* or *merge* them.

The following rules apply for merging CSS styles:

- CSS files with the same title will be merged.
- CSS files without a title will contribute to all others.
- They are merged sequentially, in the order that they appear in the list.

Using the Styles Drop-Down Menu

You can use the **Styles** drop-down menu to select a *main style* that applies to the whole document and then select one or more *alternate styles* that behave like layers and are merged sequentially with the *main style*. The *main* styles are listed in the top section, while the *alternate styles* are listed in the bottom section. The styles (defined in their respective CSS files) that are selected in this drop-down menu are used to render your documents in **Author** mode and in the output.

Note: If you deselect the **Enable multiple selection of alternate CSSs** option in the **CSS** subtab of the **Document Type** configuration dialog box, the *alternate styles* are treated like *main CSS styles* and you can only select one at a time.

The selections from the **Styles** drop-down menu are persistent, meaning that Oxygen XML Editor plugin will remember the selections when subsequent documents are opened.

EXAMPLE: CSS Styles in DITA

Oxygen XML Editor plugin comes with a set of predefined CSS layer stylesheets for DITA documents (as well as some that are specifically for *DITA maps*). In the subsequent figure, a DITA document has the **Century** style selected for the *main CSS style* and the *alternate styles* **Full width**, **Show table column specification**, **Hints**, and **Inline actions** are combined for additive styling to specific parts of the document.

Tip: The **Hints** style displays tooltips throughout DITA documents that offer additional information to help you with the DITA structure. The **Inline actions** style displays possible elements that are allowed to be inserted at various locations throughout DITA documents.

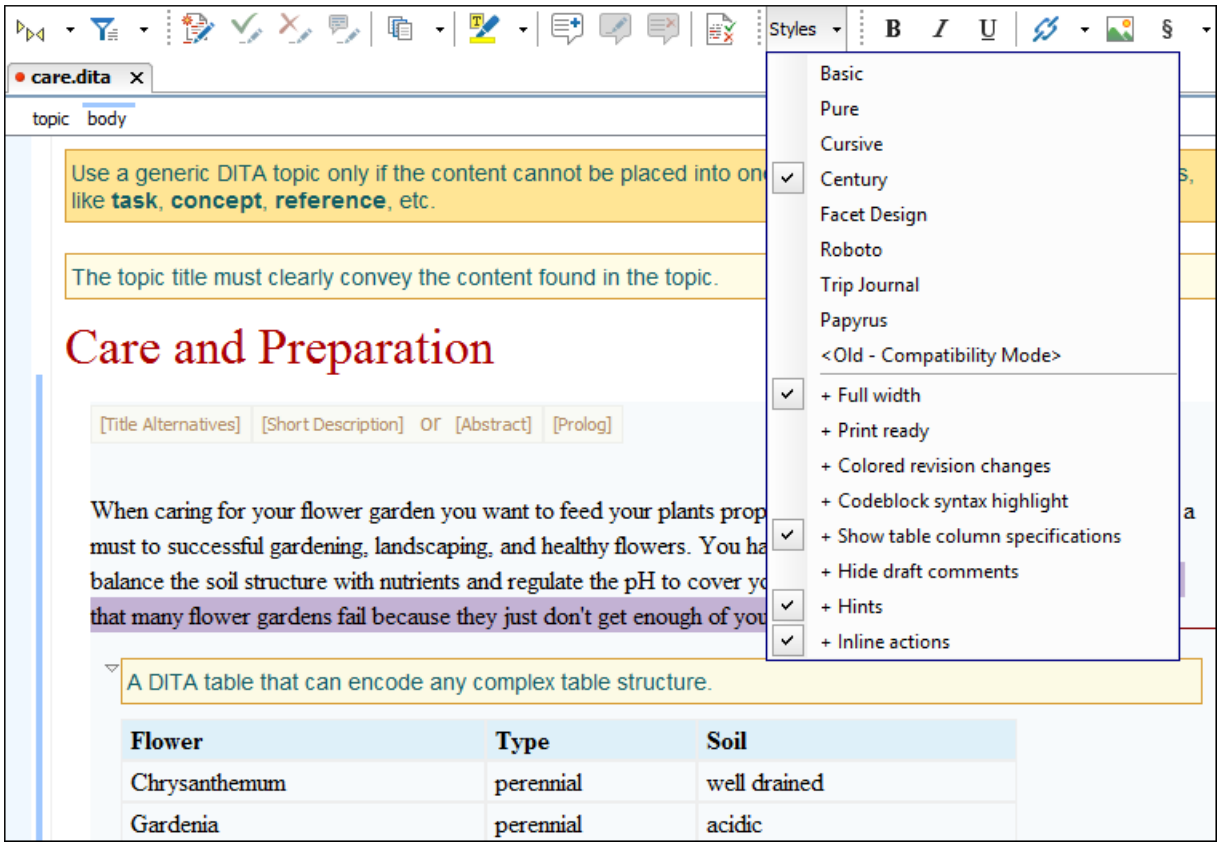

Figure 669: Styles Drop-down Menu in a DITA Document

Customizing the Main CSS of a Framework on page 1297

Handling CSS Imports

When a CSS document contains imports to other CSS documents, the references are also passed through the *XML Catalog* URI mappings to determine an indirect CSS referenced location.

Example: CSS Import

For example, if you can have a CSS import, such as:

```
@import "http://host/path/to/location/custom.css";
```

and then add your own *XML Catalog* file that maps the location to a custom CSS in the **XML Catalog** preferences page:

```
<uri name="http://host/path/to/location/custom.css"
      uri="path/to/custom.css"/>
```

Add a Custom Default CSS for Every XML Document

To add a custom CSS that is applied to every XML document, add a mapping in your *XML Catalog* file that looks like this:

```
<uri name="http://www.oxygenxml.com/extensions/author/css/userCustom.css"
      uri="path/to/custom.css"/>
```

This extra mapped CSS location will be parsed every time the application processes the CSS stylesheets used to render the opened XML document in the visual **Author** editing mode. This allows your custom CSS to be used without the need to modify all other CSS stylesheets contributed in the document type configuration.

Editor Variables in CSS Imports

You can use various editor variables in CSS imports. When editing an XML document with an associated CSS in **Author** mode, the editor variables will be expanded and resolved.

Example: Editor Variable in a CSS Import

For example, the following editor variable:

```
@import "${framework(DITA)}/custom.css";
```

is resolved in the DITA *framework* folder where the `custom.css` is placed.

`oxygen` Media Type

The CSS stylesheets can specify how a document is presented on different types of media (on the screen, paper, etc.) You can specify that some of the selectors from your CSS should be taken into account only in the Oxygen XML Editor plugin **Author** mode and ignored in other media types. This can be accomplished by using the `oxygen` media type.

Example: *oxygen* Media Type

```
b{
 font-weight:bold;
 display:inline;
}

@media oxygen{
 b{
  text-decoration:underline;
 }
}
```

This example results in the text being bold if the document is opened in a web browser that does not recognize `@media oxygen`, while the text is bold and underlined when opened in Oxygen XML Editor plugin **Author** mode.

You can also use the `oxygen` media type to specify CSS selectors to be applied in certain operating systems or platforms by using the `os` and `platform` properties. For example, you can specify one set of style rules for displaying Oxygen XML Editor plugin in Windows, and another set of style rules for Mac OS. The supported properties are as follows:

- **os** - The possible values are: `win`, `linux`, or `mac`.
- **platform** - The possible values are: `standalone`, `eclipse`, or `webapp`.

Example: *os* and *platform* Properties

```
@media oxygen AND (os:"win") AND (platform:"standalone") {
    p{
        content:"PPP";
    }
}
```

Related Information:

@media Rule on page 1320

CSS At-Rules

Oxygen XML Editor plugin supports some of the standard at-rules specified by CSS Level 2.1 and 3. The `@media` rule also include support for some style rules that are specific to Oxygen XML Editor plugin.

@font-face At-Rule

Oxygen XML Editor plugin allows you to use custom fonts in the **Author** mode by specifying them in the CSS using the `@font-face` media type. Only the `src` and `font-family` CSS properties can be used for this media type.

Example: *@font-face* Rule

```
@font-face{
    font-family:"Baroque Script";
    /*The location of the loaded TTF font must be relative to the CSS*/
    src:url("BaroqueScript.ttf");
```

```
}
```

The specified `font-family` must match the name of the font declared in the `.ttf` file.

@media Rule

The @media rule allows you to set different style rules for multiple types of media in the same stylesheet. For example, you can set the font size to be different on the screen than on paper. Oxygen XML Editor plugin supports several media types, allowing you to set the style rules for presenting a document on various media (on screen, paper, etc.)

Supported Media Types

- `screen` - The styles marked with this media type are used only for rendering a document on screen.
- `print` - The styles marked with this media type are used only for printing a document.
- `all` - The styles marked with this media type are used for rendering a document in all supported types of media.
- `oxygen` - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor plugin **Author** mode. For more information, see oxygen Media Type on page 1319.
- `oxygen-dark-theme` - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor plugin **Author** mode when a dark theme is used (for example, *Graphite*).
- `oxygen-high-contrast-black` - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor plugin **Author** mode on a Windows High Contrast Theme with a black background.
- `oxygen-high-contrast-white` - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor plugin **Author** mode on a Windows High Contrast Theme with a white background.

Example: *@media* Rule

```
@media oxygen{
 b{
  text-decoration:underline;
 }
}
@media oxygen-high-contrast-white{
 b{
  font-weight:bold;
 }
}
```

Supported Properties

Oxygen XML Editor plugin also supports a few properties to set specific style rules that depend upon the size of the visible area in **Author** mode. These supported properties are as follows:

- `min-width` - The styles selected in this property are applied if the visible area in **Author** mode is equal to or greater than the specified value.
- `max-width` - The styles selected in this property are applied if the visible area in **Author** mode is less than or equal to the specified value.

Example: *min-width* and *max-width* Properties

```
@media (min-width:500px){
 p{
    content:'XXX';
 }
}
@media (max-width:700px){
 p:after{
    content:'yyy';
 }
}
```

oxygen Media Type on page 1319

Standard W3C CSS Supported Features

Oxygen XML Editor plugin supports most of the CSS Level 3 selectors and most of the CSS Level 2.1 properties

Supported CSS Selectors

The following table lists the CSS selectors that are supported in Oxygen XML Editor plugin:

Expression	Name	CSS Level	Description / Example
`*`	Universal selector	CSS Level 2	Matches any element
`E`	Type selector	CSS Level 2	Matches any E element (i. e. an element with the local name E)
`E F`	Descendant selector	CSS Level 2	Matches any F element that is a descendant of an E element.
`E > F`	Child selectors	CSS Level 2	Matches any F element that is a child of an element E.
`E:lang(c)`	Language pseudo-class	CSS Level 2	Matches element of type E if it is in (human) language c (the document language specifies how language is determined).
`E + F`	Adjacent selector	CSS Level 2	Matches any F element immediately preceded by a sibling element E.
`E ~ F`	General sibling selector	CSS Level 3	Matches any F element preceded by a sibling element E.
`E[foo]`	Attribute selector	CSS Level 2	Matches any E element with the `"foo"` attribute set (whatever the value).
`E[foo="warning"]`	Attribute selector with value	CSS Level 2	Matches any E element whose `"foo"` attribute value is exactly equal to `"warning"`.
`E[foo~="warning"]`	Attribute selector containing value	CSS Level 2	Matches any E element whose `"foo"` attribute value is a list of space-separated values, one of which is exactly equal to `"warning"`.
`E[lang|="en"]`	Attribute selector containing hyphen separated values	CSS Level 2	Matches any E element whose `"lang"` attribute has a hyphen-separated list of values beginning (from the left) with `"en"`.
`E:before` and `E:after`	Pseudo elements	CSS Level 2	The `':before'` and `':after'` pseudo-elements can be used to insert generated content before or after an element's content.
`E:before(n)` and `E:after(n)`	Pseudo elements	CSS Level 3	Multiple `':before(n)'` and `':after(n)'` pseudo-elements can be used to insert content before or after the content of an element (or other pseudo-element). For more information, see the W3C CSS3 pseudo elements site.

Expression	Name	CSS Level	Description / Example
`E:first-child`	The first-child pseudo-class	CSS Level 2	Matches element E when E is the first child of its parent.
`E:not(s)`	Negation pseudo-class	CSS Level 2	An E element that does not match simple selector s.
`E:has`	Relational pseudo-class	CSS Level 4	The `:has()` relational pseudo-class is a functional pseudo-class that takes a relative selector as an argument. For more information, see :has Relational Pseudo-Class on page 1325.
`E:hover`	The hover pseudo-class	CSS Level 2	The `:hover` pseudo-class applies while the user designates an element with a pointing device, but does not necessarily activate it. When moving the pointing device over an element, all the parent elements up to the root are taken into account.
`E:focus`	The focus pseudo-class	CSS Level 2	The `:focus` pseudo-class applies while an element has the focus (accepts keyboard input).
`E:focus-within`	The generalized input focus pseudo-class	CSS Level 4	The `:focus-within` pseudo-class applies to elements for which the `:focus` pseudo-class applies. Additionally, the ancestors of an element that matches `:focus-within` also match.
`E#myid`	The ID selector	CSS Level 2	Matches any E element with ID equal to "myid". **Important:** Limitation: In Oxygen XML Editor plugin the match is performed only taking into account the attributes with the exact name: *"id"*.
`E[att^="val"]`	Substring matching attribute selector	CSS Level 3	An E element whose `att` attribute value begins exactly with the string `val`.
`E[att$="val"]`	Substring matching attribute selector	CSS Level 3	An E element whose `att` attribute value ends exactly with the string `val`.
`E[att*="val"]`	Substring matching attribute selector	CSS Level 3	An E element whose `att` attribute value contains the substring `val`.
`E:root`	Root pseudo-class	CSS Level 3	Matches the root element of the document. In HTML, the root element is always the HTML element.
`E:empty`	Empty pseudo-class	CSS Level 3	An E element that has no text or child elements.

Expression	Name	CSS Level	Description / Example
`E:nth-child(n)`	The nth-child pseudo-class	CSS Level 3	An E element, the nth child of its parent.
`E:nth-last-child(n)`	The nth-last-child pseudo-class	CSS Level 3	An E element, the nth child of its parent, counting from the last one.
`E:nth-of-type(n)`	The nth-of-type pseudo-class	CSS Level 3	An E element, the nth sibling of its type.
`E:nth-last-of-type(n)`	The nth-last-of-type pseudo-class	CSS Level 3	An E element, the nth sibling of its type, counting from the last one.
`E:last-child`	The last-child pseudo-class	CSS Level 3	An E element, last child of its parent.
`E:first-of-type`	The first-of-type pseudo-class	CSS Level 3	An E element, first sibling of its type.
`E:last-of-type`	The last-of-type pseudo-class	CSS Level 3	An E element, last sibling of its type.
`E:only-child`	The only-child pseudo-class	CSS Level 3	An E element, only child of its parent.
`E:only-of-type`	The only-of-type pseudo-class	CSS Level 3	An E element, only sibling of its type.
`ns|E`	Element namespace selector	CSS Level 3	An element that has the local name E and the namespace given by the prefix `ns`. The namespace prefix can be bound to a URI by the at-rule: `@namespace ns "http://some_namespace_uri";` See Namespace Selector on page 1323.
`E!>F`	The subject selector	CSS Level 4 (experimental)	An element that has the local name E and has a child F. See Subject Selector on page 1324.

Namespace Selector

In the CSS 2.1 standard, the element selectors ignore the namespaces of the elements they are matching. Only the local name of the elements are considered in the selector matching process.

Oxygen XML Editor plugin uses a different approach that is similar to the CSS Level 3 specification. If the element name from the CSS selector is not preceded by a namespace prefix it is considered to match an element with the same local name as the selector value and ANY namespace. Otherwise, the element must match both the local name and the namespace.

In CSS up to version 2.1 the name tokens from selectors are matching all elements from ANY namespace that have the same local name. Example:

```
<x:b xmlns:x="ns_x"/>
<y:b xmlns:y="ns_y"/>
```

Are both matched by the rule:

```
b {font-weight:bold}
```

Starting with CSS Level 3 you can create selectors that are namespace aware.

Example: Defining both prefixed namespaces and the default namespace

Given the namespace declarations:

```
@namespace sync "http://sync.example.org";
@namespace "http://example.com/foo";
```

In a context where the default namespace applies:

sync|A

represents the name A in the `http://sync.example.org` namespace.

|B

represents the name B that belongs to NO NAMESPACE.

***|C**

represents the name C in ANY namespace, including NO NAMESPACE.

D

represents the name D in the `http://example.com/foo` namespace.

Example: Defining only prefixed namespaces

Given the namespace declaration:

```
@namespace sync "http://sync.example.org";
```

Then:

sync|A

represents the name A in the `http://sync.example.org` namespace.

|B

represents the name B that belongs to NO NAMESPACE.

***|C**

represents the name C in ANY namespace, including NO NAMESPACE.

D

represents the name D in ANY namespace, including NO NAMESPACE.

Example: Defining prefixed namespaces combined with pseudo-elements

To match the `def` element its namespace will be declared, bind it to the *abs* prefix, and then write a CSS rule:

```
@namespace abs "http://www.oxygenxml.com/sample/documentation/abstracts";
```

Then:

abs|def

represents the name "def" in the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

abs|def:before

represents the :before pseudo-element of the "def" element from the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

Subject Selector

Oxygen XML Editor plugin supports the subject selector described in CSS Level 4 (currently a working draft at W3C http://www.w3.org/TR/selectors4/). This selector matches a structure of the document, but unlike a compound selector, the styling properties are applied to the subject element (the one marked with "!") instead of the last element from the path.

The subject of the selector can be explicitly identified by appending an exclamation mark (!) to one of the compound selectors in a selector. Although the element structure that the selector represents is the same with or

without the exclamation mark, indicating the subject in this way can change which compound selector represents the subject in that structure.

Example:

```
table! > caption {
  border: 1px solid red;
}
```

A border will be drawn to the table elements that contain a caption, as direct child.

This is different from:

```
table > caption {
  border: 1px solid red;
}
```

This draws a border around the caption.

Taking Processing Instructions into Account in CSS Subject Selectors

You can test for the existence of specific processing instructions (`PI`) in the child hierarchy of a subject selector.

For example:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```
<chapter>
   <title>A title</title>
   <?important level='high'?>
</chapter>
```

Descendant Selectors Limitation

Important: The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```
a:has(b c)
```

and:

```
a:has(b>c)
```

Related Information:

:has Relational Pseudo-Class on page 1325

`:has` Relational Pseudo-Class

Oxygen XML Editor plugin supports the CSS Level 4 subject selector (currently a working draft at W3C http://www.w3.org/TR/selectors4/), as described in Subject Selector on page 1324. Oxygen XML Editor plugin also supports the `:has` relational pseudo-class that has similar functionality and it can match an element by taking its child elements into account. For more information, see https://drafts.csswg.org/selectors-4/#relational.

You can create conditions that take into account the structure of the matching element.

Example: *has* Pseudo Class

```
table:has( tbody > thead){
 border: 1px solid red;
}
```

This example will result in a border being drawn for the table elements that contain at least a `thead` element in the `tbody` element.

Taking Processing Instructions into Account in CSS Subject Selectors

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```
<chapter>
   <title>A title</title>
   <?important level='high'?>
</chapter>
```

Descendant Selectors Limitation

Important: The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```
a:has(b c)
```

and:

```
a:has(b>c)
```

Supported CSS Properties

Oxygen XML Editor plugin validates all CSS 2.1 properties, but does not render *aural* and *paged* categories properties in **Author** mode, as well as some of the values of the *visual* category that are listed below under the **Ignored Values** column. For the Oxygen XML Editor plugin-specific (extension) CSS properties, see Oxygen XML Editor plugin CSS Extensions on page 1332.

Name	Rendered Values	Ignored Values
'background-attachment'	NONE	
'background-color'	<color> | inherit	transparent

Oxygen XML Editor plugin CSS Extensions on page 1332

Transparent Colors

CSS3 supports RGBA colors. The RGBA declaration allows you to set opacity (via the Alpha channel) as part of the color value. A value of `0` corresponds to a completely transparent color, while a value of 1 corresponds to a completely opaque color. To specify a value, you can use either a *real* number between `0` and 1, or a percent.

Example: RGBA Color

```
personnel:before {
    display:block;
    padding: 1em;
    font-size: 1.8em;
    content: "Employees";
    font-weight: bold;
    color:#EEEEEE;
    background-color: rgba(50, 50, 50, 0.6);
}
```

`attr()` Function: Properties Values Collected from the Edited Document

In CSS Level 2.1 you may collect attribute values and use them as content *only* for the pseudo-elements. For instance, the `:before` pseudo-element can be used to insert some content before an element. This is valid in CSS 2.1:

```
title:before{
  content: "[Audience Level: " attr(audience) "]";
}
```

If the `title` element from the XML document is:

```
<title audience="Expert">Changing the Timing Belt</title>
```

Then the title will be displayed as:

```
[Audience Level: Expert] Changing the Timimg Belt
```

In Oxygen XML Editor plugin, the use of `attr()` function is available not only for the `content` property, but also for any other property. This is similar to the CSS Level 3 working draft: http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional. The arguments of the function are:

`attr ( attribute_name , attribute_type , default_value )`

`attribute_name`

The attribute name. This argument is required.

`attribute_type`

The attribute type. This argument is optional. If it is missing, argument's type is considered `string`. This argument indicates what is the meaning of the attribute value and helps to perform conversions of this value. Oxygen XML Editor plugin accepts one of the following types:

`color`

The value represents a color. The attribute may specify a color in various formats. Oxygen XML Editor plugin supports colors specified either by name (`red`, `blue`, `green`, etc.) or as an RGB hexadecimal value `#FFEEFF`.

`url`

The value is a URL pointing to a media object. Oxygen XML Editor plugin supports only images. The attribute value can be a complete URL, or a relative one to the XML document. Note that this URL is also resolved through the catalog resolver.

`integer`

The value must be interpreted as an integer.

`number`

The value must be interpreted as a float number.

`length`

The value must be interpreted as an integer.

`percentage`

The value must be interpreted relative to another value (length, size) expressed in percents.

`em`

The value must be interpreted as a size. 1 em is equal to the *font-size* of the relevant font.

`ex`

The value must be interpreted as a size. 1 ex is equal to the *height* of the **x** character of the relevant font.

`px`

The value must be interpreted as a size expressed in pixels relative to the viewing device.

`mm`

The value must be interpreted as a size expressed in millimeters.

`cm`

The value must be interpreted as a size expressed in centimeters.

`in`

The value must be interpreted as a size expressed in inches. 1 inch is equal to 2.54 centimeters.

`pt`

The value must be interpreted as a size expressed in points. The points used by CSS2 are equal to 1/72th of an inch.

pc

The value must be interpreted as a size expressed in picas. 1 pica is equal to 12 points.

default_value

This argument specifies a value that is used by default if the attribute value is missing. This argument is optional.

Example: *attr* Function

Consider the following XML instance:

```
<sample>
   <para bg_color="#AAAAFF">Blue paragraph.</para>
   <para bg_color="red">Red paragraph.</para>
   <para bg_color="red" font_size="2">Red paragraph with large font.</para>
   <para bg_color="#00AA00" font_size="0.8" space="4">
        Green paragraph with small font and margin.</para>
</sample>
```

The `para` elements have `bg_color` attributes with RGB color values (such as #AAAAFF). You can use the `attr()` function to change the elements appearance in the editor based on the value of this attribute:

```
background-color:attr(bg_color, color);
```

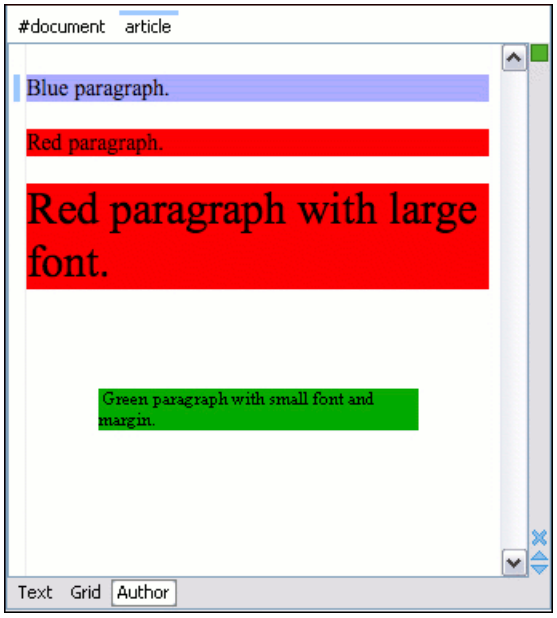
The attribute `font_size` represents the font size in *em* units. You can use this value to change the style of the element:

```
font-size:attr(font_size, em);
```

The complete CSS rule is:

```
para{
 display:block;
 background-color:attr(bg_color, color);
 font-size:attr(font_size, em);
 margin:attr(space, em);
}
```

The document is rendered as:



Oxygen XML Editor plugin CSS Extensions

CSS stylesheets provide support for displaying documents. When editing non-standard documents, Oxygen XML Editor plugin CSS extensions are useful.

Examples of how they can be used:

- Property for marking *foldable elements* in large files.
- Enforcing a display mode for the XML tags, regardless of the current mode selected by the user.
- Constructing a URL from a relative path location.
- String processing functions.

Built-in CSS Selectors

When Oxygen XML Editor plugin renders content in the **Author** mode, it adds built-in CSS selectors (in addition to the CSS stylesheets linked in the XML or specified in the document type associated to the XML document). These built-in CSS selectors are processed before all other CSS content, but they can be overwritten if the CSS developer wants to modify a default behavior.

List of CSS Selector Contributed by Oxygen XML Editor plugin

```

    content:url(../images/link.png);
    link: attr(xlink|href) !important;
}

/*No direct display of the MathML and SVG images.*/
svg|svg{
 display:inline !important;
    white-space: -oxy-trim-when-ws-only !important;
}

svg|svg * {
    display:none !important;
    white-space:normal !important;
}

mml|math{
 display:inline !important;
    white-space: -oxy-trim-when-ws-only !important;
}
mml|math mml|*{
    display:none !important;
    white-space: normal !important;
}

/*Text direction attributes*/
*[dir='rtl'] { direction:rtl; unicode-bidi:embed; }
*[dir='rlo'] { direction:rtl; unicode-bidi:bidi-override; }

*[dir='ltr'] { direction:ltr; unicode-bidi:embed; }
*[dir='lro'] { direction:ltr; unicode-bidi:bidi-override; }

@media oxygen-high-contrast-black, oxygen-dark-theme{
    xi|include:before,
    xi|include:after{
        color:#808080 !important;
    }
}
```

Example:

To show all entities in the **Author** mode as transparent, without a gray background, first define in your CSS after all imports the namespace:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";
```

and then add the following selector:

```
oxy|entity {
    background-color: inherit !important;
}
```

Additional CSS Selectors

Oxygen XML Editor plugin provides support for selecting additional types of nodes. These custom selectors apply to: *document*, *doctype sections*, *processing-instructions*, *comments*, *CDATA sections*, *reference sections*, and *entities*. *Processing-instructions* are not displayed by default. To display them, open the **Preferences** dialog box , go to **Editor** > **Author**, and select **Show processing instructions**.

Note: The custom selectors are presented in the default CSS for **Author** mode and all of their properties are marked with an *!important* flag. For this reason, you have to set the *!important* flag on each property of the custom selectors from your CSS to be applicable.

For the custom selectors to work in your CSS stylesheets, declare the **Author** mode extensions namespace at the beginning of the stylesheet documents:

```
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
```

- The `oxy|document` selector matches the entire document:

  ```
  oxy|document {
      display:block !important;
  }
  ```

- The following example changes the rendering of doctype sections:

  ```
  oxy|doctype {
      display:block !important;
      color:blue !important;
      background-color:transparent !important;
  }
  ```

- To match the processing instructions, you can use the `oxy|processing-instruction` selector:

  ```
  oxy|processing-instruction {
      display:block !important;
      color:purple !important;
      background-color:transparent !important;
  }
  ```

  A processing instruction usually has a target and one or more pseudo attributes:

  ```
  <?target_name data="b"?>
  ```

  You can match a processing instruction with a particular target from the CSS using the construct:

  ```
  oxy|processing-instruction[target_name]
  ```

  You can also match the processing instructions having a certain target and pseudo attribute value, such as:

  ```
  oxy|processing-instruction[target_name][data="b"]
  ```

- The XML comments display in **Author** mode can be changed using the `oxy|comment` selector:

  ```
  oxy|comment {
      display:block !important;
      color:green !important;
      background-color:transparent !important;
  }
  ```

- The `oxy|cdata` selector matches CDATA sections:

  ```
  oxy|cdata{
      display:block !important;
      color:gray !important;
      background-color:transparent !important;
  }
  ```

- The `oxy|entity` selector matches the entities content:

  ```
  oxy|entity {
      display:morph !important;
      editable:false !important;
      color:orange !important;
      background-color:transparent !important;
  }
  ```

  To match particular entities, use the `oxy|entity` selector in expressions such as:

  ```
  oxy|entity[name='amp'],
  oxy|entity[name='lt'],
  oxy|entity[name='gt'],
  oxy|entity[name='quot'],
  oxy|entity[name='apos'],
  oxy|entity[name^='#']{
      -oxy-display-tags: none;
  }
  ```

- The *references to entities*, *XInclude*, and *DITA conrefs* and *conkeyrefs* are expanded by default in **Author** mode and the referenced content is displayed. The referenced resources are displayed inside the element or entity that refers to them.

- You can use the `reference` property to customize the way these references are rendered in **Author** mode:

```
oxy|reference {
  border:1px solid gray !important;
}
```

In the **Author** mode, content is highlighted when text contains comments and changes (if *Track Changes* was active when the content was modified).

If this content is referenced, the **Author** mode does not display the highlighted areas in the new context. If you want to mark the existence of this comments and changes you can use the `oxy|reference[comments]`, `oxy|reference[changeTracking]`, and `oxy|reference[changeTracking][comments]` selectors.

Note: Two artificial attributes (`comments` and `changeTracking`) are set on the reference node, containing information about the number of comments and tracked changes in the content.

- The following example represents the customization of the reference fragments that contain comments:

```
oxy|reference[comments]:before {
  content: "Comments: " attr(comments) !important;
}
```

- To match reference fragments based on the fact that they contain tracked changes inside, use the `oxy|reference[changeTracking]` selector.

```
oxy|reference[changeTracking]:before {
  content: "Change tracking: " attr(changeTracking) !important;
}
```

- Here is an example of how you can set a custom color to the reference containing both tracked changes and comments:

```
oxy|reference[changeTracking][comments]:before {
  content: "Change tracking: " attr(changeTracking)
           " and comments: " attr(comments) !important;
}
```

Figure 670: Example: A Document Rendered Using these Rules

Additional CSS Properties

Oxygen XML Editor plugin offers an extension of the standard CSS properties suited for content editing.

Folding Elements: -oxy-foldable

Oxygen XML Editor plugin allows you to declare some elements to be *foldable*. This is especially useful when working with large documents organized in logical blocks, editing a large DocBook article or book, for instance. Oxygen XML Editor plugin marks the *foldable* content with a small blue triangle. When you hover with your mouse pointer over this marker, a dotted line borders the collapsible content. The following actions are available in the **Folding** submenu of the contextual menu:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))

Folds all the elements except the current element.

Collapse Child Folds (Ctrl + NumPad- (Command + NumPad- on OS X))

Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on OS X))

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))

Unfolds all elements in the current document.

To define the element whose content can be *folded* by the user, you must use the property: `-oxy-foldable:true;`. To define the elements that are *folded* by default, use the `-oxy-folded:true` property.

Note: The `-oxy-folded` property works in conjunction with the `-oxy-foldable` property. Thus, the `folded` property is ignored if the `-oxy-foldable` property is not set on the same element.

When collapsing an element, it is useful to keep some of its content visible (for example, a short description of the collapsed region). The property `-oxy-not-foldable-child` is used to identify the child element that is kept visible. It accepts as value an element name or a list of comma separated element names. The first child element from the XML document that appears in the list of element names will be identified as the not *foldable* child and displayed. If the element is marked as *foldable* (`-oxy-foldable:true;`) but it doesn't have the property `-oxy-not-foldable-child` or none of the specified *non-foldable* children exists, then the element is still *foldable*. In this case the element kept visible when *folded* will be the `before` pseudo-element.

Note: Deprecated properties `foldable`, `not-foldable-child`, and `folded` are also supported.

Example: Folding DocBook Elements

All the elements below can have a `title` child element and are considered to be logical sections. You mark them as being *foldable* leaving the `title` element visible.

```
set,
book,
part,
reference,
chapter,
preface,
article,
sect1,
sect2,
sect3,
sect4,
section,
appendix,
figure,
example,
table {
    -oxy-foldable:true;
    -oxy-not-foldable-child: title;
}
```

Placeholders for Empty Elements: -oxy-placeholder-content

Oxygen XML Editor plugin displays the element name as pseudo-content for empty elements if the **Show placeholders for empty elements** option is selected in the **Author** preferences page and there is no *before* or *after* content set in the CSS for this type of element. There are two CSS properties that can be used to control the placeholders (`-oxy-placeholder-content` and `-oxy-show-placeholder`).

`-oxy-placeholder-content` CSS Property

To control the displayed pseudo-content for empty elements, you can use the `-oxy-placeholder-content` CSS property.

The following example would change the `keyword` element to be displayed as `key`:

```
keyword{
    -oxy-placeholder-content:"key";
}
```

Note: This CSS property accepts the **${i18n(key)}** localization editor variable, as in the following example:

```
-oxy-placeholder-content:"${i18n(id)}";
```

`-oxy-show-placeholder` CSS Property

The `-oxy-show-placeholder` property allows you to decide whether or not the placeholder will be shown. The possible values are:

- `always` - Always display placeholders.
- `default` - Always display placeholders if *before* or *after* content are not set is CSS.
- `inherit` - The placeholders are displayed according to the **Show placeholders for empty elements** option (if `before` and `after` content is not declared).
- no - Never display placeholders.

Note: Deprecated properties `show-placeholder` and `placeholder-content` are also supported.

Read-only Elements: `-oxy-editable` property

If you want to inhibit editing a certain element content, you can set the `-oxy-editable` (deprecated property `editable` is also supported) CSS property to `false`.

Display Elements: `-oxy-morph` Value

Oxygen XML Editor plugin allows you to specify that an element has an `-oxy-morph` display type (deprecated `morph` property is also supported), meaning that the element is *inline* if all its children are *inline*.

Example: *-oxy-morph* Property Value

Suppose you have a **wrapper** XML element that allows users to set a number of attributes on all sub-elements. This element should have an *inline* or *block* behavior, depending on the behavior of its child elements:

```
wrapper{
 display:-oxy-morph;
}
```

Visibility Property: -oxy-collapse-text Value

Oxygen XML Editor plugin allows you to set the value of the `visibility` property to `-oxy-collapse-text`, meaning that the text content of that element is not rendered. If an element is marked as `-oxy-collapse-text` you are not able to position the cursor inside it and edit it. The purpose of `-oxy-collapse-text` is to make the text value of an element editable only through a form control.

Example: *visibility* Property

The text value of an XML element will be edited using a text field form control. In this case, we want the text content not to be directly present in the **Author** visual editing mode:

```
title{
 content: oxy_textfield(edit, '#text', columns, 40);
 visibility:-oxy-collapse-text;
}
```

Cyrillic Counters: -oxy-lower-cyrillic

Oxygen XML Editor plugin allows you to set the value of the `list-style-type` property to Cyrillic counters. For example, `-oxy-lower-cyrillic-ru`, `-oxy-lower-cyrillic-uk`, `-oxy-upper-cyrillic-ru` or `-oxy-upper-cyrillic-uk`, meaning that you can have Russian and Ukrainian counters.

Example: Cyrillic Counters

Counting list items with Cyrillic symbols:

```
li{
  display:list-item;
  list-style-type:-oxy-lower-cyrillic-ru;
}
```

Link Property: -oxy-link

Oxygen XML Editor plugin allows you to declare some elements to be *links*. This is especially useful when working with many documents that reference each other. The links allow for an easy way to get from one document to another. Clicking the link marker will open the referenced resource in an editor.

To define the element that should be considered a link, you must use the `link` property on the `before` or `after` pseudo element. The value of the property indicates the location of the linked resource. Since links are usually indicated by the value of an attribute in most cases it will have a value similar to `attr(href)`

Example: DocBook Link Elements

The following elements are defined to be links on the `before` pseudo element and their values are defined by the value of an attribute.

```
*[href]:before{
    -oxy-link:attr(href);
    content: "Click " attr(href) " for opening" ;
}

ulink[url]:before{
    -oxy-link:attr(url);
    content: "Click to open: " attr(url);
```

```
}

olink[targetdoc]:before{
    -oxy-link: attr(targetdoc);
    content: "Click to open: " attr(targetdoc);
}
```

Display Tag Markers: -oxy-display-tags

Oxygen XML Editor plugin allows you to choose whether tag markers of an element should never be presented or the current display mode should be respected. This is especially useful when working with `:before` and `:after` pseudo-elements, in which case the element range is already visually defined so the tag markers are redundant.

The property is named `-oxy-display-tags`, with the following possible values:

- *none* - Tags markers must not be presented regardless of the current display mode..
- *default* - The tag markers will be created depending on the current display mode..
- *inherit* - The value of the property is inherited from an ancestor element.

```
-oxy-display-tags
    Value: none | default | inherit
    Initial: default
    Applies to: all nodes(comments, elements, CDATA, etc.)
    Inherited: false
    Media: all
```

Example: *-oxy-display-tags* Property

In this example, the **para** element from DocBook uses a `:before` and `:after` element and its tag markers will not be visible.

```
para:before{
    content: "{";
}

para:after{
    content: "}";
}

para{
    -oxy-display-tags: none;
    display:block;
    margin: 0.5em 0;
}
```

Append Content Properties: `-oxy-append-content` / `-oxy-prepend-content`

`-oxy-append-content` Property

This property appends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `-oxy-append-content` property adds content to that generated by the lesser specificity rules into a new compound content.

Example:

```
element:before{
    content: "Hello";
}
element:before{
    -oxy-append-content: " World!";
}
```

The content shown before the `element` will be `Hello World!`.

`-oxy-prepend-content` Property

Prepends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `-oxy-prepend-content` prepends content to that generated by the lesser specificity rules into a new compound content.

Example:

```
element:before{
    content: "Hello!";
}
element:before{
    -oxy-prepend-content: "said: ";
}
element:before{
    -oxy-prepend-content: "I ";
}
```

The content shown before the `element` will be `I said: Hello!`.

Custom Colors for Element Tags: -oxy-tags-color

By default, Oxygen XML Editor plugin does not display element tags. You can use the **Partial Tags** button from the **Author** toolbar to control the amount of displayed markup.

To configure the default background and foreground colors of the tags, open the **Preferences** dialog box , go to **Editor** > **Edit modes** > **Author**, and set the desired colors in the **Tags background color** and **Tags foreground color** options.

If you want to be more specific and configure the colors using your CSS, the `-oxy-tags-background-color` and `-oxy-tags-color` properties allow you to control the background and foreground colors for any particular XML element.

Example:

```
para {
    -oxy-tags-color:white;
    -oxy-tags-background-color:green;
}
title {
    -oxy-tags-color:yellow;
    -oxy-tags-background-color:black;
}
```

Style Element Property: -oxy-style

Oxygen XML Editor plugin allows you to specify the style for an XML element. This is helpful if you want to embed CSS styling to XML elements directly in the XML file you are editing without having to edit the CSS files that are normally attached to the XML files. The property should have an XPath function for the value.

Example: *-oxy-style* Property

The following code snippet should be added in the CSS file that renders the files for your framework customization:

```
*{
   -oxy-style:attr(style);
}
```

Suppose you want to display the `title` elements in your XML document in the color red. You could add the following snippet directly in the XML document:

```
<title style="color:red;">My Memoirs</title>
```

Tip: The `style` attribute is supported by default in HTML5 documents.

Custom CSS Functions

The visual **Author** editing mode supports also a wide range of custom CSS extension functions.

`oxy_local-name()` Function
This function evaluates the local name of the current node.

It does not have any arguments.

Example: *oxy_local-name* Function

To insert the local name as static text content before the element, use this CSS selector:

```
*:before{
```

```
  content: oxy_local-name() ": ";
}
```

`oxy_name()` Function

This function evaluates the qualified name of the current node.

It does not have any arguments.

Example: *oxy_name* Function

To insert a qualified name as static text content before the element, use this CSS selector:

```
*:before{
  content: oxy_name() ": ";
}
```

`oxy_url()` Function

This function extends the standard CSS **url()** function by allowing you to specify additional relative path components (parameters **loc_1** to **loc_n**).

Oxygen XML Editor plugin uses all these parameters to construct an absolute location. Note that any of the parameters that are passed to the function can be either relative or absolute locations. These locations can be expressed as String objects, functions, or editor variables (built-in or custom).

Syntax:

`oxy_url ( base_location , loc_1 , loc_2 )`

base_location

String representing the base location. If not absolute, will be solved relative to the CSS file URL.

loc_1 ... loc_n (optional)

Strings representing relative location path components.

Examples: *oxy_url* Function

The following function receives String objects as input parameters:

```
oxy_url('http://www.oxygenxml.com/css/test.css', '../dir1/',
        'dir2/dir3/', '../../dir4/dir5/test.xml')
```

and returns:

```
'http://www.oxygenxml.com/dir1/dir4/dir5/test.xml'
```

The following function receives the result of the evaluation of two other functions as parameters (for instance, this is useful if you have image references and you want to see thumbnail images stored in the same folder):

```
image[href]{
 content:oxy_url(oxy_base-uri(), oxy_replace(attr(href),
    '.jpeg', 'Thumbnail.jpeg'));
}
```

The following function uses an editor variable as the first parameter to point to the Oxygen XML Editor plugin installation location:

```
image[href] {
    content: oxy_url('${oxygenHome}', 'logo.png');
}
```

Related Information:

Editor Variables on page 125

`oxy_base-uri()` Function

This function evaluates the base URL in the context of the current node.

It does not have any arguments and takes into account the `xml:base` context of the current node. See the XML Base specification for more details.

Example: *oxy_base-uri* Function

Suppose you have some image references but you want to see other thumbnail images that reside in the same folder (in **Author** mode):

```
image[href]{
 content:oxy_url(oxy_base-uri(), oxy_replace(attr(href),
    '.jpeg', 'Thumbnail.jpeg'));
}
```

`oxy_parent-url()` Function

This function evaluates the parent URL of a URL received as string.

Syntax:

`oxy_parent-url ( URL )`

URL

The URL as string.

`oxy_capitalize()` Function

This function capitalizes the first letter of the text received as argument.

Syntax:

`oxy_capitalize ( text )`

text

The text in which the first letter will be capitalized.

Example: *oxy_capitalize* Function

```
*:before{
  content: oxy_capitalize(oxy_name()) ": ";
}
```

This would insert the capitalized qualified name as static text content before the element.

`oxy_uppercase()` Function

This function transforms to upper case the text received as argument.

Syntax:

`oxy_uppercase ( text )`

text

The text to be capitalized.

Example: *oxy_uppercase* Function

To insert the upper-cased qualified name as static text content before the element, use this CSS selector:

```
*:before{
  content: oxy_uppercase(oxy_name()) ": ";
}
```

`oxy_lowercase()` Function

This function transforms to lower case the text received as argument.

Syntax:

`oxy_lowercase ( text )`

text

The text to be lower cased.

Example: *oxy_lowercase* Function

To insert a lower-cased qualified name as static text content before the element, use this CSS selector:

```
*:before{
  content: oxy_lowercase(oxy_name()) ": ";
}
```

`oxy_concat()` Function

This function concatenates the received string arguments.

Syntax:

`oxy_concat ( str_1 , str_2 )`

str_1 … str_n

The string arguments to be concatenated.

Example: *oxy_concat* Function

If an XML element has an attribute called **padding-left**:

```
<p padding-left="20">...
```

and you want to add a padding before it with that specific amount specified in the attribute value:

```
*[padding-left]{
 padding-left:oxy_concat(attr(padding-left), "px");
}
```

`oxy_replace()` Function

This function is used to replace a string of text.

The `oxy_replace()` function has two signatures:

Syntax 1:

`oxy_replace ( text , target , replacement )`

This function replaces each substring of the text that matches the literal target string with the specified literal replacement string.

text

The text in which the replace will occur.

target

The target string to be replaced.

replacement

The string replacement.

Example: Suppose that you have image references but you want to see other thumbnail images that reside in the same folder in the visual **Author** editing mode:

```
image[href]{
 content:oxy_url(oxy_base-uri(), oxy_replace(attr(href),
    '.jpeg', 'Thumbnail.jpeg'));
}
```

Syntax 2:

`oxy_replace ( text , target , replacement , isRegExp )`

This function replaces each substring of the text that matches the target string with the specified replacement string.

text

The text in which the replace will occur.

target

The target string to be replaced.

replacement

The string replacement.

isRegExp

If *true* the target and replacement arguments are considered regular expressions, if *false* they are considered literal strings.

Example: Suppose that you want to use a regular expression to replace all space sequences with an underscore:

```
image[title]{
 content:oxy_replace(attr(title), "\\s+", "_", true)
}
```

`oxy_unparsed-entity-uri()` Function

This function returns the URI value of an unparsed entity name.

Syntax:

`oxy_unparsed-entity-uri ( unparsedEntityName )`

unparsedEntityName

The name of an unparsed entity defined in the DTD.

This function can be useful to display images that are referenced with unparsed entity names.

Example: *oxy_unparsed-entity-uri* Function

CSS for displaying the image in Author for an *`imagedata`* with *`entityref`* to an unparsed entity:

```
imagedata[entityref]{
content: oxy_url(oxy_unparsed-entity-uri(attr(entityref)));
}
```

`oxy_attributes()` Function

This function concatenates the attributes for an element and returns the serialization.

Syntax:

`oxy_attributes ( )`

Example: *oxy_attributes* Function

```
element{
  content:oxy_attributes();
}
```

For instance, if you have the following XML fragment: `<element att1="x" xmlns:a="2" x="""/>`, the CSS function will display:

```
att1="x" xmlns:a="2" x=""""
```

`oxy_substring()` Function

This function is used to return a string of text.

The `oxy_substring()` function has two signatures:

Syntax 1:

`oxy_substring ( text , startOffset )`

Returns a new string that is a substring of the original **text** string. It begins with the character at the specified index and extends to the end of **text** string.

text

The original string.

startOffset

The beginning index, inclusive

Syntax 2:

`substring ( text , startOffset , endOffset )`

Returns a new string that is a substring of the original **text** string. The substring begins at the specified **startOffset** and extends to the character at index **endOffset** - 1.

text

The original string.

startOffset

The beginning index, inclusive.

endOffset

The ending index, exclusive.

Example: *oxy_substring* Function

`oxy_substring('abcd', 1)` returns the string `'bcd'`.

`oxy_substring('abcd', 4)` returns an empty string.

`oxy_substring('abcd', 1, 3)` returns the string `'bc'`.

If you only want to display part of an attribute value, for instance the part that comes before an **Appendix** string:

```
image[longdesc]{
 content: oxy_substring(attr(longdesc), 0,
          oxy_indexof(attr(longdesc), "Appendix"));
}
```

`oxy_getSomeText(text, length)` Function

This function allows you to truncate a long string and to set a maximum number of displayed characters.

Syntax:

`oxy_getSomeText ( text , length , endsWithPoints )`

text

Displays the actual text.

length

Sets the maximum number of characters that are displayed.

endsWithPoints

Specifies if the truncated text ends with ellipsis.

Example: *oxy_getSomeText* Function

If an attribute value is very large, you can trim its content before it is displayed as static content:

```
*[longdesc]:before{
  content: oxy_getSomeText(attr(longdesc), 200);
}
```

`oxy_indexof()` Function

This function is used to define searches.

The `oxy_indexof()` function has two signatures:

Syntax 1:

`oxy_indexof ( text , toFind )`

Returns the index within **text** string of the first occurrence of the **toFind** substring.

text

Text to search in.

toFind

The searched substring.

Syntax 2:

`oxy_indexof ( text , toFind , fromOffset )`

Returns the index within **text** string of the first occurrence of the **toFind** substring. The search starts from **fromOffset** index.

text

Text to search in.

toFind

The searched substring.

fromOffset

The index to start the search from.

Example: *oxy_indexof* Function

`oxy_indexof('abcd', 'bc')` returns 1.

`oxy_indexof('abcdbc', 'bc', 2)` returns 4.

If you only want to display part of an attribute value, for instance the part that comes before an **Appendix** string:

```
image[longdesc]{
 content: oxy_substring(attr(longdesc), 0,
          oxy_indexof(attr(longdesc), "Appendix"));
}
```

`oxy_lastindexof()` Function

This function is used to define last occurrence searches.

The `oxy_lastindexof()` function has two signatures:

Syntax 1:

`oxy_lastindexof ( text , toFind )`

Returns the index within **text** string of the rightmost occurrence of the **toFind** substring.

text

Text to search in.

toFind

The searched substring.

Syntax 2:

`oxy_lastindexof ( text , toFind , fromOffset )`

The search starts from **fromOffset** index. Returns the index within **text** string of the last occurrence of the **toFind** substring, searching backwards starting from the **fromOffset** index.

text

Text to search in.

toFind

The searched substring.

fromOffset

The index to start the search backwards from.

Example: *oxy_lastindexof* Function

`oxy_lastindexof('abcdbc', 'bc')` returns 4.

`oxy_lastindexof('abcdbccdbc', 'bc', 2)` returns 1.

If you only want to display part of an attribute value, for instance the part that comes before an **Appendix** string:

```
image[longdesc]{
 content: oxy_substring(attr(longdesc), 0,
          oxy_lastindexof(attr(longdesc), "Appendix"));
}
```

`oxy_xpath()` Function

This function is used to evaluate XPath expressions.

Syntax:

`oxy_xpath ( XPathExpression [ , processChangeMarkers , value ] [ , evaluate , value ])`

It evaluates the given XPath 2.0 expression using Saxon 9 and returns the result. XPath expressions that depend on the cursor location can be successfully evaluated only when the cursor is located in the actual XML content. Evaluation fails when the current editing context is inside a referenced **xi:include** section or inside artificially referenced content (for example, DITA `conref` or `topicref` references).

The parameters of the function are as follows:

- A required `expression` parameter, which is the XPath expression to be evaluated.
- An optional `processChangeMarkers` parameter, followed by its value, which can be either `true` or `false` (default value). When you set the parameter to `true`, the function returns the resulting text with all the change markers accepted (*delete* changes are removed and *insert* changes are preserved).
- An optional `evaluate` parameter, followed by its value, which can be one of the following:
  - `dynamic` - Evaluates the XPath each time there are changes in the document.
  - `dynamic-once` - Separately evaluates the XPath for each node that matches the CSS selector. It will not re-evaluate the expression when changes are made to other nodes in the document. This will lead to improved performance, but the displayed content may not be updated to reflect the actual document content.
  - `static` - If the same XPath is evaluated on several nodes, the result for the first evaluation will be used for all other matches. Use this only if the XPath does not contain a relationship with the node on which the CSS property is evaluated. This will lead to improved performance, but the static displayed content may not be updated to reflect the actual document content.

    Note: When XPath expressions are evaluated, the entities and `xi:include` elements are replaced with the actual content that is referenced. For example, consider the following code snippet:

    ```
    <article>
      <xi:include href="section1.xml" xmlns:xi="http://www.w3.org/2001/XInclude"/>
    </article>
    ```

    where `section1.xml` contains the following content:

    ```
    <section>
      <p>Referenced content</p>
    </section>
    ```

    The latter will be the actual content in which the XPath expression is executed.

Example: *oxy_xpath* Function

The following example counts the number of words from a paragraph (including *tracked changes*) and displays the result in front of it:

```
para:before{
  content:
   concat("|Number of words:",
    oxy_xpath(
        "count(tokenize(normalize-space(string-join(text(), '')), ' '))",
        processChangeMarkers,
       true),
    "| ");
}
```

Note: The `oxy_xpath()` function supports *editor variables*, as in the following example:

```
* {
    content:
    oxy_concat("Result: ",
        oxy_xpath('count(collection("${cfdu}/?select=*.xml"))')
    );
}
```

`oxy_action()` Function

This function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

The `oxy_action()` function is frequently used from the *oxy_button()* function.

The arguments received by the `oxy_action()` function are a list of properties that define an action. The following properties are supported:

- `name` - The name of the action. It will be displayed as the label for the button or menu item.
- `description` (optional) - A short description with details about the result of the action.
- `icon` (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor plugin (`oxygen.jar`) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed as an *editor variable*.
- `operation` - The name of the Java class implementing the *ro.sync.ecss.extensions.api.AuthorOperation* interface. There is also a variety of predefined operations that can be used.

  Note: If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Editor plugin operations from `ro.sync.ecss.extensions.commons.operations` package. If the class is not found in this package, then it will be loaded using the specified name.
- `arg-<string>` - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed).
- `ID` - (optional) - The ID of the action from the *framework*. If this is specified, all others parameters are disregarded.

Example: *oxy_action* function inside an *oxy_button* form control:

```
oxy_button(
   action, oxy_action(
            name, 'Insert',
            description, 'Insert an element after the current one',
            icon, url('insert.png'),
            operation,
             'InsertFragmentOperation',
            arg-fragment, '<element>${caret}</element>',
            arg-insertLocation, '.',
            arg-insertPosition, 'After'),
            showIcon, true)
```

Example: *oxy_action* Function

You can also create a button form control directly from an `oxy_action` function:

```
oxy_action(
            name, 'Insert',
            description, 'Insert an element after the current one',
            operation, 'InsertFragmentOperation',
            arg-fragment, '<element>${caret}</element>',
            arg-insertLocation, '.',
            arg-insertPosition, 'After')
```

Tip: A code template is available to make it easy to add the `oxy_action` function with the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_action` code template.

Related Information:

Button Form Control on page 1358
The `oxy_button` built-in form control is used for graphical user interface objects that invoke a custom **Author** mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

`oxy_action_list()` Function

This function allows you to define a sequential list of actions directly in the CSS, rather than referencing them from the associated framework.

The `oxy_action_list()` function is used from the *oxy_buttonGroup()* function.

The arguments received by the `oxy_action_list()` function are a list of actions (executed sequentially) that are defined with the *oxy_action()* function. The following properties are supported in the `oxy_action_list()` function:

- `name` - The name of the action. The name of the first defined action will be displayed as the label for the button or menu item.
- `description` (optional) - A short description with details about the result of the action. The description of the first defined action will be displayed in a tooltip.

- `icon` (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor plugin (`oxygen.jar`) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed as an *editor variable*.
- `operation` - The name of the Java class implementing the *ro.sync.ecss.extensions.api.AuthorOperation* interface. There is also a variety of predefined operations that can be used.

  Note: If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in Oxygen XML Editor plugin operations from `ro.sync.ecss.extensions.commons.operations` package. If the class is not found in this package, then it will be loaded using the specified name.
- `arg-<string>` - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed).
- `ID` - (optional) - The ID of the action from the *framework*. If this is specified, all others parameters are disregarded.

Example: *oxy_action_list* Function

```
oxy_action_list(
  oxy_action(
    name, 'Insert',
    description,
        'Insert an element after the current one',
    operation, InsertFragmentOperation,
    arg-fragment, '<element></element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After'
  ),
  oxy_action(
    name, 'Delete',
    description, 'Deletes the current element',
    operation, DeleteElementOperation
  )
)
```

Tip: A code template is available to make it easy to add the `oxy_action_list` function with the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_action_list` code template.

Related Information:

oxy_action() Function on page 1349
This function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

Button Group Form Control on page 1359
The `oxy_buttonGroup` built-in form control is used for a graphical user interface group of buttons that invokes one of several custom **Author** mode actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

`oxy_compound_action()` Function

This function allows you to define multiple actions that will be executed sequentially.

The `oxy_compound_action()` function is used from the *oxy_button()* form control function.

The arguments received by the `oxy_compound_action()` function are a list of actions (executed sequentially) that are defined with the *oxy_action()* function.

You can use three optional properties (`name`, `description`, `icon`) in the `oxy_compound_action()` function to provide labels for the compound action. If you do not specify these three properties, those same properties defined in the first *oxy_action* function will be used for the labels.

- `name` - The name of the action. It will be displayed as the label for the action. If you want to reuse the name of an action already defined in your framework, you can use the *oxy_getActionName* function.
- `description` - A short description with details about the result of the action. It will be displayed in a tooltip when hovering over the button linked to this action. If you want to reuse the description of an action already defined in your framework, you can use the *oxy_getActionDescription* function.
- `icon` - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor plugin (`oxygen.jar`) by starting its value with `/` (for

example, `/images/Remove16.png`). It can also be expressed as an *editor variable*. If you want to reuse the icon of an action already defined in your framework, you can use the *oxy_getActionIcon* function.

The *oxy_getActionName*, *oxy_getActionDescription*, and *oxy_getActionIcon* functions accept the following 2 parameters:

- `framework.defined.action.id` (required) - The ID of an action defined in the current framework that gets the name, description, or icon for that action.
- `fallback` (optional) - A fallback value in case the ID value provided in the `framework.defined.action.id` parameter is not found.

Example: *oxy_compound_action* Function

```
oxy_button(
  action, oxy_compound_action(
        name, oxy_getActionName('framework.id', 'Fallback'),
        description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',
        icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
       oxy_action(
         name, 'Insert',
         description, 'Insert an element after the current one',
         operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
         icon, url('insert.png'),
         arg-fragment, '<p audience=''></p>',
         arg-insertLocation, '.',
         arg-insertPosition, 'After'
       ),
       oxy_action(
         name, 'Activate edit mode',
         description, 'Sets a pseudo class that will activate a CSS rule that will
                       present a text field form control for the @audience attribute',
         operation, 'SetPseudoClassOperation',
         arg-name, 'edit-mode-on',
         arg-elementLocation , '.',
       )
   ),
  showIcon, true)
```

Tip: A code template is available to make it easy to add the `oxy_compound_action` function with the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_action_list` code template.

Related Information:

oxy_action() Function on page 1349
This function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

Button Form Control on page 1358
The `oxy_button` built-in form control is used for graphical user interface objects that invoke a custom **Author** mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

`oxy_label()` Function

This function can be used in conjunction with the CSS `content` property to change the style of generated text.

The arguments of the function are *property name* - *property value* pairs. The following properties are supported:

- `text` - This property specifies the built-in form control you are using.
- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `color` - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- `background-color` - Specifies the background color of the form control. If the value of the `background-color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- `styles` - Specifies styles for the form control. The values of this property are a set of CSS properties:
  - `font-weight`, `font-size`, `font-style`, `font`
  - `text-align`, `text-decoration`
  - `width`
  - `color`, `background-color`

- `link` - For more information about this property see the *link* property section.

```
element{
    content: oxy_label(text, "Label Text", styles,
      "font-size:2em;color:red;link:attr(href);");
}
```

Instead of using the values of the `styles` property individually, you can define them in a CSS file as in the following example:

```
* {
    width: 40%;
    text-align:center;
}
```

Then refer that file with an `@import` directive, as follows:

```
elem {
  content: oxy_label(text, 'my_label', styles, "@import 'labels.css';")
}
```

CAUTION: Extensive use of the `styles` property may lead to performance issues.

If the text from an `oxy_label()` function contains new lines, for example `oxy_label(text, 'LINE1\A LINE2', width, 100px)`, the text is split in two. Each of the two new lines has the specified width of 100 pixels.

Note: The text is split after `\A`, which represents a new line character.

You can use the `oxy_label()` function together with a built-in form control function to create a form control based layouts.

Example: *oxy_label* Function

An example of a use case is if you have multiple attributes on a single element and you want use form controls on separate lines and style them differently. Consider the following CSS rule:

```
person:before {
  content: "Name:*" oxy_textfield(edit, '@name', columns, 20)
    "\A Address:" oxy_textfield(edit, '@address', columns, 20)
}
```

Suppose you only want the **Name** label to be set to **bold**, while you want both labels aligned to look like a table (the first column with labels and the second with a text field). To achieve this, you can use the `oxy_label()` to style each label differently.

```
person:before {
 content: oxy_label(text, "Name:*", styles, "font-weight:bold;width:200px")
          oxy_textfield(edit, '@name', columns, 20) "\A "
          oxy_label(text, "Address:", styles, "width:200px")
          oxy_textfield(edit, '@address', columns, 20)
}
```

Tip: A code template is available to make it easy to add the `oxy_label` function with the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_label` code template..

`oxy_link-text()` Function

You can use this function on the CSS `content` property to obtain a text description from the source of a reference.

By default, the `oxy_link-text()` function resolves DITA and DocBook references. For further details about how you can also extend this functionality to other *frameworks*, go to Configuring an Extensions Bundle.

DITA Support

For DITA, the `oxy_link-text()` function resolves the `xref` element and the elements that have a `keyref` attribute. The text description is the same as the one presented in the final output for those elements. If you use this function for a `topicref` element that has the `navtitle` and `locktitle` attributes set, the function returns the value of the `navtitle` attribute.

DocBook Support

For DocBook, the `oxy_link-text()` function resolves the `xref` element that defines a link in the same document. The text description is the same as the one presented in the final output for those elements.

Example: *oxy_link-text* Function

For the following XML and associated CSS fragments the `oxy_link-text()` function is resolved to the value of the `xreflabel` attribute.

```
<para><code id="para.id" xreflabel="The reference label">my code</code>
      </para>
<para><xref linkend="para.id"/></para>
```

```
xref {
    content: oxy_link-text();
}
```

If the text from the target cannot extracted (for instance, if the `href` is not valid), you can use an optional argument to display fallback text.

```
*[class~="map/topicref"]:before{
    content: oxy_link-text("Cannot find the topic reference");
    link:attr(href);
}
```

`oxy_unescapeURLValue(string)` Function
This function returns the unescaped value of a URL-like string given as a parameter.

For example, if the value contains `%20` it will be converted to a simple space character.

Example: *oxy_unescapeURLValue* Function

`oxy_unescapeURLValue("http://www.example.com/a%20simple%20example.html")` returns the following value:

```
http://www.example.com/a simple example.html
```

Arithmetic Functions
Arithmetic Functions that are supported.

You can use any of the arithmetic functions implemented in the *java.lang.Math* class (http://download.oracle.com/javase/6/docs/api/java/lang/Math.html).

In addition, the following functions are available:

Syntax	Details
oxy_add (*param1*, ... , *paramN*, *'returnType'*)	Adds the values of all parameters from *param1* to *paramN*.
oxy_subtract (*param1*, *param2*, ... , *paramN*, *'returnType'*)	Subtracts the values of parameters *param2* to *paramN* from *param1*.
oxy_multiply (*param1*, ... , *paramN*, *'returnType'*)	Multiplies the values of parameters from *param1* to *paramN*.
oxy_divide (*param1*, *param2*, *'returnType'*)	Performs the division of *param1* to *param2*.
oxy_modulo (*param1*, *param2*, *'returnType'*)	Returns the reminder of the division of *param1* to *param2*.

Note: The *returnType* can be *'integer'*, *'number'*, or any of the supported CSS measuring types.

Example: *oxy_multiply* Function

If you have an image with **width** and **height** specified on it, this will compute the number of pixels on it:

```
image:before{
 content: "Number of pixels: " oxy_multiply(attr(width), attr(height), "px");
}
```

Form Controls

Oxygen XML Editor plugin provides a variety of built-in form controls that allow users to interact with documents with familiar user interface objects. For customization purposes, Oxygen XML Editor plugin also supports custom form controls in Java.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Related Information:
Dynamically Add Form Controls Using a Styles Filter on page 1387

Audio File Player Form Control
The `oxy_audio` built-in form control is used for providing a mechanism to play audio clips.

The `oxy_audio` form control supports the following properties:

- `href` - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  ```
  oxy_audio(href, oxy_url(oxy_base-uri(), 'ex.mp3')), width, 400px)
  ```

- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the % character) length units.

Example: *oxy_audio* Form Control

```
object {
    content:
        oxy_audio(
            href, 'resources/audio.mp3',
            width, 200px),
}
```

Tip: To insert a sample of the `oxy_audio` form control in a CSS file , invoke the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_audio` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: ***[OXYGEN_INSTALL_DIR]*/samples/form-controls**.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Browser Form Control
The `oxy_browser` built-in form control is used for providing a mechanism to integrate HTML frames or interact with SVG documents directly in the **Author** mode editor. It can also be used to load HTML that executes JavaScript and from that JavaScript you can access the Oxygen XML Editor plugin workspace.

The `oxy_browser` form control supports the following properties:

- `href` - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

  ```
  oxy_browser(href, oxy_url(oxy_base-uri(), 'ex.svg')), width, 50%, height, 50%)
  ```

- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the % character) length units.
- `height` - Specifies the height of the form control area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the % character) length units.

Example: *oxy_browser* Form Control

```
object {
  content:
    oxy_browser(
      href, 'http://example.page',
      width, 600px,
      height, 400px),
```

```
}
```

Tip: To insert a sample of the `oxy_browser` form control in a CSS file , invoke the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_browser` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: ***[OXYGEN_INSTALL_DIR]*/samples/form-controls**.

Interacting with the Oxygen XML Editor plugin Workspace

The `oxy_browser` form control also provides the possibility of creating custom form control without having to use the Java-based API. You can use the `oxy_browser` form control to load HTML that executes JavaScript. In the JavaScript, you can use some predefined global variables that provide a gateway between the JavaScript and the Oxygen XML Editor plugin Java API. This allows you to perform changes in the document, open resources, and more, solely from the JavaScript.

Important: This will only work if the loaded HTML is located inside a framework or plugin directory, such as: *[OXYGEN_INSTALL_DIR]*`/frameworks/` or *[OXYGEN_INSTALL_DIR]*`/plugins/`.

The following global variables can be used:

- **authorAccess** - This object is an instance of *ro.sync.ecss.extensions.api.AuthorAccess*.
- **contextElement** - An instance of ro.sync.ecss.extensions.api.node.AuthorNode. The form control is added over this node.
- **pluginWorkspace** - An instance of ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace.
- **fcArguments** - A `java.util.Map` implementation with the properties (name and value pairs) passed on the form control function.
- **apiHelper** - A helper object for creating Java objects. It allows you to create Java objects from within the JavaScript code. These objects can then be passed to the Java methods as in the following example:

```
var newAttrValue = apiHelper.newInstance(
          "ro.sync.ecss.extensions.api.node.AttrValue",
          ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute(
        "counter", newAttrValue, contextElement);
...
```

You can also specify the constructor signature:

```
var newAttrValue = apiHelper.newInstance(
        "ro.sync.ecss.extensions.api.node.AttrValue
        (java.lang.String, java.lang.String, boolean)",
        ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute(
        "counter", newAttrValue, contextElement);
...
```

For more information, open the `form-controls.xml` file in the ***[OXYGEN_INSTALL_DIR]*/samples/form-controls** directory and go to section **11.1 - Interacting with the Oxygen Workspace**.

Warning: On Mac OS X, you need to use asynchronous calls to our API, due to the following JDK bug: https://bugs.openjdk.java.net/browse/JDK-8087465. By default, the API is called synchronously, but you can change this behavior for each API object by calling two methods: **sync()** and **async()**.

```
// By default, the methods are invoke synchronously.
var ctrl = authorAccess.getDocumentController();
try {
  // On Mac, methods that change the document must be executed asynchronously.
  ctrl.async();
  ctrl.setAttribute("counter", newAttrValue, contextElement);
} finally {
  ctrl.sync();
}
```

Listening for Changes in the Document

If the form control presents some information from the document (for example, the value of an attribute), then it needs to be notified on changes in the document so that it can update that information. To do this, follow these steps:

1. In the JavaScript, the **`bridgeReady()`** method is invoked as soon as the form control is loaded and our API bridge is installed. This is where you can add a listener:

```
function bridgeReady () {
  // We declare a member function for each method of the
  // ro.sync.ecss.extensions.api.AuthorListener interface (same function signature)
  var handler = {
    attributeChanged : function(event) {
      var node = event.getOwnerAuthorNode();
      var attrName = event.getAttributeName();

      if (node.equals(contextElement) && attrName === "counter") {
        init();
      }
    },
    contentDeleted : function(event) {},
    contentInserted : function(event) {}
  };

  // We create a proxy over an ro.sync.ecss.extensions.api.AuthorListener that will
  // delegate its methods to the JS object's functions.
  // We assign the listener to a global variable so that we can remove it later on,
  // on the dispose() method.
  authorDocumentListener = apiHelper.createProxyListener(
      "ro.sync.ecss.extensions.api.AuthorListener", handler);

  var ctrl = authorAccess.getDocumentController();

  // Add the proxy listener.
  ctrl.addAuthorListener(authorDocumentListener);
}
```

2. Since a listener was added on the document, it is important to remove it once the form control is not used anymore. When a form control is discarded, you can call the **`dispose()`** method from the JavaScript. This is where the previously created listener can be removed:

```
/**
 * The form control will not be used anymore. Clean up.
 */
function dispose() {
  // Dispose all added listeners.
  var ctrl = authorAccess.getDocumentController();
  ctrl.removeAuthorListener(authorDocumentListener);
}
```

Debugging JavaScript Used for Custom Form Controls

If you encounter unexpected results when using the method described above, you can debug the script by using the following guidelines:

- Calls to `alert("message.to.present")` or `console.log("message.to.present")` will be presented in the Results panel.
- You can install the **Firebug** extension by executing the following script:

```
{code:javascript}
function installFB() {
  if (!document.getElementById('FirebugLite')) {
    E = document['createElement' + 'NS'] && document.documentElement.namespaceURI;
    E = E ? document['createElement' + 'NS'](E, 'script')
          : document['createElement']('script');
    E['setAttribute']('id', 'FirebugLite');
    E['setAttribute']('src',
                      'https://getfirebug.com/' + 'firebug-lite.js' + '#startOpened');
    E['setAttribute']('FirebugLite', '4');
    (document['getElementsByTagName']('head')[0]
          || document['getElementsByTagName']('body')[0]).appendChild(E);
    E = new Image;
    E['setAttribute']('src', 'https://getfirebug.com/' + '#startOpened');
  }
}
{code}
```

Note: To force the *Browser Form Control* to reload after making changes to the JavaScript file, you need to use the **Reload page** action from the form control's contextual menu.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Button Form Control
The `oxy_button` built-in form control is used for graphical user interface objects that invoke a custom **Author** mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The `oxy_button` form control supports the following properties:

- `actionContext` - Specifies the context in which the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- `color` - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- `actionID` - The ID of the action, specified in the *document type association*, that is invoked when you click the button.

  Note: The element that contains the form control represents the context where the action is invoked.
- `action` - Defines an action directly, rather than using the `actionID` parameter to reference an action from the *document type association*. This property is defined using the *oxy_action* function.

  Tip: You can also create a button form control directly from an *oxy_action* function.

  ```
  oxy_button(action, oxy_action(
            name, 'Insert',
            description, 'Insert an element after the current one',
            icon, url('insert.png'),
            operation, 'InsertFragmentOperation',
            arg-fragment, '<element>${caret}</element>',
            arg-insertLocation, '.',
            arg-insertPosition, 'After'
  ))
  ```

  Tip: To execute multiple actions sequentially, you can use the *oxy_compound_action* function.
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `transparent` - Flattens the aspect of the button form control, removing its border and background. The values of this property can be `true` or `false` (default value).
- `showText` - Specifies if the action text should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be `true` or `false`.

  ```
  element {
    content: oxy_button(actionID, 'remove.attribute', showText, true);
  }
  ```
- `showIcon` - Specifies if the action icon should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be `true` or `false`.

  ```
  element {
    content: oxy_button(actionID, 'remove.attribute', showIcon, true);
  }
  ```
- `enableInReadOnlyContext` - To enable button form controls or groups of buttons form controls this property needs to be set to `true`. This property can be used to specify areas as *read-only* (by setting the `-oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

  ```
  p:before {
    content: oxy_button(hoverPseudoclassName, 'showBorder')
  }
  p:showBorder {
  ```

```
  border: 1px solid red;
}
```

Example: *oxy_button* Form Control

```
button:before {
  content: "Label:"
     oxy_button(
         /* This action is declared in the document type
            associated with the XML document. */
         actionID, "insert.popupWithMultipleSelection");
}
```

Tip: To insert a sample of the `oxy_button` form control in a CSS file , invoke the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_button` code template. Also, an `oxy_button_in_place_action` code template is available that inserts an `oxy_button` function that includes an `action` parameter.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: ***[OXYGEN_INSTALL_DIR]*/samples/form-controls**.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Button Group Form Control
The `oxy_buttonGroup` built-in form control is used for a graphical user interface group of buttons that invokes one of several custom **Author** mode actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The `oxy_buttonGroup` form control supports the following properties:

- `actionIDs` - The IDs of the actions that will be presented in the group of buttons.
- `actionID` - The ID of the action, specified in the *document type association*, that is invoked when you click the button.

  Note: The element that contains the form control represents the context where the action is invoked.
- `actions` - Defines a sequential list of actions directly, rather than using the `actionID` parameter to reference actions from the *document type association*. This property is defined using the *oxy_action_list* function.

  ```
  oxy_buttonGroup(
      label, 'A group of actions',
      icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
      actions,
        oxy_action_list(
            oxy_action(
                  name, 'Insert',
                  description, 'Insert an element after the current one',
                  operation, 'InsertFragmentOperation',
                  arg-fragment, '<element></element>',
                  arg-insertLocation, '.',
                  arg-insertPosition, 'After'
            ),
            oxy_action(
                  name, 'Delete',
                  description, 'Deletes the current element',
                  operation, 'DeleteElementOperation'
            )
        )
    )
  ```

  Tip: A code template is available to make it easy to add the `oxy_action_list` function.
- `label` - Specifies the label to be displayed on the button. This label can be translated using the *${i18n()}* editor variable.
- `icon` - The path to the icon to be displayed on the button.
- `actionContext` - Specifies the context in which the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.

- `actionStyle` - Specifies what to display for an action in the form control. The values of this property can be `text` (default value), `icon`, or `both`.
- `tooltip` - Specifies a tooltip to be displayed when you hover over the form control.
- `transparent` - Makes the button transparent without any borders or background colors. The values of this property can be `true` or `false`.
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- `enableInReadOnlyContext` - To enable button form controls or groups of buttons form controls this property needs to be set to `true`. This property can be used to specify areas as *read-only* (by setting the `-oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_buttonGroup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

Example: *oxy_buttonGroup* Form Control

```
buttongroup:before {
  content:
    oxy_label(text, "Button Group:", width, 150px, text-align, left)
    oxy_buttonGroup(
       label, 'A group of actions',
       /* The action IDs are declared in the document type
          associated with the XML document. */
       actionIDs,
          "insert.popupWithMultipleSelection,insert.popupWithSingleSelection",
       actionStyle, "both");
}
```

Tip: To insert a sample of the `oxy_buttonGroup` form control in a CSS file ,, invoke the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_buttonGroup` code template. Also, an `oxy_buttonGroup_in_place_action` code template is available that inserts an `oxy_buttonGroup` function that includes an `oxy_action_list` function.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: ***[OXYGEN_INSTALL_DIR]*/samples/form-controls**.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Checkbox Form Control
The `oxy_checkbox` built-in form control is used for a graphical user interface box that you can click to enable or disable an option. A single checkbox or multiple checkboxes can be used to present and edit the value on an attribute or element.

The `oxy_checkbox` form control supports the following properties:

- `edit` - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

    Note: You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.
- `resultSeparator` - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the *space* character is used.

- `tooltips` - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `${comma}` variable.
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `values` - Specifies the values that are committed when the check-boxes are selected. If these values are not specified in the CSS, they are collected from the associated XML Schema.

  Note: Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\\, 2\\, 3, 4, edit, false)` will display a form control that has **1, 2, 3** for the first value and **4** for the second value.
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`..
- `uncheckedValues` - Specifies the values that are committed when check-boxes are not selected.
- `labels` - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the *${i18n()}* editor variable.. If this property is not specified, the `values` property is used as the label.
- `columns` - Controls the layout of the form control. The check boxes will be grouped in a number of columns equal to the given value.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_checkbox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

Example: Single *oxy_checkbox* Form Control

```
checkBox[attribute]:before {
    content: "A check box editor that edits a two valued attribute (On/Off)
              The values are specified in the CSS:"
        oxy_checkbox(
        edit, "@attribute",
        values, "On",
        uncheckedValues, "Off",
        labels, "On/Off");
}
```

Example: Multiple *oxy_checkbox* Form Controls

```
multipleCheckBox[attribute]:before {
    content: "Multiple checkboxes editor that edits an attribute value.
              Depending whether the check-box is selected,
              a different value is committed:"
        oxy_checkbox(
        edit, "@attribute",
        values, "true, yes, on",
        uncheckedValues, "false, no, off",
        resultSeparator, ","
        labels, "Present, Working, Started");
}
```

Tip: To insert a sample of the `oxy_checkbox` form control in a CSS file , invoke the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_checkbox` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: ***[OXYGEN_INSTALL_DIR]*/samples/form-controls**.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Combo Box Form Control
The `oxy_combobox` built-in form control is used for providing a graphical user interface object that is a drop-down menu of proposed values. This form control can also be used for a combination of a drop-down menu and an editable single-line text field.

The `oxy_combobox` form control supports the following properties:

- `edit` - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

  Note: You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.
- `columns` - Controls the width of the form control. The unit size is the width of the **w** character.
- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `editable` - This property accepts the **true** and **false** values. In addition to a drop-down menu, the **true** value also generates an editable text field box that allows you to insert other values than the proposed ones. The **false** value generates a drop-down menu that only accepts the proposed values.
- `tooltips` - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `${comma}` variable.
- `values` - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema..

  Note: Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\\, 2\\, 3, 4, edit, false)` will display a form control that has **1, 2, 3** for the first value and **4** for the second value.
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- `labels` - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the *${i18n()}* editor variable.

  Note: This property is only available for read-only combo boxes (the `editable` property is set to `false`).
- `color` - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_combobox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

- `canRemoveValue` - If the value is set to `true` and the combo box is not editable, then a new `<Empty>` value is added in that combo box. This clears or removes the value being edited, depending on if it edits an element or attribute.
- `onChange` - Can be used to invoke an action when the value of the combo box changes. The action can be created in the CSS using the `oxy_action()` function or referenced from the *framework* by its ID. After the action is executed, the cursor remains in the combo box. Note that this property does not support actions defined by JavaScript code.

Example: *oxy_combobox* Form Control

```
comboBox:before {
    content: "A combo box that edits an attribute value.
              The possible values are provided from CSS:"
        oxy_combobox(
            edit, "@attribute",
            editable, false,
            values, "value1, value2, value3",
            labels, "Value no1, Value no2, Value no3",
            onChange, oxy_action(
                name, 'Insert',
                operation, 'XQueryUpdateOperation',
                arg-script, 'insert node <product>{xs:string(@attribute)}</product>
                         as last into .'));
}
```

Tip: To insert a sample of the `oxy_combobox` form control in a CSS file , invoke the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_combobox` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: ***[OXYGEN_INSTALL_DIR]*/samples/form-controls**.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Date Picker Form Control
The `oxy_datePicker` built-in form control is used for offering a text field with a calendar browser that allows the user to choose a certain date in a specified format.

The `oxy_datePicker` form control supports the following properties:

- `edit` - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

    Note: You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.
- `columns` - Controls the width of the form control. The unit size is the width of the **w** character.
- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `color` - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- `format` - This property specifies the format of the inserted date. The pattern value must be a valid Java date (or date-time) format. If this property is missing, the format of the date is determined from the associated schema.
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `validateInput` - Specifies if the form control is validated. If you introduce a date that does not respect the format, the `datePicker` form control is rendered with a red foreground. By default, the input is validated. To disable the validation, set this property to `false`.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_datePicker(edit, "@attribute", hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

Example: *oxy_datePicker* Form Control

```
date {
    content:
        oxy_label(text, "Date time attribute with
                  format defined in CSS: ", width, 300px)
        oxy_datePicker(
            columns, 16,
            edit, "@attribute",
            format, "yyyy-MM-dd");
}
```

Tip: To insert a sample of the `oxy_datePicker` form control in a CSS file , invoke the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_datePicker` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: ***[OXYGEN_INSTALL_DIR]*/samples/form-controls**.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

HTML Content Form Control
The `oxy_htmlContent` built-in form control is used for rendering HTML content. This HTML content is displayed as a graphical element shaped as a box. The shape of the box is determined by a given width and the height is computed based upon the length of the text.

The `oxy_htmlContent` form control supports the following properties:

- `href` - The absolute or relative location of a resource. The resource needs to be a well-formed HTML file.
- `id` - The unique identifier of an item. This is a `div` element that has a unique `id` and is a child of the `body` element. The `div` element is the container of the HTML content to be rendered by the form control.
- `content` - An alternative to the `href` and `id` pair of elements. It provides the HTML content that will be displayed in the form control.
- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

  ```
  p:before {
    content: oxy_htmlContent(hoverPseudoclassName, 'showBorder')
  }
  p:showBorder {
    border: 1px solid red;
  }
  ```

You can customize the style of the content using CSS that is either referenced by the file identified by the `href` property or is defined inline. If you change the HTML content or CSS and you want your changes to be reflected in the XML that renders the form control, then you need to refresh the XML file. If the HTML does not have an associated style, then a default text and background color will be applied.

Example: *oxy_htmlContent* Form Control

In the following example, the form control collects the content from the `p_description` `div` element found in the `descriptions.html` file. The box is 400 pixels wide and is displayed before a paragraph identified by the `intro_id` attribute value.

```
p#intro_id:before {
    content:
        oxy_htmlContent(
            href, "descriptions.html",
            id, "p_description",
            width, 400px);
}
```

An alternative example, using the `content` property:

```
p#intro_id:before {
    content:
```

```
        oxy_htmlContent(
            content, "<div style='font-weight:bold;'>My content</div>",
            width, 400px);
}
```

Note: *Anchor* HTML elements are displayed but the links are inactive.

Tip: To insert a sample of the `oxy_htmlContent` form control in a CSS file , invoke the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_htmlContent` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: ***[OXYGEN_INSTALL_DIR]*/samples/form-controls**.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Pop-up Form Control
The `oxy_popup` built-in form control is used to offer a contextual menu that provides quick access to various actions. A pop-up form control can display single or multiple selections.

The `oxy_popup` form control supports the following properties:

- `edit` - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

    Note: You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.
- `rows` - This property specifies the number of rows that the form control presents.

  Note: If the value of the **rows** property is not specified, the default value of **12** is used.
- `color` - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.

  Note: This property is used for rendering in the **Author** mode.
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `tooltips` - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `${comma}` variable.

  Example:

```
link:before{
 content: oxy_popup(
         edit, '@href',
         values, "Spring, Summer, Autumn, Winter",
         tooltips, "Iris${comma}Snowdrop, Gardenia${comma}Liliac,
             Chrysanthemum${comma}Salvia, Gerbera",
        selectionMode, single);
}
```

- `values` - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

  Note: Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\\, 2\\, 3, 4, edit, false)` will display a form control that has **1, 2, 3** for the first value and **4** for the second value.
- `resultSeparator` - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the *space* character is used.

  Note: The value of the `resultSeparator` property cannot exceed one character.

- `selectionMode` - Specifies whether the form control allows the selection of a single value or multiple values. The predefined values of this property are `single` (default value) and `multiple`.
- `labels` - Specifies the label associated with each entry used for presentation. If this property is not specified, the **values** property is used instead.
- `columns` - Controls the width of the form control. The unit size is the width of the **w** character. This property is used for the visual representation of the form control.
- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `rendererSort` - Allows you to sort the values rendered on the form control label. The possible values of this property are `ascending` and `descending`.
- `editorSort` - Allows you to sort the values rendered on the form control. The possible values of this property are `ascending` and `descending`.
- `rendererSeparator` - Defines a separator used when multiple values are rendered. If not specified, the value of the `resultSeparator` property is used.
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_popup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

Example: *oxy_popup* Form Control

```
popupWithMultipleSelection:before {
    content: " This editor edits an attribute value.
              The possible values are specified
    inside the CSS: "
        oxy_popup(
            edit, "@attribute",
            values, "value1, value2, value3, value4, value5",
            labels, "Value no1, Value no2, Value no3, Value no4, Value no5",
            resultSeparator, "|",
            columns, 10,
            selectionMode, "multiple",
            color, "blue",
            fontInherit, true);
    font-size:30px;
}
```

Tip: To insert a sample of the `oxy_popup` form control in a CSS file , invoke the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_popup` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: ***[OXYGEN_INSTALL_DIR]*/samples/form-controls**.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Text Area Form Control
The `oxy_textArea` built-in form control is used for entering multiple lines of text in a graphical user interface box. A text area may include optional syntax highlight capabilities to present the form control.

The `oxy_textArea` form control supports the following properties:

- `edit` - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

Note: You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.

- **#content** - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

  For example, if you have the following XML content:

  ```
  <codeblock outputclass="language-xml">START_TEXT<ph>phase</ph>
            <apiname><text>API</text></apiname></codeblock>
  ```

  and your CSS includes the following snippet:

  ```
  codeblock:before{
  content:
      oxy_textArea(
        edit, '#content',
        contentType, 'text/xml');
  }
  ```

  then the text area form control will edit the following fragment:

  ```
  START_TEXT<ph>phase</ph><apiname><text>API</text></apiname>
  ```

  Note: When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- **#content** - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

  For example, if you have the following XML content:

  ```
  <codeblock outputclass="language-xml">START_TEXT<ph>phase</ph>
            <apiname><text>API</text></apiname></codeblock>
  ```

  and your CSS includes the following snippet:

  ```
  codeblock:before{
  content:
      oxy_textArea(
        edit, '#content',
        contentType, 'text/xml');
  }
  ```

  then the text area form control will edit the following fragment:

  ```
  START_TEXT<ph>phase</ph><apiname><text>API</text></apiname>
  ```

  Note: When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals.

- `columns` - Controls the width of the form control. The unit size is the width of the **w** character.
- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `rows` - This property specifies the number of rows that the form control presents. If the form control has more lines, you can scroll and see them all.
- `contentType` - Specifies the type of content for which the form control offers syntax highlighting. The following values are supported: `text/css; text/shell; text/cc; text/xquery; text/xml; text/python; text/xsd; text/c; text/xpath; text/javascript; text/xsl; text/wsdl; text/html; text/xproc; text/properties; text/sql; text/rng; text/sch; text/json; text/perl; text/php; text/java; text/batch; text/rnc; text/dtd; text/nvdl; text/plain.`

- `indentOnTab` - Specifies the behavior of the **Tab** key. If the value of this property is set to `true` (default value), the **Tab** key inserts characters. If it is set to `false`, **Tab** is used for navigation, jumping to the next editable position in the document.
- The `white-space` CSS property influences the value that you edit, as well as the from control size:
  - `pre` - The whitespaces and new lines of the value are preserved and edited. If the `rows` and `columns` properties are not specifies, the form control calculates its size on its own so that all the text is visible.
  - `pre-wrap` - The long lines are wrapped to avoid horizontal scrolling.

    Note: The `rows` and `columns` properties must be specified. If these are not specified, the form control considers the value to be `pre`.
  - `normal` - The white spaces and new lines are normalized.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_textArea(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

Example: *oxy_textArea* Form Control

The following example presents a text area with CSS syntax highlighting that calculates its own dimension, and a second one with XML syntax highlighting with defined dimension.

```
textArea {
    visibility: -oxy-collapse-text;
    white-space: pre;
}

textArea[language="CSS"]:before {
    content: oxy_textArea(
      edit, '#text',
      contentType, 'text/css');
}

textArea[language="XML"]:before {
    content: oxy_textArea(
      edit, '#text',
      contentType, 'text/xml',
      rows, 10,
      columns, 30);
}
```

Tip: To insert a sample of the `oxy_textArea` form control in a CSS file , invoke the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_textArea` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: ***[OXYGEN_INSTALL_DIR]*/samples/form-controls**.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Text Field Form Control
The `oxy_textfield` built-in form control is used for entering a single line of text in a graphical user interface box. A text field may include optional content completion capabilities, used to present and edit the value of an attribute or an element.

The `oxy_textfield` form control supports the following properties:

- `edit` - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

    Note: You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.

- `columns` - Controls the width of the form control. The unit size is the width of the **w** character.
- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `values` - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.
- `tooltips` - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `${comma}` variable.
- `tooltip` - Specifies a tooltip to be displayed when you hover over the form control.
- `color` - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- `hasMultipleValues` - Specifies if the text field allows multiple values separated by spaces or just a single value.

  Note: If the value is `false`, the *Content Completion Assistant* considers the entire text as the prefix for its proposals. If the value is `true` (the default value), the space is the delimiter for the values and thus it is not included in the prefix (the prefix will be whatever comes after the space).

  For example, suppose the possible values for your text field are: `value a`, `value b`, and `other values`. If the `hasMultipleValues` property is set to `true` and the user enters `"value "` (notice the space character after 'value') in the text field, the *Content Completion Assistant* will suggest all three values because the prefix is whatever comes after the space, and in this case the user did not enter anything after the space. If the `hasMultipleValues` property was set to `false` for our example, the *Content Completion Assistant* would only suggest `value a` and `value b` because the space is considered part of the prefix.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_textfield(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

Example: *oxy_textfield* Form Control

```
element {
    content: "Label: "
        oxy_textfield(
            edit, "@my_attr",
            values, "value1, value2",
            color, "red",
            columns, 40);
}
```

Tip: To insert a sample of the `oxy_textfield` form control in a CSS file , invoke the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_textfield` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: ***[OXYGEN_INSTALL_DIR]*/samples/form-controls**.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

URL Chooser Form Control
The `oxy_urlChooser` built-in form control is used for a dialog box that allows you to select the location of local or remote resources. The inserted reference is made relative to the URL of the currently opened editor.

The `oxy_urlChooser` editor supports the following properties:

- `edit` - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
  - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName* and the CSS must have a namespace declaration for the prefix.
  - **#text** - Specifies that the presented/edited value is the simple text value of an element.

    Note: You can set the value of the `visibility` property to `-oxy-collapse-text` to render the text only in the form control that the `oxy_editor` function specifies.
- `columns` - Controls the width of the form control. The unit size is the width of the **w** character.
- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the % character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- `color` - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element in which it is inserted.
- `visible` - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- `fontInherit` - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- `fileFilter` - string value that holds comma-separated file extensions. The URL chooser uses these extensions to filter the displayed files. A value such as "`jpg,png,gif`" is mapped to three filters that will display all `jpg`, `png`, and `gif` files respectively.
- `hoverPseudoclassName` - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_urlChooser(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

Example: *oxy_urlChooser* Form Control

```
urlChooser[file]:before {
    content: "A URL chooser editor that allows browsing for a URL.
          The selected URL is made relative to the currently edited file:"
        oxy_urlChooser(
        edit, "@file",
        columns 25);
}
```

Tip: To insert a sample of the `oxy_urlChooser` form control in a CSS file , invoke the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_urlChooser` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: ***[OXYGEN_INSTALL_DIR]*/samples/form-controls**.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Video Player Form Control
The `oxy_video` built-in form control is used for providing a mechanism to play videos.

The `oxy_video` form control supports the following properties:

- `href` - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

```
oxy_video(href, oxy_url(oxy_base-uri(), 'ex.mp4')), width, 400px, height, 300px)
```

- `width` - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the % character) length units.
- `height` - Specifies the height of the form control area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the % character) length units.

Example: *oxy_video* Form Control

```
object {
    content:
        oxy_video(
            href, 'resources/video.mp4',
            width, 400px,
            height, 300px),
}
```

Tip: To insert a sample of the `oxy_video` form control in a CSS file , invoke the *Content Completion Assistant* by pressing **Ctrl + Space (Command + Space on OS X)** and select the `oxy_video` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: ***[OXYGEN_INSTALL_DIR]*/samples/form-controls**.

https://www.youtube.com/embed/-WY3wzkMSLM

Implementing Custom Form Controls
If the built-in form controls are not sufficient for your needs, you can implement custom form controls in Java.

Custom Form Controls Implementation

You can specify custom form controls using the following properties:

- **rendererClassName** - The name of the class that draws the edited value. It must be an implementation of *ro.sync.ecss.extensions.api.editor.InplaceRenderer*. The renderer has to be a **SWING** implementation and can be used both in the standalone and Eclipse distributions.
- **swingEditorClassName** - You can use this property for the standalone (**Swing**-based) distribution to specify the name of the class used for editing. It is a **Swing** implementation of *ro.sync.ecss.extensions.api.editor.InplaceEditor*.
- **swtEditorClassName** - You can use this property for the Eclipse plugin distribution to specify the name of the class used for editing. It is a **SWT** implementation of the *ro.sync.ecss.extensions.api.editor.InplaceEditor*.

  Note: If the custom form control is intended to work in the Oxygen XML Editor plugin standalone distribution, the declaration of **swtEditorClassName** is not required. The **renderer** (the class that draws the value) has different properties from the **editor** (the class that edits the value) because you can present a value in one way and edit it in another.
- **classpath** - You can use this property to specify the location of the classes used for a custom form control. The value of the **classpath** property is an enumeration of URLs separated by comma.
- **edit** - If your form control edits the value of an attribute or the text value of an element, you can use the `@attribute_name` and `#text` predefined values and Oxygen XML Editor plugin will perform the commit logic by itself. You can use the `custom` value to perform the commit logic yourself.
- **ecHeavyFormControlClassName** - This type of form control is effectively present at all times at its allocated bounds. This is useful if you need a form controls that renders dynamic or interactive SVG documents (for example, if you have an SVG document that displays tooltips when hovering over certain areas).

  The value of this property is a class name that must implement the *ro.sync.ecss.extensions.api.editor.InplaceHeavyEditor* method. The *JAR* that contains this implementation can either be added in the **Classpath** tab in the **Document Type Configuration** dialog box for your particular *framework* or specified with the `classpath` property.

Example: Java Code

The following is a sample Java code for implementing a custom combo box form control that inserts an XML element in the content when the editing stops:

```
public class ComboBoxEditor  extends AbstractInplaceEditor {
  /**
```

```
   * @see ro.sync.ecss.extensions.api.editor.InplaceEditor#stopEditing()
   */
  @Override
   public void stopEditing() {
     Runnable customCommit =  new Runnable() {
       @Override
        public void run() {
         AuthorDocumentController documentController =
             context.getAuthorAccess().getDocumentController();
         documentController.insertXMLFragment( "<custom/>", offset);
       }
     };
     EditingEvent event =  new EditingEvent(customCommit,  true);
     fireEditingStopped(event);
   }
```

The custom form controls can use any of the predefined properties of the built-in form controls, as well as specified custom properties.

Example: CSS

The following is an example of how to specify a custom form control in the CSS:

```
myElement {
    content: oxy_editor(
        rendererClassName, "com.custom.editors.CustomRenderer",
        swingEditorClassName, "com.custom.editors.SwingCustomEditor",
        swtEditorClassName, "com.custom.editors.SwtCustomEditor",
        edit, "@my_attr",
        customProperty1, "customValue1",
        customProperty2, "customValue2"
    )
}
```

How to Implement Custom Form Controls

To implement a custom form control, follow these steps:

1. Download the Oxygen XML Editor plugin SDK at https://www.oxygenxml.com/oxygen_sdk.html.
2. Implement the custom form control by extending *ro.sync.ecss.extensions.api.editor.InplaceEditorRendererAdapter*. You could also use *ro.sync.ecss.extensions.api.editor.AbstractInplaceEditor*, which offers some default implementations and listeners management.
3. Pack the previous implementation in a Java *JAR* library.
4. Copy the *JAR* library to the *[OXYGEN_INSTALL_DIR]*`/frameworks/[FRAMEWORK_DIR]` directory.
5. In Oxygen XML Editor plugin, open the **Preferences** dialog box , go to **Document Type Association**, edit the appropriate *framework*, and add the *JAR* library in the **Classpath** tab.
6. Specify the custom form control in your CSS, as described above.

Tip: To see more detailed examples and more information about how form controls work in Oxygen XML Editor plugin, see the sample files in the following directory: ***[OXYGEN_INSTALL_DIR]*`/samples/form-controls`**.

For more information about form controls, watch our video demonstration:

https://www.youtube.com/embed/-WY3wzkMSLM

Editing Processing Instructions Using Form Controls
Oxygen XML Editor plugin allows you to edit *processing instructions*, *comments*, and *CDATA* by using the built-in editors.

Oxygen XML Editor plugin allows you to edit *processing instructions*, *comments*, and *CDATA* by using the built-in editors.

Note: You can edit both the content and the attribute value from a *processing instruction*.

Example: Editing an Attribute from a Processing Instruction

PI content:

```
<?pi_target attr="val"?>
```

CSS:

```
oxy|processing-instruction:before {
    display:inline;
    content:
        "EDIT attribute: " oxy_textfield(edit, '@attr', columns, 15);
    visibility:visible;
}
oxy|processing-instruction{
    visibility:-oxy-collapse-text;
}
```

Custom CSS Pseudo-classes

You can set your custom CSS pseudo-classes on the nodes from the *AuthorDocument* model. These are similar to the normal XML attributes, with the important difference that they are not serialized, and by changing them the document does not create undo and redo edits - the document is considered unmodified. You can use custom pseudo-classes for changing the style of an element (and its children) without altering the document.

In Oxygen XML Editor plugin they are used to hide/show the `colspec` elements from CALS tables. To take a look at the implementation, see:

1. *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/css/cals_table.css` (Search for `-oxy-visible-colspecs`)
2. The definition of action `table.toggle.colspec` from the DocBook *framework* makes use of the pre-defined *TogglePseudoClassOperation* **Author** mode operation.

Here are some examples:

Example: Controlling the visibility of a section using a pseudo-class

You can use a non standard (custom) pseudo-class to impose a style change on a specific element. For instance, you can have CSS styles matching the custom pseudo-class `access-control-user`, like the one below:

```
section {
  display:none;
}

section:access-control-user {
  display:block;
}
```

By setting the pseudo-class `access-control-user`, the element section will become visible by matching the second CSS selector.

Example: Coloring the elements at the current cursor location

You could create an *AuthorCaretListener* that sets the `caret-visited` pseudo-class to the element at the cursor location. The effect will be that all the elements traversed by the cursor become red.

```
*:caret-visited {
  color:red;
}
```

The API that you can use from the *CaretListener*:

ro.sync.ecss.extensions.api.AuthorDocumentController#setPseudoClass(java.lang.String, ro.sync.ecss.extensions.api.node.AuthorElement)

ro.sync.ecss.extensions.api.AuthorDocumentController#removePseudoClass(java.lang.String, ro.sync.ecss.extensions.api.node.AuthorElement)

Predefined Pseudo-Class Author Mode Operations

Pre-defined **Author** mode operations can be used directly in your *framework* to work with custom pseudo-classes:

1. *TogglePseudoClassOperation*
2. *SetPseudoClassOperation*
3. *RemovePseudoClassOperation*

Debugging CSS Stylesheets

To assist you with debugging and customizing CSS stylesheets the **Author** mode includes a **CSS Inspector** view to examine the CSS rules that match the currently selected element.

This tool is similar to the Inspect Element development tool that is found in most browsers. The **CSS Inspector** view allows you to see how the CSS rules are applied and the properties defined. Each rule that is displayed in this view includes a link to the line in the CSS file that defines the styles for the element that matches the rule. You can use the link to open the appropriate CSS file and edit the style rules. Once you have found the rule you want to edit, you can click the link in the top-right corner of that rule to open the CSS file in the editor.

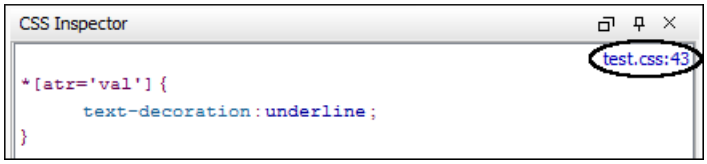

Figure 671: CSS Inspector View

There are two ways to open the CSS Inspector view:

1. Select **CSS Inspector** from the **Window** > **Show View** menu.
2. Select the **Inspect Styles** action from the contextual menu in **Author** mode.

Related Information:

CSS Inspector View on page 209

Creating and Running Automated Tests

If you have developed complex custom *plugin* or *framework* (document types), the best way to test your implementation and ensure that further changes will not interfere with the current behavior is to make automated tests for your customization.

An Oxygen XML Editor plugin standalone installation includes a main `oxygen.jar` library located in the *[OXYGEN_INSTALL_DIR]*. That *JAR* library contains a base class for testing developer customizations named: *ro.sync.exml.workspace.api.PluginWorkspaceTCBase*.

To develop *JUnit* tests for your customizations using the **Eclipse** workbench, follow these steps:

1. Create a new Eclipse Java project and copy to it the entire contents of the *[OXYGEN_INSTALL_DIR]*.
2. Add all *JAR* libraries present in the *[OXYGEN_INSTALL_DIR]*`/lib` directory to the **Java Build Path**->**Libraries** tab. Make sure that the main *JAR* library `oxygen.jar` or `oxygenAuthor.jar` is the first one in the Java classpath by moving it up in the **Order and Export** tab.
3. Click **Add Library** and add the *JUnit* and *JFCUnit* libraries.
4. Create a new Java class that extends *ro.sync.exml.workspace.api.PluginWorkspaceTCBase*.
5. Pass the following parameters on to the constructor of the super class:
   - `File installationFolder` - The file path to the main application installation directory. If not specified, it defaults to the folder where the test is started.
   - `File frameworksFolder` - The file path to the `frameworks` directory. It can point to a custom *framework* directory where it resides.
   - `File pluginsFolder` - The file path to the `plugins` directory. It can point to a custom *plugin* directory where it resides.
   - `File optionsFolder` - The folder that contains the application options. If not specified, the application will auto-detect the location based on the started product ID.
   - `String licenseKey` - The license key used to license the test class.
   - `int productID` - The ID of the product and should be one of the following: `PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT`, `PluginWorkspaceTCBase.XML_EDITOR_PRODUCT`, or `PluginWorkspaceTCBase.XML_DEVELOPER_PRODUCT`.

6. Create test methods that use the API in the base class to open XML files and perform various actions on them. Your test class could look something like this:

```
public class MyTestClass extends PluginWorkspaceTCBase {

/**
 * Constructor.
 */
public MyTestClass() throws Exception {
 super(null, new File("frameworks"), new File("plugins"), null,
"------START-LICENSE-KEY------\n" +
 "\n" +
 "Registration_Name=Developer\n" +
 "\n" +
 "Company=\n" +
 "\n" +
 "Category=Enterprise\n" +
 "\n" +
 "Component=XML-Editor, XSLT-Debugger, Saxon-SA\n" +
 "\n" +
 "Version=14\n" +
 "\n" +
 "Number_of_Licenses=1\n" +
 "\n" +
 "Date=09-04-2012\n" +
 "\n" +
 "Trial=31\n" +
 "\n" +
 "SGN=MCwCFGNoEGJSeiC3XCYIyalvjzHhGhhqAhRNRDpEu8RIWb8icCJO7HqfVP4++A\\=\\=\n" +
 "\n" +
"-------END-LICENSE-KEY-------",
 PluginWorkspaceTCBase.XML_AUTHOR_PRODUCT);
 }

 /**
   * <p><b>Description:</b> TC for opening a file and using a bold operation</p>
   * <p><b>Bug ID:</b> EXM-20417</p>
   *
   * @author radu_coravu
   *
   * @throws Exception
   */
public void testOpenFileAndBoldEXM_20417() throws Exception {
      WSEditor ed = open(new File
("D:/projects/eXml/test/authorExtensions/dita/sampleSmall.xml").toURL());
     //Move caret
     moveCaretRelativeTo("Context", 1, false);

     //Insert <b>
     invokeAuthorExtensionActionForID("bold");
     assertEquals("<?xml version=\"1.0\" encoding=\"utf-8\"?>\n" +
       "<!DOCTYPE task PUBLIC \"-//OASIS//DTD DITA Task//EN\"
 \"http://docs.oasis-open.org/dita/v1.1/OS/dtd/task.dtd\">\n" +
       "<task id=\"taskId\">\n" +
       "    <title>Task <b>title</b></title>\n" +
       "    <prolog/>\n" +
       "    <taskbody>\n" +
       "        <context>\n" +
       "            <p>Context for the current task</p>\n" +
       "        </context>\n" +
       "        <steps>\n" +
       "            <step>\n" +
       "                <cmd>Task step.</cmd>\n" +
       "            </step>\n" +
       "        </steps>\n" +
       "    </taskbody>\n" +
       "</task>\n" +
       "", getCurrentEditorXMLContent());
   }
}
```

API Frequently Asked Questions (API FAQ)

This section contains answers to common questions regarding the Oxygen XML Editor plugin customizations using the *Oxygen SDK*, or plugins.

For additional questions, contact us. The preferred approach is via email because API questions must be analyzed thoroughly. We also provide code snippets, if they are required.

Add Custom Actions to the Contextual Menu?

Question

How do I add my own custom actions to the contextual menu using an API?

Answer

The *WSAuthorEditorPageBase.addPopUpMenuCustomizer* and *WSTextEditorPage.addPopUpMenuCustomizer* API methods allow you to customize the contextual menu shown either in the **Author** or **Text** modes. The API is available both in the standalone application and in the Eclipse plugin.

Here is an elegant way to add actions to the **Author** page from your Eclipse plugin extension:

1. Create a pop-up menu customizer implementation:

```
import org.eclipse.jface.action.ContributionManager;
import org.eclipse.ui.PlatformUI;
import org.eclipse.ui.menus.IMenuService;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.structure.AuthorPopupMenuCustomizer;
/**
* This class is used to create the possibility to attach certain
* menuContributions to the {@link ContributionManager}, which is used for the
* popup menu in the Author Page of the Oxygen Editor.<br />
* You just need to use the org.eclipse.ui.menus extension and add a
* menuContribution with the locationURI: <b>menu:oxygen.authorpage</b>
*/
public class OxygenAuthorPagePopupMenuCustomizer implements
        AuthorPopupMenuCustomizer {

    @Override
    public void customizePopUpMenu(Object menuManagerObj,
            AuthorAccess authoraccess) {
        if (menuManagerObj instanceof ContributionManager) {
 ContributionManager contributionManager = (ContributionManager) menuManagerObj;
            IMenuService menuService = (IMenuService) PlatformUI.getWorkbench()
                    .getActiveWorkbenchWindow().getService(IMenuService.class);

            menuService.populateContributionManager(contributionManager,
                    "menu:oxygen.authorpage");
            contributionManager.update(true);
        }
    }
}
```

2. Add a workbench listener and add the pop-up customizer when an editor is opened in the **Author** page:

```
Workbench.getInstance().getActiveWorkbenchWindow().getPartService()
.addPartListener(
    new IPartListener() {
      @Override
      public void partOpened(IWorkbenchPart part) {
        if(part instanceof ro.sync.exml.workspace.api.editor.WSEditor) {
          WSEditorPage currentPage = ((WSEditor)part).getCurrentPage();
          if(currentPage instanceof WSAuthorEditorPage) {
            ((WSAuthorEditorPage)currentPage).addPopUpMenuCustomizer
(new OxygenAuthorPagePopupMenuCustomizer());
          }
        }
      }
      ........
    });
```

3. Implement the extension point in your `plugin.xml` file:

```
<extension
       point="org.eclipse.ui.menus">
    <menuContribution
          allPopups="false"
          locationURI="menu:oxygen.authorpage">
       <command
             commandId="eu.doccenter.kgu.client.tagging.removeTaggingFromOxygen"
             style="push">
       </command>
    </menuContribution>
</extension>
```

Add Custom Callouts

Question

I want to highlight validation errors, instead of underlining them (for example, changing the text background color to light red or yellow). Also, I want to let Oxygen XML Editor plugin write a note about the error type into the **Author** mode directly at the error position (for example, " [value "text" not allowed for attribute "type"] "). Is this possible using the API?

Answer

The Plugins API allows you to set a *ValidationProblemsFilter* that gets notified when automatic validation errors are available. Then you can map each of the problems to an offset range in the **Author** mode using the API *WSTextBasedEditorPage.getStartEndOffsets(DocumentPositionedInfo)*. For each of those offsets, you can add either persistent or non-persistent highlights. If you add persistent highlights, you can also customize callouts to appear for each of them. The downside is that they need to be removed before the document gets saved. The result would look something like this:

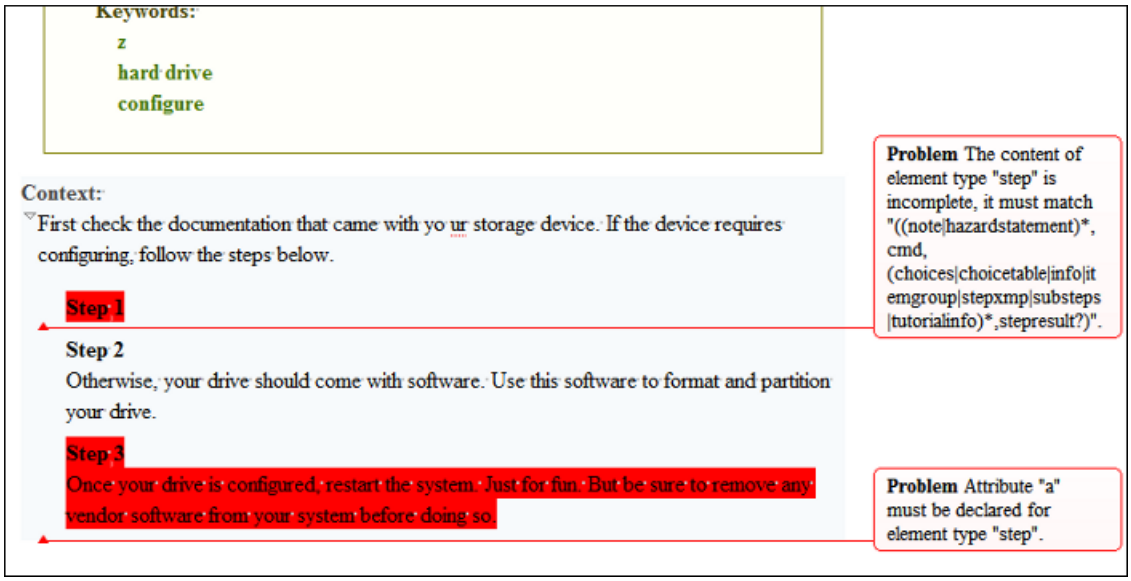

Figure 672: Custom Callouts with Persistent Highlights

Here is a working example:

```
/**
* Plugin extension - workspace access extension.
*/
public class CustomWorkspaceAccessPluginExtension
                    implements WorkspaceAccessPluginExtension {

/**
* @see ro.sync.exml.plugin.workspace.WorkspaceAccessPluginExtension
   #applicationStarted(
ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace)
*/
    public void applicationStarted
(final StandalonePluginWorkspace pluginWorkspaceAccess) {
        pluginWorkspaceAccess.addEditorChangeListener
(new WSEditorChangeListener() {
          /**
           * @see WSEditorChangeListener#editorOpened(java.net.URL)
           */
          @Override
          public void editorOpened(URL editorLocation) {
            final WSEditor currentEditor = pluginWorkspaceAccess.getEditorAccess
(editorLocation, StandalonePluginWorkspace.MAIN_EDITING_AREA);
            WSEditorPage currentPage = currentEditor.getCurrentPage();
            if(currentPage instanceof WSAuthorEditorPage) {
              final WSAuthorEditorPage currentAuthorPage =
(WSAuthorEditorPage)currentPage;
              currentAuthorPage.getPersistentHighlighter().setHighlightRenderer
(new PersistentHighlightRenderer() {
                @Override
                public String getTooltip(AuthorPersistentHighlight highlight) {
                  return highlight.getClonedProperties().get("message");
```

```
                }
                @Override
                public HighlightPainter getHighlightPainter
(AuthorPersistentHighlight highlight) {
                  //Depending on severity could have different color.
                  ColorHighlightPainter painter = new ColorHighlightPainter
(Color.COLOR_RED, -1, -1);
                  painter.setBgColor(Color.COLOR_RED);
                  return painter;
                }
              });
        currentAuthorPage.getReviewController()
        .getAuthorCalloutsController().setCalloutsRenderingInformationProvider(
              new CalloutsRenderingInformationProvider() {
              @Override
    public boolean shouldRenderAsCallout(AuthorPersistentHighlight highlight) {
                  //All custom highlights are ours
                  return true;
                }
                @Override
    public AuthorCalloutRenderingInformation getCalloutRenderingInformation(
                    final AuthorPersistentHighlight highlight) {
                  return new AuthorCalloutRenderingInformation() {
                    @Override
                    public long getTimestamp() {
                      //Not interesting
                      return -1;
                    }
                    @Override
                    public String getContentFromTarget(int limit) {
                      return "";
                    }
                    @Override
                    public String getComment(int limit) {
                      return highlight.getClonedProperties().get("message");
                    }
                    @Override
                    public Color getColor() {
                      return Color.COLOR_RED;
                    }
                    @Override
                    public String getCalloutType() {
                      return "Problem";
                    }
                    @Override
                    public String getAuthor() {
                      return "";
                    }
                    @Override
                    public Map<String, String> getAdditionalData() {

    }
```

Add Custom Highlights to Content

Question

How can we add custom highlights to the document content in **Author** mode?

Answer

There are two types of highlights you can add:

1. **Non-Persistent Highlights** - Such highlights are removed when the document is closed and then re-opened.

   You can use the following API method:

   `ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPageBase.getHighlighter()`

   to obtain an AuthorHighlighter that allows you to add a highlight between certain offsets with a specified painter.

   For example, you can use this support to implement your own spell checker with a custom highlight for the unrecognized words.
2. **Persistent Highlights** - Such highlights are saved in the XML content as processing instructions.

   You can use the following API method:

   `ro.sync.exml.workspace.api.editor.page.author.WSAuthorEditorPageBase.getPersistentHighlig`

   to obtain an AuthorPersistentHighlighter class that allows you to add a persistent highlight between certain offsets, set new properties for a specific highlight, and render it with a specified painter.

   For example, you can use this support to implement your own way of adding review comments.

Auto-Generate an ID When a Document is Opened or Created

Question

Is it possible to configure how the application generates ids? For project compliance we need ids having a certain format for each created topic.

Answer

This could be done implementing a *plugin* for Oxygen XML Editor plugin using the Plugins SDK:

There is a type of *plugin* called "Workspace Access" that can be used to add a listener to be notified when an editor is opened.

The implemented *plugin* would intercept the opened editor and editor page change events (which occur when a new editor is created) and generate a new ID attribute value on the root element.

The Java code would look like this:

```
pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
/**
* @see WSEditorChangeListener#editorOpened(java.net.URL)
*/
@Override
public void editorOpened(URL editorLocation) {
    WSEditor ed = pluginWorkspaceAccess.getEditorAccess
(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
        generateID(ed);
}
/**
* @see WSEditorChangeListener#editorPageChanged(java.net.URL)
*/
@Override
public void editorPageChanged(URL editorLocation) {
    WSEditor ed = pluginWorkspaceAccess.getEditorAccess
(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
        generateID(ed);
}
```

```
private void generateID(WSEditor ed) {
 if(ed.getCurrentPage() instanceof WSAuthorEditorPage) {
  WSAuthorEditorPage authorEditPage = (WSAuthorEditorPage) ed.getCurrentPage();
  AuthorDocumentController ctrl = authorEditPage.getDocumentController();
  AuthorElement root = ctrl.getAuthorDocumentNode().getRootElement();
   if(root.getAttribute("id") == null ||
!root.getAttribute("id").getValue().startsWith("generated_")) {
    ctrl.setAttribute("id", new AttrValue("generated_" + Math.random()), root);
          }
        }
      }

    }, PluginWorkspace.MAIN_EDITING_AREA);
```

Change the Default Track Changes (Review) Author Name

Question

How can we change the default author name used for *Tracked Changes* in the *Author Component*?

Answer

The *Track Changes* (Review) author name is determined in the following order:

1. **API** - The review user name can be imposed through the following API:

   ```
   ro.sync.ecss.extensions.api.AuthorReviewController.setReviewerAuthorName(String)
   ```

2. **Options** - If the author name was not imposed from the API, it is determined from the **Author** option set in the **Review** preferences page.
3. **System properties** - If the author name was not imposed from the API or from the application options then the following system property is used:

   ```
   System.getProperty("user.name")
   ```

So, to impose the *Track Changes* author, use one of the following approaches:

1. Use the API to impose the reviewer author name. Here is the online Javadoc of this method: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/AuthorReviewController.html#setReviewerAuthorName(java.lang.String)
2. Customize the default options and set a specific value for the **Author** name option set in the **Review** preferences page.
3. Set the value of `user.name` system property when the applet is initializing and before any document is loaded.

Change the DOCTYPE of an Opened XML Document

Question

How to change the DOCTYPE of a document opened in the **Author** mode?

Answer

The following API:

`ro.sync.ecss.extensions.api.AuthorDocumentController.getDoctype()`

allows you to get the DOCTYPE of the current XML file opened in the **Author** mode.

There is also an API method available that would allow you to set the DOCTYPE back to the XML:

`ro.sync.ecss.extensions.api.AuthorDocumentController.setDoctype(AuthorDocumentType)`

Here is an example of how this solution would work:

```
AuthorDocumentType
dt = new AuthorDocumentType("article", "testSystemID", "testPublicID",
            "<!DOCTYPE article PUBLIC \"testPublicID\" \"testSystemID\">");
docController.setDoctype(dt);
```

Basically, you could take the entire content from the existing DOCTYPE,

`ro.sync.ecss.extensions.api.AuthorDocumentType.getContent()`

modify it to your needs, and create another `AuthorDocumentType` object with the new content and with the same public, system IDs.

For example, you could use this API is you want to add unparsed entities in the XML `DOCTYPE`.

Control XML Serialization in the Oxygen XML Author Component

Question

How can I force the Oxygen XML Author Component to save the XML with zero indent size and not to break the line inside *block elements*?

Answer

Usually, in a standalone version of Oxygen XML Editor plugin, the **Editor** > **Format** and **Editor** > **Format** > **XML** preferences pages allow you to control the way the XML is saved on the disk after you edit it in the **Author** mode.

In the editor application (Standalone or Eclipse-based), you can either bundle a default set of options or use the `PluginWorkspace.setGlobalObjectProperty(String, Object)` API:

```
//For not breaking the line
//Long line
pluginWorkspace.setObjectProperty("editor.line.width", new Integer(100000));
//Do not break before inline elements
pluginWorkspace.setObjectProperty("editor.format.indent.inline.elements", false)
;

//For forcing zero indent
//Force indent settings to be controlled by us
pluginWorkspace.setObjectProperty("editor.detect.indent.on.open", false);
//Zero indent size
pluginWorkspace.setObjectProperty("editor.indent.size.v9.2", 0);
```

In the Oxygen XML Author Component, you can either bundle a fixed set of options, or use our Java API to set properties that overwrite the default options:

```
    //For not breaking the line
    //Long line
    AuthorComponentFactory.getInstance().setObjectProperty
("editor.line.width", new Integer(100000));
    //Do not break before inline elements
    AuthorComponentFactory.getInstance().setObjectProperty
("editor.format.indent.inline.elements", false);

    //For forcing zero indent
    //Force indent settings to be controlled by us
    AuthorComponentFactory.getInstance().setObjectProperty
("editor.detect.indent.on.open", false);
    //Zero indent size
    AuthorComponentFactory.getInstance().setObjectProperty
("editor.indent.size.v9.2", 0);
```

Customize the Default Icons for Toolbars/Menus

Question

How can we change the default icons used for the application built-in actions?

Answer

If you look inside the main *JAR* library *[OXYGEN_INSTALL_DIR]*`\lib\oxygen.jar` or *[OXYGEN_INSTALL_DIR]*`\lib\author.jar`, it contains an `images` folder that contains all the images that we use for our buttons, menus, and toolbars.

To overwrite them with your own creations, follow these steps:

1. In the *[OXYGEN_INSTALL_DIR]*`\lib` directory create a folder called `endorsed`.
2. In the `endorsed` folder create another folder called `images`.

3. Add your own images in the `images` folder.

You can use this mechanism to overwrite any kind of resource located in the main *Oxygen JAR library*. The folder structure in the endorsed directory and in the main *Oxygen JAR* must be identical.

Customize the Outline View in Text Mode?

Question

How do I customize the **Outline** view in **Text** mode?

Answer

Suppose that you have the following XML document:

```
<doc startnumber="15">
    <sec counter="no">
        <info/>
        <title>Introduction</title>
      </sec>
    <sec>
        <title>Section title</title>
      <para>Content</para>
        <sec>
            <title>Section title</title>
                <para>Content</para>
        </sec>
    </sec>
    <sec>
            <title>Section title</title>
        <para>Content</para>
      </sec>
</doc>
```

and you want to display the XML content in a simplified Outline view like this:

```
doc "15"
sec Introduction
sec 15 Section title
sec 15.1 Section title
sec 16 Section title
```

Usually an Outline should have the following characteristics:

1. Double clicking in the Outline the corresponding XML content would get selected.
2. When the cursor moves in the opened XML document the Outline would select the proper entry.
3. When modifications occur in the document, the Outline would refresh.

A simple implementation using a Workspace Access plugin type could be something like this:

```
/**
 * Simple Outline for Text mode based on executing XPaths over the text content.
 */
 public class CustomWorkspaceAccessPluginExtension implements
WorkspaceAccessPluginExtension {
  /**
   * The custom outline list.
   */
  private JList customOutlineList;

  /**
   * Maps outline nodes to ranges in document
   */
  private WSXMLTextNodeRange[] currentOutlineRanges;

  /**
   * The current text page
   */
  private WSXMLTextEditorPage currentTextPage;

  /**
   * Disable CaretListener when we select from the CaretListener.
   */
  private boolean enableCaretListener = true;

  /**
   * @see WorkspaceAccessPluginExtension#applicationStarted
(ro.sync.exml.workspace.api.standalone.StandalonePluginWorkspace)
   */
  @Override
  public void applicationStarted
(final StandalonePluginWorkspace pluginWorkspaceAccess) {
```

```
    pluginWorkspaceAccess.addViewComponentCustomizer
(new ViewComponentCustomizer() {
      /**
       * @see ViewComponentCustomizer#customizeView
(ro.sync.exml.workspace.api.standalone.ViewInfo)
       */
      @Override
      public void customizeView(ViewInfo viewInfo) {
        if(
            //The view ID defined in the "plugin.xml"
            "SampleWorkspaceAccessID".equals(viewInfo.getViewID())) {
          customOutlineList = new JList();
          //Render the content in the Outline.
          customOutlineList.setCellRenderer(new DefaultListCellRenderer() {
       /**
        * @see javax.swing.DefaultListCellRenderer#getListCellRendererComponent
(javax.swing.JList, java.lang.Object, int, boolean, boolean)
        */
      @Override
      public Component getListCellRendererComponent
(JList<?> list, Object value, int index,
          boolean isSelected, boolean cellHasFocus) {
        JLabel label = (JLabel) super.getListCellRendererComponent
(list, value, index, isSelected, cellHasFocus);
        String val = null;
        if(value instanceof Element) {
          Element element = ((Element)value);
          val = element.getNodeName();
          if(!"".equals(element.getAttribute("startnumber"))) {
            val += " " + "'" + element.getAttribute("startnumber") + "'";
          }
          NodeList titles = element.getElementsByTagName("title");
          if(titles.getLength() > 0) {
            val += " \"" + titles.item(0).getTextContent() + "\"";
          }
        }
        label.setText(val);
        return label;
      }
    });
    //When we click a node, select it in the text page.
    customOutlineList.addMouseListener(new MouseAdapter() {
     @Override
     public void mouseClicked(MouseEvent e) {
       if(SwingUtilities.isLeftMouseButton(e) && e.getClickCount() == 2) {
          int sel = customOutlineList.getSelectedIndex();
          enableCaretListener = false;
         try {
          currentTextPage.select(currentTextPage.getOffsetOfLineStart
(currentOutlineRanges[sel].getStartLine()) +
currentOutlineRanges[sel].getStartColumn() - 1,
            currentTextPage.getOffsetOfLineStart
(currentOutlineRanges[sel].getEndLine()) +
currentOutlineRanges[sel].getEndColumn());
          } catch (BadLocationException e1) {
           e1.printStackTrace();
         }
          enableCaretListener = true;
        }
       }
    });
     viewInfo.setComponent(new JScrollPane(customOutlineList));
     viewInfo.setTitle("Custom Outline");
  }
 }
});

pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
  /**
  * @see WSEditorChangeListener#editorOpened(java.net.URL)
  */
  @Override

Difference Between a Framework (Document Type) and a Plugin Extension

Question

What is the difference between a *Framework* and a *Plugin* Extension?

Answer

There are two possible ways to customize the application:

1. Implement a *plugin*.

   A *plugin* serves a general purpose and influences any type of XML file that you open in Oxygen XML Editor plugin.

   For the Oxygen XML Editor plugin Plugins API, Javadoc, samples, and documentation, go to https://www.oxygenxml.com/oxygen_sdk.html#Developer_Plugins
2. Create or modify the document type that is associated to your specific XML vocabulary.

   This document type can be used, for instance, to provide custom actions for your type of XML files and to mount them on the toolbar, menus, and contextual menus.

   For example, if the end users are editing DITA documents, all the toolbar actions that are specific for DITA are provided by the DITA *framework*. If you look in the **Document Type Association** preferences page there is a *DITA* document type. If you edit that document type you will see that it has an **Author** tab in the **Document Type Configuration** dialog box. The subtabs in this tab can be used to define custom DITA actions and add them to the toolbars, main menus, or contextual menus.

   For information about developing your own document types (*frameworks*), see the Advanced Framework Customization on page 1230 section.

   If you look on disk in the *[OXYGEN_INSTALL_DIR]*`\frameworks\dita` folder, there is a file called `dita.framework`. That file gets updated when you edit a document type from the **Document Type Association** preferences page. Then you can share that updated file with all users.

   The same folder contains some *JAR* libraries. These libraries contain custom Java operations that are called when the user presses certain toolbar actions.

   We have an *Oxygen SDK* that contains the Java sources from all the DITA Java customizations:

   https://www.oxygenxml.com/oxygen_sdk.html#XML_Editor_Authoring_SDK

Add a Custom Operation to an Existing Framework on page 1256

Disable Context-Sensitive Menu Items for Custom Author Actions

Question

Is there a way to disable menu items for custom **Author** mode actions depending on the cursor context?

Answer

By default, Oxygen XML Editor plugin does not toggle the enabled/disabled states for actions based on whether or not the activation XPath expressions for that certain **Author** mode action are fulfilled. This is done because the actions can be many and evaluating XPath expression on each cursor move can lead to performance problems. However, if you have your own *ro.sync.ecss.extensions.api.ExtensionsBundle* implementation you can overwrite the method:

`ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExtensionStateListener()`

and when the extension state listener gets activated, you can use the API like this:

```
    /**
     * @see ro.sync.ecss.extensions.api.AuthorExtensionStateListener#activated
(ro.sync.ecss.extensions.api.AuthorAccess)
     */
    public void activated(final AuthorAccess authorAccess) {

      //Add a caret listener to enable/disable extension actions:
authorAccess.getEditorAccess().addAuthorCaretListener(new AuthorCaretListener()
{
    @Override
    public void caretMoved(AuthorCaretEvent caretEvent) {
      try {
        Map<String, Object> authorExtensionActions =
```

```
authorAccess.getEditorAccess().getActionsProvider().getAuthorExtensionActions();
        //Get the action used to insert a paragraph. It's ID is "paragraph"
        AbstractAction insertParagraph = (
AbstractAction) authorExtensionActions.get("paragraph");
        //Evaluate an XPath expression in context of the current node
     Object[] evaluateXPath = authorAccess.getDocumentController().evaluateXPath
(".[ancestor-or-self::p]", false, false, false, false);
        if(evaluateXPath != null && evaluateXPath.length > 0 &&
evaluateXPath[0] != null) {
          //We are inside a paragraph, disable the action.
          insertParagraph.setEnabled(false);
        } else {
          //Enable the action
          insertParagraph.setEnabled(true);
        }
      } catch (AuthorOperationException e) {
        e.printStackTrace();
      }
    }
  });
```

When the extension is deactivated, you should remove the *CaretListener* to avoid adding multiple listeners that perform the same functionality.

Dynamically Add Form Controls Using a Styles Filter

Question

How do I add form controls using an API?

Answer

Usually, a form control is added from the CSS using one of the built-in form controls. However, in some cases you do not have all the information you need to properly initialize the form control at CSS level. In these cases you can add the form controls by using the API, more specifically *ro.sync.ecss.extensions.api.StylesFilter*.

For instance, if you want a combo box form control and the values to populate the combo are specified inside a file (or they come from a database). Here is how to add the form control from the API:

```
public class SDFStylesFilter implements StylesFilter {

 public Styles filter(Styles styles, AuthorNode authorNode) {
  if(authorNode.getType() == AuthorNode.NODE_TYPE_PSEUDO_ELEMENT
      && "before".equals(authorNode.getName())) {
    authorNode = authorNode.getParent();
   if ("country".equals(authorNode.getName())) {
    // This is the BEFORE pseudo element of the "country" element.
    // Read the supported countries from the configuration file.
    Map<String, Object> formControlArgs = new HashMap<String, Object>();
    formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_EDIT, "#text");
    formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_TYPE,
          InplaceEditorArgumentKeys.TYPE_COMBOBOX);
    // This will be a comma separated enumeration: France, Spain, Great Britain
    String countries = readCountriesFromFile();
    formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, countries);
    formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_EDITABLE, "false");

    // We also add a label in form of the form control.
    Map<String, Object> labelProps = new HashMap<String, Object>();
    labelProps.put("text", "Country: ");
    labelProps.put("styles", "* {width: 100px; color: gray;}");
    StaticContent[] mixedContent = new StaticContent[]
           {new LabelContent(labelProps),new EditorContent(formControlArgs)};
    styles.setProperty(Styles.KEY_MIXED_CONTENT, mixedContent);
      }
    }

    // The added form control is the only way the element can be edited.
    if ("country".equals(authorNode.getName())) {
      styles.setProperty(Styles.KEY_VISIBITY, "-oxy-collapse-text");
    }

    return styles;
  }
}
```

If the execution of the `formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES, countries);` line consumes too much execution time (for example, if it connects to a database or if it needs

to extract data from a very large file), you can choose to delay it until the values are actually needed by the form control. This approach is called *lazy evaluation* and can be implemented as follows:

```
formControlArgs.put(InplaceEditorArgumentKeys.PROPERTY_VALUES,
          new LazyValue<List<CIValue>>() {
  public java.util.List<CIValue> get() {
    // We avoid reading the possible values until they are actually requested.
    // This will be a List with CIValues created over countries:
           France, Spain, Great Britain
    return readCountriesFromFile();
  }
});
```

The lazy evaluation approach can be used for the following form controls properties:

- `InplaceEditorArgumentKeys.PROPERTY_VALUES`
- `InplaceEditorArgumentKeys.PROPERTY_LABELS`
- `InplaceEditorArgumentKeys.PROPERTY_TOOLTIPS`

The full source code for this example is available inside the Oxygen SDK.

Dynamically Modify the Content Inserted by the Author

Question

Is there a way to insert typographic quotation marks instead of double quotes?

Answer

By using the API you can set a document filter to change the text that is inserted in the document in **Author** mode. You can use this method to change the insertion of double quotes with the typographic quotes.

Here is some sample code:

```
    authorAccess.getDocumentController().setDocumentFilter
(new AuthorDocumentFilter() {
    /**
     * @see ro.sync.ecss.extensions.api.AuthorDocumentFilter#insertText
(ro.sync.ecss.extensions.api.AuthorDocumentFilterBypass, int, java.lang.String)
     */
    @Override
    public void insertText(AuthorDocumentFilterBypass filterBypass,
int offset, String toInsert) {
      if(toInsert.length() == 1 && "\"".equals(toInsert)) {
        //User typed a quote but he actually needs a smart quote.
        //So we either have to add \u201E (start smart quote)
        //Or we add \u201C (end smart quote)
        //Depending on whether there's already a start smart quote inserted
in the current paragraph.

      try {
        AuthorNode currentNode =
authorAccess.getDocumentController().getNodeAtOffset(offset);
        int startofTextInCurrentNode = currentNode.getStartOffset();
        if(offset > startofTextInCurrentNode) {
          Segment seg = new Segment();
        authorAccess.getDocumentController().getChars(startofTextInCurrentNode,
offset - startofTextInCurrentNode, seg);
          String previosTextInNode = seg.toString();
          boolean insertStartQuote = true;
          for (int i = previosTextInNode.length() - 1; i >= 0; i--) {
            char ch = previosTextInNode.charAt(i);
            if('\u201C' == ch) {
              //Found end of smart quote, so yes, we should insert a start one
              break;
            } else if('\u201E' == ch) {
              //Found start quote, so we should insert an end one.
              insertStartQuote = false;
              break;
            }
          }

          if(insertStartQuote) {
            toInsert = "\u201E";
          } else {
            toInsert = "\u201C";
          }
        }
      } catch (BadLocationException e) {
        e.printStackTrace();
      }
    }
```

```
    System.err.println("INSERT TEXT |" + toInsert + "|");
    super.insertText(filterBypass, offset, toInsert);
  }
});
```

You can find the online Javadoc for `AuthorDocumentFilter` API here: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/AuthorDocumentFilter.html

An alternative to using a document filtering is the use of a *ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter*, which has clear callbacks indicating the source from where the API is called (Paste, Drag and Drop, Typing).

Dynamically Open File in Oxygen XML Editor plugin Distributed via JavaWebStart

Question

How can we dynamically open a file in an Oxygen XML Editor plugin distributed via JWS?

Answer

The JWS packager Ant build file that is included with Oxygen XML Editor plugin signs by default the JNLP file (this means that a copy of it is included in the main *JAR* library) in this step:

```
<copy file="${outputDir}/${packageName}/${productName}.jnlp"
          tofile="${home}/JNLP-INF/APPLICATION.JNLP"/>
```

Signing the JNLP file is required by newer Java versions and means that it is impossible to automatically generate a JNLP file containing some dynamic arguments. The solution is to use the signed JNLP template feature of Java 7, bundle inside the *JAR* library a signed `APPLICATION_TEMPLATE.JNLP` instead of an `APPLICATION.JNLP` with a wildcard command line argument:

```
<application-desc main-class="ro.sync.jws.JwsDeployer">
   <argument>*</argument>
</application-desc>
```

Then you can replace the wildcard in the external placed JNLP to the actual, dynamic command line arguments value.

A different, more complicated approach would be to have the JNLP file signed and always referenced as a URL argument a location like this:

```
http://path/to/server/redirectEditedURL.php
```

When the URL gets clicked on the client side you would also call a PHP script on the server side that would update the redirect location for `redirectEditedURL.php` to point to the clicked XML resource. Then the opened Oxygen XML Editor plugin would try to connect to the redirect PHP and be redirected to open the XML.

Extend the Java Functionality of an Existing Framework (Document Type)

Question

How can I change the way a DocBook 4 `xref` displays in **Author** mode based on what element is at the `linkend`?

Answer

Follow these steps:

1. Create a Maven Java project and add a dependency on the Oxygen XML Editor plugin classes:

   ```
   <dependency>
       <groupId>com.oxygenxml</groupId>
       <artifactId>oxygen-sdk</artifactId>
       <version>${oxygen.version}</version>
   </dependency>
   ```

   where `${oxygen.version}` is the version of Oxygen XML Editor plugin.

Alternatively, if the project does not use Maven, all the transitive dependencies of the above Maven artifact need to be added to the classpath of the project.

2. Also add the *[OXYGEN_INSTALL_DIR]*`\frameworks\docbook\docbook.jar` to the class path of the project.
3. Create a class that extends *ro.sync.ecss.extensions.docbook.DocBook4ExtensionsBundle* and overwrites the method: *ro.sync.ecss.extensions.api.ExtensionsBundle#createLinkTextResolver()*
4. For your custom resolver implementation you can start from the Java sources of the *ro.sync.ecss.extensions.docbook.link.DocbookLinkTextResolver* (the Java code for the entire DocBook customization is present in a subfolder in the Oxygen SDK).
5. Pack your extension classes in a *JAR* file. Copy the *JAR* to: *[OXYGEN_INSTALL_DIR]*`\frameworks\docbook\custom.jar`.
6. Start Oxygen XML Editor plugin.
7. Open the **Preferences** dialog box and go to **Document Type Association**. Edit the DocBook 4 document type. In the **Classpath** list add the path to the new *JAR*. In the extensions list select your custom extension instead of the regular DocBook one.
8. You can rename the document type and the `docbook` *framework* folder to something else (such as `custom_docbook`) and share it with others.

Impose Custom Options for Authors

Question

How to enable *Track Changes* at startup?

Answer

There are two ways to enable *Track Changes* for every document that you open:

1. You could customize the default options that are used by your authors and set the **Track Changes - Initial State** option to **Always On**.
2. Use an API to toggle the *Track Changes* state after a document is opened in **Author** mode:

```
// Check the current state of Track Changes
boolean trackChangesOn = authorAccess.getReviewController().isTrackingChanges();
if (!trackChangesOn) {
  // Set Track Changes state to On
  authorAccess.getReviewController().toggleTrackChanges();
}
```

Insert an Element with all the Required Content

Question

I am inserting a DITA `image` XML element using the API that points to a certain resource and has required content. Can the required content be automatically inserted by the application?

Answer

The API `ro.sync.ecss.extensions.api.AuthorSchemaManager` can propose valid elements that can be inserted at the specific offset. Using the method `AuthorSchemaManager.createAuthorDocumentFragment(CIElement)`, you can convert the proposed elements to *document fragments* (which have all the required content filled in) that can then be inserted in the document.

```
    AuthorSchemaManager schemaManager =
this.authorAccess.getDocumentController().getAuthorSchemaManager();

    WhatElementsCanGoHereContext context =
schemaManager.createWhatElementsCanGoHereContext
(this.authorAccess.getEditorAccess().getCaretOffset());

    List<CIElement> possibleElementsAtCaretPosition =
schemaManager.whatElementsCanGoHere(context);
    loop: for (int i = 0; i < possibleElementsAtCaretPosition.size(); i++) {
```

```
      CIElement possibleElement = possibleElementsAtCaretPosition.get(i);
      List<CIAttribute> attrs = possibleElement.getAttributes();
      if(attrs != null) {
        for (int j = 0; j < attrs.size(); j++) {
          CIAttribute ciAttribute = attrs.get(j);
          if (ciAttribute.getName().equals("class")) {
            if (ciAttribute.getDefaultValue() != null
                 && ciAttribute.getDefaultValue().contains("  topic/image ")) {
              //Found a CIElement for image
   //Create a fragment that contains all required child elements already built.
              AuthorDocumentFragment frag =
schemaManager.createAuthorDocumentFragment(possibleElement);
              //Now set the @href to it.
              //Ask the user and obtain a value for the @href
              //Then:

          String href = "test.png";
          List<AuthorNode> nodes = frag.getContentNodes();
          if(!nodes.isEmpty()) {
            AuthorElement imageEl = (AuthorElement) nodes.get(0);
            imageEl.setAttribute("href", new AttrValue(href));
          }
          //And insert the fragment.
          this.authorAccess.getDocumentController().insertFragment
(this.authorAccess.getEditorAccess().getCaretOffset(), frag);
          break loop;
        }
      }
    }
  }
}
```

AuthorDocumentFragment Class

Modify the XML Content on Open

Question

I have a bunch of DITA documents that have a fixed path the image `src` attributes. These paths are not valid and I am trying to move away from this practice by converting it in to relative paths. When an XML document is opened, can I trigger the Java API to change the fixed path to a relative path?

Answer

The Plugins SDK contains a sample plugin type called **WorkspaceAccess**. Such a plugin is notified when the application starts and it can do what you want in a couple of ways:

1. Add a listener that notifies you when the user opens an XML document. Then if the XML document is opened in the **Author** visual editing mode you can use our *Author API* to change attributes:

```
    pluginWorkspaceAccess.addEditorChangeListener(new  WSEditorChangeListener() {
       /**
        * @see WSEditorChangeListener#editorOpened(java.net.URL)
        */
       @Override
       public void editorOpened(URL editorLocation) {
         WSEditor openedEditor = pluginWorkspaceAccess.getCurrentEditorAccess
(StandalonePluginWorkspace.MAIN_EDITING_AREA);
         if(openedEditor.getCurrentPage() instanceof WSAuthorEditorPage) {
         WSAuthorEditorPage authPage = (WSAuthorEditorPage)
openedEditor.getCurrentPage();
         AuthorDocumentController docController =
authPage.getDocumentController();
         try {
          //All changes will be undone by pressing Undo once.
          docController.beginCompoundEdit();
          fixupImageRefs(docController,
           docController.getAuthorDocumentNode());
         } finally {
            docController.endCompoundEdit();
           }
         }
       }

       private void fixupImageRefs
(AuthorDocumentController docController, AuthorNode authorNode) {
           if(authorNode instanceof AuthorParentNode) {
             //Recurse
             List<AuthorNode> contentNodes =
((AuthorParentNode)authorNode).getContentNodes();
             if(contentNodes != null) {
                for (int i = 0; i < contentNodes.size(); i++) {
                  fixupImageRefs(docController, contentNodes.get(i));
```

```
                }
              }
            }
            if(authorNode.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
              AuthorElement elem = (AuthorElement) authorNode;
              if("image".equals(elem.getLocalName())) {
                 if(elem.getAttribute("href") != null) {
                   String originalHref = elem.getAttribute("href").getValue();
    URL currentLocation = docController.getAuthorDocumentNode().getXMLBaseURL();
                   //TODO here you compute the new href.
                   String newHref = null;
                  docController.setAttribute("href", new AttrValue(newHref), elem);
                }
              }
            }
          }
        },
    StandalonePluginWorkspace.MAIN_EDITING_AREA);
```

2. An API to open XML documents in the application:

```
ro.sync.exml.workspace.api.Workspace.open(URL)
```

So you can create up a plugin that automatically opens one by one XML documents from a certain folder in the application, makes modifications to them, saves the content by calling:

```
ro.sync.exml.workspace.api.editor.WSEditorBase.save()
```

and then closes the editor:

```
ro.sync.exml.workspace.api.Workspace.close(URL)
```

Modify the XML Content on Save

Question

Is it possible to get Oxygen XML Editor plugin to update the revised date on a DITA document when it's saved?

Answer

The Plugins SDK contains a sample plugin type called **WorkspaceAccess**.Such a plugin is notified when the application starts.

You can add a listener that notifies you before the user saves an XML document. Then if the XML document is opened in the **Author** visual editing mode you can use our *Author API* to change attributes before the save takes place:

```
      @Override
      public void applicationStarted
(final StandalonePluginWorkspace pluginWorkspaceAccess) {
       pluginWorkspaceAccess.addEditorChangeListener
(new WSEditorChangeListener(){
         //An editor was opened
        @Override
        public void editorOpened(URL editorLocation) {
          final WSEditor editorAccess = pluginWorkspaceAccess.getEditorAccess
(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
          if(editorAccess != null){
            editorAccess.addEditorListener
(new ro.sync.exml.workspace.api.listeners.WSEditorListener(){
              //Editor is about to be saved
              @Override
              public boolean editorAboutToBeSavedVeto(int operationType) {
                if(EditorPageConstants.PAGE_AUTHOR.equals
(editorAccess.getCurrentPageID())){
                  WSAuthorEditorPage authorPage =
(WSAuthorEditorPage) editorAccess.getCurrentPage();
                  AuthorDocumentController controller =
authorPage.getDocumentController();
                  try {
                    //Find the revised element
                    AuthorNode[] nodes = controller.findNodesByXPath
("//revised", true, true, true);
                    if(nodes != null && nodes.length > 0){
                      AuthorElement revised = (AuthorElement) nodes[0];
                      //Set the modified attribute to it...
                      controller.setAttribute("modified",
new AttrValue(new Date().toString()), revised);
                    }
                  } catch (AuthorOperationException e) {
                    e.printStackTrace();
```

```
                }
              }
              //And let the save continue..
              return true;
            }
          });
        }
      }
    }, PluginWorkspace.MAIN_EDITING_AREA);
  }
```

Multiple Rendering Modes for the Same Document in Author Mode

Question

How can we add multiple buttons, each showing a different visualization mode of the same document in **Author** mode?

Answer

In the toolbar of the **Author** mode there is a **Styles** drop-down menu that contains *alternate CSS styles* for the same document. To add an *alternate* CSS stylesheet, open the **Preferences** dialog box , go to **Document Type Association**, select the document type associated with your documents and press **Edit**. In the **Document Type** configuration dialog box that appears, go to the **Author** tab, and in the **CSS** subtab add references to *alternate* CSS stylesheets.

For example, one of the alternate CSS stylesheets that we offer for the DITA document type is located here:

```
[OXYGEN_INSTALL_DIR]/frameworks/dita/css_classed/hideColspec.css
```

If you open it, you will see that it imports the *main CSS* and then adds selectors of its own.

Obtain a DOM Element from *AuthorNode* or *AuthorElement*

Question

Can a DOM Element be obtained from an `AuthorNode` or an `AuthorElement`?

Answer

No, a DOM Element cannot be obtained from an `AuthorNode` or an `AuthorElement`. The `AuthorNode` structure is also hierarchical but the difference is that all the text content is kept in a single text buffer instead of having individual text nodes.

We have an image in the Javadoc documentation that explains this situation: https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/node/AuthorDocumentFragment.html

Obtain the Currently Selected Element Using the Author API

Question

In **Author** mode, if an element is fully selected, I want to perform an action on it. If not, I want to perform an action on the node that is located at the cursor position. Is this possible via the API?

Answer

When an element is fully selected by the user the selection start and end offsets are actually outside of the node's offset bounds. So using *AuthorDocumentController.getNodeAtOffset* will actually return the parent of the selected node. We have some special API that makes it easier for you to determine this situation: *WSAuthorEditorPageBase.getFullySelectedNode()*.

```
AuthorDocumentController controller = authorPageAccess.getDocumentController();
AuthorAccess authorAccess = authorPageAccess.getAuthorAccess();
int caretOffset = authorAccess.getEditorAccess().getCaretOffset();

    AuthorElement nodeAtCaret =
(AuthorElement) authorAccess.getEditorAccess().getFullySelectedNode();
```

```
    if (nodeAtCaret == null) {
     //We have no fully selected node. We can look at the cursor offset.
     nodeAtCaret = (AuthorElement)
authorAccess.getDocumentController().getNodeAtOffset(caretOffset);
    //Or we could look at the selection start and end, see which node is
the parent of each offset and get the closest common ancestor.
}
```

Run XSLT or XQuery Transformations

Question

Can I run XSL 2.0 / 3.0 transformation with Saxon EE using the *Oxygen SDK*?

Answer

The API class *ro.sync.exml.workspace.api.util.XMLUtilAccess* allows you to create an XSLT Transformer that implements the JAXP interface *javax.xml.transform.Transformer*. Then this type of transformer can be used to transform XML. Here's just an example of transforming when you have an *AuthorAccess* API available:

```
     InputSource is = new org.xml.sax.InputSource
(URLUtil.correct(new File("test/personal.xsl")).toString());
     xslSrc = new SAXSource(is);
     javax.xml.transform.Transformer transformer =
authorAccess.getXMLUtilAccess().createXSLTTransformer
(xslSrc, null, AuthorXMLUtilAccess.TRANSFORMER_SAXON_ENTERPRISE_EDITION);
     transformer.transform(new StreamSource(new File("test/personal.xml")),
new StreamResult(new File("test/personal.html")));
```

If you want to create the transformer from the *plugin* side, you can use this method instead: *ro.sync.exml.workspace.api.PluginWorkspace.getXMLUtilAccess()*.

Save a New Document with a Predefined File Name Pattern

Question

Is it possible to get Oxygen XML Editor plugin to automatically generate a file name comprising a UUID plus file extension using the SDK?

Answer

This could be done implementing a *plugin* for Oxygen XML Editor plugin using the Plugins SDK.

There is a type of *plugin* called *Workspace Access* that can be used to add a listener to be notified before an opened editor is saved. The implemented *plugin* would intercept the save events when a newly created document is untitled and display an alternative chooser dialog box, then save the topic with the proper name.

The Java code would look like this:

```
  private static class CustomEdListener extends WSEditorListener{
    private final WSEditor editor;
    private final StandalonePluginWorkspace
        pluginWorkspaceAccess;
    private boolean saving = false;
    public CustomEdListener
(StandalonePluginWorkspace pluginWorkspaceAccess, WSEditor editor) {
            this.pluginWorkspaceAccess = pluginWorkspaceAccess;
            this.editor = editor;
    }
    @Override
    public boolean editorAboutToBeSavedVeto(int operationType) {
      if(! saving &&
        editor.getEditorLocation().toString().contains("Untitled")) {
        File chosenDir = pluginWorkspaceAccess.chooseDirectory();
        if(chosenDir != null) {
          final File chosenFile =
new File(chosenDir, UUID.randomUUID().toString() + ".dita");
        SwingUtilities.invokeLater(new Runnable() {
            @Override
              public void run() {
              try {
                saving = true;
                editor.saveAs(new URL(chosenFile.toURI().toASCIIString()));
              } catch (MalformedURLException e) {
                e.printStackTrace();
              } finally {
```

```
                saving = false;
              }
            }
          });
        }

        //Reject the original save request.
        return false;
      }
      return true;
    }
  }

    @Override
    public void applicationStarted
(final StandalonePluginWorkspace pluginWorkspaceAccess) {
    pluginWorkspaceAccess.addEditorChangeListener(new WSEditorChangeListener() {
      @Override
      public void editorOpened(URL editorLocation) {
        final WSEditor editor = pluginWorkspaceAccess.getEditorAccess
(editorLocation, PluginWorkspace.MAIN_EDITING_AREA);
      if(editor !=
null && editor.getEditorLocation().toString().contains("Untitled")) {

        //Untitled editor
 editor.addEditorListener(new CustomEdListener(pluginWorkspaceAccess, editor));
        }
      }
     },
  PluginWorkspace.MAIN_EDITING_AREA);
.............................................
```

Split Paragraph on Enter (Instead of Showing Content Completion List)

Question

Is it possible to split the paragraph on **Enter** instead of showing the content completion list?

Answer

Yes, it is possible by creating your own custom operation.

To obtain this behavior, follow this procedure:

1. Create a custom **Author** mode operation that handles the split. You can use the `AuthorDocumentController.split` API to achieve this.
2. Create a JAR library that contains its compiled version.
3. Open the **Preferences** dialog box , go to **Document Types Association**, and select your *framework*.
4. Click **Edit** and in the **Document Type** configuration dialog box, go to the **Classpath** tab and add a reference to the JAR library for your custom operation.
5. Go to the **Author** tab, then go to the **Actions** subtab.
6. Click the **New** button and use the **Action** dialog box to create your own paragraph split action.
7. Make sure you assign **Enter** as the **Shortcut Key** and specify your custom operation in the **Operations** section.

Result: Now, when you press **Enter**, your Java operation will be invoked to split the paragraph instead of opening the *Content Completion Assistant*.

Tip: The *Content Completion Assistant* can still be invoked by using the **Ctrl+Space** keyboard shortcut.

Use Custom Rendering Styles for Entity References, Comments, or PIs

Problem

Is there a way to display entity references in the **Author** mode without the distinct gray background and tag markers?

Solution

There is a built-in CSS stylesheet in the Oxygen XML Editor plugin libraries that is used when styling content in the **Author** mode, no matter what CSS you use. This CSS has the following content:

```
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
```

```
@namespace xi "http://www.w3.org/2001/XInclude";
@namespace xlink "http://www.w3.org/1999/xlink";
@namespace svg "http://www.w3.org/2000/svg";
@namespace mml "http://www.w3.org/1998/Math/MathML";

oxy|document {
    display:block !important;
}

oxy|cdata {
    display:morph !important;
    white-space:pre-wrap !important;
    border-width:0px !important;
    margin:0px !important;
    padding: 0px !important;
}

oxy|processing-instruction {
    display:block !important;
    color: rgb(139, 38, 201) !important;
    white-space:pre-wrap !important;
    border-width:0px !important;
    margin:0px !important;
    padding: 0px !important;
}

oxy|comment {
    display:morph !important;
    color: rgb(0, 100, 0) !important;
    background-color:rgb(255, 255, 210) !important;
    white-space:pre-wrap !important;
    border-width:0px !important;
    margin:0px !important;
    padding: 0px !important;
}

oxy|reference:before,
oxy|entity[href]:before{
  link: attr(href) !important;
  text-decoration: underline !important;
  color: navy !important;

  margin: 2px !important;
  padding: 0px !important;
}

oxy|reference:before {
  display: morph !important;
  content: url(../images/editContent.gif) !important;
}

oxy|entity[href]:before{
  display: morph !important;
  content: url(../images/editContent.gif) !important;
}

oxy|reference,
oxy|entity {
    editable:false !important;
    background-color: rgb(240, 240, 240) !important;
    margin:0px !important;
    padding: 0px !important;
}

oxy|reference {
    display:morph !important;
}

oxy|entity {
    display:morph !important;
}

oxy|entity[href] {
  border: 1px solid rgb(175, 175, 175) !important;
  padding: 0.2em !important;
}

xi|include {
    display:block !important;
    margin-bottom: 0.5em !important;
    padding: 2px !important;
}
xi|include:before,
xi|include:after{
    display:inline !important;
    background-color:inherit !important;
    color:#444444 !important;
    font-weight:bold !important;
}

xi|include:before {
    content:url(../images/link.gif) attr(href)  !important;
    link: attr(href) !important;
}
xi|include[xpointer]:before {
```

```
    content:url(../images/link.gif) attr(href) " " attr(xpointer) !important;
    link: oxy_concat(attr(href), "#", attr(xpointer)) !important;
}

xi|fallback {
    display:morph !important;
    margin: 2px !important;
    border: 1px solid #CB0039 !important;
}

xi|fallback:before {
    display:morph !important;
    content:"XInclude fallback: " !important;
    color:#CB0039 !important;
}

oxy|doctype {
    display:block !important;
    background-color: transparent !important;
    color:blue !important;
    border-width:0px !important;
    margin:0px !important;
    padding: 2px !important;
}

oxy|error {
    display:morph !important;
    editable:false !important;
    white-space:pre !important;
    color: rgb(178, 0, 0) !important;
    font-weight:bold !important;
}

*[xlink|href]:before {
    content:url(../images/link.gif);
    link: attr(xlink|href) !important;
}

/*No direct display of the MathML and SVG images.*/
svg|svg{
 display:inline !important;
    white-space: trim-when-ws-only;
}
svg|svg svg|*{
    display:none !important;
    white-space:normal;
}

mml|math{
 display:inline !important;
    white-space: trim-when-ws-only;
}
mml|math mml|*{
    display:none !important;
    white-space: normal;
}
```

In the CSS used for rendering the XML in **Author** mode, do the following:

1. Import the special **Author** mode namespace.
2. Use a special selector to customize the `entity` node.

Example:

```
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
oxy|entity {
   background-color: inherit !important;
   margin:0px !important;
   padding: 0px !important;
    -oxy-display-tags:none;
}
```

You can overwrite styles in the predefined CSS to customize style comments, processing instructions, and *CData* sections. You can also customize the way `xi:include` elements are rendered.

Use a Custom View with the Oxygen XML Editor plugin Distribution

Question

Is it possible to create a custom view in Eclipse that can insert certain XML fragments in the documents opened with the Oxygen XML Editor plugin?

Answer

Here you can find more information about the Eclipse part of the *Oxygen SDK*:

https://www.oxygenxml.com/oxygen_sdk.html#oXygen_Eclipse_plugin

Use the provided Oxygen XML Editor plugin sample project as a starting point.
From any custom view/component you can have singleton access to the using the `ro.sync.exml.workspace.api.PluginWorkspaceProvider.getPluginWorkspace()` API.

The Java code for inserting a certain XML fragment in the currently open editor (either in the **Text** or **Author** editing modes) would look like this:

```
    WSEditor currentEditorAccess = PluginWorkspaceProvider.getPluginWorkspace().
getCurrentEditorAccess(PluginWorkspace.MAIN_EDITING_AREA);
    if(currentEditorAccess.getCurrentPage() instanceof WSXMLTextEditorPage) {
      //Editor opened in Text page
      WSXMLTextEditorPage tp =
(WSXMLTextEditorPage) currentEditorAccess.getCurrentPage();

      //You can access an API to insert text in the XML content
//      tp.getDocument().insertString(tp.getCaretOffset(), "<testTag/>", null);
      //This is the internal StyledText implementation
//      tp.getTextComponent()
      //You can use this XPath API to find the range of an XML element.
//      tp.findElementsByXPath(xpathExpression)
 } else if(currentEditorAccess.getCurrentPage() instanceof WSAuthorEditorPage) {
      //Editor opened in Author page
//      try {
        WSAuthorEditorPage authPage = (WSAuthorEditorPage)
currentEditorAccess.getCurrentPage();

        //Then you can do stuff like this to insert XML at cursor position
//        authPage.getDocumentController().insertXMLFragment("<testTag/>",
authPage.getCaretOffset());
//      } catch (AuthorOperationException e) {
//        // TODO Auto-generated catch block
//        e.printStackTrace();
//      }
    }
```

Extension Points for Oxygen XML Editor plugin

17

The Oxygen XML Editor plugin includes a number of *extension* points, which can be implemented by other Eclipse *plugins* that depend on it. All of them are listed in the `plugin.xml` file, along with samples of usage code. The following is a list with short descriptions for some of the most useful extension points:

Extension point: *ditaKeyDefinitionManager*

It can be used to provide an external keys manager, responsible of providing DITA keys that are then used for editing and resolving referenced content. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/ditaKeyDefinitionManager.exsd`.

Extension point: *actionBarContributorCustomizer*

A very useful extension point that can add or remove actions from various menus, contextual menus, and toolbars that are contributed by the Oxygen XML Editor plugin. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/actionBarContributorCustomizer.exsd`.

Extension point: *customEditorInputCreator*

Use this extension point to create your custom editor input for a certain resource that will be opened by the Oxygen XML Editor plugin when clicking links. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/customEditorInputCreator.exsd`.

Extension point: *editorAdapterContributor*

When an adapter is requested to the opened XML editor you can provide your custom adapter from your external *plugin*. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/editorAdapterContributor.exsd`.

Extension point: *extensionsBundleContributor*

Use this extension point to provide your own *ExtensionsBundle* implementation for a certain opened XML resource. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/extensionsBundleContributor.exsd`.

Extension point: *stylesFilterContributor*

Use this extension point to provide your own *StylesFilter* implementation for special visual rendering when an XML resource is opened in the **Author** editing mode. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/stylesFilterContributor.exsd`.

Extension point: *XMLRefactoringContributor*

Contributes a folder that contains the additional XML Refactoring operation descriptor files and XQuery scripts that can be used by the batch XML refactoring actions. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/xmlRefactoringContributor.exsd`.

Extension point: *workspaceAccessPlugin*

Use this extension point to be notified when Oxygen XML Editor plugin has started. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/exsd-schema/workspaceAccessExtension.exsd`.

Extension point: *AuthorStylesheet*

Use this extension point to provide a stylesheet layer that will be used when rendering any XML document in **Author** mode. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/authorStylesheetContributor.exsd`.

Tools

18

Topics:

- Refactoring XML Documents
- Generating Sample XML Files
- Converting Schema to Another Schema Language
- Converting Database to XML Schema
- JSON to XML Converter
- XML to JSON Converter
- Compiling an XSL Stylesheet for Saxon
- Generate Documentation
- Canonicalizing Files
- Signing Files
- Verifying Signature
- WSDL SOAP Analyzer
- XML Schema Regular Expressions Builder

Oxygen XML Editor plugin includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools. These tools are available in the **Tools** menu and some of them can be launched through keyboard shortcuts or command-line scripts.

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor plugin includes a specialized **XML Refactoring** tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The **XML Refactoring** tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the **XML Refactoring** action from one of the following locations:

- The **XML Tools** menu.
- The **Refactoring** submenu from the contextual menu in the **Navigator** view.
- The **Refactoring** submenu from the contextual menu in the **DITA Maps Manager** view.

Note: The predefined refactoring operations are also available from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor plugin considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5

operations that were finished or previewed also appear in the **Refactoring** submenu of the contextual menu in the **DITA Maps Manager**.

XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

Refactoring operations

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

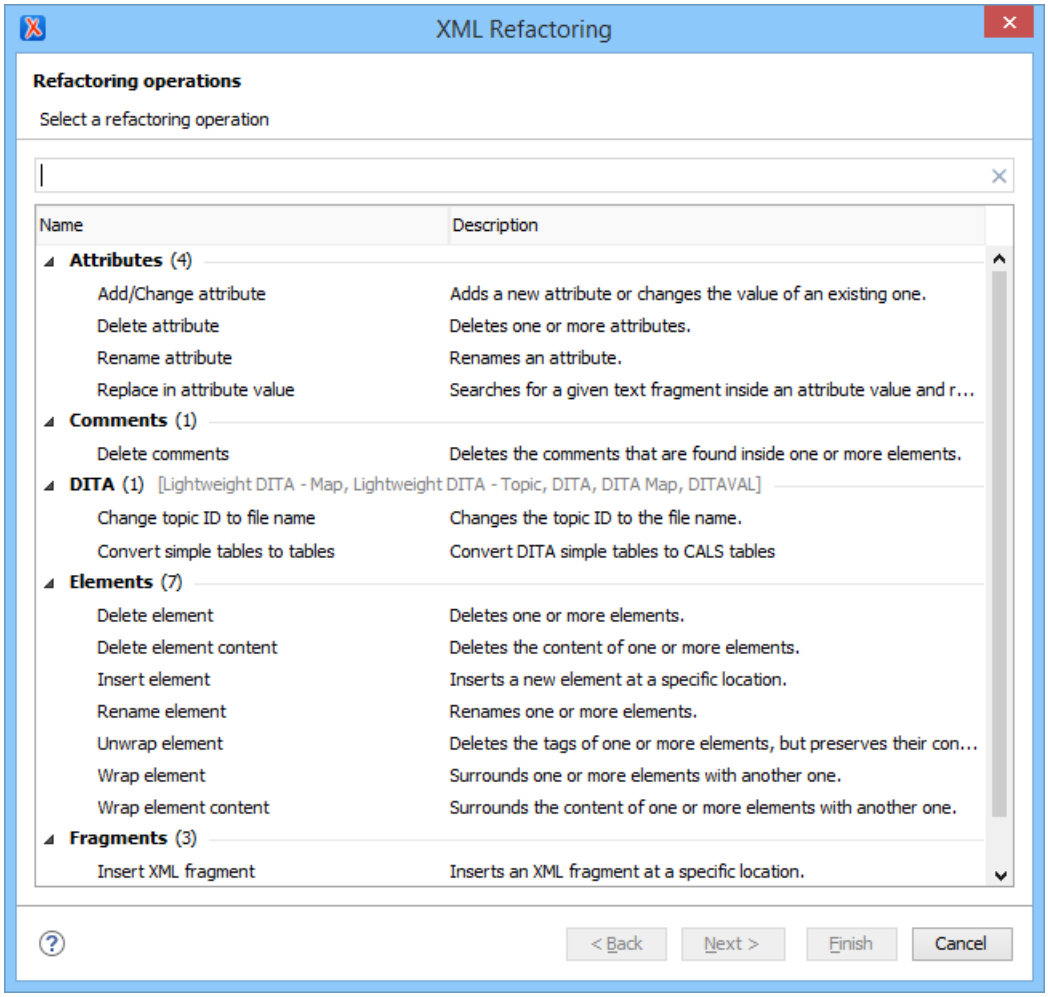

Figure 673: XML Refactoring Wizard

Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

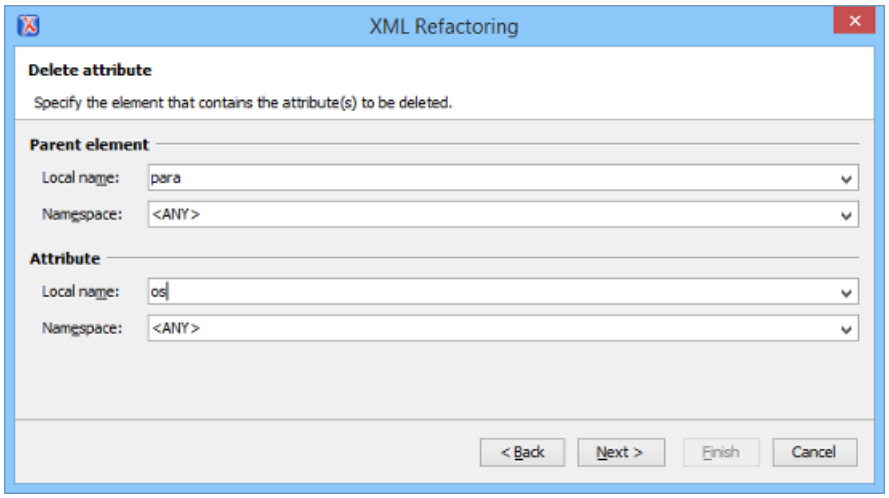

Figure 674: XML Refactoring 2nd Wizard Page (Delete Attribute Operation)

Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

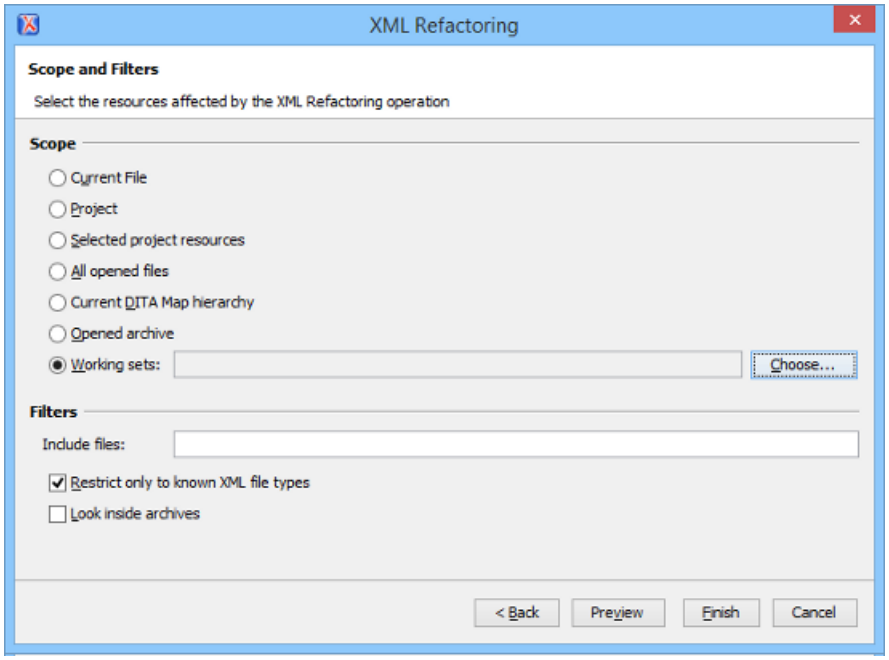

Figure 675: XML Refactoring - Scope and Filters Wizard Page

Scope section

In the **Scope** section, you can select from predefined resource sets (such as the current file, your whole project, the current *DITA map* hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a *working set*.

Filters

The **Filters** section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.

Preview

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

Finish

After clicking the **Finish** button, the operation will be processed and Oxygen XML Editor plugin provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

Trouble: If an operation fails, a notification will be displayed in the **Results** panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

Tip: If an operation takes longer than expected you can use the **Stop** button in the progress bar to cancel the operation.

Predefined Refactoring Operations

The XML Refactoring tool includes a variety of predefined operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor plugin considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Tip: Each operation includes a link in the lower part of the wizard that opens the **XML / XSLT-FO-XQuery / XPath** preferences page where you can configure XPath options and declare namespace prefixes.

The following predefined operations are available:

Refactoring Operations for *Attributes*

Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

- **Parent element** section
  - **Element** - The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** section
  - **Local name** - The local name of the affected attribute.
  - **Namespace** - The namespace of the affected attribute.
  - **Value** - The value for the affected attribute.
- **Options** section
  - You can choose between one of the following options for the **Operation mode**:
    - **Add the attribute in the parent elements where it is missing**
    - **Change the value in the parent elements where the atrribute already exists**
    - **Both**

Convert attribute to element

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

- **Parent element** section
  - **Element** - The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** section
  - **Local name** - The local name of the affected attribute.

    - **Namespace** - The namespace of the affected attribute.
- **New element** section
    - **Local name** - The local name of the new element.
    - **Namespace** - The namespace of the new element.

Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be deleted.

Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be renamed.
- **New local name** - The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

- **Target attribute** section
    - **Element** - The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
    - **Attribute** - The name of the attribute to be modified.
- **Find / Replace** section
    - **Find** - The text fragments to find. You can use Perl-like regular expressions.
    - **Replace with** - The text fragment to replace the target with. This parameter can bind regular expression capturing groups ($1 , $2, etc.) from the find pattern.

Refactoring Operations for *Comments*

Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

- **Element** - The target element (or elements) for which comments will be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Note: Comments that are outside the root element will not be deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *DITA*

Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS tables to simple tables

Use this operation to convert DITA CALS tables to simple tables.

Convert conrefs to conkeyrefs

Use this operation to convert `conref` attributes to `conkeyref` attributes. For more information and instructions for using this operation, see Converting Conrefs to Conkeyrefs on page 1544.

Convert simple tables to CALS tables

Use this operation to convert DITA simple tables to CALS tables.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see Converting DITA Topics to Another Type on page 1507.

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see Converting DITA Topics to Another Type on page 1507.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see Converting DITA Topics to Another Type on page 1507.

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see Converting DITA Topics to Another Type on page 1507.

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see Converting DITA Topics to Another Type on page 1507.

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see Converting DITA Topics to Another Type on page 1507.

Rename Key

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

All of these DITA refactoring actions allow you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as ***** or **?**).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.

Refactoring Operations for *Elements*

Delete element

Use this operation to delete elements. This operation requires you to specify the following parameter:

- **Element** - The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Delete element content

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

- **Element** - The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Insert element

Use this operation to insert new elements. This operation allows you to specify the following parameters:

- **Element** section
  - **Local name** - The local name of the element to be inserted.
  - **Namespace** - The namespace of the element to be inserted.
- **Location** section

- **XPath**- An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **Position** - The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Rename element

Use this operation to rename elements. This operation requires you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **New local name** - The new local name of the element.

Unwrap element

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

- **Target elements (XPath)** - The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrap element

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **Wrapper element** section
  - **Local name** - The local name of the *Wrapper element*.
  - **Namespace** - The namespace of the *Wrapper element*.

Wrap element content

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **Wrapper element** section
  - **Local name** - The local name of the *Wrapper element* that will surround the content of the target.
  - **Namespace** - The namespace of the *Wrapper element* that will surround the content of the target.

Refactoring Operations for *Fragments*

Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

- **XML Fragment** - The XML fragment to be inserted.
- **Location** section
  - **XPath** - An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
  - **Position** - The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

- **XML Fragment** - The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the target element.

Refactoring Operations for *JATSKit*

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these JATSKit refactoring actions allow you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as ***** or **?**).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.

Additional Notes

Note: There are some operations that allow `<ANY>` for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<NO_NAMESPACE>` value can be used to select nodes that do not belong to a namespace.

Note: Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the **Options** > **Preferences** > **XML** > **XSLT-FO-XQUERY** > **XPath** page. This preferences page can be easily opened by clicking the link in the note (**Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section**) at the bottom of the **Configure Operation Parameters** wizard page.

Custom Refactoring Operations

While Oxygen XML Editor plugin includes a variety of predefined XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An *XQuery Update script* or *XSLT stylesheet* that Oxygen XML Editor plugin will run to refactor the XML files.
- An *XML Operation Descriptor* file that contains information about the operation (such as the name, description, and parameters).

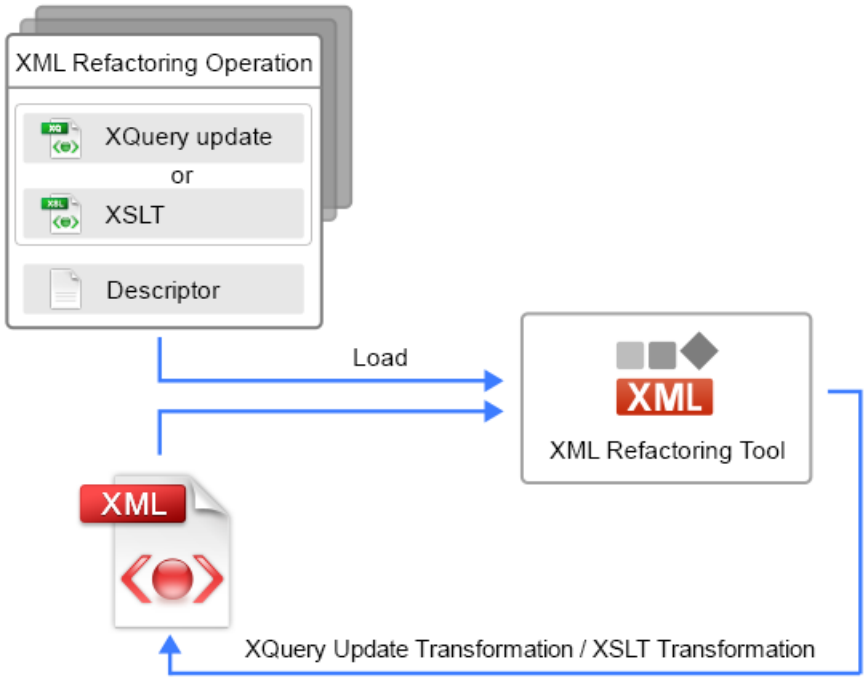

Figure 676: Diagram of an XML Refactoring Operation

All the defined custom operations are loaded by the **XML Refactoring Tool** and presented in the **Refactoring Operations** wizard page, along with the predefined built-in operations.

After the user chooses an operation and specifies its parameters, Oxygen XML Editor plugin processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a **safe mode**, which implies the following:

- When loading the document:
  - The **XInclude** mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
  - The DTD entities will be processed without being expanded.
  - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.
- When saving the updated XML document:
  - The DOCTYPE will be preserved.

    Note: This can be changed using Saxon extension functions in XSLT.
  - The DTD entities will be preserved as they are in the original document when the document is saved.
  - The attribute values will be kept in their original form without being normalized.
  - The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

Note: To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the `http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes` namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.

Restriction: *Comments* or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be applied on the root element and the nodes inside it. However, as a work around to this limitation, you can use Saxon extension functions and the XSLT stylesheet method to implement the new custom XML refactoring operation.

Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:

1. Create an XQuery Update script or XSLT stylesheet file.
2. Create an **XML Refactoring Operation Descriptor** file contains the path to the XQuery Update script or XSLT stylesheet.
3. Store both files in one of the locations that Oxygen XML Editor plugin scans when loading the custom operations.

   Result: Once you run the **XML Refactoring** tool again, the custom operation appears in the **Refactoring Operations** wizard page.

Related Information:

Storing and Sharing Refactoring Operations on page 614

Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an XQuery Update script or XSLT stylesheet that is needed to process the refactoring operations. The easiest way to create this script file is to use the **New** document wizard to create a new **XQuery** or **XSLT** file and you can use our XQuery method example or XSLT method example to help you with the content.

There are cases when it is necessary to add parameters in the XQuery script or XSLT stylesheet. For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the *refactoring operation descriptor file* that is associated with this operation.

Note: The XQuery Update processing is disabled by default in Oxygen XML Editor plugin. Thus, if you want to create or edit an XQuery Update script you have to enable this mechanism by creating an XQuery transformation scenario and choose **Saxon EE** as the transformation engine. Also, you need to make sure the **Enable XQuery update** option is selected in the Saxon processor advanced options.

Note: If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the **XML /XSLT-FO-XQuery / XPath** preferences page.

The next step in creating a custom refactoring operation is to create an **XML Refactoring Operation Descriptor** file contains the path to the XQuery Update script or XSLT stylesheet.

Related Information:

XQuery Update Script for Creating a Custom Operation on page 608
XSLT Stylesheet for Creating a Custom Operation on page 610

Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the **New** document wizard and choose the **XML Refactoring Operation Descriptor** template.

Introduction to the Descriptor File

This file contains information (such as `name`, `description`, and `id`) that is necessarily when loading an XML Refactoring operation . It also contains the path to the XQuery Update script or XSLT stylesheet that is associated with the particular operation through the `script` element.

You can specify a `category` for your custom operations to logically group certain operations. The `category` element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is *Other operations*.

The descriptor file is edited and validated against the following schema: `frameworks/xml_refactoring/operation_descriptor.xsd`.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the **parameters** section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the **XML Refactoring** tool within the **Configure Operation Parameters** wizard page for that particular operation.

The value of the first `description` element in the **parameters** section will be displayed at the top of the **Configure Operation Parameters** wizard page.

To declare a parameter, specify the following information:

- **`label`** - This value is displayed in the user interface for the parameter.
- **`name`** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- **`type`** - Defines the type of the parameter and how it will be rendered. There are several types available:
  - `TEXT` - Generic type used to specify a simple text fragment.
  - `XPATH` - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor plugin will use a text input with corresponding content completion and syntax highlighting.

    Note: The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.

    Note: A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.

    Note: When writing XPath expressions, you can only use prefixes declared in the **Options** > **Preferences** > **XML** > **XSLT-FO-XQUERY** > **XPath** options page.
  - `NAMESPACE` - Used for editing namespace values.
  - `REG_EXP_FIND` - Used when you want to match a certain text by using Perl-like regular expressions.
  - `REG_EXP_REPLACE` - Used along with `REG_EXP_FIND` to specify the replacement string.
  - `XML_FRAGMENT` - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor plugin will display a text area specialized for inserting XML documents.
  - `NC_NAME` - The parameter for `NC_NAME` values. It is useful when you want to specify the local part of a *QName* for an element or attribute.
  - `BOOLEAN` - Used to edit boolean parameters.
  - `TEXT_CHOICE` - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor plugin renders each possible value as a radio button option.
- **`description`** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.
- **`possibleValues`** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```
<possibleValues onlyPossibleValuesAllowed="true">
    <value name="before">Before</value>
    <value name="after"default="true">After</value>
    <value name="firstChild">First child</value>
    <value name="lastChild">Last child</value>
</possibleValues>
```

Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor plugin will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

`elementLocation`

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the `label` attribute is displayed in the application as the label of the text field. The `name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the `useCurrentContext`

attribute is set to **true**, the element name from the cursor position is used as proposed values for this parameter.

Example of an `elementLocation`:

```
<elementLocation name="elem_loc" useCurrentContext="false">
                <element label="Element location">
                    <description>Element location description.</description>
                </element>
</ ElementLocation>
```

`attributeLocation`

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the `label` attributes is displayed in the application as the label of the associated text fields. The `name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the `element` and `attribute` text fields. For example, if `section` is entered for the element and a `title` is entered for the attribute, the XPath expression would be computed as `//section/@title`. If the value of the `useCurrentContext` attribute is set to `true`, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an `attributeLocation`:

```
<attributeLocation name="attr_xpath" useCurrentContext="true">
                <element label="Element path">
                    <description>Element path description.</description>
                </element>
                <attribute label="Attribute" >
                    <description>Attribute path description.</description>
                </attribute>
</ AttributeLocation>
```

`elementParameter`

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the `label` attribute is displayed in the application as label of the associated combo. The `name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the `allowsAny` attribute, the application will propose *<ANY>* as a possible value for the **Name** and **Namespace** combo boxes. You can also use the `useCurrentContext` attribute and if its value is set to `true`, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an `elementParameter`:

```
<elementParameter id="elemID" useCurrentContext="true">
    <localName label="Name" name="element_localName" allowsAny="true">
        <description>Local name of the parent element.</description>
    </localName>
    <namespace label="Namespace" name="element_namespace" allowsAny="true">
        <description>Local name of the parent element</description>
    </namespace>
</elementParameter>
```

`attributeParameter`

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the `label` attribute is displayed in the application as the label of the associated combo box. You can also use the `useCurrentContext` attribute and if its value is set to `true`, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

Note: An `attributeParameter` is dependant upon an `elementParameter`. The list of attributes and namespaces are computed based on the selection in the `elementParameter` combo boxes.

Example of an `attributeParameter`:

```
<attributeParameter dependsOn="elemID" useCurrentContext="true">
```

```
    <localName label="Name" name="attribute_localName">
        <description>The name of the attribute to be converted.</description>
    </localName>
    <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
        <description>Namespace of the attribute to be converted.</description>
    </namespace>
</attributeParameter>
```

Note: All predefined operations are loaded from the *[OXYGEN_INSTALL_DIR]*`/refactoring` folder.

XSLT Stylesheet for Creating a Custom Operation

To demonstrate creating a custom operation, consider that we have a task where we need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `image` elements where a deprecated `alt` attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `image` element.

Thus, our task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

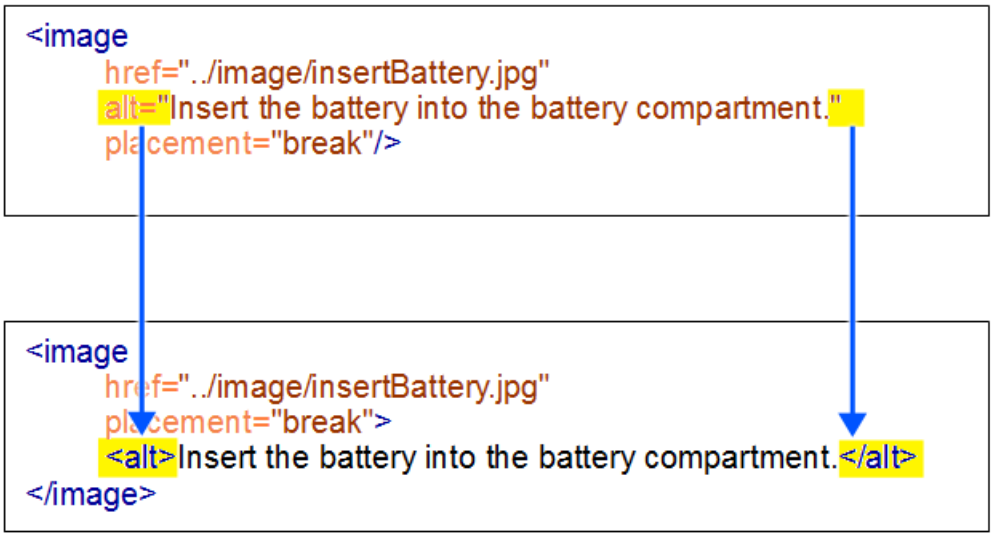

Figure 677: Example: Custom XML Refactoring Operation

We can use an XSLT stylesheet to implement the new custom XML refactoring operation. The second requirement is an XML Refactoring operation descriptor file that contains the path to the XSLT stylesheet.

Example of an XSLT Script for Creating a Custom Operation to *Convert an Attribute to an Element*

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
  version="2.0">

  <xsl:import
href="http://www.oxygenxml.com/ns/xmlRefactoring/resources/commons.xsl"/>
```

```
    <xsl:param name="element_localName" as="xs:string" required="yes"/>
    <xsl:param name="element_namespace" as="xs:string" required="yes"/>
    <xsl:param name="attribute_localName" as="xs:string" required="yes"/>
    <xsl:param name="attribute_namespace" as="xs:string" required="yes"/>
    <xsl:param name="new_element_localName" as="xs:string" required="yes"/>
    <xsl:param name="new_element_namespace" as="xs:string" required="yes"/>

    <xsl:template match="node() | @*">
        <xsl:copy>
            <xsl:apply-templates select="node() | @*"/>
        </xsl:copy>
    </xsl:template>
    <xsl:template match="//*[xr:check-local-name($element_localName, ., true())
       and
          xr:check-namespace-uri($element_namespace, .)]">

        <xsl:variable name="attributeToConvert"
           select="@*[xr:check-local-name($attribute_localName, ., true())
       and
          xr:check-namespace-uri($attribute_namespace, .)]"/>

        <xsl:choose>
            <xsl:when test="empty($attributeToConvert)">
                <xsl:copy>
                    <xsl:apply-templates select="node() | @*"/>
                </xsl:copy>
            </xsl:when>
        <xsl:otherwise>
            <xsl:copy>
                <xsl:for-each select="@*[empty(. intersect $attributeToConvert)]">
                     <xsl:copy-of select="."/>
                </xsl:for-each>
                  <!-- The new element namespace -->
                  <xsl:variable name="nsURI" as="xs:string">
                      <xsl:choose>
             <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">
                           <xsl:value-of select="''"/>
                       </xsl:when>
                       <xsl:otherwise>
                           <xsl:value-of select="$new_element_namespace"/>
                       </xsl:otherwise>
                      </xsl:choose>
                  </xsl:variable>
            <xsl:element name="{$new_element_localName}" namespace="{$nsURI}">
                      <xsl:value-of select="$attributeToConvert"/>
                  </xsl:element>
                <xsl:apply-templates select="node()"/>
           </xsl:copy>
         </xsl:otherwise>
       </xsl:choose>
    </xsl:template>
  </xsl:stylesheet>
```

Note: The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an *XML Catalog* set in the XML Refactoring *framework*.

Example of an Operation Descriptor File That References the XSLT Stylesheet for Creating a Custom Operation to *Convert an Attribute to an Element*

After you have developed the XSLT stylesheet, you have to create an XML Refactoring operation descriptor. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
 id="convert-attribute-to-element"
 name="Convert attribute to element">
 <description>Converts the specified attribute to an element.
          The new element will be inserted as first child of the attribute's
          parent element.</description>
 <!-- For the XSLT stylesheet option uncomment the following line and comment
          the line referring the XQuery Update script -->
 <!-- <script type="XSLT" href="convert-attribute-to-element.xsl"/> -->
 <script type="XQUERY_UPDATE" href="convert-attribute-to-element.xq"/>
  <parameters>
   <description>Specify the attribute to be converted to element.</description>
    <section label="Parent element">
     <elementParameter id="elemID">
      <localName label="Name" name="element_localName" allowsAny="true">
       <description>Local name of the parent element.</description>
        </localName>
       <namespace label="Namespace" name="element_namespace" allowsAny="true">
         <description>Local name of the parent element</description>
       </namespace>
     </elementParameter>
    </section>
    <section label="Attribute">
```

```
      <attributeParameter dependsOn="elemID">
       <localName label="Name" name="attribute_localName">
        <description>Name of the attribute to be converted.</description>
       </localName>
      <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
        <description>Namespace of the attribute to be converted.</description>
      </namespace>
      </attributeParameter>
     </section>
     <section label="New element">
         <elementParameter>
            <localName label="Name" name="new_element_localName">
                <description>The name of the new element.</description>
            </localName>
            <namespace label="Namespace" name="new_element_namespace">
                <description>The namespace of the new element.</description>
            </namespace>
         </elementParameter>
     </section>
   </parameters>
</refactoringOperationDescriptor>
```

Note: If you are using an XSLT file, the line with the `script` element would look like this:

```
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor plugin when it loads the custom operation. When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in our example of the custom operation to convert an attribute to an element:

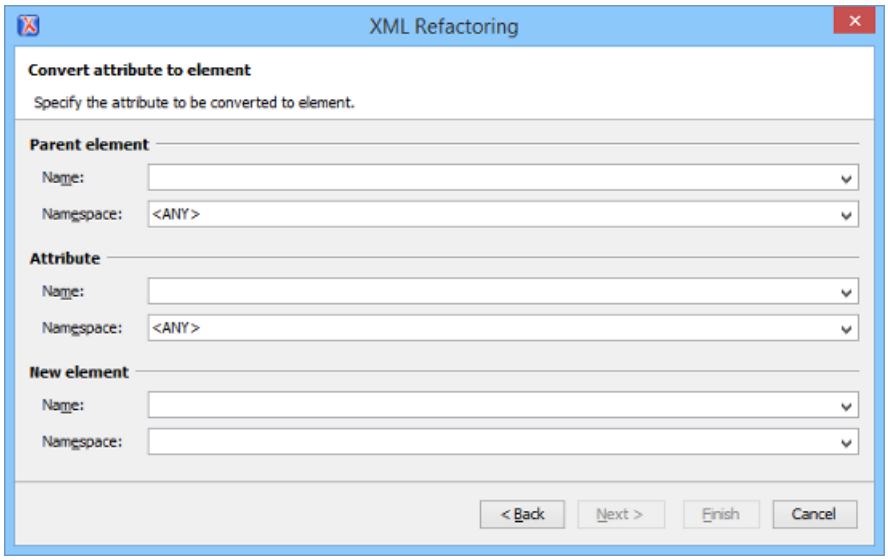

Figure 678: Example: XML Refactoring Wizard for a Custom Operation

Using Saxon Extension Functions to Allow Custom Refactoring Operations to Read and Modify Content Outside the Root Node

One advantage to using an XSLT stylesheet is that there is limitation when using an XQuery Update script in that refactoring operations can only be performed on *comments* or *processing instructions* that are inside the root element. Thus, using the XQuery method, *comments* or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation.

The XSLT stylesheet method offers a work around to this limitation through the use of some Saxon extension functions.

To illustrate the use of these functions, consider the following sample XML file:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
```

```
<?pi before root ?>
<root>
    <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

The following Saxon extension functions can be used to read and modify content outside the root node:

Note: They belong to the `http://www.oxygenxml.com/ns/xmlRefactoring/functions` namespace.

- **get-content-after-root()** - Returns the content after root as `xs:string`.

  For the XML above, the call of this function will return the following string value:

  ```
  <!-- comment after root -->
  <?pi after root ?>
  ```

- **set-content-after-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

  The function call `set-content-after-root('<!-- Inserted comment -->')` will result in replacing the nodes after the root element with the comment passed as string argument. The XML document will be modified as follows:

  ```
  <?xml version="1.0" encoding="UTF-8"?>
  <!-- comment before root -->
  <?pi before root ?>
  <root>
      <child></child>
  </root><!-- Inserted comment -->
  ```

- **get-content-before-root()** - Returns the content before root as `xs:string`.

  For the XML above, the call of this function will return the following string value:

  ```
  <?xml version="1.0" encoding="UTF-8"?>
  <!-- comment before root -->
  <?pi before root ?>
  ```

- **set-content-before-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

  The function call `set-content-before-root('<!-- Inserted comment -->')` will result in replacing the nodes before the root element with the comment passed as string argument. The XML document will be modified as follows:

  ```
  <!-- Inserted comment --><root>
      <child></child>
  </root>
  <!-- comment after root -->
  <?pi after root ?>
  ```

XSLT Example:

To process content after the root node, the XSLT would look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="xs"
    xmlns:xrf="http://www.oxygenxml.com/ns/xmlRefactoring/functions" version="3.0">
    <xsl:template match="/">
        <!-- The comment content that will be inserted after the root element -->
        <xsl:variable name="commentAsText">&lt;!-- COMMENT ADDED FROM XR OPERATION-->
        </xsl:variable>
        <!-- Retrieve the content after the root element as is -->
        <xsl:variable name="after-root-content" as="xs:string"
                      select="xrf:get-content-after-root()"/>

        <xsl:variable name="processedContent"
                      select="concat($after-root-content, $commentAsText)"/>

        <!-- Update the content after the root element -->
        <xsl:value-of select="xrf:set-content-after-root($processedContent)"/>

        <xsl:apply-templates/>
    </xsl:template>

    <xsl:template match="node() | @*">
        <xsl:copy>
```

```
            <xsl:apply-templates select="node() | @*"/>
        </xsl:copy>
    </xsl:template>
</xsl:stylesheet>
```

Note: The above XSLT retrieves the nodes after the root element as string, appends a new comment, and then sets back the updated content into the XML document.

Storing and Sharing Refactoring Operations

Oxygen XML Editor plugin scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A `refactoring` folder, created inside a directory that is associated to a *framework* you are customizing. To associate the parent directory to the *framework*, you need to add it in the **Classpath** tab of the **Document type** configuration dialog box.
- A folder that you specify in the **Load additional refactoring operations from** text box in the **XML Refactoring** preferences page.
- The `refactoring` folder from the Oxygen XML Editor plugin installation directory (*[OXYGEN_INSTALL_DIR]*`/refactoring/`).

Sharing Custom Refactoring Operations

The purpose of Oxygen XML Editor plugin scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as *framework* or projects.

After storing custom operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Editor plugin includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in *[OXYGEN_INSTALL_DIR]*`/refactoring/i18n/translation.xml`.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation `name`, `description`, and `category`.
- The `description` of the `parameters` element.
- The `label`, `description`, and `possibleValues` for each `parameter`.

Translated refactoring information uses the following form:

```
${i18n(translation_key)}
```

Oxygen XML Editor plugin scans the following locations to find the `translation.xml` files that are used to load the translation keys:

- A `refactoring/i18n` folder, created inside a directory that is associated to a customized *framework*.
- A `i18n` folder, created inside a directory that is associated to a customized *framework*.
- An `i18n` folder inside any specified folder. In this case, you need to open the **Preferences** dialog box , go to **XML** > **XML Refactoring**, and specify the folder in the **Load additional refactoring operations from** text box.
- The `refactoring/i18n` folder from the Oxygen XML Editor plugin installation directory (*[OXYGEN_INSTALL_DIR]*`/refactoring/i18n`).

Example: Refactoring Operation Descriptor File with *i18n* Support

```
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
    xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"
           name="${i18n(Remove_text_content)}">
    <description>${i18n(Remove_text_content_description)}</description>
    <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>
    <parameters>
```

```
        <description>${i18n(parameters_description)}</description>
        <parameter label="${i18n(Element_name)}" name="element_localName"
                   type="NC_NAME">
            <description>${i18n(Element_name_descriptor)}</description>
            <possibleValues>
                <value default="true" name="value1">${i18n(value_1)}</value>
                <value name="value2">${i18n(value_2)}</value>
            </possibleValues>
        </parameter>
    </parameters>
</refactoringOperationDescriptor>
```

Generating Sample XML Files

Oxygen XML Editor plugin offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in **XML Schema** preferences page.

To generate sample XML files from an XML Schema, use the **Generate Sample XML Files** action from the **XML Tools** menu. This action is also available in the contextual menu of the schema Design mode. The action opens the **Generate Sample XML Files** dialog box that allows you to configure a variety of options for generating the files.

The **Generate Sample XML Files** dialog box contains three tabs with various configurable options. Default values for these options can be set in the **Sample XML Files Generator** preferences page.

Schema Tab (Generate Sample XML Files Tool)

The **Generate Sample XML Files** tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The first set of options are found in the **Schema** tab.

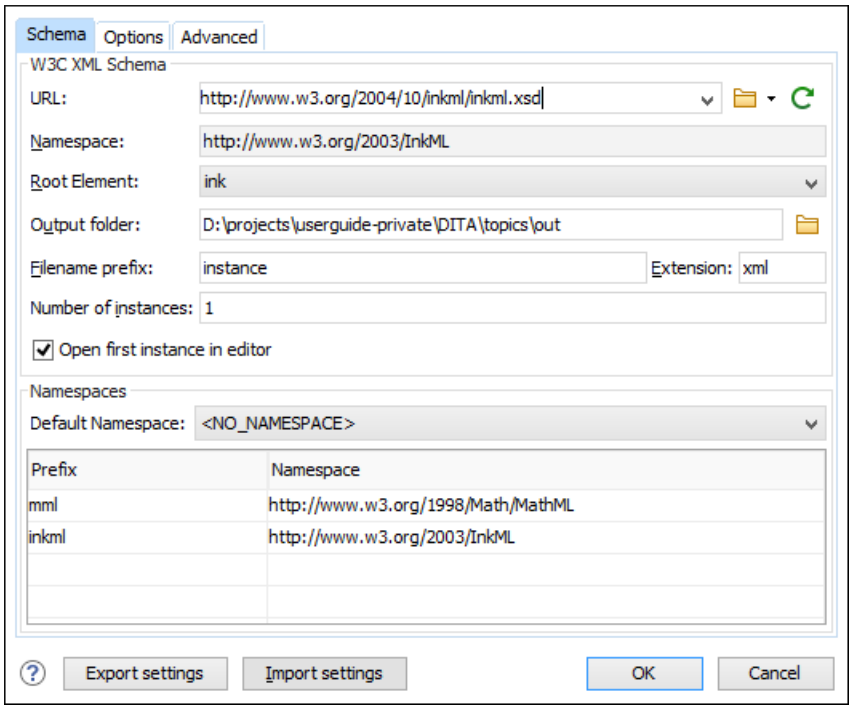

Figure 679: Generate Sample XML Files Dialog Box (Schema Tab)

This tab includes the following options:

URL

Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing tools in the **Browse** drop-down list.

Namespace

Displays the namespace of the selected schema.

Root Element

After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

Output folder

Path to the folder where the generated XML instances will be saved.

Filename prefix and Extension

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: `prefixN.extension`, where N represents an incremental number from 0 up to the specified **Number of instances**.

Number of instances

The number of XML files to be generated.

Open first instance in editor

When selected, the first generated XML file is opened in the editor.

Namespaces section

You can specify the **Default Namespace**, as well as the prefixes for the namespaces.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Options Tab (Generate Sample XML Files Tool)

The **Generate Sample XML Files** tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The **Options** tab allows you to set specific options for namespaces and elements.

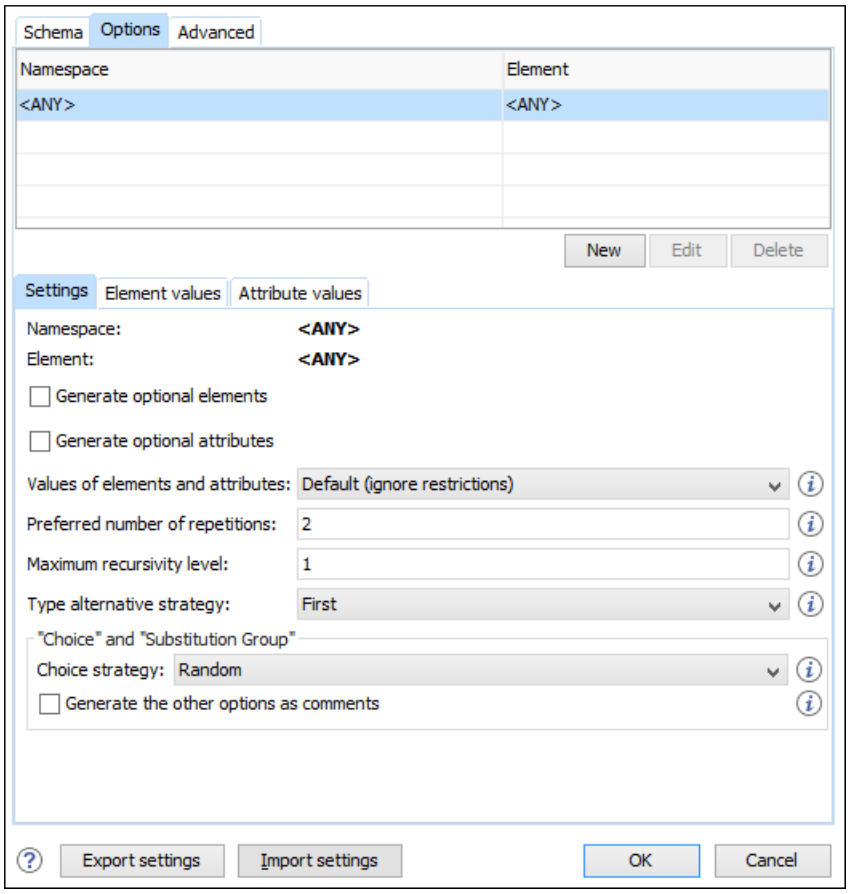

Figure 680: Generate Sample XML Files Dialog Box (Options Tab)

This tab includes the following options:

Namespace / Element table

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces (<ANY> - <ANY>). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

Settings subtab

Namespace

Displays the namespace specified in the table at the top of the dialog box.

Element

Displays the element specified in the table at the top of the dialog box.

Generate optional elements

When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

Generate optional attributes

When selected, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending of data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element

(according to the global option from the **Sample XML Files Generator** preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an **xs:string** with the **xs:maxLength** facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.

- **Random** - Inserts a random value depending of data type descriptor of the particular element or attribute.

  Important: If all of the following are true, the **Generate Sample XML Files** tool outputs invalid values:

  - At least one of the restrictions is a `regexp`.
  - The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the `xs:alternative` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

Choice strategy

Used for `xs:choice` or `substitutionGroup` elements. The possible strategies are:

- **First** - The first branch of `xs:choice` or the head element of `substitutionGroup` is always used.
- **Random** - A random branch of `xs:choice` or a substitute element or the head element of a `substitutionGroup` is used.

Generate the other options as comments

If selected, generates the other possible choices or substitutions (for `xs:choice` and `substitutionGroup`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Element values subtab

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

Attribute values subtab

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Advanced Tab (Generate Sample XML Files Tool)

The **Generate Sample XML Files** tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The **Advanced** tab allows you to set some options in regards to output values and performance.

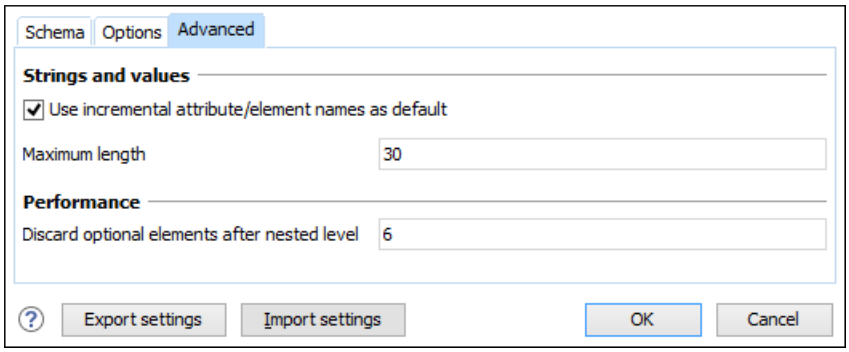

Figure 681: Generate Sample XML Files Dialog Box (Advanced Tab)

This tab includes the following options:

Use incremental attribute / element names as default

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an a element the generated values are: a1, a2, a3, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

Converting Schema to Another Schema Language

The **Generate/Convert Schema** tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor plugin generates an approximation of the source schema. Oxygen XML Editor plugin uses *Trang multiple format converter* to perform the actual schema conversions.

To use this tool, select the **Generate/Convert Schema (Ctrl + Shift + BackSlash (Command + Shift + BackSlash on OS X))** action from the **XML Tools** menu. This action opens the **Generate/Convert Schema** dialog box that allows you to configure various options for conversion.

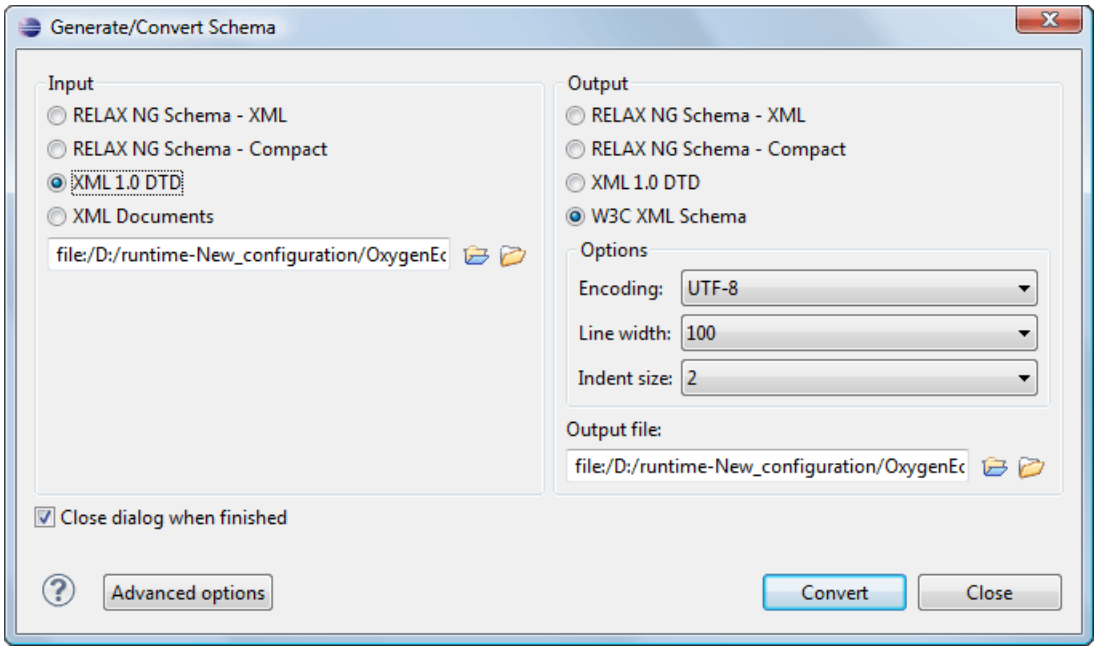

Figure 682: Generate/Convert Schema Dialog Box

The **Generate/Convert Schema** dialog box includes the following options:

Input section

Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the **XML Documents** option and use the file selector to add the XML files involved in the conversion.

Output section

Allows you to select the language of the target schema.

Options

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

Output file

Specifies the path for the output file that will be generated.

Close dialog when finished

If you deselect this option, the dialog box will remain opened after the conversion so that you can easily continue to convert more files.

Advanced options

If you select **XML 1.0 DTD** for the input, you can click this button to access more advance options to further fine-tune the conversion. The following advanced options are available:

XML 1.0 DTD Input section

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.

- **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **annotation-prefix** - Default values are represented using an annotation attribute `prefix:defaultValue` where prefix is the specified value and is bound to `http://relaxng.org/ns/compatibility/annotations/1.0` as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.
- **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.
- **strict-any** - Preserves the exact semantics of *ANY* content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element
- **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.
- **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

W3C XML Schema Output section

This section is available if you select **W3C XML Schema** for the output.

- **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.
- **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the `processContents` attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).
- **any-attribute-process-contents** - Specifies the value for the `processContents` attribute of `anyAttribute` elements. The default is skip (corresponding to RELAX NG semantics).

Converting Database to XML Schema

Oxygen XML Editor plugin includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.

   Result: The **Convert DB Structure to XML Schema** dialog box is opened and your current database connections are displayed in the **Connections** section.
2. If the database source is not listed, click the **Configure Database Sources** button to open the **Data Sources** preferences page where you can configure data sources and connections.
3. In the **Format for generated schema** section, select one of the following formats:
   - **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.
   - **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.
4. Click **Connect**.

   Result: The database structure is listed in the **Select database tables** section according to the format you chose.
5. Select the database tables that you want to be included in the XML Schema.
6. If you selected **Hierarchical schema** for the format, you can configure the database columns.
   a. Select the database column you want to configure.

b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
c. You can also change the name of the selected database column by changing it in the **Name** text field.

7. Click **Generate XML Schema**.

Result: The database structure is converted to an XML Schema and it is opened for viewing and editing.

JSON to XML Converter

Oxygen XML Editor plugin includes a useful and simple tool for converting JSON files to XML. It can be found in the **XML Tools** menu.

To convert a JSON document to XML, follow these steps:

1. Select the **JSON to XML** action from the **XML Tools** menu.
   The **JSON to XML** dialog box is displayed:

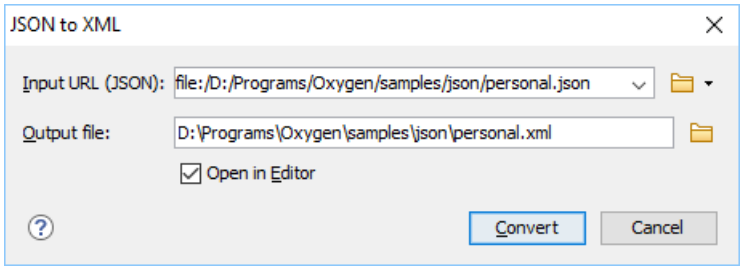

Figure 683: JSON to XML Dialog Box

2. Choose or enter the **Input URL** of the JSON document.
3. Choose the path of the **Output file** that will contain the resulting XML document.
4. Select the **Open in Editor** option to open the resulting XML document in the main editing pane.
5. Click the **Convert** button.

The original JSON document is now converted to an XML document.

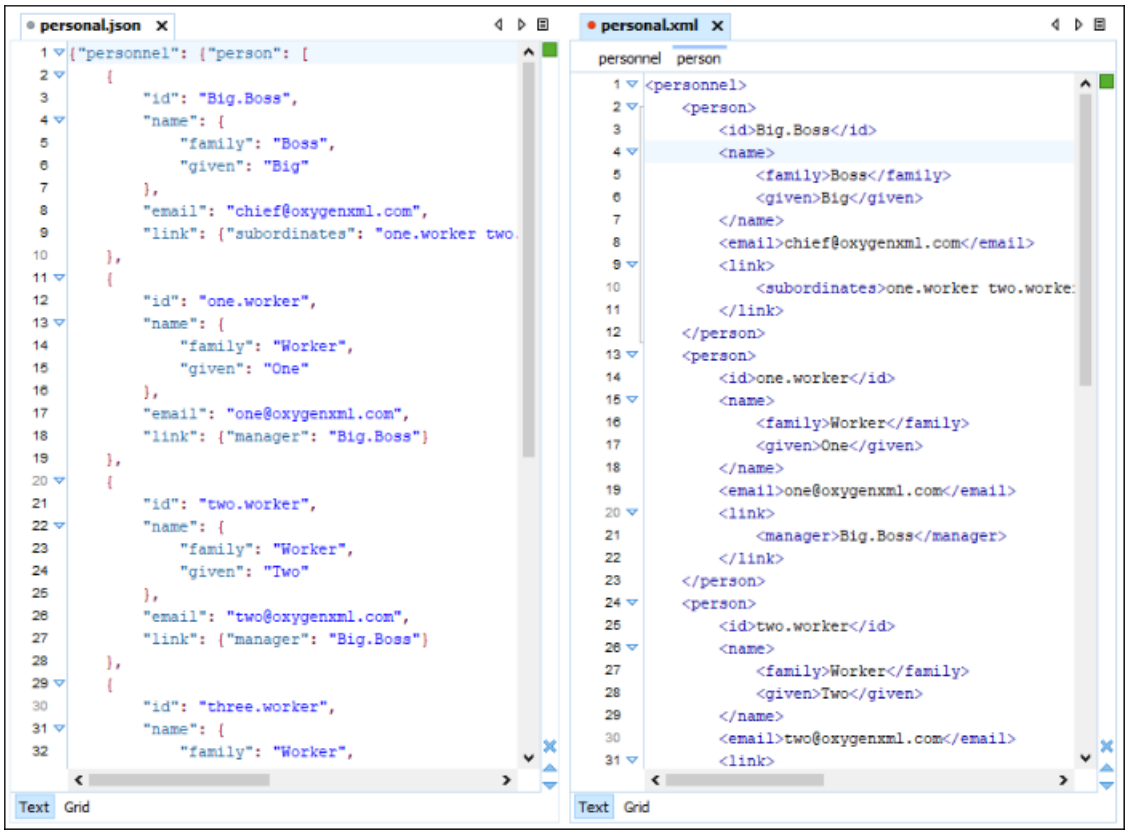

Figure 684: Example: XML to JSON Operation Result

XML to JSON Converter

Oxygen XML Editor plugin includes a useful and simple tool for converting XML files to JSON. It can be found in the **XML Tools** menu.

To convert an XML document to JSON, follow these steps:

1. Select the **XML to JSON** action from the **XML Tools** menu.

   The **XML to JSON** dialog box is displayed:

   Figure 685: XML to JSON Dialog Box

2. Choose or enter the **Input URL** of the XML document.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
5. Click the **Convert** button.

The original XML document is now converted to a JSON document.

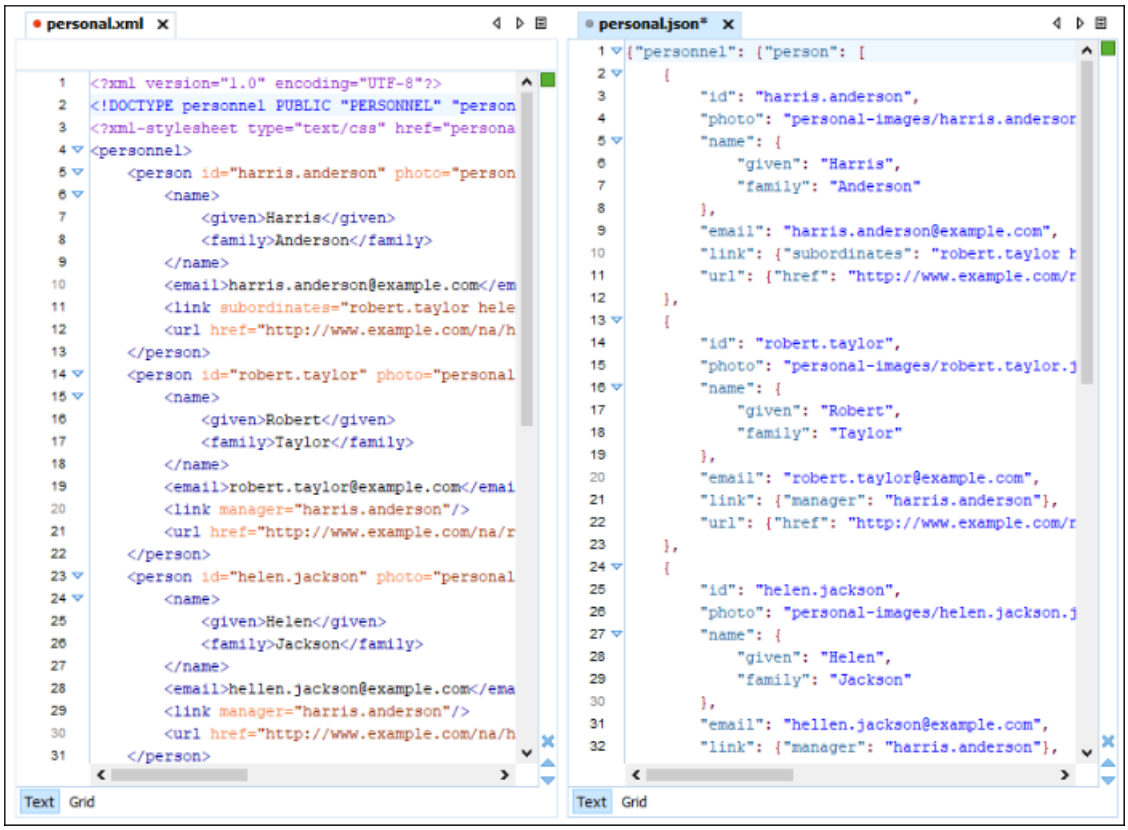

Figure 686: Example: XML to JSON Operation Result

Compiling an XSL Stylesheet for Saxon

As of Saxon 9.7, it is possible to export a compiled form of a stylesheet as an XML file (called a *stylesheet export file* or SEF). Oxygen XML Editor plugin includes a simple tool called **Compile XSL Stylesheet for Saxon** (found in the **XML Tools** menu) that does this for you.

Use-Cases for a Stylesheet Export File (SEF)

- **Use Saxon-JS to run transformations in a browser** - A *stylesheet export file* (SEF) is needed if you want to use the Saxon-JS product to run transformations in a browser, as in the following example:

```
<script type="text/javascript" src="SaxonJS/SaxonJS.min.js"></script>
<script>
    window.onload = function() {
      SaxonJS.transform({
         stylesheetLocation: "books.sef",
         sourceLocation: "books.xml"
         });
    }
</script>
```

- **Use SEF to run transformations in Oxygen XML Editor plugin** - You can also use a *stylesheet export file* (SEF) in Oxygen XML Editor plugin to apply an XSLT transformation over an XML file. This requires **Saxon-EE** or **Saxon-PE** versions of the Saxon product and you must select one of those two versions for the **Target** when you configure the SEF file. When configuring the XSLT transformation, you will specify the SEF file in the **XSL URL** field.

Compiling an SEF File

The **Compile XSL Stylesheet for Saxon** tool can be found in the **XML Tools** menu and it compiles a specified stylesheet as an XML file (*stylesheet export file* with a file extension of `.sef`).

Selecting this tool opens the **Compile XSL Stylesheet for Saxon** dialog box that allows you to configure some options for conversion.

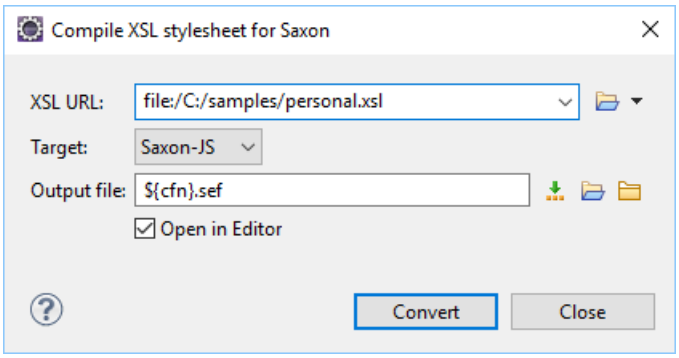

Figure 687: Compile XSL Stylesheet for Saxon Dialog Box

This dialog box includes the following options:

XSL URL

Allows you to select URL of the source XSL stylesheet. You can specify the URL by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down list.

Target

Allows you to select the type of Saxon product that the export file will be used with. You can choose **Saxon-JS**, **Saxon-EE**, **Saxon-PE**, or **Saxon-HE**.

Output file

You can specify the path where the output file will be saved by entering it in the text field, using the **Insert Editor Variables** button, or using the browsing tool buttons ( ).

Open in Editor

Select this option to open the resulting *stylesheet export file* in the main Oxygen XML Editor plugin editing pane.

Convert

Use this button to generate the *stylesheet export file* according the options selected in this dialog box.

Generate Documentation

Oxygen XML Editor plugin includes a tool for generating documentation for XSLT, XML Schema, XQuery, and WSDL documents.

Generating Documentation for an XML Schema

Oxygen XML Editor plugin can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

Note: You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select **XML Schema Documentation** from the **XML Tools** > **Generate Documentation** menu or from the **Generate XML Schema Documentation** action from the contextual menu of the **Navigator** view.

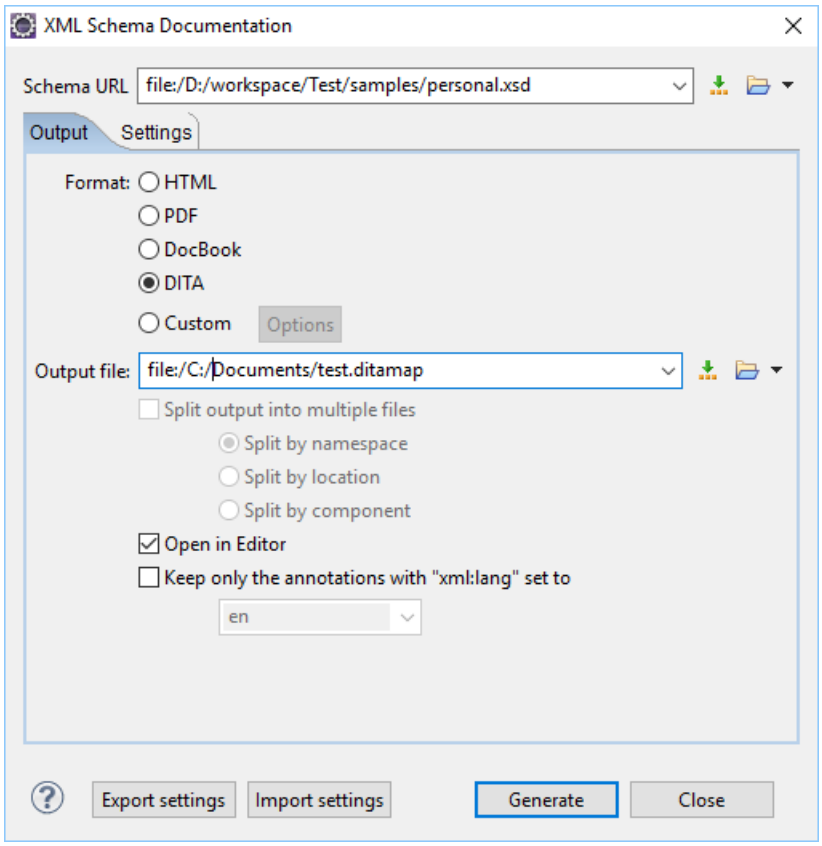

Figure 688: XML Schema Documentation Dialog Box

The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file for which you want to generate documentation. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in HTML output format.
  - **PDF** - The documentation is generated in PDF output format.
  - **DocBook** - The documentation is generated in DocBook output format.
  - **DITA** - The documentation is generated in DITA output format.
  - **Custom** - The documentation is generated in a custom output format, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type. For DITA and DocBook documents, this option appears as **Open in Editor** and the result will be opened in Oxygen XML Editor plugin (in the current editor).

Note: To set the browser or system application that will be used, go to **Window** > **Preferences** > **General** > **Web Browser** and specify it there. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `xml:lang` attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

Settings Tab

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

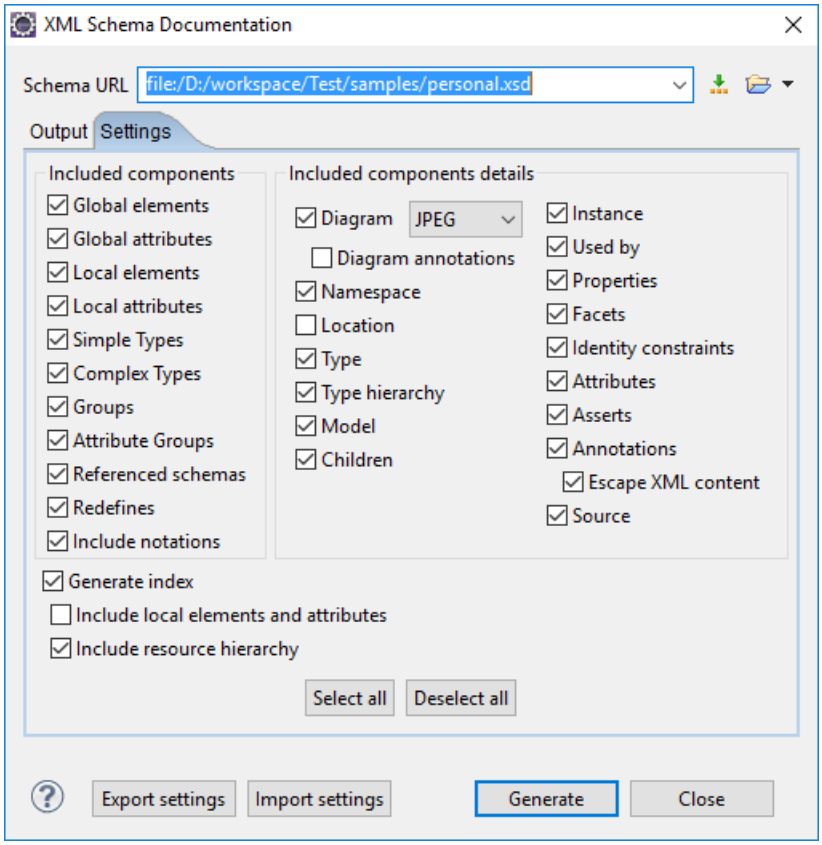

Figure 689: Settings Tab of the XML Schema Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the Schema Design Properties page.
  - **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.
- **Namespace** - Displays the namespace for each component.
- **Location** - Displays the schema location for each component.
- **Type** - Displays the component type if it is not an anonymous one.
- **Type hierarchy** - Displays the types hierarchy.
- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:
  - `xs:all` - Its children will be separated by space characters.

    - `xs:sequence` - Its children will be separated by comma characters.
    - `xs:choice` - Its children will be separated by / characters.
- **Children** - Displays the list of component's children.
- **Instance** - Displays an XML instance generated based on each schema element.
- **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
- **Properties** - Displays some of the component's properties.
- **Facets** - Displays the facets for each simple type
- **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
- **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
- **Asserts** - Displays the **assert** elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
- **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.
- **Source** - Displays the text schema source for each component.
- **Generate index** - Displays an index with the components included in the documentation.
    - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
    - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command line interface.)

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XML Schema documentation.

Customizing PDF or DocBook Output of Generated XML Schema Documentation on page 712

Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Editor plugin to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for each of them. The elements are hyperlinked. To generate documentation in a custom output format, you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the **XSLT Stylesheet Documentation** dialog box, select **XSLT Stylesheet Documentation** from the **XML Tools** > **Generate Documentation** menu or from the **Generate Stylesheet Documentation** action from the contextual menu of the **Navigator** view.

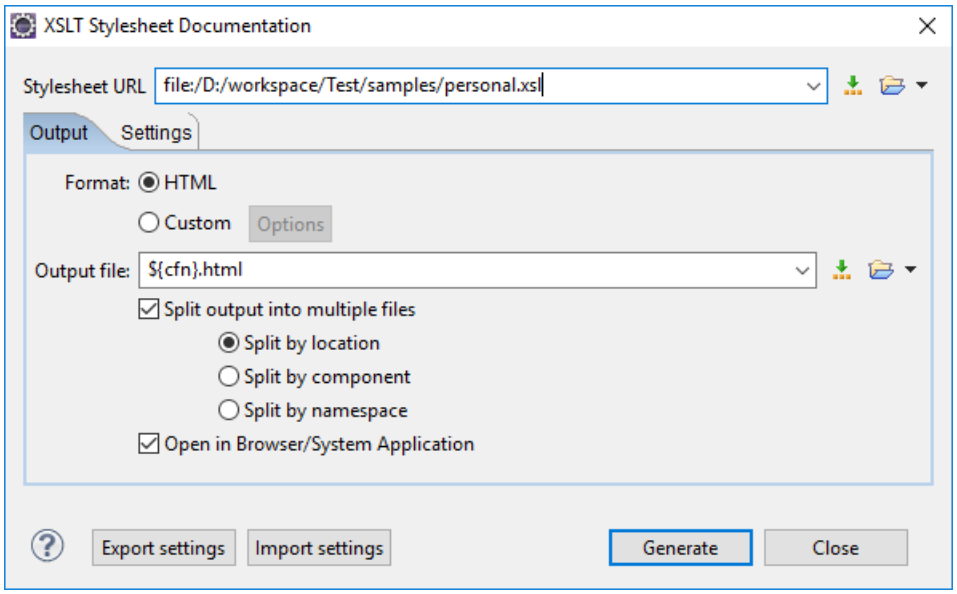

Figure 690: XSLT Stylesheet Documentation Dialog Box

The **XSL URL** field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in HTML output format.
  - **Custom** - The documentation is generated in a custom output format, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

  Note: To set the browser or system application that will be used, go to **Window** > **Preferences** > **General** > **Web Browser** and specify it there. This will take precedence over the default system application settings.

Settings Tab

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

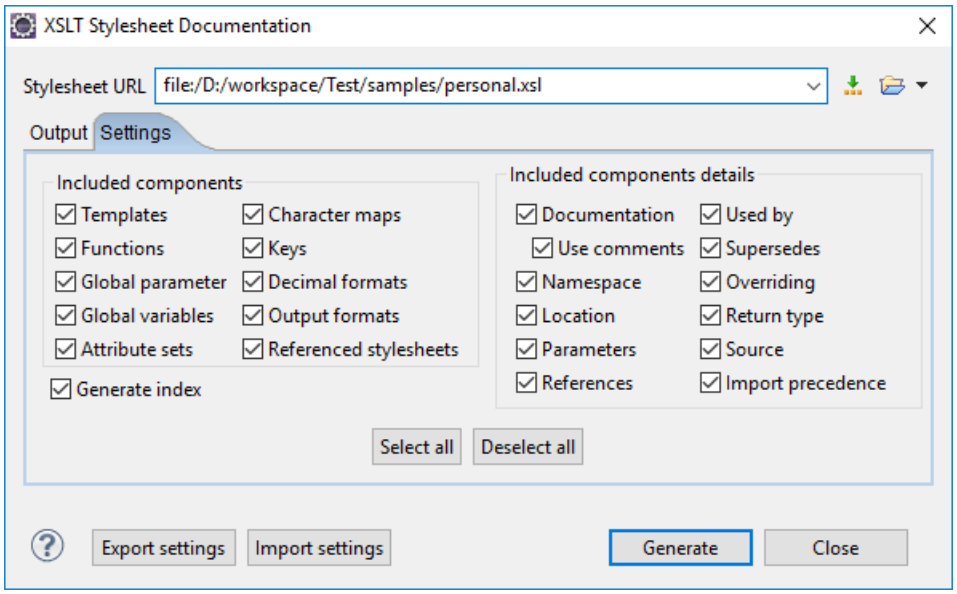

Figure 691: Settings Tab of the XSLT Stylesheet Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Templates**, **Functions**, **Global parameters**, **Global variables**, **Attribute sets**, **Character maps**, **Keys**, **Decimal formats**, **Output formats**, **Referenced stylesheets**.

You can choose whether or not to include the following other details:

- **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
  - Oxygen XML Editor plugin built-in XSLT documentation schema.
  - A subset of DocBook 5 elements. The recognized elements are: *section*, *sect1* to *sect5*, *emphasis*, *title*, *ulink*, *programlisting*, *para*, *orderedlist*, *itemizedlist*.
  - A subset of DITA elements. The recognized elements are: *concept*, *topic*, *task*, *codeblock*, *p*, *b*, *i*, *ul*, *ol*, *pre*, *sl*, *sli*, *step*, *steps*, *li*, *title*, *xref*.
  - Full XHTML 1.0 support.
  - XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
  - DOXSL documentation *framework*. Supported elements are : *codefrag*, *description*, *para*, *docContent*, *documentation*, *parameter*, *function*, *docSchema*, *link*, *list*, *listitem*, *module*, *parameter*, *template*, *attribute-set*;

    Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML *pre* element. You can change this behavior by using a custom format instead of the built-in HTML format and providing your own XSLT stylesheets.
- **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the *xsl:stylesheet* element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.
- **Namespace** - Shows the namespace for named XSLT elements.
- **Location** - Shows the stylesheet location for each XSLT element.
- **Parameters** - Shows parameters of templates and functions.
- **References** - Shows the named XSLT elements that are referenced from within an element.
- **Used by** - Shows the list of all the XSLT elements that reference the current named element.
- **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.
- **Overriding** - Shows the list of all the XSLT elements that override the current element.
- **Return type** - Shows the return type of the function.

- **Source** - Shows the text stylesheet source for each XSLT element.
- **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.
- **Generate index** - Creates an index with all the XSLT elements included in the documentation.

Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command-line interface.)

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XSLT documentation.

XSLT Stylesheet Component Documentation Support on page 641

Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the **XQuery Documentation** dialog box. It is opened with the **XQuery Documentation** action that is available from the **XML Tools** > **Generate Documentation** menu or from the **Generate XQuery Documentation** action from the contextual menu of the **Navigator** view.

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

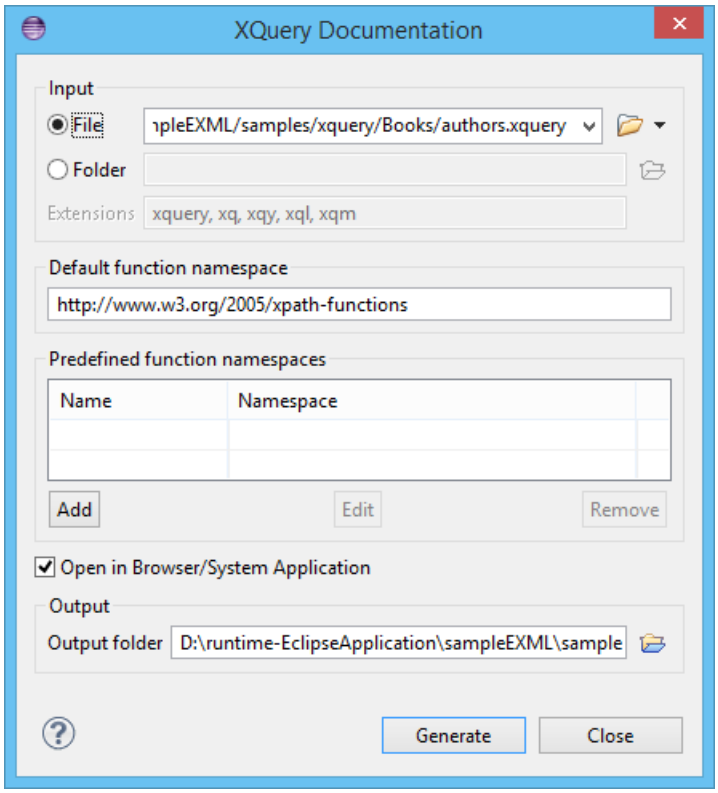

Figure 692: XQuery Documentation Dialog Box

The following options are available:

- **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
  - **URLFile** - The URL of the file in which you want to generate the documentation.
  - **Folder** - The directory that contains the files for which you want to generate the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.
- **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.
- **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation

component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).

- **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.

  Note: To set the browser or system application that will be used, go to **Window** > **Preferences** > **General** > **Web Browser** and specify it there. This will take precedence over the default system application settings.
- **Output** - Allows you to specify where the generated documentation is saved on disk.

Generating Documentation for WSDL Documents

You can use Oxygen XML Editor plugin to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a custom output format by using a custom stylesheet.

Note: The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **XML Tools** > **Generate Documentation** menu or from the **Generate WSDL Documentation** action from the contextual menu of the **Navigator** view.

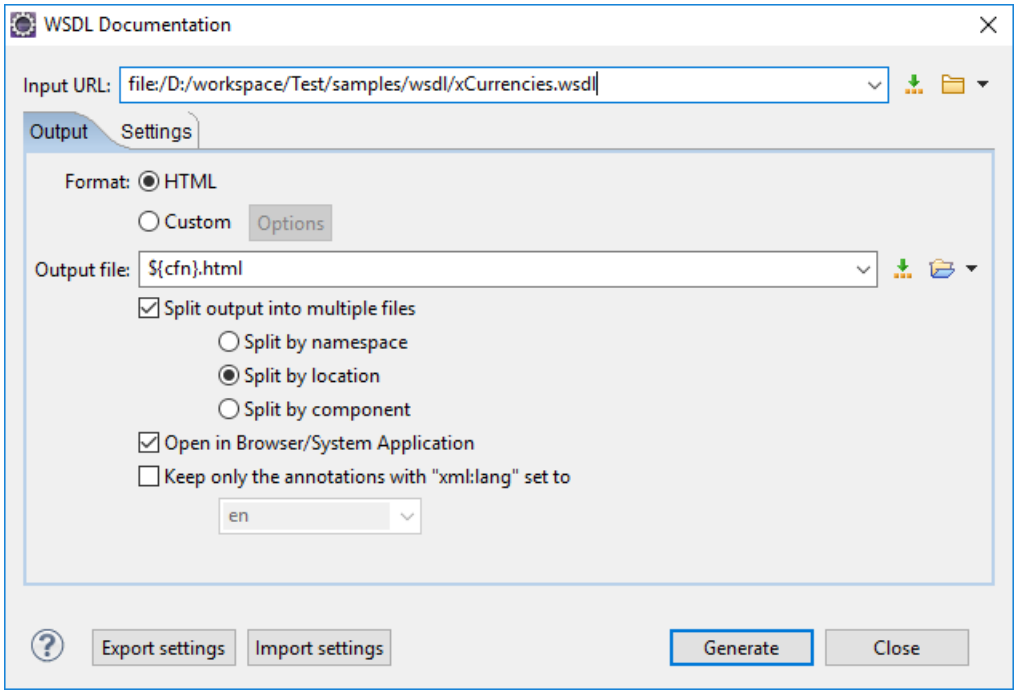

Figure 693: WSDL Documentation Dialog Box

The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  - **HTML** - The documentation is generated in HTML output format.
  - **Custom** - The documentation is generated in a custom output format, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom

stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

  Note: To set the browser or system application that will be used, go to **Window** > **Preferences** > **General** > **Web Browser** and specify it there. This will take precedence over the default system application settings.
- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `xml:lang` attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

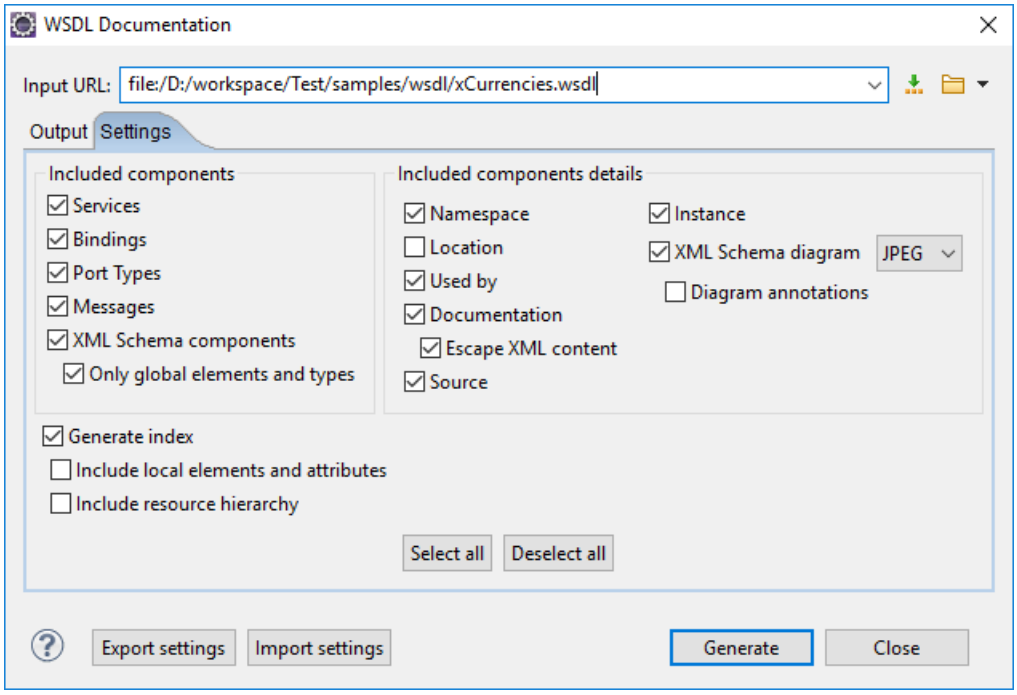

Figure 694: Settings Tab of the WSDL Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following:

- **Components**
  - **Services** - Specifies whether or not the generated documentation includes the WSDL services.
  - **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
  - **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.
  - **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
  - **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.

    - **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.
- **Component Details**
    - **Namespace** - Presents the namespace information for WSDL or XML Schema components.
    - **Location** - Presents the location information for each WSDL or XML Schema component.
    - **Used by** - Presents the list of components that reference the current one.
    - **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
    - **Source** - Presents the XML fragment that defines the current component.
    - **Instance** - Generates a sample XML instance for the current component.

      Note: This option applies to the XML Schema components only.
    - **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section.
        - **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.
- **Generate index** - Displays an index with the components included in the documentation.
    - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
    - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command-line interface.)

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the WSDL documentation.

Canonicalizing Files

You can select the *canonicalization* algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu.

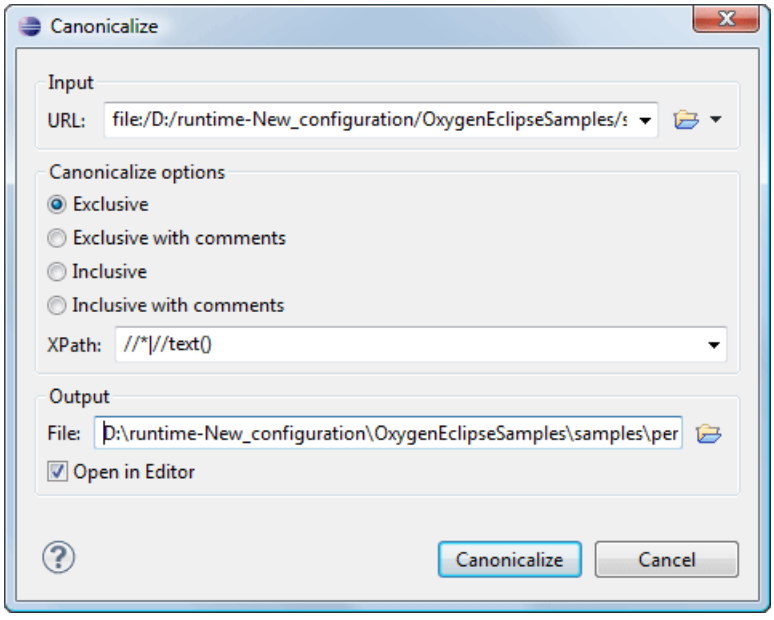

Figure 695: Canonicalization Settings Dialog Box

The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **XML Tools** menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) *canonicalization* method is used.

  Note: *Exclusive Canonicalization* just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.
- **Exclusive with comments** - If selected, the exclusive with comments *canonicalization* method is used.
- **Inclusive** - If selected, the inclusive (uncommented) *canonicalization* method is used.

  Note: *Inclusive Canonicalization* copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive *Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive *Canonicalization* will copy them and the signature will be invalid.
- **Inclusive with comments** - If selected, the inclusive with comments *canonicalization* method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the **Canonicalize** action was selected from the **XML Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in the editor.

Related Information:

Digital Signatures Overview on page 615

Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu.

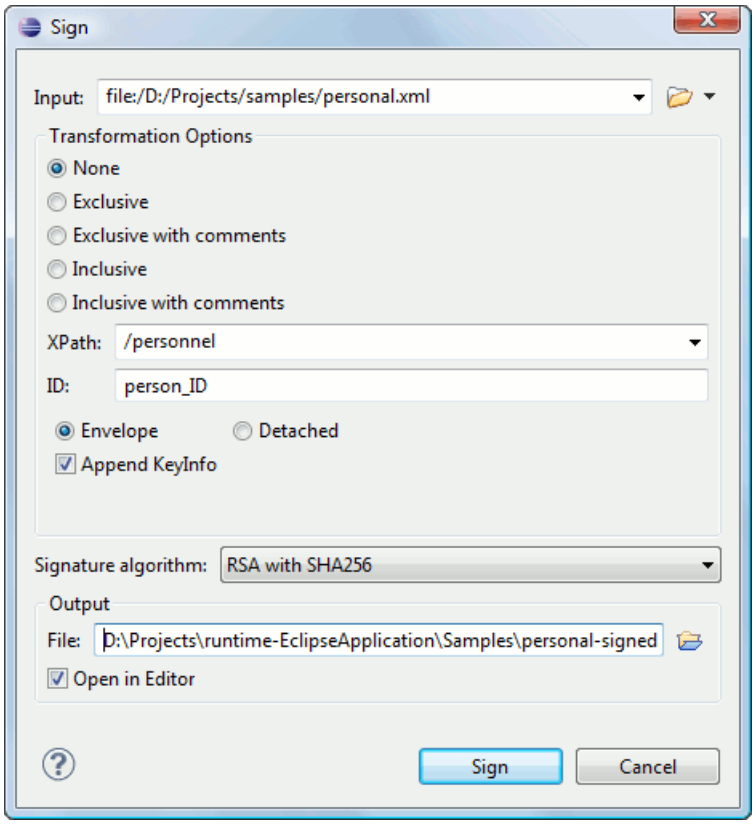

Figure 696: Signature Settings Dialog Box

The following options are available:

Note: If Oxygen XML Editor plugin could not find a valid certificate, a link is provided at the top of the dialog box that opens the XML Signing Certificates preferences page where you can configure a valid certificate.

- **Input** - Available if the **Sign** action was selected from the **XML Tools** menu. Specifies the location of the input URL.
- **Transformation Options** - See the Digital Signature Overview section for more information about these options.
  - **None** - If selected, no *canonicalization* algorithm is used.
  - **Exclusive** - If selected, the exclusive (uncommented) *canonicalization* method is used.

    Note: *Exclusive Canonicalization* just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.
  - **Exclusive with comments** - If selected, the exclusive with comments *canonicalization* method is used.
  - **Inclusive** - If selected, the inclusive (uncommented) *canonicalization* method is used.

    Note: *Inclusive Canonicalization* copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive *Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive *Canonicalization* will copy them and the signature will be invalid.
  - **Inclusive with comments** - If selected, the inclusive with comments *canonicalization* method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.

- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the *enveloped* signature is used. See the Digital Signature Overview for more information.
- **Detached** - If selected, the *detached* signature is used. See the Digital Signature Overview for more information.
- **Append KeyInfo** - If this option is selected, the `ds:KeyInfo` element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: **RSA with SHA1**, **RSA with SHA256**, **RSA with SHA384**, and **RSA with SHA512**.
- **Output** - Available if the **Sign** action was selected from the **XML Tools** menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in Oxygen XML Editor plugin.

Related Information:

Digital Signatures Overview on page 615
Verifying Signature on page 620

Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

WSDL SOAP Analyzer

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated **WSDL SOAP Analyzer** tool (available from the toolbar or **WSDL** menu).

Oxygen XML Editor plugin provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the **WSDL SOAP Analyzer** tool for the currently edited WSDL document do one of the following:

- Click the **WSDL SOAP Analyzer** toolbar button.
- Use the **WSDL SOAP Analyzer** action from the **WSDL** menu.
- Go to **Open with** > **WSDL Editor** in the contextual menu of the **Navigator** view.

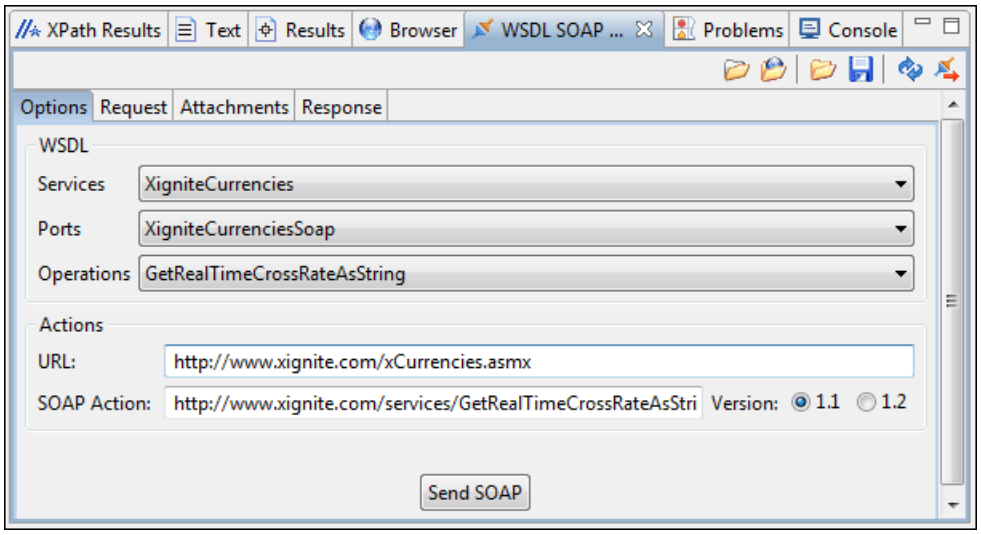

Figure 697: WSDL SOAP Analyzer View

This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.
- **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor plugin tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is *http://schemas.xmlsoap.org/soap/envelope/* for SOAP 1.1 or *http://www.w3.org/2003/05/soap-envelope* for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The *Content Completion Assistant* is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Editor plugin remembers the modified request for each one. You can press the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.
- **Attachments List** - You can define a list of file URLs to be attached to the request.
- **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Editor plugin prompts you to save them, then tries to open them with the associated system application.
- **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.
- **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor plugin is connecting to the server.

The testing of a WSDL file is straight-forward: click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the Testing Remote WSDL Files section.

Note: SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

1. Go to **Window** > **Show View** > **Other** > **Oxygen XML Editor plugin** > **WSDL SOAP Analyzer**.
2. Press the **Choose WSDL** button and enter the URL of the remote WSDL file.
   You enter the URL:
   - by typing
   - by browsing the local file system
   - by browsing a remote file system
   - by browsing a UDDI Registry
3. Press the **OK** button.
   This will open the **WSDL SOAP Analyzer** tool. In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

UDDI Registry Browser

Pressing the button in the **WSDL File Opener** dialog box (menu **Tools** > **WSDL SOAP Analyzer**) opens the **UDDI Registry Browser** dialog box.

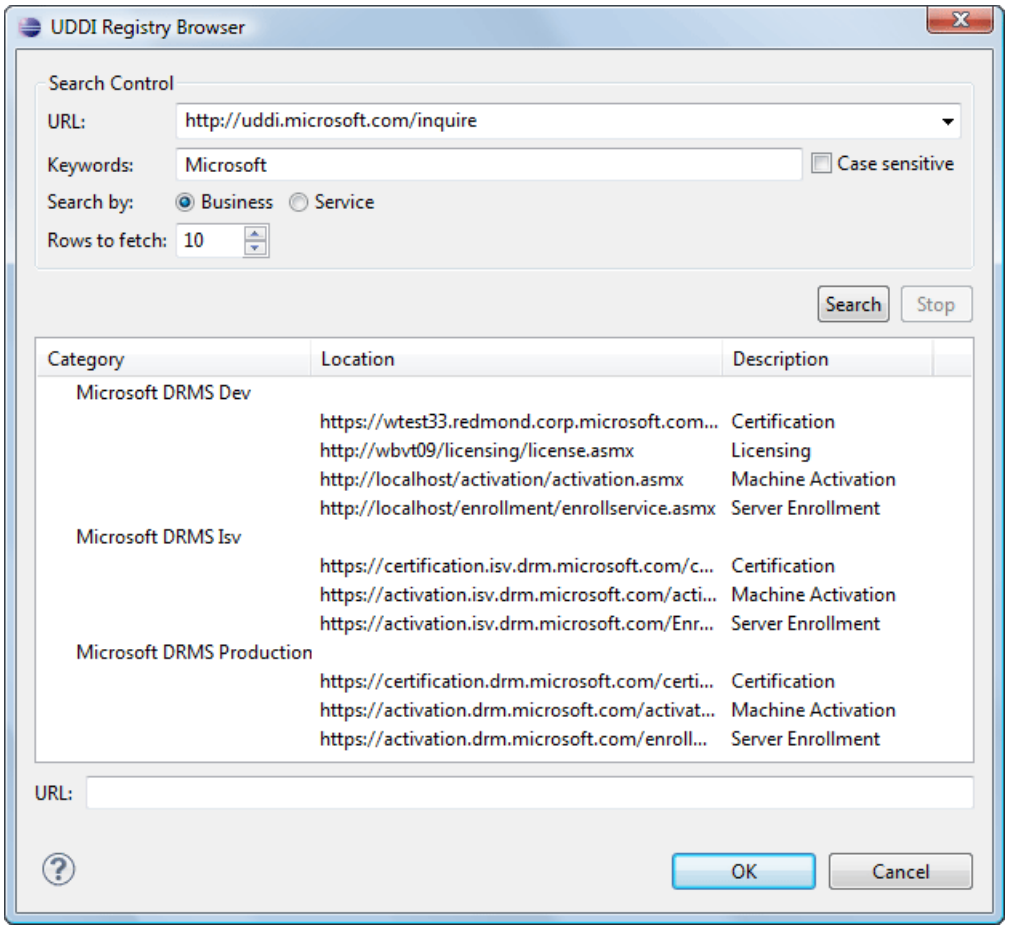

Figure 698: UDDI Registry Browser Dialog Box

The fields of the dialog box are as follows:

- **URL** - Type the URL of an UDDI registry or choose one from the default list.
- **Keywords** - Enter the string you want to be used when searching the selected UDDI registry for available Web services.
- **Rows to fetch** - The maximum number of rows to be displayed in the result list.
- **Search by** - You can choose to search either by company or by provided service.
- **Case sensitive** - When selected, the search takes into account the keyword case.
- **Search** - The WSDL files that matched the search criteria are added in the result list.

When you select a WSDL from the list and click the **OK** button, the **UDDI Registry Browser** dialog box is closed and you are returned to the **WSDL File Opener** dialog box.

XML Schema Regular Expressions Builder

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting **XML Schema Regular Expressions Builder** from the **XML Tools** menu.

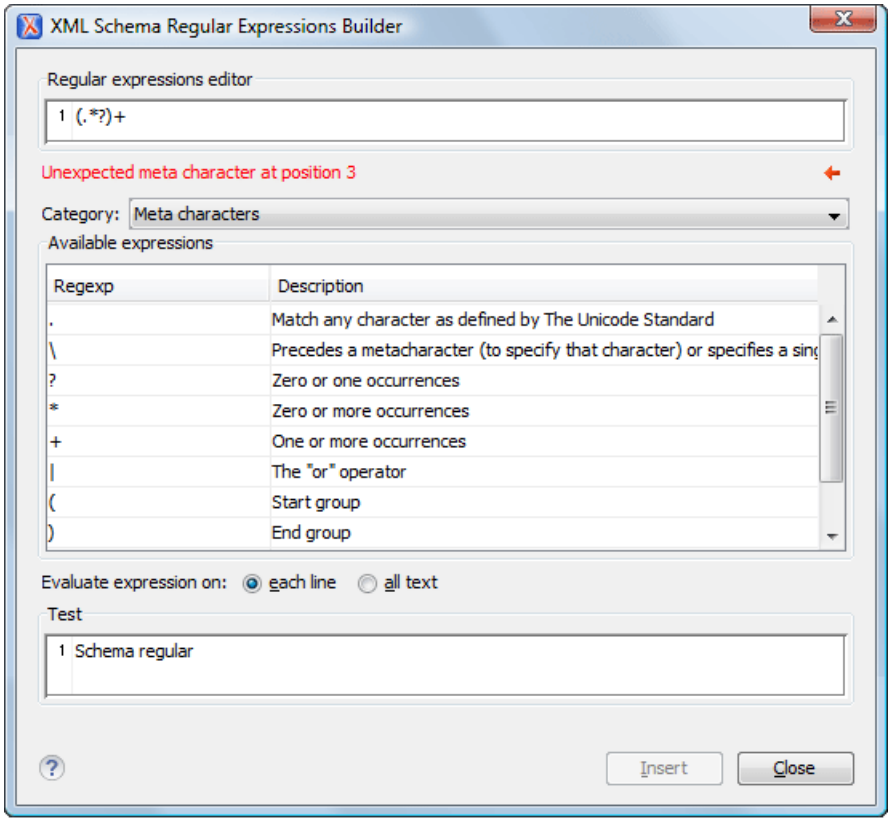

Figure 699: XML Schema Regular Expressions Builder Dialog Box

The dialog box contains the following:

Regular expressions editor

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing **Ctrl + Space (Command + Space on OS X)**.

Error display area

If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button (←) highlights the error inside the regular expression.

Category

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the **Available expressions** table.

Available expressions

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous **Category** combo box. You can add an expression in the **Regular expressions editor** by double-clicking the expression row in the table. You will notice that in the case of **Character categories** and **Block names**, the expressions are also listed in complementary format.

Evaluate expression on

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the **Test** area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

Test

A text editor that allows you to enter a text sample for which the regular expression will be applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The **Insert** button will become active when an editor is opened in the background and there is an expression in the **Regular expressions editor**.

The regular expression builder cannot be used to insert regular expressions in the **Grid** mode or schema **Design** mode. Accordingly, the **Insert** button will be not available if the current document is edited in these modes.

Note: Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

Common Problems

19

Topics:

- Performance Problems and Solutions
- Misc Problems and Solutions

This section provides a collection of common performance and other types of problems that might be encountered when using Oxygen XML Editor plugin, along with their possible solutions.

Performance Problems and Solutions

This section contains solutions for some common performance problems that may appear when running Oxygen XML Editor plugin.

Out of Memory on External Processes

Problem

Oxygen XML Editor plugin throws an *Out Of Memory* error when trying to generate PDF output with the built-in Apache FOP processor.

Cause

The amount of allocated memory might be insufficient.

Solutions

- Open the **Preferences** dialog box , go to **XML** > **XSLT-FO-XQuery** > **FO Processors**, and increase the value of the **Memory available to the built-in FOP** option.
- For external XSL-FO processors, XSLT processors, and external tools, the maximum value of the allocated memory is set in the command line of the tool using the **-Xmx** parameter set to the Java virtual machine.

Related Information:

FO Processors Preferences on page 111

Custom Engines Preferences on page 109

How to Enable Debugging for FO Processor Transformations on page 1127

Performance Issues with Large Documents

Problem

The performance of the application slows down considerably over time when working with large documents.

Cause

A possible cause is that the application needs more memory to run properly.

Solutions

- You can increase the maximum amount of memory available to Oxygen XML Editor plugin by setting the `-vmargs` and `-Xmx` parameters in the command used to launch the Eclipse platform.

Attention: The maximum amount of memory should not be equal to the physical amount of memory available on the machine because in that case the operating system and other applications will have no memory available.

- **Note:**

Misc Problems and Solutions

This chapter presents common problems that may appear when running the application along with solutions for these problems.

'Address Family Not Supported by Protocol Family; Connect' Error

Problem

I have experienced the following error: *"Address Family Not Supported by Protocol Family; Connect"*. How do I solve it?

Cause

This seems to be an IPv6 connectivity problem. By default, the Java runtime used by Oxygen XML Editor plugin prefers to create connections via IPv6, if the support is available. However, even though it is available in appearance, IPv6 sometimes happens to be configured incorrectly on some systems.

Solution

A quick solution for this problem is to set the `java.net.preferIPv4Stack` Java property to `true` (`java.net.preferIPv4Stack=true`), by following this procedure:

1. Create a file named `custom_commons.vmoptions` and add on a single line – `Djava.net.preferIPv4Stack=true`. Then save the file and copy it to the Oxygen XML Editor plugin installation folder (may need admin access).
2. Restart Oxygen XML Editor plugin.
3. Make sure the procedure was successful by going to **Help** > **About** > **System properties** and check that the value of the `java.net.preferIPv4Stack` property is `true`.

Alignment Issues of the Main Menu on Linux Systems Based on Gnome 3.x

Problem

On some Linux systems based on Gnome 3.x (Ubuntu 11.x, 12.x), the main menu of Oxygen XML Editor plugin has alignment issues when you navigate it using your mouse.

Cause

This is a known problem caused by Java SE 6 1.6.0_32 and earlier.

Solution

You can resolve this problem using the latest Java SE 6 JRE from Oracle. To download the latest version, go to http://www.oracle.com/technetwork/java/javase/downloads/index.html.

To bypass the JRE bundled with Oxygen XML Editor plugin, go to the installation directory of Oxygen XML Editor plugin and rename or move the `jre` folder. If Oxygen XML Editor plugin does not seem to locate the system JRE, either set the JAVA_HOME environment variable to point to the location where you have installed the JRE, or you can simply copy that folder with the JRE to the installation directory and rename it to `jre` to take the place of the bundled JRE.

Compatibility Issue Between Java and Certain Graphics Card Drivers

Problem

Under certain settings, a compatibility issues can appear between Java and some graphics card drivers, which results in the text from the editor (in **Author** or **Text** mode) being displayed garbled.

Solution

If you encounter this problem, update your graphics card driver.

Damaged File Associations on OS X

Problem

After upgrading OS X and Oxygen XML Editor plugin, it is no longer associated to the appropriate file types (such as XML, XSL, XSD). How can I re-create the file associations?

Cause

The upgrade damaged the file associations in the LaunchService Database on your OS X machine.

Solution

You can rebuild the LaunchService Database with the following procedure. This will reset all file associations and rescan the entire file system searching for applications that declare file associations and collect them in a database used by Finder.

1. Find all the Oxygen XML Editor plugin installations on your hard drive.
2. Delete them by dragging them to the Trash.
3. Clear the Trash.
4. Unpack the Oxygen XML Editor plugin installation kit on your desktop.
5. Copy the contents of the archive into the folder `/ Applications / Oxygen`.
6. Run the following command in a Terminal:

   ```
   /System/Library/Frameworks/CoreServices.framework/Versions/A/Frameworks/
   LaunchServices.framework/Versions/A/Support/lsregister -kill -r -domain local -
   domain system -domain user
   ```
7. Restart Finder with the following command:

   ```
   killall Finder
   ```
8. Create an XML or XSD file on your desktop. It should have the Oxygen XML Editor plugin icon.
9. Double-click the file.
10. Accept the confirmation.

Result: When you start Oxygen XML Editor plugin, the file associations should work correctly.

Details to Submit in a Request for Technical Support Using the Online Form

Problem

What details should I add to my request for technical support on the online form in the product website?

Solution

When completing a request for Technical Support using the online form, include as many details as possible about your problem. For problems where a simple explanation may not be enough for the Technical Support team to reproduce or address the issue (such as server connection errors, unexpected delays while editing a document, an application crash, etc.), you should generate a log file and attach it to the problem report. In the case of a crash, you should also attach the crash report file generated by your operating system.

If the text content of an XML document you want to send to the support team contains sensitive or private information, you can use the **Randomize XML text content** action to create filler content. Before using this action, you need to copy the initial XML resources and save them in a separate folder. Otherwise, you might lose your original information.

To generate an Oxygen XML Editor plugin log file, follow these steps:

1. Create a text file called `log4j.properties` in the `lib` folder of the installed *plugin* folder, with the following content:

```
log4j.rootCategory= debug, R2

log4j.appender.R2=org.apache.log4j.RollingFileAppender
log4j.appender.R2.File=${user.home}/Desktop/oxygenLog/oxygen.log
log4j.appender.R2.MaxFileSize=12000KB
log4j.appender.R2.MaxBackupIndex=20
log4j.appender.R2.layout=org.apache.log4j.PatternLayout
log4j.appender.R2.layout.ConversionPattern=%r %p [ %t ] %c - %m%n
```

2. Restart the application.
3. Reproduce the error.
4. Close the application.
5. Delete the `log4j.properties` file because it might cause performance issues if you leave it in the `lib` folder.

   Important: The logging mode may severely decrease the performance of the application. Therefore, please do not forget to delete the `log4j.properties` file when you are done with the procedure.

Result: The resulting log file is named `oxygen#.log` (for example, `oxygen.log`, `oxygen.log.1`, `oxygen.log.2`, etc.) and is located in the `Desktop\oxygenLog` folder.

DITA Map Transformation Fails (Cannot Connect to External Location)

Problem

DITA map transformation fails because it cannot connect to an external location.

Solution

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the **DITA Transformation** tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the Network Connections.

DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

Problem

DITA Map WebHelp transformation fails with a message that indicates duplicate topic references were found.

Cause

By default the WebHelp transformation uses the `force-unique` parameter set to **true** to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

Solution

To solve this issue, you should manually set a unique `copy-to` attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```
<map>
...
  <topicref href="../topics/MyTopic.dita"/>
...
```

```
  <topicref href="../topics/MyTopic.dita" copy-to="../topics/MyTopic-2.dita"/>
</map>
```

DITA PDF Transformation Fails

Problem

The DITA to PDF transformation fails.

Cause

To generate the PDF output, Oxygen XML Editor plugin uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see DITA PDF Processing Common Errors on page 1449.

Solution

If your transformation fails, you can detect some of the problems that caused the errors by running the **Validate and Check for Completeness** action. Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the *DITA map*, broken links, and missing external resources.

You can analyze the **Results** tab of the DITA transformation and search for messages that contain text similar to `[fop] [ERROR]`. If you encounter this type of error message, edit the transformation scenario you are using and set the **clean.temp** parameter to **no** and the **retain.topic.fo** parameter to **yes**. Run the transformation, go to the temporary directory of the transformation, open the `topic.fo` file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to **Help** > **About** > **Components** > **Frameworks** and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

How to Enable Debugging for FO Processor Transformations on page 1127

DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
.............
[fop] Caused by: java.io.FileNotFoundException:
C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)
```

Solution: Cannot Save PDF

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

Problem: Table Contains More Cells Than Defined in Colspec

One of the DITA tables contains more cells in a table row than the defined number of `colspec` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException:
```

```
The column-number or number of cells in the row overflows the number of
fo:table-columns specified for the table.
(See position 179:-1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of cells
in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)
[fop]  at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler
(Fop.java:657)
[fop]  at net.sf.saxon.event.ContentHandlerProxy.startContent
(ContentHandlerProxy.java:375)
.............
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf
```

Solution: Table Contains More Cells Than Defined in Colspec

To resolve this issue, correct the `colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Editor plugin, and look in it at the line specified in the error message (`See position 179:-1`).
3. Look around that line in the XSL-FO file to find relevant text content that you can use (for example, with the **Find/Replace in Files** action in the **DITA Maps Manager** view) to find the original DITA topic for which the table was generated.

Problem: Broken Link

There is a broken link in the generated XSL-FO file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

Solution: Broken Link

To resolve this issue:

1. Use the **Validate and Check for Completeness** action available in the **DITA Maps Manager** view to find such problems.
2. If you publish to PDF using a *DITAVAL* filter, select the same DITAVAL file in the **DITA Map Completeness Check** dialog box.
3. If the **Validate and Check for Completeness** action does not discover any issues, edit the transformation scenario and set the `clean.temp` parameter to `no`.
4. Run the transformation, open the `topic.fo` file in Oxygen XML Editor plugin, and search for the *unresolved ID references* (for example: `unique_4_Connect_42_wrongID`).
5. Look in the XSL-FO file to find relevant text content that you can use (for example, with the **Find/Replace in Files** action in the **DITA Maps Manager** view) to find the original DITA topic for which the table was generated.

How to Enable Debugging for FO Processor Transformations on page 1127

DITA to CHM Transformation Fails - Cannot Open File

Problem

The DITA to CHM transformation fails with the following error: `[exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.`

Cause

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

Solution

To solve this issue, close the CHM help file and run the transformation scenario again.

Tip: It is a good practice to validate the *DITA map* before executing the transformation scenario. To do so, run the **Validate and Check for Completeness** action. Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the *DITA map*), broken links, and missing external resources.

Related Information:
DITA Map to CHM (Compiled HTML Help) Transformation on page 935

DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: `[exec] HHC5003: Error: Compilation failed while compiling fileName`.

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

Tip: It is a good practice to validate the *DITA map* before executing the transformation scenario. To do so, run the **Validate and Check for Completeness** action. Depending on the selected options, this action reports errors, such as topics referenced in other topics (but not in the *DITA map*), broken links, and missing external resources.

Related Information:
DITA Map to CHM (Compiled HTML Help) Transformation on page 935

Error After Switching Oxygen Products in Eclipse

Problem

On an Eclipse deployment, after installing and using the **Editor** product, I later decided to uninstall it and use **Author** or **Developer** instead. After installing the new product, I received an error that looked like this:

```
java.lang.Exception
      at org.eclipse.ui.internal.ViewReference.createErrorPart(ViewReference.java:112)
      at org.eclipse.ui.internal.ViewReference.createPart(ViewReference.java:98)
      at org.eclipse.ui.internal.e4.compatibility.CompatibilityPart.createPart
                                                  (CompatibilityPart.java:279)
      at org.eclipse.ui.internal.e4.compatibility.CompatibilityPart.create
                                                  (CompatibilityPart.java:317)
      at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method)
      at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:62)
      at sun.reflect.DelegatingMethodAccessorImpl.invoke
                                          (DelegatingMethodAccessorImpl.java:43)
      at java.lang.reflect.Method.invoke(Method.java:498)
...
```

Solution

You need to manually delete the perspective for the product you uninstalled by following this procedure:

1. Go to **Window** > **Preferences** > **General** > **Perspectives**.

2. Select the perspective for the product you uninstalled (for example, **<oXygen/> XML**) and click **Delete**.
3. Restart Eclipse.
4. Go to **Window** > **Open Perspective** and select the perspective for the new product (for example, **<oXygen/> XML Author**).

Images Appear Stretched Out in the PDF Output

Problem

When publishing XML content (DITA, DocBook, etc.), images are sometimes scaled up in the PDF outputs but are displayed perfectly in the HTML (or WebHelp) output.

Solution

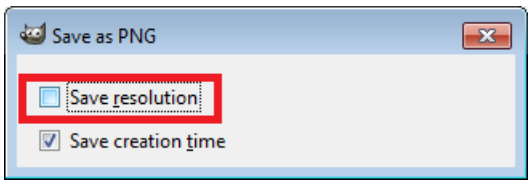
PDF output from XML content is obtained by first obtaining a intermediary XML format called XSL-FO and then applying an XSL-FO processor to it to obtain the PDF. This stretching problem is caused by the fact that all XSL-FO processors take into account the DPI (dots-per-inch) resolution when computing the size of the rendered image.

The PDF processor that comes out of the box with the application is the open-source Apache FOP processor. Here is what Apache FOP does when deciding the image size:

1. If the XSL-FO output contains width, height or a scale specified for the image `external-graphic` tag, then these dimensions are used. This means that if in the XML (DITA, DocBook, etc.) you set explicit dimensions to the image they will be used as such in the PDF output.
2. If there are no sizes (width, height or scale) specified on the image XML element, the processor looks at the image resolution information available in the image content. If the image has such a resolution saved in it, the resolution will be used and combined with the image width and height to obtain the rendered image dimensions.
3. If the image does not contain resolution information inside, Apache FOP will look at the FOP configuration file for a default resolution. The FOP configuration file for XSLT transformations that output PDF is located in the *[OXYGEN_INSTALL_DIR]*`/lib/fop.xconf`. DITA publishing uses the DITA Open Toolkit that has the Apache FOP configuration file located in [*DITA-OT-DIR*`/plugins/org.dita.pdf2/fop/conf/fop.xconf`. The configuration file contains two XML elements called `source-resolution` and `target-resolution`. The values set to those elements can be increased (usually a DPI value of 110 or 120 should render the image in PDF the same as in the HTML output).

The commercial **RenderX XEP** XSL-FO processor behaves similarly but as a fallback it uses 120 as the DPI value instead of using a configuration file.

Tip: It is best to save your images without any DPI resolution information. For example, when saving a PNG image in the open-source GIMP image editor, you do not want to save the resolution.



This allows you to control the image resolution from the configuration file for all referenced images.

Increasing the Memory for the Ant Process

Problem

The Ant build process runs out of memory.

Solution

For details about setting custom JVM arguments to the Ant build process, see JVM Arguments.

JPEG CMYK Color Space Issues

Problem

JPEG images with the CMYK color profile and have the color profiles embedded in the image aren't rendered in the **Author** mode.

Solution

If the color profile information is missing from the JPEG image but you have the ICC file available, you can copy the `profileFileName.icc` to the *`[OXYGEN_INSTALL_DIR]`*`\lib` directory.

If the color space profile is missing, JPEG images that have the CMYK color space are rendered without taking the color profile into account. The **Unsupported Image Type** message is displayed above the image.

Machine Signature Mismatch Error

Problem

During the floating license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called *Machine Signature*) is sent to the Oxygen XML Editor plugin servers, which in turn will sign the license key. The *Machine Signature* is computed from the list of network interfaces of the machine where you deployed the floating license.

Causes

When starting the license server, if you receive an error stating that your server's Machine Signature does not match the one found in your license key, there are several possible causes:

1. You have moved your floating license key to a new machine that hosts your license server.
2. You have changed, added, or activated a new network interface in the machine that hosts your license server.

   Note: A specific example of when this could happen, is if you activate/deactivate the Bluetooth module or the WiFi module.

Solutions

- Revert back to your previous configuration.
- If this is not possible, contact our support team.

MSXML 4.0 Transformation Issues

Problem

When running a transformation scenario that uses the MSXML 4.0 transformer, I receive an error that looks like this:

```
Could not create the 'MSXML2.DOMDocument.4.0' object.
Make sure that MSXML version 4.0 is correctly installed on the machine.
```

Cause

It is likely that the latest MSXML 4.0 service pack is not installed on your computer.

Solution

To fix this issue, go to the Microsoft website and get the latest MSXML 4.0 service pack.

Navigation to a Web Page is Canceled when Viewing CHM on a Network Drive

Problem

When viewing a CHM on a network drive, I only see the TOC and an empty page that displays the message: **Navigation to the web page was canceled**.

Cause

This is actually normal behavior. The Microsoft viewer for CHM does not display the topics for a CHM opened on a network drive.

Solution

As a workaround, copy the CHM file on your local system and view it there.

Oxygen XML Editor plugin Takes Several Minutes to Start

Problem

Oxygen XML Editor plugin seems to take an abnormally long amount of time to start.

Cause

Some anti-virus software can cause Java applications, such as Oxygen XML Editor plugin, to start very slowly due to scanning compressed archives (such as the *JAR* libraries that all Java applications use).

Solution

A possible solution is to add the Oxygen XML Editor plugin folder to the list of exceptions in the anti-virus software settings.

High Resolution Scaling Issues

Problem

I encounter scaling detection issues in a high resolution display. For example, some GUI components are too small.

Cause

This sometimes happens when using multiple displays with different resolutions because the application cannot detect the correct scaling setting.

Solution

You can use the *com.oxygenxml.hidpi.scaling* custom system property to force a specific scaling setting. For example: `-Dcom.oxygenxml.hidpi.scaling=1.5` for 150% scaling.

Signature Verification Failed Error on a Resource from Documentum

Problem

When I try to open or edit a resource from Documentum, I receive the following error:

```
signature verification failed: certificate for All-MB.jar.checksum not signed by a certification authority.
```

Cause

The problem is that the certificates from the Java Runtime Environment 1.6.0_22 or later no longer validate the signatures of the UCF *JARS*.

Solution

Edit the `eclipse.ini` file from the Eclipse directory and add the following parameter to the -vmargs: `-Drequire.signed.ucf.jars=false`. For example:

```
-vmargs
-Xms40m
-Xmx256m
-Drequire.signed.ucf.jars=false
```

Syntax Highlights Not Available in Eclipse Plugin

Problem

I associated the `.ext` extension with Oxygen XML Editor plugin in Eclipse but an `.ext` file opened with the Oxygen XML Editor plugin plugin does not have syntax highlights.

Solution

Associate an extension with Oxygen XML Editor plugin in Eclipse versions 3.6-3.8, 4.2-4.7 by following these steps:

1. Associate the `.ext` extension with the Oxygen XML Editor plugin plugin:
   a. Open the **Preferences** dialog box and go to **General** > **Editors** > **File Associations**.
   b. Add `*.ext` to the list of file types.
   c. Select `*.ext` in the list by clicking it.
   d. Add Oxygen XML Editor plugin to the list of **Associated editors** and make it the default editor.
2. Associate the `.ext` extension with the **Oxygen XML** content type:
   a. Open the **Preferences** dialog box and go to **General** > **Content Types**.
   b. Add `*.ext` to the **File associations** list for the **Text** > **XML** > **Oxygen XML Editor plugin** content type.
3. Press the **OK** button in the Eclipse preferences dialog box.

Result: Now when an `*.ext` file is opened, the icon and the syntax highlights should be the same as for XML files opened with the Oxygen XML Editor plugin plugin.

TocJS Transformation Does not Generate All Files for a Tree-Like TOC

Problem

The *TocJS* transformation of a *DITA map* does not generate all the files needed to display the tree-like table of contents.

Solution

To get a complete set of output files, follow these steps:

1. Run the *XHTML* transformation on the same *DITA map*. Make sure the output gets generated in the same output folder as for the *TocJS* transformation.
2. Copy the content of the *DITA-OT-DIR*`/plugins/com.sophos.tocjs/basefiles` folder to the transformation output folder.
3. Copy the *DITA-OT-DIR*`/plugins/com.sophos.tocjs/sample/basefiles/frameset.html` file to the transformation output folder.
4. Edit `frameset.html` file.
5. Locate element `<frame name="contentwin" src="concepts/about.html">`.
6. Replace `"concepts/about.html"` with `"index.html"`.

References Outside the Main DITA Map Folder

Problem

A reference to a DITA topic, *map*, or binary resource (for example, an image) that is located outside of the folder where the main *DITA map* is located leads to problems when publishing the content using the DITA Open Toolkit.

Cause

DITA-OT often has trouble resolving references that are outside the directory where the published *DITA map* is found. By default, it does not even copy the referenced topics to the output directory.

Solution

To solve this, try one of the following solutions:

- Create another *DITA map* that is located in a folder path above all referenced folders and reference the original *DITA map* from this new map. Then transform this *DITA map* instead.
- Edit the transformation scenario and in the **Parameters** tab, change the value of the **fix.external.refs.com.oxygenxml** parameter to `true`. This parameter is used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content.

  Important: The **fix.external.refs.com.oxygenxml** parameter is only supported when the DITA OT transformation process is started from Oxygen XML Editor plugin.
- For PDF output, you can edit the transformation scenario and in the **Parameters** tab set the value of the **generate.copy.outer** parameter to 3. This parameter specifies whether to generate output files for content that is not located in or beneath the directory containing the DITA map file. By setting the value of this parameter to 3, the transformation scenario shifts the output directory so that it contains all output for the publication.

  Important: This method is recommended for transformation scenarios that use an external DITA-OT.

Windows Service Reports Incorrect Function Error When Starting (TCP Server)

Problem

My TCP floating license server reports an "Incorrect Function" error message when starting the Windows service.

Cause

This usually appears because the Windows service launcher cannot locate a Java virtual machine on your system.

Solution

Make sure that you have installed a 32-bit Java SE from Oracle (or Sun) on the system: http://www.oracle.com/technetwork/java/javase/downloads/index.html.

Windows Service Reports Process Terminated Unexpectedly Error (TCP Server)

Problem

My TCP floating license server reports a "Process Terminated Unexpectedly" error message for the Windows service.

Cause

This error message appears if the Windows service launcher quits immediately after being started. This problem usually happens because the license key has not been correctly deployed (`license.txt` file in the license folder).

Solution

Re-deploy your license key. For more information, see the Setting up a Floating License Server section.

XSLT Debugger Is Very Slow

Problem

When I run a transformation in the **XSLT Debugger** *perspective*, it is very slow.

Solution

If the transformation produces HTML or XHTML output, you can disable rendering of output in the XHTML output view during the transformation process. To view the XHTML output result do one of the following:

- Run the transformation in the **Editor** *perspective* and make sure the **Open in Browser/System Application** option is selected.
- Run the transformation in the **XSLT Debugger** *perspective*, save the text output area to a file, and use a browser application for viewing it (for example, Firefox or Internet Explorer).

DITA Authoring

- Migrating MS Office Documents to DITA
- DITA 1.3 Support

DITA is an XML standard, an architectural approach, and a writing methodology, developed by technical communicators for technical communicators. It provides a standardised architectural *framework* for a common structure for content that promotes the consistent creation, sharing, and re-use of content.

Some of the benefits of using DITA include the following:

- **Flexibility** - DITA is a topic-based architecture and it offers flexibility in content organization.
- **Modularity** - DITA allows for content reuse that saves time and reduces the number of modifications.
- **Structured Authoring** - DITA offers a standardized, methodological approach that helps to reduce authoring time and improve consistency.
- **Single-Source Publishing** - DITA provides the ability to change content in one place and have the change propagate everywhere.
- **Multiple Output Formats** - DITA supports multiple types of output.
- **Inheritance** - The DITA inheritance model makes it easy to specialize topics or elements within topics and you only have to define how the element is different from its immediate ancestor.
- **Process Automation** - DITA offers various ways to automate processes, such as with index or glossary production, output delivery, validation, and more.
- **Specialization** - DITA allows you to define your own information types and semantic elements/attributes to suit the needs of your particular content model.
- **Multi-Lingual** - DITA is a translation-friendly structure that supports numerous languages and text encodings.
- **Conditional Profiling** - DITA supports conditional text processing and profiling to filter content in the publishing stage.

This chapter is designed to be a guide to help content authors who use DITA. It also presents the Oxygen XML Editor plugin features that are specific to working with DITA documents and concepts.

DITA Resources

For more general information and technical details about working with DITA, refer to the following resources:

- The DITA Specifications.

- The DITA Style Guide Best Practices for Authors.
- Various sample DITA topics and maps can be found in the *[OXYGEN_INSTALL_DIR]*/samples/dita folder.

Related Information:

DITA Topics Document Type (Framework) on page 848
DITA Map Document Type (Framework) on page 858

Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Editor plugin. Oxygen XML Editor plugin makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Editor plugin and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Editor plugin works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Editor plugin helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Editor plugin, along with the features of DITA, in a variety of ways.

Creating a DITA Topic in Oxygen XML Editor plugin

To create a DITA topic:

1. Select **File** > **New** > **Other** > **Oxygen XML Editor plugin**, or click the **New** button on the toolbar, and select **New from Templates**.

   Step Result: The **New from Templates Wizard** is displayed:

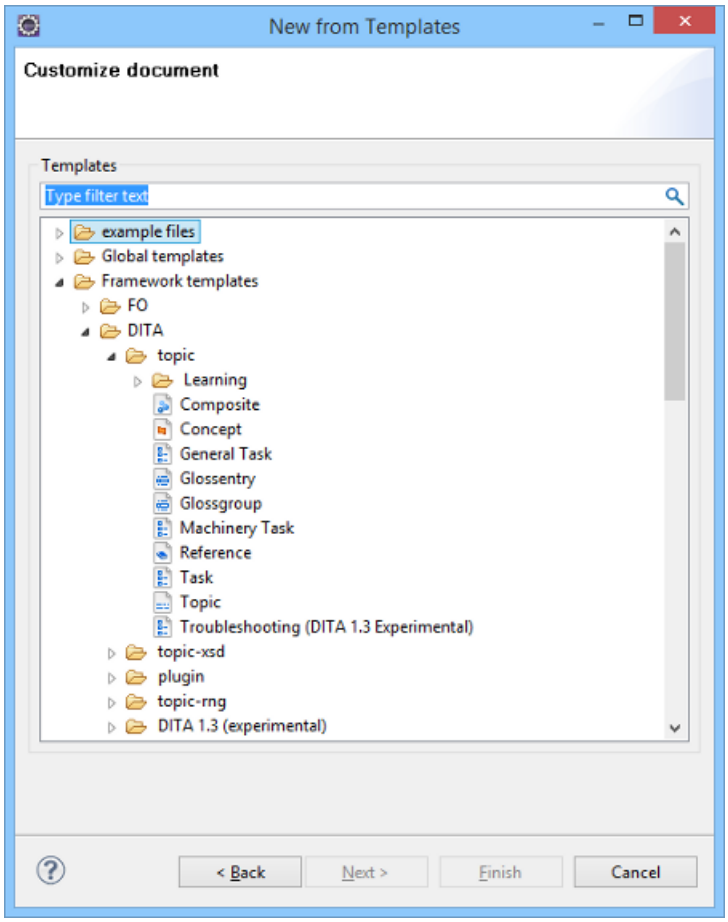

Figure 700: New DITA Document from Templates Wizard

2. Go to **Framework templates** > **DITA** > **topic** and select the type of topic that you want to create, then click **Next**.

   Note: If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.
3. Select a file path where it will be saved.
4. Click **Finish**.

   Result: Your document is opened in the editor. Eventually you will need to add a reference to it in your DITA map.

Your DITA topic is an XML document, thus all the editing features that Oxygen XML Editor plugin provides for editing XML documents also apply to DITA topics. Oxygen XML Editor plugin also provides additional specific DITA-related support for working with DITA topics, their associated *DITA maps*, and for creating DITA output.

Role of Maps

The basic method that DITA uses to express the relationship between topics is through a *DITA map*. Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

Creating a Map in Oxygen XML Editor plugin

To create a map:

1. Select **File** > **New** > **Other** > **Oxygen XML Editor plugin**, or click the **New** button on the toolbar, and select **New from Templates**.
2. Go to **Framework templates** > **DITA Map** > **map** and select the type of map you want to create.
3. Choose whether you want to open the map in the **Editor** or in the **DITA Maps Manager**. Usually, opening it in the **DITA Maps Manager** is the best choice. The **DITA Maps Manager** presents a view of the *DITA map* that is similar to a table of contents.

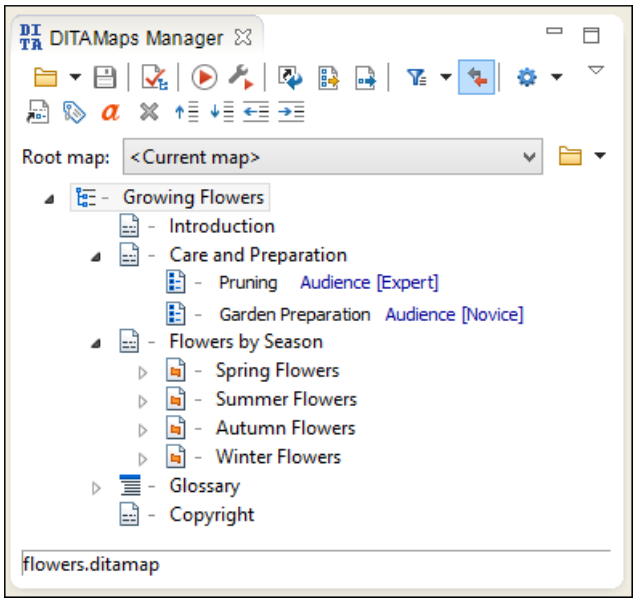

Figure 701: DITA Maps Manager View

Adding Existing Topics to a Map in Oxygen XML Editor plugin

There are several ways to add a topic reference to a map. Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.
2. Right-click the *DITA map* in the **DITA Maps Manager** view and choose **Reference to the currently edited file** from the **Append Child**, **Insert Before**, or **Insert After** submenu.

   Step Result: This opens the **Insert Reference** dialog box with all of the required fields already filled in for you.

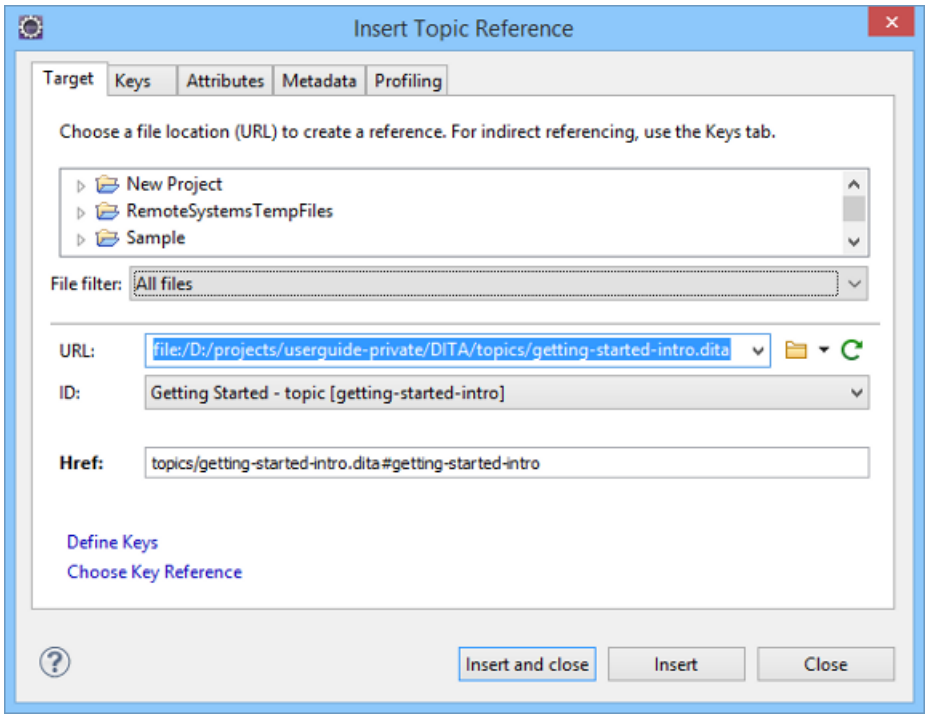

Figure 702: Insert Reference Dialog Box

3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
4. Select **Insert and close** to add a reference to your topic in the map.
5. Save the *DITA map*.

Adding New Topics to a Map in Oxygen XML Editor plugin

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To add a new topic to a map, follow these steps:

1. In the **DITA Maps Manager**, right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - **Append Child** > **New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New** file dialog box that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert Before** > **New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New** file dialog box that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert After** > **New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New** file dialog box that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

   Step Result: The new topic is now referenced (as a `topicref`) in the *DITA map* at the location where you inserted it and the new topic is opened in the editor.
3. Save the *DITA map*.

You can also change the order and nesting of topics in the **DITA Maps Manager** view by doing either of the following:

- Select the topic to move while holding down the **Alt** key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

Adding Submaps in Oxygen XML Editor plugin

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can break up the content into smaller submaps. A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To add a child map to the current map:

1. Right-click the parent *DITA map* in the **DITA Maps Manager** view and choose **Append child** > **Map reference**.

   Step Result: This opens the **Insert Reference** dialog box with all of the required fields already filled in for you.
2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
3. Select **Insert and close** to add a reference to your submap in the main map.
4. Save the main *DITA map*.

Validating a Map in Oxygen XML Editor plugin

Just as it is with your individual topics, it is important to validate your maps. Oxygen XML Editor plugin provides a validation function for *DITA maps* that does more than simply validating that the XML is well formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the **Validate and Check for Completeness** button in the **DITA Maps Manager** view.

   Step Result: This opens the **DITA Map Completeness Check** dialog box.
2. Select any of the various options you want to check.
3. Click **Check** to run the validation process.

Publishing Your Topics in Oxygen XML Editor plugin

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you create published output by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default, Oxygen XML Editor plugin uses the transformations provided by the **DITA Open Toolkit** for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in **DITA Open Toolkit** transformations. In either case, Oxygen XML Editor plugin manages them by using transformation scenarios.

To publish output for a map:

1. Click the **Configure Transformation Scenario(s)** button in the **DITA Maps Manager** view.

   Step Result: This opens the **Configure Transformation Scenario(s)** dialog box.

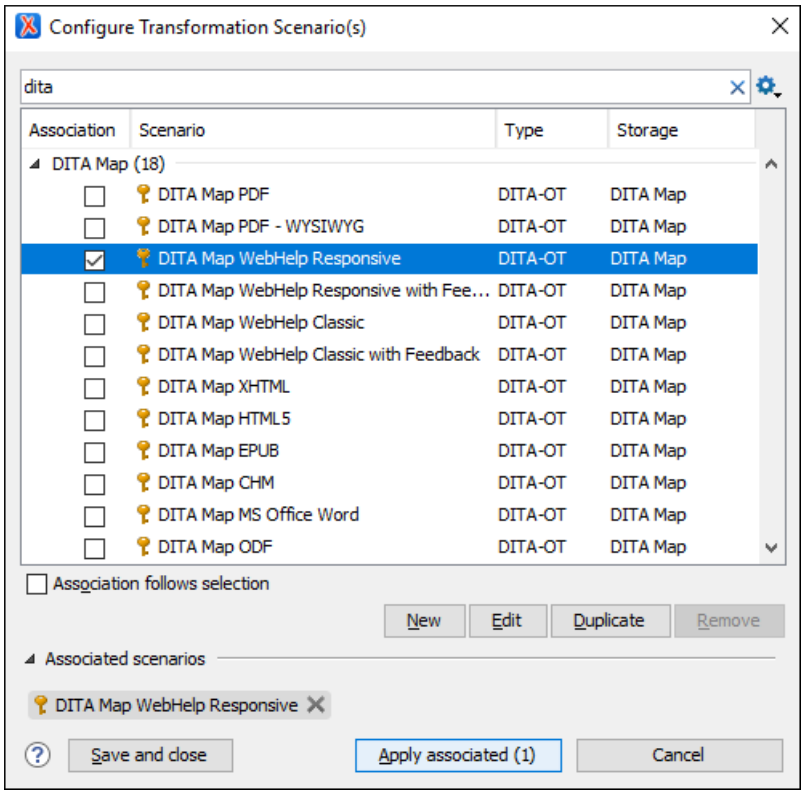

Figure 703: Configure Transformation Scenarios Dialog Box

2. Select the appropriate transformation depending on the type of output you desire.
3. To change or view the configuration or storage options for a transformation scenario, select the transformation and click **Edit**.
4. Click **Apply associated**.

   Result: Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application.

Editing XML Documents in Author Mode on page 441

Working with DITA Maps

In the DITA standard architecture you create documents by collecting topics into maps.

DITA Maps

A *DITA map* organizes a set of topics into a hierarchy. In most output formats, the structure of the map becomes the structure of the table of contents. Oxygen XML Editor plugin provides support for creating and managing *DITA maps* through the **DITA Maps Manager**. There are also specialized types of *DITA maps*, such as a *bookmap*, which is intended for creating the structure of a book.

Submaps

You do not have to create an entire publication using a single map. It is generally good practice to break up a large publication into several smaller submaps that are easier to manage. You can reuse submaps in multiple publications by including them in each of the main maps. The **DITA Maps Manager** provides support for easily creating and managing submaps.

Opening a DITA Map

There are several ways to open a *DITA map* and you can choose to open it in the **DITA Maps Manager** or in the XML Editor. Use any of the following methods to open a map:

- To open a submap in its own tab in the **DITA Maps Manager**, simply double-click it (or right-click it and select **Open**).
- To open a map in the XML editor from the **DITA Maps Manager**, right-click it and select **Open Map in Editor**.
- Drag a *DITA map* file from your system browser and drop it in the XML editor. This will open the map in the editor.
- To open a map in the **DITA Maps Manager**, you can right-click a map file in the **Navigator** view and select **Open in DITA Maps Manager**.

Chunking DITA Maps

By default, many output types place a single topic on each output page. In some cases you may want to output multiple topics as a single output page (also known as chunking). To support this, Oxygen XML Editor plugin provides an **Edit Properties** dialog box that allows you to easily configure the attributes of a topic to control how your table of contents and topics are rendered in the output.

Validating a Map

You should validate your maps to make sure that the individual topics are valid and that the relationships between them are working. Oxygen XML Editor plugin provides a validation function for *DITA maps* that performs a comprehensive validation of a map and its topics.

For more information about DITA editing, watch our video demonstration:

https://www.youtube.com/embed/t2cG3Xe1TXY

Related Information:

DITA Map Document Type (Framework) on page 858
DITA Map Author Mode Actions on page 859

DITA Maps Manager

Oxygen XML Editor plugin provides a view for managing and editing *DITA maps*. The **DITA Maps Manager** view presents a *DITA map* as a Table of Contents. It allows you to navigate the topics and maps, make changes, and apply transformation scenarios to obtain various output formats. By default, it is located to the left of the main editor. If the view is not displayed, it can be opened by selecting it from the **Window** > **Show View** menu.

The **DITA Maps Manager** includes a variety of useful actions to help you edit and organize the structure of your *DITA maps* and topics. The actions that are available and their functions depend on the type of nodes that are selected in the **DITA Maps Manager**. If you select multiple sibling nodes, the result of the actions will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the actions will be applied to the parent node and the child nodes will inherit certain attributes from the parent node.

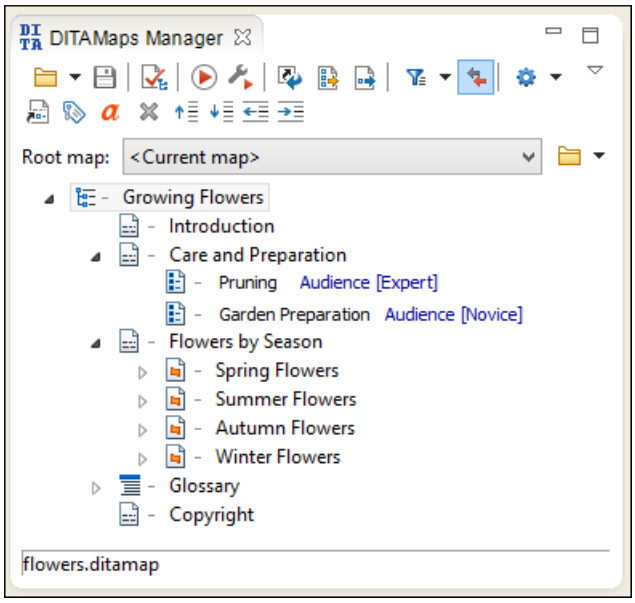

Figure 704: DITA Maps Manager View

Opening Maps in the DITA Maps Manager

The **DITA Maps Manager** view supports multiple open maps at the same time, with each one presented in its own tab. To open a *DITA map* in the **DITA Maps Manager**, use any of the following methods:

- To open a submap in its own tab, simply double-click it (or right-click it and select **Open**).
- Right-click a map file in the **Navigator** view and select **Open in DITA Maps Manager**.

If your map references other *DITA maps*, they will be shown, expanded, in the **DITA Maps Manager** view and you will be able to navigate their content. To edit the submaps and their content, you need to open each referenced map separately.

Drag and Drop in the DITA Maps Manager

You can move topics or nodes within the same map, or other maps, by dragging and dropping them into the desired position. You can arrange the nodes by dragging and dropping one or more nodes at a time. You can arrange multiple topics by dragging them while pressing the **Ctrl** or **Shift** key. Drop operations can be performed before, after, or as child of the targeted node.

Drag and drop operations include:

Copy

Select the nodes you want to copy and start dragging them. Before dropping them in the appropriate place, press and hold the **Ctrl** key. The mouse pointer changes to a ⊞ symbol to indicate that a copy operation is being performed.

Move

Select the nodes you want to move and drag and drop them in the appropriate place.

Promote (Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X))/Demote (Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X))

You can move nodes between child and parent nodes by using the **Promote** (**Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X)**) and **Demote** (**Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X)**) operations.

DITA Maps Manager Toolbar

The toolbar includes the following actions (also available in the**DITA Maps** menu) and their availability depend on the nodes that are selected:

Note: If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

Open Drop-down Menu

You can use this drop-down menu to open new *DITA maps* or to reopen recently viewed maps. The drop-down menu contains the following:

- List of recently viewed *DITA maps* that can be selected to reopen them.
- **Clear history** - Clears the history list of the recently viewed *DITA maps*.
- **Open** - Allows you to open the map in the **DITA Maps Manager** view. You can also open a map by dragging it from the file system explorer and dropping it into the **DITA Maps Manager** view.
- **Browse workspace** - Opens a file browser dialog box allowing you to select a file from the local workspace.
- **Open URL** - Displays the **Choose DITA Map** dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing tools in the **Browse for remote file** drop-down menu.

Save (Ctrl (Meta on Mac OS)+S)

Saves the current *DITA map*.

Validate and Check for Completeness

Checks the validity and integrity of the map.

Apply Transformation Scenario(s)

Applies the DITA Map transformation scenario that is associated with the current map.

Configure Transformation Scenario(s)

Opens the **Configure Transformation Scenarios(s)** dialog box where you can edit or create transformation scenarios or associate a DITA Map transformation scenario with the current map.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced documents. This action is useful when the referenced documents are modified externally. When they are modified and saved from Oxygen XML Editor plugin, the *DITA map* is updated automatically.

Open Map in Editor with Resolved Topics

Opens the *DITA map* in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action **Edit Reference** to open the topic for editing.

Tip: If you want to print the expanded content, you should consider changing the **Styles** drop-down to **+ Print ready**.

Open Map in Editor

For complex operations that cannot be performed in the simplified **DITA Maps Manager** view (for instance, editing a relationship table) you can open the map in the main editing area.

Note: You can also use this action to open referenced *DITA maps* in the **Editor**.

Profiling/Conditional Text Drop-down Menu

This drop-down menu contains the following actions:

- **Show Profiling Colors and Styles** - Select this option to turn on conditional styling. To configure the colors and styles open the **Preferences** dialog box and go to **Editor** > **Edit modes** > **Author** > **Profiling/Conditional Text** > **Colors and Styles**.
- **Show Profiling Attributes** - Select this option to display the values of the profiling attributes at the end of the titles of topic references. When selected, the values of the profiling attributes are displayed in both the **DITA Maps Manager** view and in the **Author** view.
- **Show Excluded Content** - Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the **Outline** and **DITA Maps Manager** views. When this option is

selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

- **Profiling Settings** - Opens the preferences page for adding and editing the profiling conditions that you can apply in the **DITA Maps Manager** view and the **Author** mode editing pane. When a profiling condition set is applied, the keys that are defined in the *DITA map* are gathered by filtering out the excluded content.

Link with Editor

Toggles the synchronization between the file path of the current editor and the selected topic reference in the **DITA Maps Manager** view. If enabled, it results in the following types of synchronizations:

- If you select a topic tab in the main editing area and it is referenced in the map currently opened in the **DITA Maps Manager**, the reference to that topic is selected in the **DITA Maps Manager**.
- If you have a map opened in both the **DITA Maps Manager** and the main editor, selecting the map tab in the main editing area opens that map in the **DITA Maps Manager**.
- If you have a map opened in both the **DITA Maps Manager** and the main editor (**Author** mode) and , selecting one or more *topicrefs* in the **DITA Maps Manager** will also select the same *topicrefs* in the main editor.
- If you have a map opened in both the **DITA Maps Manager** and the main editor (**Author** mode) and , selecting one or more *topicrefs* in the main editor will also select the same *topicrefs* in the **DITA Maps Manager**.

Settings

Show extended toolbar

Toggles whether or not the extended toolbar will be displayed in the **DITA Maps Manager** toolbar.

Show root map toolbar

Toggles whether or not the **Root map** option will be displayed in the **DITA Maps Manager** toolbar.

Show topic titles

Toggles how topics are presented in the **DITA Maps Manager**. If selected, the title of each topic is shown. Otherwise, the file path (value of the `href` attribute) for each topic is shown.

Root map

Specifies a master *DITA map* (*root map*) that Oxygen XML Editor plugin uses to define a hierarchical structures of submaps and to establish a *key space* that defines the keys that are propagated throughout the entire map structure. For more information, see Selecting a Root Map on page 1474.

Browse Drop-down menu

You can use this drop-down menu to browse for *root maps* with the following choices:

- **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local *root map*.
- **Browse workspace** - Allows you to select a *root map* from the local workspace.
- **Browse for remote file** - Displays the **Open using FTP/SFTP** dialog box that allows you to select a remotely stored *root map*.
- **Browse for archived file** - Displays the **Archive Browser** that allows you to browse the content of an archive and choose a *root map*.
- **Browse Data Source Explorer** - Opens the **Data Source Explorer** that allows you to browse the data sources defined in the Data Sources preferences page.

  Tip: You can open the **Data Sources** preferences page by using the **Configure Database Sources** shortcut from the **Open URL** dialog box.
- **Search for file** - Displays the **Find Resource** dialog box to search for a *root map*.

Insert Topic Reference

Opens the **Insert Reference** dialog box that allows you to insert references to targets such as topics, maps, topic sets, or key definitions.

Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box on page 1487.

Edit Attributes

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the Attributes View in Author Mode on page 202 topic.

Delete

Deletes the selected node.

Move Up

Moves the selected node up within the *DITA map* tree.

Move Down

Moves the selected node down within the *DITA map* tree.

Promote

Moves the selected node up one level to the level of its parent node.

Demote

Moves the selected node down one level to the level of its child nodes.

Contextual Menu of the DITA Maps Manager

Root Map

The following actions can be invoked from the contextual menu on the *root map* of an opened *DITA map* (many of them are also available in the**DITA Maps** menu):

Open Map in Editor

For complex operations that cannot be performed in the simplified **DITA Maps Manager** view (for instance, editing a relationship table) you can open the map in the main editing area.

Open Map in Editor with Resolved Topics

Opens the *DITA map* in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action **Edit Reference** to open the topic for editing.

Export DITA Map

Opens a dialog box that allows you to choose a destination for exporting the *DITA map*. It also includes a **Export as Zip archive** option that allows you to package the *DITA map* as a zip archive.

Find Unreferenced Resources

Allows you to search for orphaned resources that are not referenced in the *DITA maps*.

Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box on page 1487.

Fast Create Topics

Opens the **Fast Create Topics** dialog box that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the *DITA map*.

Append Child submenu

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic.
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References topic.

- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References topic.
- **Key Reference** - Opens an **Insert Key Definition** dialog box that allows you to insert a key reference.
- **Key Reference with Keyword** - Opens a simplified **Insert Key Definition** dialog box that allows you to define a key and a value inside a *keyword*.
- A set of actions that open the **Insert Reference** dialog box that allow you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

Search References

Searches all references to the current topic in the entire *DITA map*.

Refactoring submenu

The following actions are available from this submenu when invokes from a root map:

Rename resource

Allows you to change the name of a resource linked in the edited *DITA map*.

Move resource

Allows you to change the location on disk of a resource linked in the edited *DITA map*.

Rename Key

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations that were finished or previewed will also appear in this submenu.

XML Refactoring

Opens the XML Refactoring tool wizard that presents refactoring operations to assist you with managing the structure of your XML documents.

Check Spelling in Files

Allows you to spell check multiple files.

Paste

Allows you to paste content from the clipboard into the *DITA map*.

Paste Before

Pastes the content of the clipboard (only if it is a part of the *DITA map*) before the currently selected *DITA map* node.

Paste After

Pastes the content of the clipboard (only if it is a part of the *DITA map*) after the currently selected *DITA map* node.

Expand All

Allows you to expand the entire *DITA map* structure.

Collapse All

Allows you to collapse the entire *DITA map* structure.

Editable Child Nodes

The following actions are available when the contextual menu is invoked on an editable child node of a *DITA map* (submaps need to be opened in the **DITA Maps Manager** to access these actions since they are in a read-only state in the parent map):

Note: If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

Open

Opens the selected resource in the editor.

Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box on page 1487.

Fast Create Topics

Opens the **Fast Create Topics** dialog box that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the *DITA map*.

Append Child submenu

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic.
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References topic.
- **Key Reference** - Opens an **Insert Key Definition** dialog box that allows you to insert a key reference.
- **Key Reference with Keyword** - Opens a simplified **Insert Key Definition** dialog box that allows you to define a key and a value inside a *keyword*.
- A set of actions that open the **Insert Reference** dialog box that allow you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

Insert Before submenu

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, above the current node in the map:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic.
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References topic.
- **Key Reference** - Opens an **Insert Key Definition** dialog box that allows you to insert a key reference.
- **Key Reference with Keyword** - Opens a simplified **Insert Key Definition** dialog box that allows you to define a key and a value inside a *keyword*.

- A set of actions that open the **Insert Reference** dialog box that allow you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

Insert After submenu

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, below the current node in the map:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic.
- **Reference** - Inserts a reference to a topic file. You can find more details about this action in the Inserting References topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the Inserting References topic.
- **Key Reference** - Opens an **Insert Key Definition** dialog box that allows you to insert a key reference.
- **Key Reference with Keyword** - Opens a simplified **Insert Key Definition** dialog box that allows you to define a key and a value inside a *keyword*.
- A set of actions that open the **Insert Reference** dialog box that allow you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

Search References

Searches all references to the current topic in the entire *DITA map*.

Refactoring submenu

The following actions are available from this submenu:

Convert Markdown to DITA Topic (Available for Markdown documents)

Opens a dialog box that allows you to configure options for converting the Markdown document into a DITA topic.

Rename resource

Allows you to change the name of a resource linked in the edited *DITA map*.

Move resource

Allows you to change the location on disk of a resource linked in the edited *DITA map*.

Rename Key

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Convert Sections to New Topics

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic. This operation is only available for editable maps and nodes.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Other XML Refactoring Actions

For your convenience, the last 5 XML Refactoring tool operations that were finished or previewed will also appear in this submenu.

XML Refactoring

Opens the XML Refactoring tool wizard that presents refactoring operations to assist you with managing the structure of your XML documents.

Check Spelling in Files

Allows you to spell check multiple files.

Cut

Deletes the currently selected node and copies it to the clipboard.

Copy

Copies the currently selected node to the clipboard.

Paste

Allows you to paste content from the clipboard into the *DITA map*.

Paste Before

Pastes the content of the clipboard (only if it is a part of the *DITA map*) before the currently selected *DITA map* node.

Paste After

Pastes the content of the clipboard (only if it is a part of the *DITA map*) after the currently selected *DITA map* node.

Delete

Deletes the currently selected node from the *DITA map*.

Remove from Disk

This action can be used to remove the selected resource(s) from disk. Selecting this action will open a confirmation dialog box where you can also choose to remove the descendants by selecting the **Also remove all descendants** option. If you proceed, a search for references is triggered. If multiple references are detected for any of the selected resources, you will have the option to review them since this would lead to broken links.

Organize

Allows you to organize the *DITA map* with the several submenu actions:

- **Move Up** - Moves the selected node up within the *DITA map* tree.
- **Move Down** - Moves the selected node down within the *DITA map* tree.
- **Promote** - Moves the selected node up one level to the level of its parent node.
- **Demote** - Moves the selected node down one level to the level of its child nodes.

Expand All

Allows you to expand the entire *DITA map* structure.

Collapse All

Allows you to collapse the entire *DITA map* structure.

Other Nodes

The following additional actions are available when the contextual menu is invoked from other nodes, such as a *submap* node or a relationship table:

Open Map in Editor (available when invoking on a submap)

Opens the currently selected *DITA map* in the editor.

Open parent DITA map (available when invoking on a read-only topic reference or a submap reference)

Opens the parent *DITA map* of the currently selected reference in the **DITA Maps Manager**.

Edit Attributes (only available for relationship table nodes)

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the Attributes View in Author Mode on page 202 topic.

Edit Profiling Attributes (only available for relationship table nodes)

Allows you to change the profiling attributes defined on the selected node.

For more information about the **DITA Maps Manager** view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/ozFZz6YZMCY

Related Information:

DITA Map Validation and Completeness Check on page 1493
DITA Map Author Mode Actions on page 859

Creating a Map

To create a *DITA map*, *subject scheme map*, *bookmap*, or other types of *DITA maps*, follow these steps:

1. Use the **New Document** wizard to start creating your map.

   Tip: If you want the *map* to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the **DITA Maps Manager**) and selecting **New** from the **Append Child**, **Insert Before**, or **Insert After** submenu.
2. Select one of the **DITA Map** templates from the **Framework templates** folder.
3. Click the **Next** button.
4. Select a parent folder and the file name and click **Finish**.
5. Save the map after opening it in the **DITA Maps Manager** or the Editor.

Related Information:

Customizing Profiling Values with a Subject Scheme Map on page 1602
Managing DITA Maps on page 1476

Selecting a Root Map

Oxygen XML Editor plugin allows you to select a *root map* (a master *DITA map*) that defines a hierarchical structure of submaps and establishes a *key space* that defines the keys used in all the other *DITA maps* and topics in the project. Specifying the correct *root map* helps to prevent validation problems when you work with `keyrefs` and also acts as the foundation for content completion. All the *keys* that are defined in a *root map* are available in the submaps that are contained within the *root map*.

There are several ways to select or change the *root map*:

- The easiest method is to use the **Root map** drop-down menu in the **DITA Maps Manager** toolbar to select the appropriate *root map*.
- If you insert a *key reference* using the **Cross Reference** action from the **Link** drop-down menu (from the toolbar or **Link** submenu of the contextual menu) and keys are not gathered from the expected *DITA map*, you can change the *root map* by using the **Change Root Map** link in the **Choose Key** dialog box that is opened when you click the **Choose Key Reference** button.
- If you insert a *content key reference* or *key reference* using the **Reuse Content** action (from the toolbar, **DITA** menu, or **Reuse** submenu of the contextual menu) and keys are not gathered from the expected *DITA map*,

you can change the *root map* by using the **Change Root Map** link in the **Choose Key** dialog box that is opened when you click the **Choose Key Reference** button.

For more information about the DITA *root map* support, watch our video demonstration:

https://www.youtube.com/embed/e81r3Y1qjnE

Creating DITA Submaps

You can break up a large *DITA map* into more manageable pieces by creating submaps. A submap is simply a *DITA map* that is included by another *DITA map*. There is no separate markup for a submap.

For example, if you are creating a book, you might use one submap for each chapter of the book. If you are reusing a set of topics in multiple publications, you might collect them into a map and reuse the map as a submap in multiple other maps, rather than referencing the topics individually from the new maps.

You add a submap to a map the same way that you would add a new topic or insert an exiting topic into a map, except you choose a map rather than a topic to create or add. When adding a submap to a map make sure that you use a `mapref` element or a `topicref` element with the `format` attribute set to `ditamap`. In most cases, Oxygen XML Editor plugin takes care of this for you.

Adding a Submap to a Map

To add a submap to a map:

1. Right-click the place in the current map where you want to add the new submap.
2. To insert the submap as a child of the selected node, select **Append Child** > **New**. To insert the submap as a sibling to the current node, select **Insert After** > **New** or **Insert Before** > **New**.

   Step Result: This opens a **New** DITA file dialog box that allows you to select the type of document and assists you with naming it.
3. Select the type of map in one of the folders inside the **DITA Map** folder and give it a name (the file type should be `.ditamap`).
4. Click **Create** to insert the submap.

You can also manage and move submaps the same as you would with topics. For more information, see Managing DITA Maps on page 1476.

Creating a Bookmap in DITA

If you want to create a traditional book in DITA, you can use a *bookmap* to organize your topics into a book. A DITA *bookmap* is a specialized type of map, intended for creating output that is structured like a book. A *bookmap* allows you to add book-specific elements such as `frontmatter`, `part`, `chapter`, `appendix`, and `backmatter` to the map. How these book-specific elements are processed for publication is up to the processing script for each media. See the DITA documentation for details.

You can find additional support for creating books in DITA in the DITA for Publishers plugin, which is included with Oxygen XML Editor plugin.

To create a book in DITA using a *bookmap*, follow these steps:

1. Create a new *bookmap* (**File** > **New** > **Framework templates** > **DITA Map** > **map** > **Bookmap**). If you want the *bookmap* to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the **DITA Maps Manager**) and selecting **New** from the **Append Child**, **Insert Before**, or **Insert After** submenus.
2. Create the structure of your book by adding the appropriate book sections and defining containers for chapters and any appendices. To add sections to a *bookmap*, or children to a section, right-click the *bookmap* or section icon and choose any of the reference actions in the **Append child** menu. The selections offered in the menu will adjust depending on the element they are applied to. Consult the DITA documentation to fully understand the structure of a DITA *bookmap* and where to create each element.
3. Create special elements such as an index and table of contents. The index and table of contents will be generated by the build process, based on the content of the map and the topics it points to.

4. Add topics to your chapters to add content to your book. You may find it easier to manage if you use submaps to create the content of your chapters. This keeps your *bookmap* from becoming long and difficult to manage.

Managing DITA Maps

You may want to manage your *DITA maps* in a variety of ways, including:

- Change the order and nesting of topics in a map.
- Add topics to a map.
- Insert various types of references in a map.
- Find, move, or rename resources in a map.
- Change other properties of the items in a map.
- Use the Edit Properties dialog box to manage attributes, keys, metadata, or add profiling to any section of a map.

This section includes various topics that describe how you can manage *DITA maps* and resources.

For more information about the **DITA Maps Manager** view and many of its features, watch our video demonstration:

https://www.youtube.com/embed/ozFZz6YZMCY

Change the Order of Topics in DITA Maps

You can change the order and nesting of the topics in a map in several ways:

- By dragging and dropping topics within the **DITA Maps Manager**.
- By showing the extended **DITA Maps Manager** toolbar (press the **Settings** icon on the **DITA Maps Manager** toolbar and select the extended toolbar) and then using the node moving buttons ( ) on the toolbar to move topics around in the map.

To understand how to organize topics in a *DITA map* using the **DITA Maps Manager**, you can examine and experiment with the sample map called `flowers.ditamap`, located in the *`[OXYGEN_INSTALL_DIR]`*`/samples/dita` folder.

Adding Topics to a DITA Map

When you are working in DITA, there are several approaches that you can use to create topics and maps. You can start by first creating topics and then assembling your finished topics into one or more documents by creating one or more maps, or you can start by creating a map and then adding new topics to it as you work.

The topics-first approach is generally more appropriate if you intend to do a lot of content reuse, as it encourages you to think of each topic as an independent unit that can be combined with other topics in various ways. The map-first approach will be more familiar to you if you are used to creating books or manuals as a whole. Oxygen XML Editor plugin supports both approaches.

A *DITA map* organizes content hierarchically, so you can add a topic as a child of the map root element or as a child or sibling of any item already in the map. Therefore, the first step to adding a topic to a map is always to choose the place it will be inserted into the map.

Adding Existing Topics to a Map

At the XML-level, a topic is added to a map by adding a reference to the map that points to the topic. There are a variety of reference types that you can use. The default type is the `topicref` element. See the DITA documentation for the full range of reference elements and their uses. Oxygen XML Editor plugin provides several tools for inserting reference elements into a map:

Using the Insert Reference Dialog Box

The **Insert Reference** dialog box allows you to create various reference types and configure the most commonly used attributes. You can open the **Insert Reference** dialog box with any of the following methods:

- Right-click an item in the current map where you want to add the reference, select **Append Child**, **Insert Before**, or **Insert After** and select the type of reference to enter.

- If the topic you want to add is currently open in the editor, you can right-click an item in the current map where you want to add the reference and select **Reference to the currently edited file**.
- Selecting an item in the map and click the **Insert Reference** button from the **DITA Maps Manager** toolbar.
- Select **Insert Reference** from the **DITA Maps** menu.

Dragging and Dropping a File into the DITA Maps Manager

You can add a topic to a *DITA map* by dragging and dropping the file into the **DITA Maps Manager**. You can drag and drop files from any of the following:

- Your OS file system explorer.
- The **Navigator** view.

Adding topics this way will not open the **Insert Reference** dialog box, but you can adjust all the same properties by invoking the contextual menu from the topic and selecting **Edit Properties**.

Adding a New Topic to a Map

To add a new topic to a map, follow these steps:

1. In the **DITA Maps Manager**, right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - **Append Child** > **New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New** file dialog box that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert Before** > **New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New** file dialog box that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert After** > **New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New** file dialog box that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

   Step Result: The new topic is now referenced (as a `topicref`) in the *DITA map* at the location where you inserted it and the new topic is opened in the editor.
3. Save the *DITA map*.

Adding Multiple Skeleton Topics at Once

Oxygen XML Editor plugin includes a feature in the **DITA Maps Manager** that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the *DITA map*.

To access this feature, right-click a node in the **DITA Maps Manager** where you want the new topics to be inserted and select **Fast Create Topics**. This opens the **Fast Create Topics** dialog box where you can configure the structure for the new topics.

For more information, see Fast Create Multiple DITA Topics on page 1504.

Adding Multiple References to the Same Topic in a Map

Oxygen XML Editor plugin allows you to reuse entire topics by adding multiple references to the same topic in a *DITA map*. Whenever multiple references to the same topic are detected in the context of the current map in the **DITA Maps Manager**, an indicator will appear in the top-right corner of the **Author** mode editor that shows the number of times the topic is referenced in the *DITA map*. It also includes navigation arrows that allow you to jump to the next or previous reference.

Remove Topics from a Map

You can remove topics from a map in a number of ways. Some ways to remove a topic from a map include:

- Highlight the topic and press **Delete**.
- Highlight the topic and click the **Delete** button on the **DITA Maps Manager** extended toolbar.

Related Information:
Fast Create Multiple DITA Topics on page 1504

Moving and Renaming Resources

You can move or rename resources on disk directly from Oxygen XML Editor plugin and you have the option of updating all the references to the moved or renamed resources. For DITA resources (such as topics and maps), you can do this from the **DITA Maps Manager** view. For non-DITA resources (such as folders, images, html files, audio, video, text files, Markdown documents), you can do this from the **Navigator** view.

Moving or Renaming DITA Resources (Topics or Maps)

To move or rename normal DITA resources (such as topics or maps), use one of the following actions available in the **Refactoring** submenu of the contextual menu when invoked on the resource in the **DITA Maps Manager** view:

Refactoring > Move resource

This action allows you to change the location of a resource linked in the edited *DITA map*, using the **Move resource** dialog box. This dialog box contains the following options:

- **Destination** - Specifies the target location of the edited resource.
- **File name** - Allows you to change the name of the edited resource.
- **Update references** - Select this checkbox to update all references of the file in the edited *DITA map* and in the files referenced from the *DITA map*, preserving the *completeness* of the *DITA map*.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Editor plugin is about to make.
- **Move** - Moves the edited resource in the target location on disk.
- **Cancel** - Cancels the **Move resource** operation. No changes are applied.

Refactoring > Rename resource

This action allows you to change the name of a resource linked in the edited *DITA map*, using the **Rename resource** dialog box. This dialog box contains the following options:

- **New name** - Presents the current name and allows you to change it.
- **Update references** - Select this checkbox to update all references of the file in the edited *DITA map* and in the files referenced from the *DITA map*, preserving the *completeness* of the *DITA map*.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Editor plugin is about to make.
- **Rename** - Executes the **Rename resource** operation.
- **Cancel** - Cancels the **Rename resource** operation. No changes are applied.

Note: If a *root DITA map* is not defined, the move and rename actions are executed in the context of the current *DITA map*.

Moving or Renaming Non-DITA Resources and Updating the References to Them

To move or rename non-DITA resources (such as folders, images, html files, audio, video, text files, Markdown documents), you can simply follow the procedures described in Moving/Renaming Resources in the Navigator View on page 380. However, this approach will not give you the option to update the references to the moved or renamed resources.

To perform move or rename operation on non-DITA resources while also updating all the references to them, use the following sets of procedures:

1. Enable *Master Files* support and add your *root DITA map* to the *Master Files* folder by following the procedure found here: How to Enable Master Files Support in DITA on page 1614.

2. Move or rename resources and update the references to them by following the procedure found here: Moving or Renaming Non-DITA Resources and Updating the References to Them on page 1615.

Finding Resources Not Referenced in DITA Maps

Over the course of time large projects can accumulate a vast amount of resources from a variety of sources. Especially in organizations with a large number of content authors or complex project structures, organizing the project resources can become a challenge. Over time a variety of actions can cause resources to become orphaned from *DITA maps*. To assist you with organizing project resources, Oxygen XML Editor plugin includes an action, **Find Unreferenced Resources**, that searches for orphaned resources that are not referenced in *DITA maps*.

To perform this search, open the *DITA map* in the **DITA Maps Manager**, invoke the contextual menu on the *DITA map*, and select **Find Unreferenced Resources**. This action opens the **Find Unreferenced Resources** dialog box.

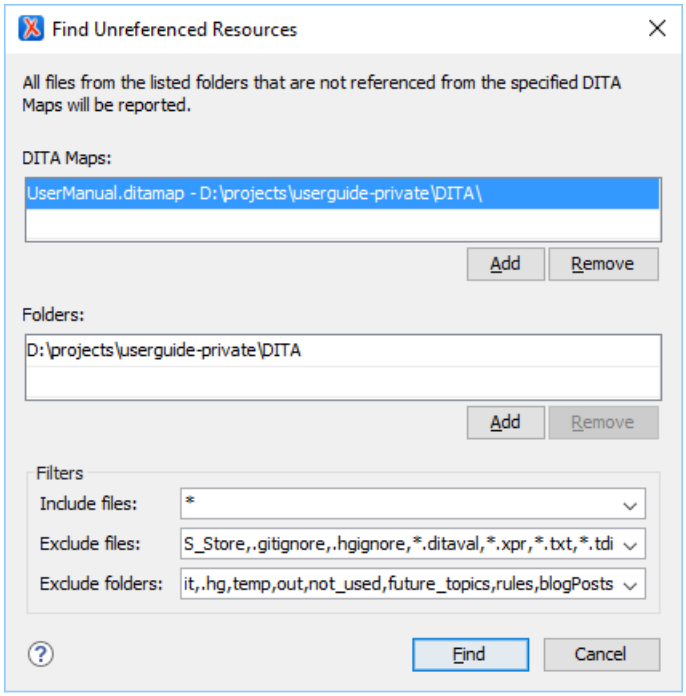

Figure 705: Find Unreferenced Resources Dialog Box

The **Find Unreferenced Resources** dialog box includes the following options:

- **DITA Maps** - Provides a list of *DITA maps* to be included in the search and allows you to **Add** maps to the list or **Remove** them.
- **Folders** - Provides a list of folders to be included in the search and allows you to **Add** or **Remove** specific folders.
- **Filters** - Provides three combo boxes that allow you to filter the search to include or exclude certain files or folders:
  - **Include files** - Allows you to filter specific files to include in the search.
  - **Exclude files** - Allows you to filter specific files to exclude from the search.
  - **Exclude folders** - Allows you filter specific folders to exclude from the search.

    Note: In any of the filter combo boxes you can enter multiple filters by separating them with a comma and you can use the *?* and *** wildcards. Use the drop-down arrow to select a previously used filter pattern.

When you click the **Find** button, if the search operation finds unreferenced resources, they are displayed in the **Results** panel at the bottom of the editor. If you want to delete an unreferenced resource, you can right-click its result and select **Remove from Disk**.

Inserting References in DITA Maps

A *DITA map* may contain various types of references. The targets of the references can be a variety of references, such as chapters, maps, topics, topic sets, or key definitions. You can insert references to such targets with the **Insert Reference** dialog box.

This section explains how to insert and configure references (such as topic references, topic groups, topic headings, and key definitions) in a *DITA map*.

Insert Reference Dialog Box

The **Insert Reference** dialog box allows you to insert and configure references in *DITA maps*. There are numerous types of references that can be inserted into maps. They include references to topics, other maps, glossary terms, and keys. You can also use this dialog box to configure the attributes of a reference, add profiling or metadata, and define keys.

To open the **Insert Reference** dialog box, use one of the following methods:

- Select **Reference**, **Reference to the currently edited file**, or any of the other specific reference actions that are available from the **Append Child**, **Insert Before**, and **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager**.
  - To insert the reference as a child of the current node, select the reference from the **Append Child** submenu.
  - To insert the reference as a sibling of the current node, below the current node in the map, select the reference from the **Insert After** submenu.
  - To insert the reference as a sibling of the current node, above the current node in the map, select the reference from the **Insert Before** submenu.

  Note: The content of these submenus depends on the node that is selected in the *DITA map* tree when the contextual menu is invoked. For example, if the selected node is a topic reference (`topicref`), its possible child nodes include the following elements: `anchorref`, `chapter`, `keydef`, `mapref`, `topicgroup`, `topichead`, `topicref`, `topicset`, and `topicsetref`.
- Click the **Insert Reference** button on the **DITA Maps Manager** extended toolbar. This action will insert the reference as a sibling of the current node (below the current node in the map).
- Select **Insert Reference** from the **DITA Maps** menu. This action will insert the reference as a sibling of the current node (below the current node in the map).

For the **Reference** or **Reference to the currently edited file** actions, a **Reference type** drop-down list is displayed at the top of the **Insert Reference** dialog box and you can select the type of reference you want to insert. Depending on the place where the reference will be inserted, Oxygen XML Editor plugin will propose only valid reference types . When you change the reference type, the fields in the various tabs of the dialog box are reconfigured depending upon the availability of the associated attributes. For the other reference actions in the **Append Child**, **Insert Before**, and **Insert After** submenus, the reference type is automatically chosen based upon the invoked action and you cannot change it.

The main section of the dialog box includes the following tabs: **Target**, **Keys**, **Attributes**, **Metadata**, and **Profiling**.

Target Tab

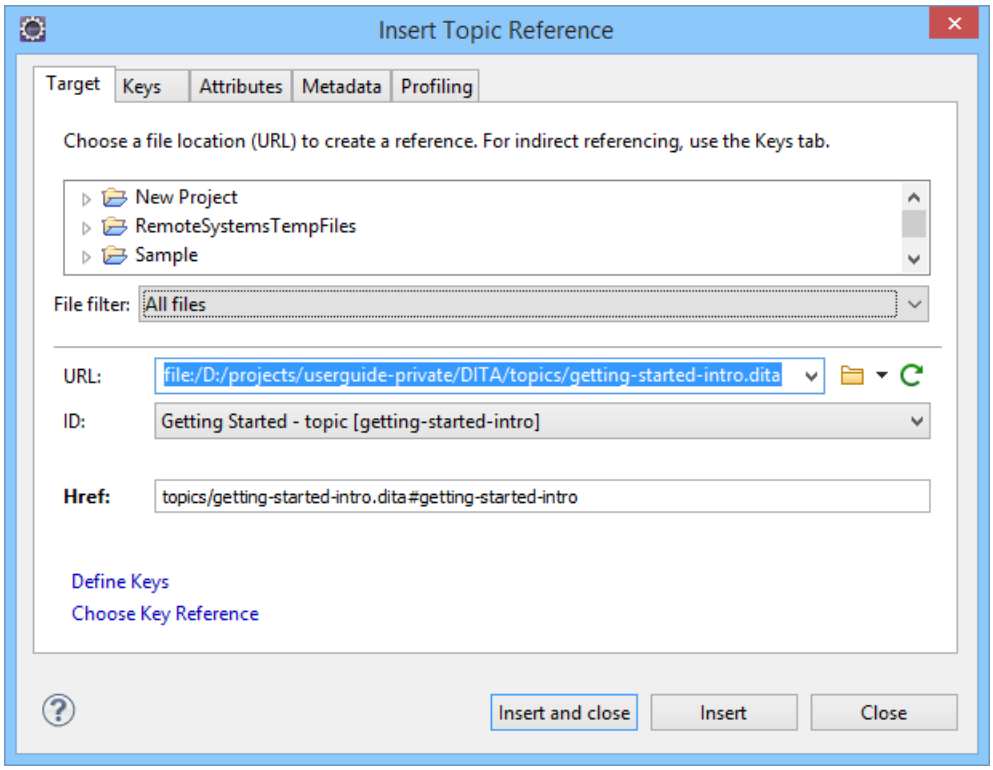

Figure 706: Insert Reference Dialog Box - Target Tab

The **Target** tab of the **Insert Reference** dialog box allows you to specify information about the target reference. It includes the following sections and fields:

Choose a file location section

You can browse for and select the source target file by using the file window in this section. You can use the **File filter** drop-down menu to narrow the list of possible file types that will be displayed.

URL

Displays the path to the target and allows you to select or change it by using the combo box or browsing tools.

ID

The drop-down list displays all of the target elements that are available for the selected target URL.

Href

The selected target automatically modifies this value to point to the corresponding `href` attribute of the target element.

Note: If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a `navref` element requires a `mapref` attribute instead.

Keys Tab

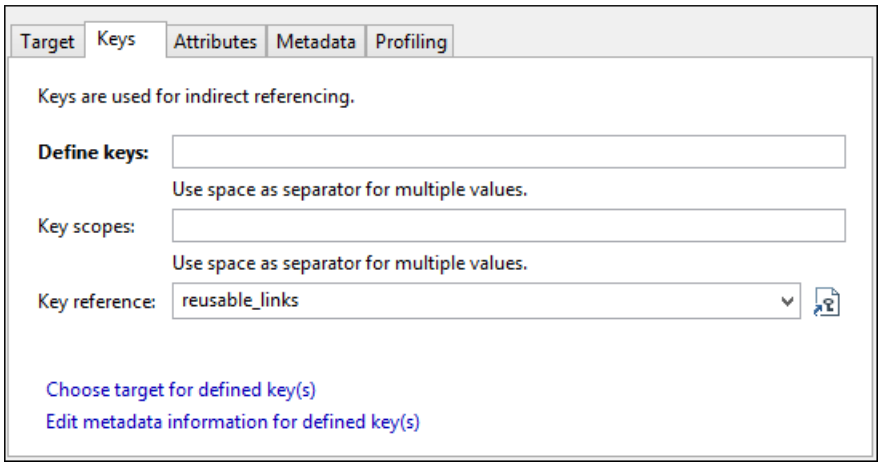

Figure 707: Insert Reference Dialog Box - Keys Tab

The **Keys** tab allows you to use and define keys for indirect referencing. For more information, see Working with Keys on page 1538. This tab includes the following:

Define keys

Use this text field to define the `keys` attribute for the target.

Key scopes [This option is only available if the Built-in DITA-OT 2.x (with DITA 1.3 support) option is selected in the DITA preferences page]

Use this text field to define or edit the value of a *keyscope* attribute. *Key scopes* allow you to specify different sets of key definitions for different map branches.

Key reference

Instead of using the **Target** tab to select a file that contains the target reference, you can reference a key definition by using this text field. Use the **Choose key reference** button to access the list of keys that are already defined in the current *root map*.

Attributes Tab

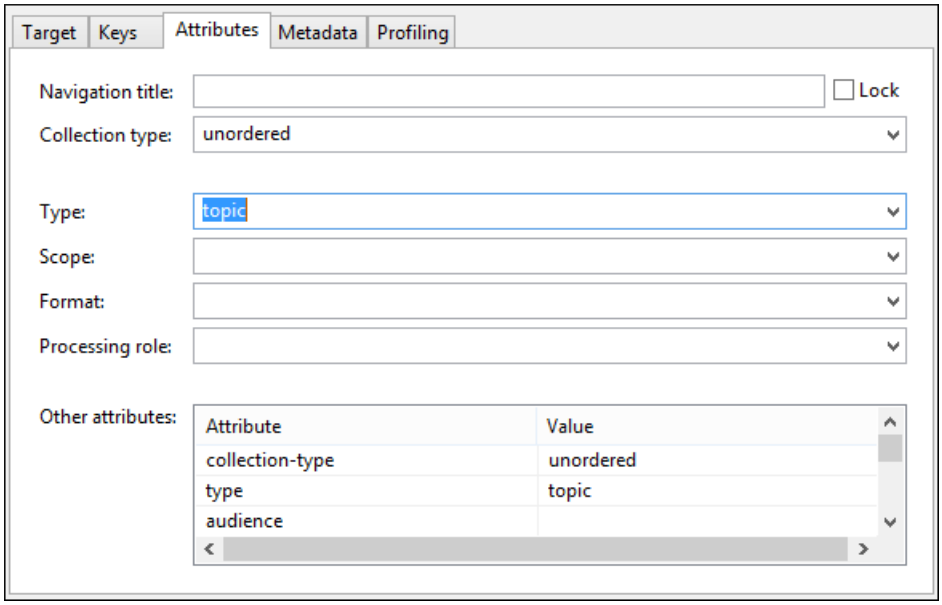

Figure 708: Insert Reference Dialog Box - Attributes Tab

The **Attributes** tab of the **Insert Reference** dialog box allows you to insert and edit attribute values for the target reference. This tab includes the following sections and actions:

Navigation title

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Navigation title** checkbox for the **Always fill values for attributes** option in the **DITA** preferences page. You can enforce the use of the specified title by selecting the **Lock** checkbox.

Tip: You can also select the **Prefer navigation title for topicref rendering** option in the **DITA** preferences page to always enforce the use of the `navtitle` value rather than selecting this **Lock** option on individual topics.

Collection type

This drop-down list allows you to select the `collection-type` attribute to create hierarchical linking between topics in a *DITA map* (for example, `unordered`, `sequence`, `choice`, `family`, `-dita-use-conref-target`).

Type

Allows you to select a `type` attribute (such as `topic`, `task`, `concept`, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Type** checkbox for the **Always fill values for attributes** option in the **DITA** preferences page.

Scope

This property corresponds to the `scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Scope** checkbox for the **Always fill values for attributes** option in the **DITA** preferences page.

Format

This property corresponds to the `format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the **DITA** preferences page.

Processing Role

This drop-down list allows you to set the `processing-role` attribute to one of the allowed values for DITA reference elements (for example, `resource-only`, `normal`, `-dita-use-conref-target`).

Other attributes table

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

Metadata Tab

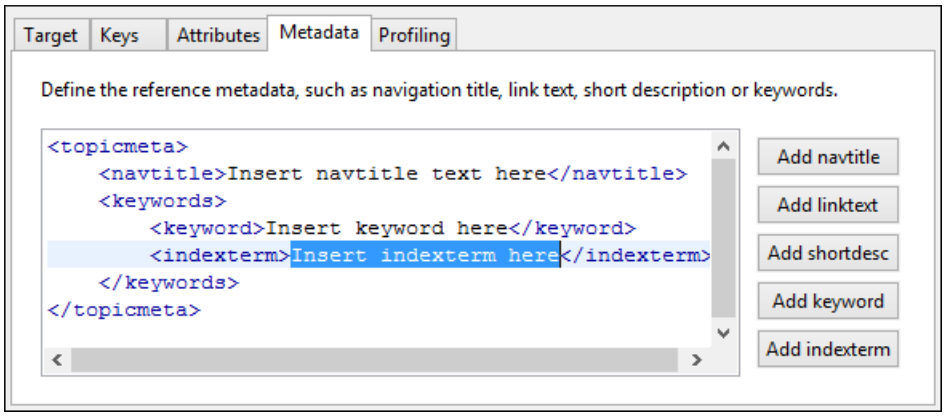

Figure 709: Insert Reference Dialog Box - Metadata Tab

The **Metadata** tab allows you to add metadata elements to the target reference. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `navtitle`, `linktext`, `shortdesc`, `keyword`, `indexterm`). The metadata elements are inserted inside a `topicmeta` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

Profiling Tab

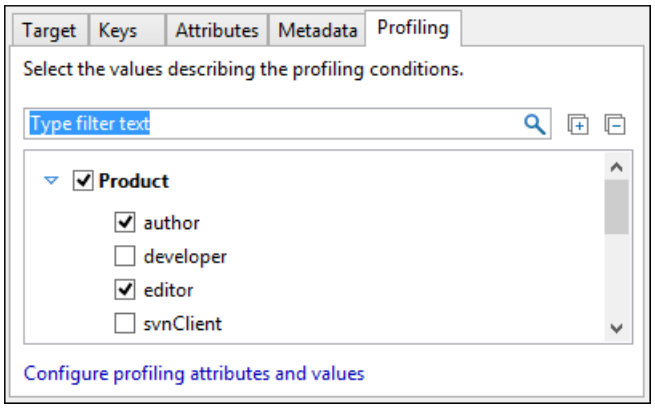

Figure 710: Insert Reference Dialog Box - Profiling Tab

The **Profiling** tab allows you to select or change profiling attributes for the selected reference. This tab displays profiling attributes and their values as determined by the following:

- If your *root map* references a DITA *subject scheme map* that defines values for the profiling attributes, those values are used.
- Otherwise, a basic default set of profiling attributes and values are used.

When you modify a selection of values in this tab, the change will also automatically be reflected in the **Attributes** tab. For more information, see DITA Profiling / Conditional Text on page 1591.

Finalizing Your Insert Reference Configuration

Once you click **Insert** or **Insert and close**, the configured reference is added in the map.

Tip: You can easily insert multiple references by keeping the **Insert Reference** dialog box opened, using the **Insert** button.

Related Information:

DITA Profiling / Conditional Text on page 1591
Working with Keys on page 1538

Inserting Topic Headings

The `topichead` element provides a title-only entry in a navigation map, as an alternative to the fully-linked title provided by the `topicref` element.

You can insert a topic heading by doing the following:

- Select **Topic Head** from the **Append Child**, **Insert Before**, or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** view.
- Open the *DITA map* in the XML editor and select the **Insert Topic Heading** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Head** dialog box that allows you to easily insert a `topichead` element. A **Navigation title** (`navtitle` attribute) is required but other attributes can also be specified from this dialog box (such as **Type**, **Scope**, **Format**, etc.)

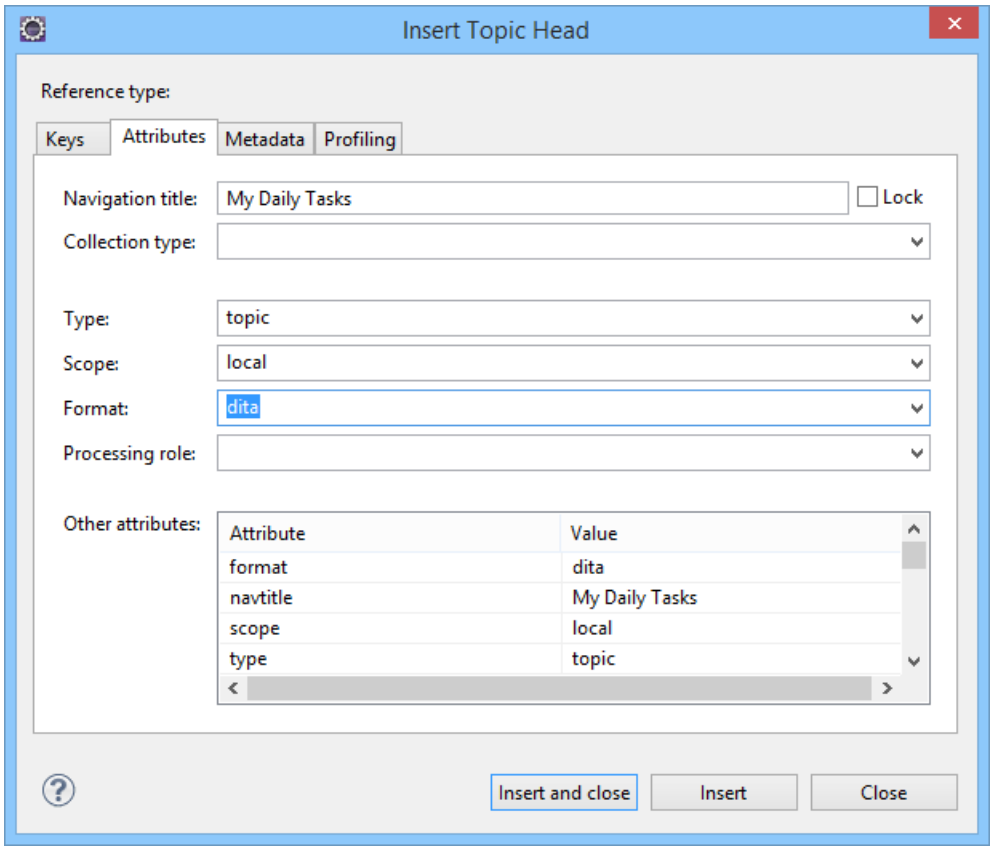

Figure 711: Insert Topic Heading Using the Insert Reference Dialog Box

Related Information:

Insert Reference Dialog Box on page 1480

Inserting Topic Groups

The `topicgroup` element identifies a group of topics (such as a concepts, tasks, or references) or other resources. A `topicgroup` can contain other `topicgroup` elements, allowing you to express navigation or table-of-contents hierarchies, as well as implying relationships between the containing `topicgroup` and its children. You can set the collection-type of a container `topicgroup` to determine how its children are related to each other. Relationships end up expressed as links in the output (with each participant in a relationship having links to the other participants by default).

You can insert a topic group by doing the following:

- Select **Topic Group** from the **Append Child**, **Insert Before**, or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** view.
- Open the *DITA map* in the XML editor and select the **Insert Topic Group** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Group** dialog box that allows you to easily insert a `topicgroup` element and various attributes can be specified (such as **Collection type**, **Type**, **Scope**, **Format**, etc.)

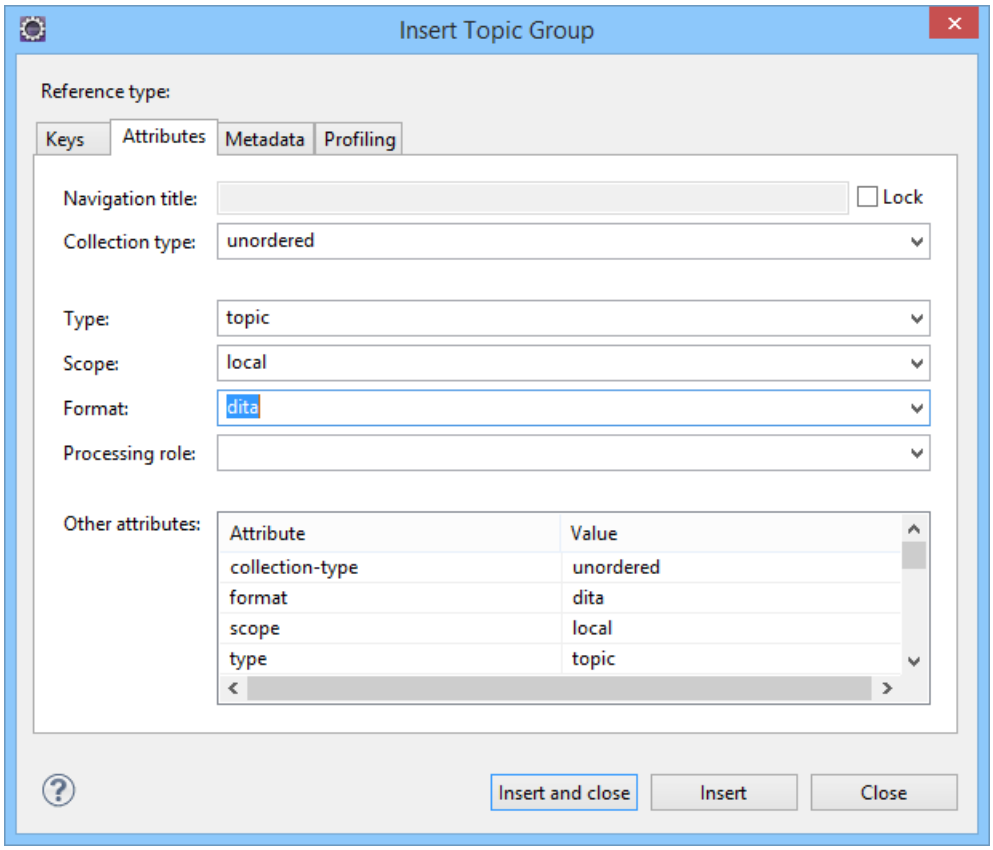

Figure 712: Insert Topic Group Using the Insert Reference Dialog Box

Insert Reference Dialog Box on page 1480

Defining Keys in DITA Maps

DITA uses keys to insert content that may have different values in various circumstances. Keys provide the means for indirect referencing in DITA. This can make it easier to manage and to reuse content. In DITA, keys are defined in maps and can then be reused and referenced throughout the whole structure of the map.

The following example is a *DITA map* that defines various values for the `product` key:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE map PUBLIC "-//OASIS//DTD DITA Map//EN" "map.dtd">
<map>
  <!-- product name -->
  <keydef keys="product" product="basic">
    <topicmeta>
      <keywords>
        <keyword>Basic Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="product" product="pro">
    <topicmeta>
      <keywords>
        <keyword>Professional Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="product" product="enterprise">
    <topicmeta>
      <keywords>
        <keyword>Enterprise Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
</map>
```

Note: The profiling of the names is now contained in the map, where it only has to occur once to reuse throughout the whole map structure.

Key Definition with a Keyword

To insert a *key definition with a keyword* in a *DITA map*, follow these steps:

1. Open the *DITA map* in the **DITA Maps Manager**.
2. Invoke the contextual menu and select **Key Definition** from the **Append Child**, **Insert Before**, or **Insert After** submenu (depending on where you want to insert the *key definition* in the *DITA map*). This opens an **Insert Key Definition** dialog box.
3. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.
4. Go to the **Metadata** tab and click **Add keyword**. In the editing window enter the key value inside the `keyword` element.

   Note: You can profile the key by using the **Profiling** tab and other attributes can also be defined in the **Attributes** tab.
5. Once you are done configuring the *key definition*, click **Insert and close**.

Alternatively, there is a simplified method that can be used if you simply want to define a key with a value inside a *keyword*, without configuring any profiling or other attributes. To use the simplified method, follow these steps:

1. Open the *DITA map* in the **DITA Maps Manager**.
2. Invoke the contextual menu and select **Key Definition with Keyword** from the **Append Child**, **Insert Before**, or **Insert After** submenu (depending on where you want to insert the *key definition* in the *DITA map*). This opens a simplified **Insert Key Definition** dialog box.
3. Enter the name of the key in the **Key** field and its value in the **Keyword** field.
4. Click **Insert and close** to finalize the operation.

Key Definition with a Target

To insert a *targeted key definition* (for example, to target a resource such as an image or topic) in a *DITA map*, follow these steps:

1. Open the *DITA map* in the **DITA Maps Manager**.
2. Invoke the contextual menu and select **Key Definition** from the **Append Child**, **Insert Before**, or **Insert After** submenu (depending on where you want to insert the *key definition* in the *DITA map*). This opens an **Insert Key Definition** dialog box.
3. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.
4. Go to the **Target** tab and select a target resource (such as an image or topic).

   Note: You can profile the key by using the **Profiling** tab and other attributes can also be defined in the **Attributes** tab.
5. Once you are done configuring the *targeted key definition*, click **Insert and close**.

Related Information:

Working with Variable Text in DITA on page 1555
Working with Keys on page 1538

Edit Properties Dialog Box

The **DITA Maps Manager** view includes a feature that allows you to view and edit the properties of a selected node. The **Edit properties** action is available on both the **DITA Maps Manager** toolbar and in the contextual menu. This action is also available in the contextual menu when you edit a *DITA map* document in **Author** mode. The action opens the **Edit Properties** dialog box and it includes several tabs with various functions and fields that are initialized with values based upon the node for which the action was invoked.

Note: If you select multiple sibling nodes and invoke the **Edit properties** action, only the **Profiling** tab will be available and your modifications in that tab will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the other tabs will also be available and your modifications will be applied to the parent node (the child nodes will inherit the attributes of the parent node).

You can use the **Edit Properties** dialog box to modify or define attributes, metadata, profiling, or keys in *DITA maps* or topics. You can also use it to modify the title of *root maps*.

At the top of the **Edit Properties** dialog box, the **Reference type** drop-down list displays the type of the selected node and it depends on the node for which the action was invoked.

The main section of the dialog box includes the following tabs: **Target**, **Keys**, **Attributes**, **Metadata**, and **Profiling**. The availability of the tabs and their functions depend on the selected node. For example, if you invoke the action on a *root map*, only the **Attributes**, **Metadata**, and **Profiling** tabs are accessible and the **Title** property can be configured. Also, if you select multiple nodes, only the **Profiling** tab is available.

Target Tab

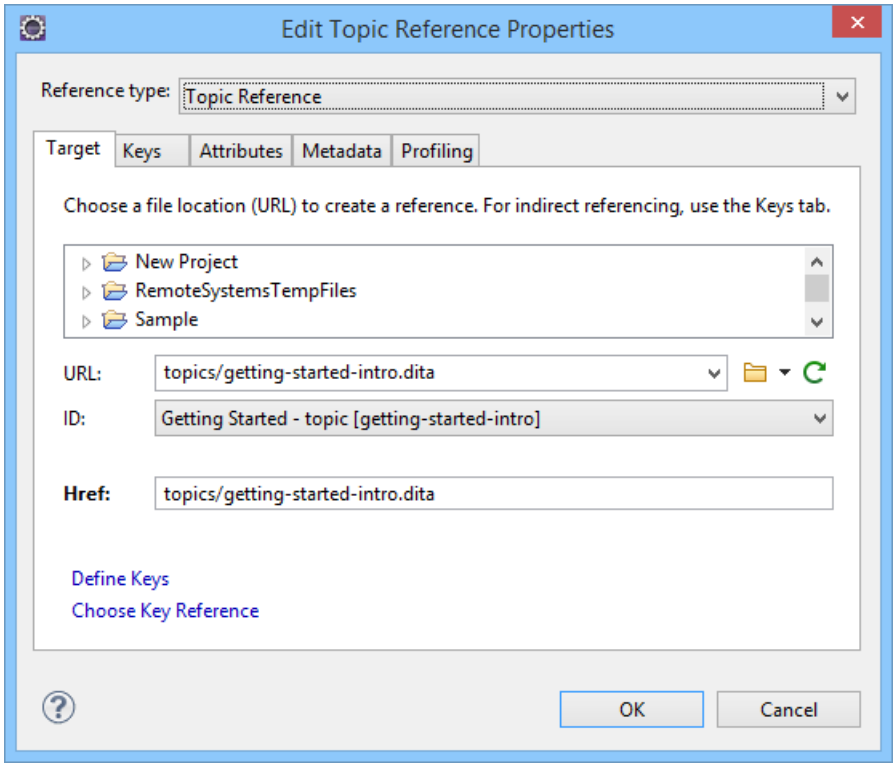

Figure 713: Edit Properties Dialog Box - Target Tab

The **Target** tab of the **Edit Properties** dialog box displays information about the target node on which the action was invoked and allows you to change the target. It includes the following sections and fields:

Choose a file location section

You can browse for and select the source target file by using the file window in this section. You can use the **File filter** drop-down menu to narrow the list of possible file types that will be displayed.

URL

Displays the path to the target and allows you to select or change it by using the combo box or browsing tools.

ID

The drop-down list displays all of the target elements that are available for the selected target URL.

Href

The selected target automatically modifies this value to point to the corresponding `href` attribute of the target element.

Note: If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a `navref` element requires a `mapref` attribute instead.

Keys Tab

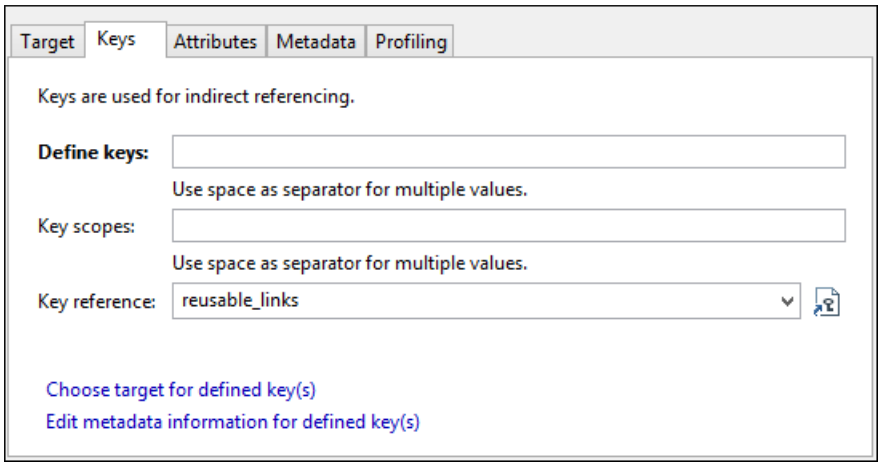

Figure 714: Edit Properties Dialog Box - Keys Tab

The **Keys** tab allows you to use and define keys for indirect referencing. For more information, see Working with Keys on page 1538. This tab includes the following:

Define keys

Use this text field to define the `keys` attribute for the target.

Key scopes [This option is only available if the Built-in DITA-OT 2.x (with DITA 1.3 support) option is selected in the DITA preferences page]

Use this text field to define or edit the value of a *keyscope* attribute. *Key scopes* allow you to specify different sets of key definitions for different map branches.

Key reference

Use this combo box (or the **Choose key reference** button) to select a key that is already defined in the *root map*.

Attributes Tab

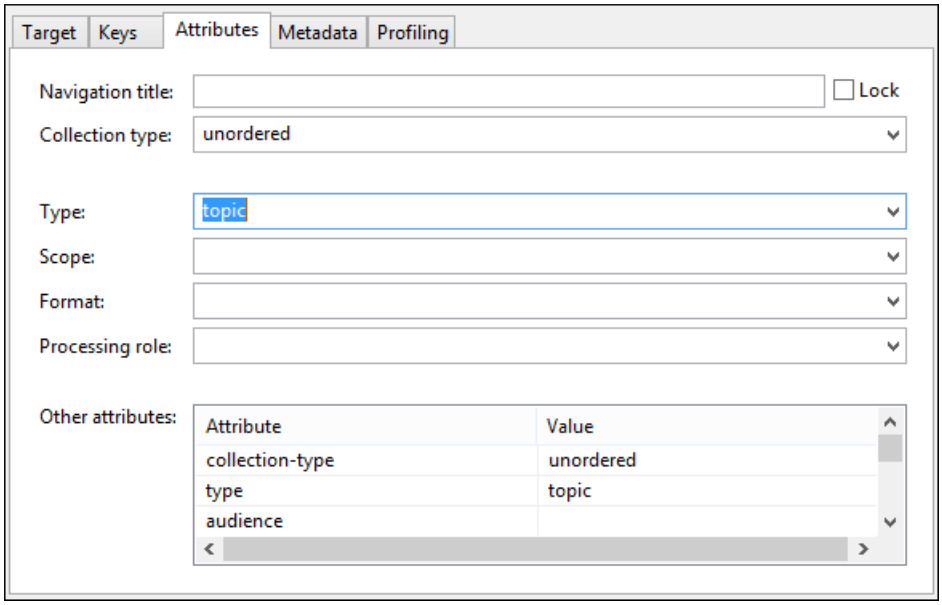

Figure 715: Edit Properties Dialog Box - Attributes Tab

The **Attributes** tab of the **Edit Properties** dialog box allows you to insert and edit attribute values for the target node for which the action was invoked.

If the target is a *root map*, the tab displays the title of the map. You can change it in the **Title** text field and assign it to an **Attribute**, **Element**, or **All**.

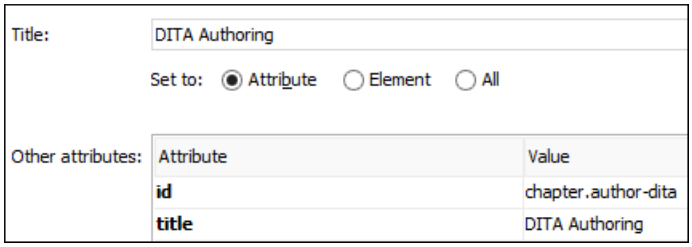

Figure 716: Attributes Tab for a Root Map

For other types of targets, the tab includes the following sections and fields that can be used to edit the attributes of the target:

Navigation title

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Navigation title** checkbox for the **Always fill values for attributes** option in the **DITA** preferences page. You can enforce the use of the specified title by selecting the **Lock** checkbox.

Tip: You can also select the **Prefer navigation title for topicref rendering** option in the **DITA** preferences page to always enforce the use of the `navtitle` value rather than selecting this **Lock** option on individual topics.

Collection type

This drop-down list allows you to select the `collection-type` attribute to create hierarchical linking between topics in a *DITA map* (for example, `unordered`, `sequence`, `choice`, `family`, `-dita-use-conref-target`).

Type

Allows you to select a `type` attribute (such as `topic`, `task`, `concept`, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Type** checkbox for the **Always fill values for attributes** option in the **DITA** preferences page.

Scope

This property corresponds to the `scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Scope** checkbox for the **Always fill values for attributes** option in the **DITA** preferences page.

Format

This property corresponds to the `format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the **DITA** preferences page.

Processing Role

This drop-down list allows you to set the `processing-role` attribute to one of the allowed values for DITA reference elements (for example, `resource-only`, `normal`, `-dita-use-conref-target`).

Other attributes table

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

Metadata Tab

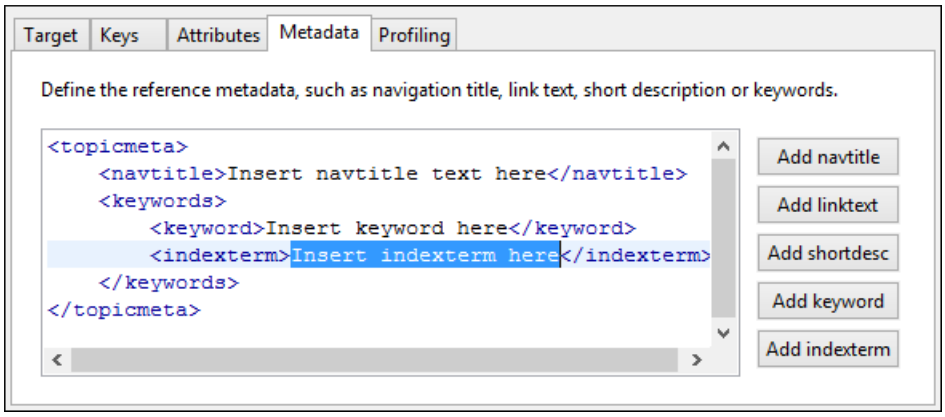

Figure 717: Edit Properties Dialog Box - Metadata Tab

The **Metadata** tab allows you to add metadata elements to the target node. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `navtitle`, `linktext`, `shortdesc`, `keyword`, `indexterm`). The metadata elements are inserted inside a `topicmeta` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

Profiling Tab

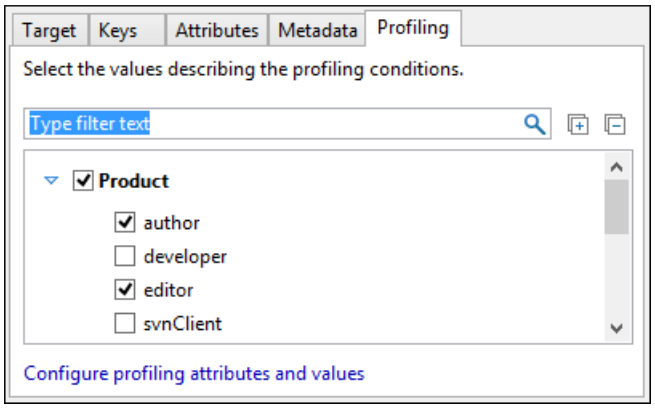

Figure 718: Edit Properties Dialog Box - Profiling Tab

The **Profiling** tab allows you to select or change profiling attributes for the selected target nodes. This tab displays profiling attributes and their values as determined by the following:

- If your *root map* references a DITA *subject scheme map* that defines values for the profiling attributes, those values are used.
- Otherwise, a basic default set of profiling attributes and values are used.

If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **Expand All**/**Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name..

When you modify a selection of values in this tab, the change will also automatically be reflected in the **Attributes** tab. For more information, see DITA Profiling / Conditional Text on page 1591.

Note: If you invoke the **Edit properties** action on a selection of multiple nodes that have different values for the same profiling attribute, a conflict panel will be displayed in the **Profiling** tab and you can choose between the following actions for resolving it:

- **Keep** - Preserves the current attribute values.
- **Change Now** - Allows you to edit the selection of values in this **Profiling** tab and the changes will be applied to all the selected nodes.

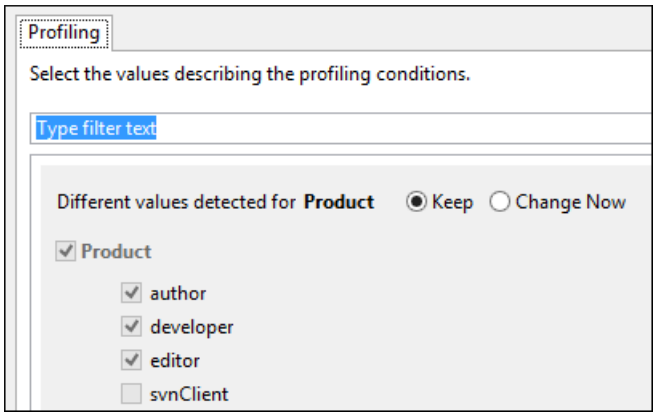

Figure 719: Profiling Conflict Panel

Finalizing Your Modifications

Once you click **OK**, all your changes are applied to the target node.

DITA Profiling / Conditional Text on page 1591
Working with Keys on page 1538

Generating a Table of Contents in DITA

In DITA, the order and hierarchy of the table of contents of a document is based directly on the *DITA map* that defines the document. In most cases, the processor generates a table of contents (TOC) based on the hierarchy of the topics in a DITA map. By default, each `topicref` element in a map represents a node in the TOC.

It is also possible to instruct DITA where the table of contents should occur (or other content lists, such as a list of figures or tables). If you want to instruct the processor to generate a table of contents at a particular location within your DITA map structure, you can use the `toc` element in a *bookmap* (as in the example below). For more information about the `toc` element, see https://docs.oasis-open.org/dita/v1.2/os/spec/langref/toc.html.

Example:

```
<bookmap>
.....
  <frontmatter>
    <booklists>
      <toc href="chapter1.dita"/>
    </booklists>
  </frontmatter>
.....
```

Creating an Index in DITA

In DITA, indexes are created from `indexterm` elements. You can insert index term elements:

- In the header of a topic. In paginated media, such as a printed book or a PDF, this results in an index entry that points to the page in which the topic starts, even if it is not the page in which the indexed term occurs.
- In the `topicref` element in a map that references the topic. This applies those index terms to that topic only when used in that map, allowing you to index topics differently in various publications. In paginated media, index entries point to the page in which the topic starts.
- In the body of a topic. In paginated media, this results in an index entry that points to the page in which the `indexterm` element occurs, even if that is not the page in which the topic starts.

To add index terms to the text of a topic of the topic header, create the elements, as you normally would, in Oxygen XML Editor plugin. To add index terms to a map, open the map in the editor and add the elements, as you normally would, in a topic.

In some media, indexes will be generated automatically when index entries are found in the source. For other media, such as books, you may need to tell DITA where to place the index. For instance, to add an index to a *bookmap*, you need to add an `indexlist` element to the `backmatter` of the book.

1. Open your *bookmap* in the **DITA Maps Manager**.
2. Right-click the *bookmap* and select **Append Child** > **Backmatter**.
   The **Insert Reference** dialog box appears.
3. Click **Insert and Close** to insert the `backmatter` element.
4. Right-click the `backmatter` element and create a `booklists` element using **Append Child** > **Book Lists**.
5. Use the same steps to create an `indexlist` element.

CAUTION: Adding `index` entries and an `indexlist` to your project creates an instruction to the DITA publishing routines to create an index. There is no guarantee that all DITA output types or third-party customizations obey that instruction or create the index the way you want it. Modifying the output may be necessary to get the result you want.

Resolving Topic References Through an XML Catalog

There are situations where you want to resolve URIs with an *XML Catalog*:

- You customized your *DITA map* to reference topics using URIs instead of local paths.
- You have URI content references in your DITA topic files and you want to map them to local files when the map is transformed.

In such situations, you have to add the catalog to Oxygen XML Editor plugin. The **DITA Maps Manager** view will solve the displayed topic refs through the added *XML catalog*, as will as *DITA map* transformations (for PDF output, XHTML output, etc.)

To add an *XML catalog* to the DITA *framework*, follow these steps:

1. Create an *XML catalog* using the guidelines described in Working with XML Catalogs on page 591.
2. Open the **Preferences** dialog box and go to **Document Type Association**.
3. Select the **DITA** document type and use the **Edit**, **Duplicate**, or **Extend** button to open a **Document type configuration** dialog box.
4. Go to the **Catalogs** tab.
5. Click on the **Add** button to open a dialog box that allows you to add your created *XML Catalog* to the list.
6. After adding your catalog, click **OK**. You may need to reopen any currently edited files that use the new catalog or run a manual **Validate** action for the changes to take effect.

   Note: You could also add your created catalog to the list of global catalogs in the **XML Catalog** preferences page.

Chunking DITA Topics

By default, when a *DITA map* is published to an online format, each topic becomes a separate page in the output. In some cases, you may want to combine multiple source topics into one output page. For instance, you may want to combine several types of information into a single page, or you may have chosen to create many small DITA topics for reuse purposes but feel they are too small to be useful to a reader by themselves. This is referred to as *chunking*.

To chunk DITA topics, you set the chunking attribute on the `topicref` that contains the sub-topics in a *DITA map*. There are several values that you can set on the chunking attribute (for example, `by-topic` or `to-content`). See the DITA documentation for full details. To achieve the effects you want in your topics and table of contents, you may also need to set the `toc` and `collection-type` attributes on the sub-topics or container topic to suitable values. See the DITA documentation for details.

You can set the `collection-type` attribute on your topics using the **Edit Properties** action in the **DITA Maps Manager**. To set the `toc` and `chunk` attributes, you must open the map file in the editor and add or edit the attributes directly (double-click the map icon in the **DITA Maps Manager** to open the map in the editor).

DITA Map Validation and Completeness Check

You should validate your *DITA maps* regularly to make sure that your maps and topics are valid, and all of the relationships between them are working. Changing one topic, image, or piece of metadata may create errors in references that rely on them. You may not discover these problems all at once. Validate your map to catch all of

these kinds of problems. The longer you wait between validating your maps, the more difficult it may be to detect and correct any errors you find.

Validating a DITA Map

To validate a DITA, follow these steps:

1. In the **DITA Maps Manager** view, make sure that the tab that holds your *root map* is selected and that the **Root map** selection is set either to the name of your *root map* or to `<current map>`.
2. It is a good practice to refresh your *DITA map* before running the validation process. To do so, select the *DITA map* in the **DITA Maps Manager** view and click **File** > **Refresh (F5)**.
3. Click the **Validate and Check for Completeness** button on the **DITA Maps Manager** toolbar to open the **DITA Map Completeness Check** dialog box.
4. If you are using profiling, check the **Use DITAVAL filters** box and select the appropriate option.
5. Select any other options you want to check.
6. Click **Check** to run the validation process.

Validation Process

The validation process of a *DITA map* includes the following:

- Verifies that the file paths of the topic references are valid. For example, if an `href` attribute points to an invalid file path, it is reported as an error in the message panel at the bottom of the editor.
- Validates each referenced topic and map. Each topic file is opened and validated against the appropriate DITA DTD. If another *DITA map* is referenced in the main one, the referenced *DITA map* is verified recursively, applying the same algorithm as for the main map.
- If errors or warnings are found, they are displayed in a separate message pane at the bottom of the editor and clicking them takes you to the location of the error or warning in the file where it was found.

DITA Map Completeness Check Dialog Box

The **DITA Map Completeness Check** dialog box allows you to configure the *DITA map* validation.

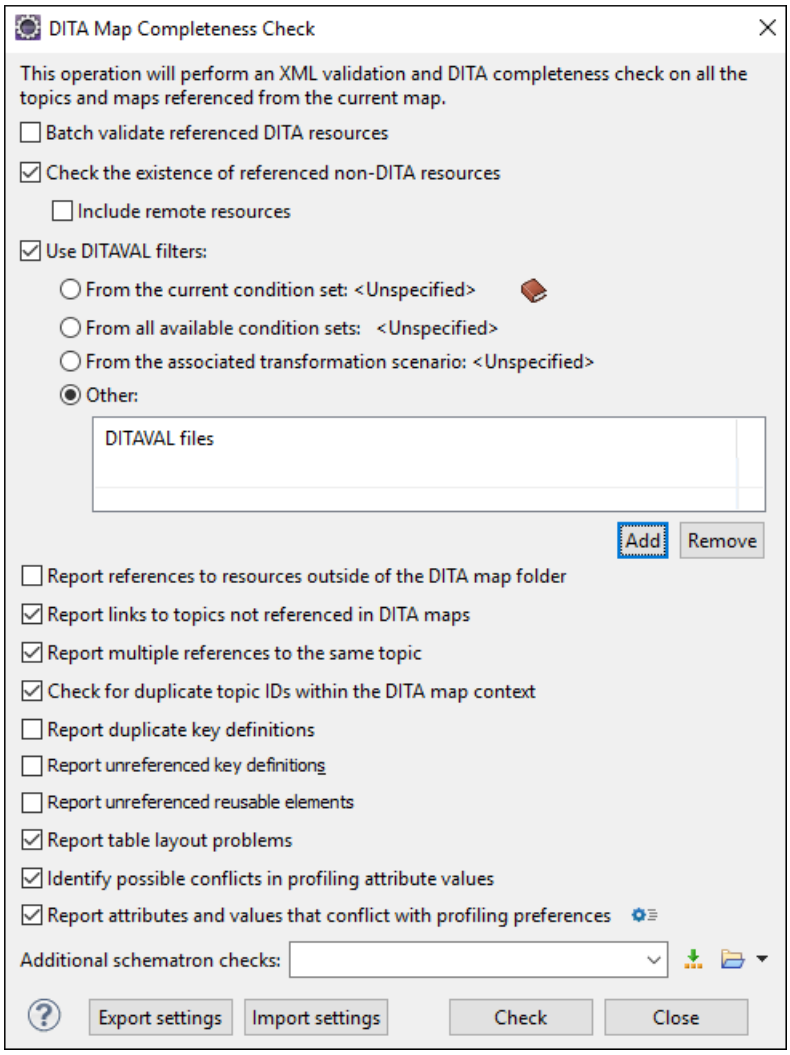

Figure 720: DITA Map Completeness Check Dialog Box

You can configure the validation process with the following options that are available in the **DITA Map Completeness Check** dialog box:

Batch validate referenced DITA resources

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated validation scenario.

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the **DITA Maps Manager** view. Clicking the **Details** icon opens a topic in the Oxygen XML Editor plugin User Guide that explains how to create a profiling condition set.

- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the *DITA map*.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the **Add** or **Remove** buttons to configure the list. The **Add** button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the *main DITA map* folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the *DITA map*.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the *DITA map*, unless a unique `copy-to` attribute is used on the `topicref` element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second `topicref` has a `copy-to` attribute set:

```
<topicref href="topic.dita"/>
.....
 <topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a `copy-to` attribute set or both of them have the `copy-to` attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita"/>
......
 <topicref href="topic.dita" copy-to="topic2.dita"/>
```

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the *DITA map* for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `keys` attribute, all references will point to the first one encountered and the other will be ignored.

Note: This option takes *key scopes* into account. For example, if you have something like this:

```
<topicref href="t2.dita" keys="k2"/>
    <topicgroup keyscope="ks">
        <topicref href="t2.dita" keys="k2"/>
    </topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a *key scope* on the second occurrence.

Report unreferenced key definitions

Checks the entire *DITA map* and reports any key definitions that are not referenced anywhere. Note that if the **Use DITAVAL filters** option is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire *DITA map* and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an *ID* specified in the following types of topic references:

- Any `topicref` that contains a `processing-role` attribute set to **resource-only**.
- Any other referenced topic that contains elements that are reused elsewhere through a `conref` or `conkeyref`.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a *CALS* table, if a cell has a vertical span greater than the available rows count.
- For a *CALS* table, if the number of `colspecs` is different than the number of columns detected from the table `cols` attribute.
- For a *CALS* table, if the number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
- For a *CALS* table, if the value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
- For a *CALS* table, if the `namest`, `nameend`, or `colname` attributes point to an incorrect column name.

Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the **Profiling / Conditional Text** preferences page (you can click the **Profiling Preferences** button to open this preferences page). It also checks if profiling attributes defined as *single-value* have multiple values set in the searched topics.

Additional schematron checks

Allows you to select a Schematron file that Oxygen XML Editor plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.

Export settings

Allows you to export the settings assigned in this dialog box to an XML file that you can share with other users or use on other systems.

Import settings

Allows you to import settings for this dialog box from an XML file that was created by the **Export settings** action.

Check

Use the **Check** button to begin the validation process. The options that you choose in this dialog box are preserved between sessions.

Related Information:

DITA Maps Manager on page 1465

DITA Map Author Mode Actions

A variety of actions are available in the *DITA map framework* that can be added to the **DITA** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant*.

DITA Map Toolbar and Menu Actions

When a *DITA map* is opened in **Author** mode, the following default actions are available on the **DITA Map Author Custom Actions** toolbar (by default, they are also available in the **DITA** menu and in various submenus of the contextual menu):

Insert New Topic

Opens a **New** DITA topic dialog box that allows you to create a new topic and inserts a reference to it at the cursor position.

Insert Topic Reference

Opens the **Insert Reference** dialog box that allows you to insert and configure a reference to a topic at the cursor position.

Reuse Content

Opens the **Reuse Content** dialog box that allows you to insert and configure a content reference (`conref`), or a content key reference (`conkeyref`) at the cursor position.

Insert Topic Heading

Opens the **Insert Reference** dialog box that allows you to insert a topic heading at the cursor position.

Insert Topic Group

Opens the **Insert Reference** dialog box that allows you to insert a topic group at the cursor position.

Insert Relationship Table

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

Relationship Table Properties

Allows you to change the properties of rows in relationship tables.

Insert Relationship Row

Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

Insert Relationship Column

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

Delete Relationship Column

Deletes the table column where the cursor is located.

Delete Relationship Row

Deletes the table row where the cursor is located.

Move Up

Moves the selected node up one position on its same level.

Move Down

Moves the selected node down one position on its same level.

Promote

Moves the selected node up one level to the level of its parent node.

Demote

Moves the selected node down one level to the level of its child nodes.

DITA Menu Actions

The following additional actions can be found in the **DITA** menu when editing a *DITA map* in **Author** mode:

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block* and *inline elements*.

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

Profiling Settings

Opens the profiling options preferences page, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin Editor Variables.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note: This option does not have an effect on content that is *cut* and *pasted*.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

DITA Map Contextual Menu Actions

In addition to many of the **DITA Map** toolbar actions and the *general* **Author** mode contextual menu actions, the following *DITA map framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box on page 1487.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Search References

Finds the references to the `href` or `keys` attribute value of the topic/map reference element at the current cursor position, in all the topics from the current *DITA map* (opened in the **DITA Maps Manager** view). The current topic/map reference element must have an `href` or `keys` attribute defined to complete the search.

Show Key Definition

Available for elements that have a `conkeyref` or `keyref` attribute set (or elements with an ancestor element that has a `conkeyref` or `keyref` attribute). It computes the key name and opens the *DITA map* that contains the definition of the key with the element that defines that key selected.

DITA Map Drag/Drop Actions

Dragging a file from the **Navigator** view or **DITA Maps Manager** view and dropping it into a *DITA map* document that is edited in **Author** mode creates a link to the dragged file (a `topicref` element, `chapter`, `part`, etc.) at the drop location.

Open Topic from DITA Map in Author Mode

When a *DITA map* is opened in **Author** mode, you can click the icon to the left of a topic to open that particular topic in the editor.

Working with DITA Topics

DITA is a structured writing format. Structure can have several meanings, all of which are relevant to DITA. This section includes information about working with DITA topics and the structure.

Information Types

The structure of a piece of content refers to how the words and images are selected and organized to convey information. One approach to structured writing is to divide content into discrete blocks that contain various types of information, and then to combine those blocks to form publications. DITA is based on this approach, and encourages the author to write in discrete blocks called topics. DITA provides three base topic types (concept, task, and reference), a number of extended topic types, and the capability to create new topic types through specialization.

Text Structure

Every piece of text is made up of certain text structures, such as paragraphs, lists, and tables. DITA supports text structures through XML elements such as `p`, `ol`, and `simpletable`. The DITA markup specifies the text structures, but not how they will be published in various types of media. The formatting of text structures is determined by the output transformations and may be customized to meet the needs of various organizations and type of media.

Semantic Structure

Semantic structure is structure that shows the meaning of things. For example:

- A `task` element specifies that a block of content contains the description of a task.
- A `codeblock` element specifies that a block of text consists of programming code.
- A `uicontrol` element specifies that a word is the name of a control in a computer GUI.
- The `platform` profiling attribute specifies that a particular piece of content applies only to certain computing platforms.

Semantic structure is important in a structured writing system because it allows both authors and readers to find content, and it allows processing scripts to process various pieces of content differently, based on their role or meaning. This can be used to do things such as filtering content related to a specific product so that you can produce documentation on many products from the same source.

There can be many forms of semantics captured in a document set. DITA captures some of these in topics and some of them in maps. If you are using a CMS, it may capture additional semantics.

Document Semantics

Documents consist of elements that may be made up of the same basic text structures as the rest of the text, but have a special function within the structure of the document. For instance, both tables of contents and indexes are lists, but they play a special role in the document. Chapters and sections are just sequences of paragraphs and other text structures, yet they are meaningful in the structure of the document. In some cases, such as indexes and tables of contents, these structures can be generated from semantic information embedded in the source. For instance, a table of contents can be built by reading the titles of chapters and sections. DITA provides elements to describe common document semantics.

Subject Matter Semantics

In some cases, the semantics of the content relate directly to the subject matter that the content describes. For instance, DITA supports tags that allow you to mark a piece of text as the name of a window in a software application (`wintitle`), or to mark a piece of text as applying only to a particular product.

Audience Semantics

In some cases, the semantics of the content relate to the audience that it is addressed to. For instance, a topic might be addressed to a particular role, or to a person with a particular level of experience. DITA provides an `audience` element to capture audience metadata.

Creating Topic Structures

Oxygen XML Editor plugin provides a number of tools to help you create topic structures:

- *Content Completion Assistant* - Shows you which elements can be created at the current position.
- **Model** view - Shows you the complete structure supported by the current element.
- **Outline** view - Shows you the current structure of your document.
- **DITA** toolbar - Helps you to easily insert many common structures.

Related Information:

Getting Started with DITA on page 8
DITA Topics Document Type (Framework) on page 848

Creating a New DITA Topic

The basic building block for DITA information is the DITA topic. DITA provides a variety of specialized topic types, the most common of which are:

- *Topic* - The base topic type from which all other topic types are specialized. Typically, it is used when a more specialized topic type is inappropriate.
- *Task* - For procedural information such as how to use a dialog box.
- *Concept* - For general, conceptual information such as a description of a product or feature.
- *Reference* - For reference information.

Oxygen XML Editor plugin also supports numerous other specialized topic types that you will find templates for in the various folder in the **New** DITA file dialog box. They include DITA 1.3 specializations, Lightweight DITA templates, MathML composites, Markdown documents, and other DITA specialized topic and *DITA map* types such as *Glossentry*, *Troubleshooting*, *Bookmap*, and *Subject Scheme Map*.

To create a new DITA topic and add a reference to it in your *DITA map*, follow these steps:

1. In the **DITA Maps Manager**, right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
   - **Append Child** > **New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New** file dialog box that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert Before** > **New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New** file dialog box that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Insert After** > **New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New** file dialog box that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
   - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

   Step Result: The new topic is now referenced (as a `topicref`) in the *DITA map* at the location where you inserted it and the new topic is opened in the editor.
3. Save the *DITA map*.

New DITA File Dialog Box

The **New** DITA file dialog box allows you to create a new DITA topic using various types of DITA file templates and provides some options that help you to configure the new topic.

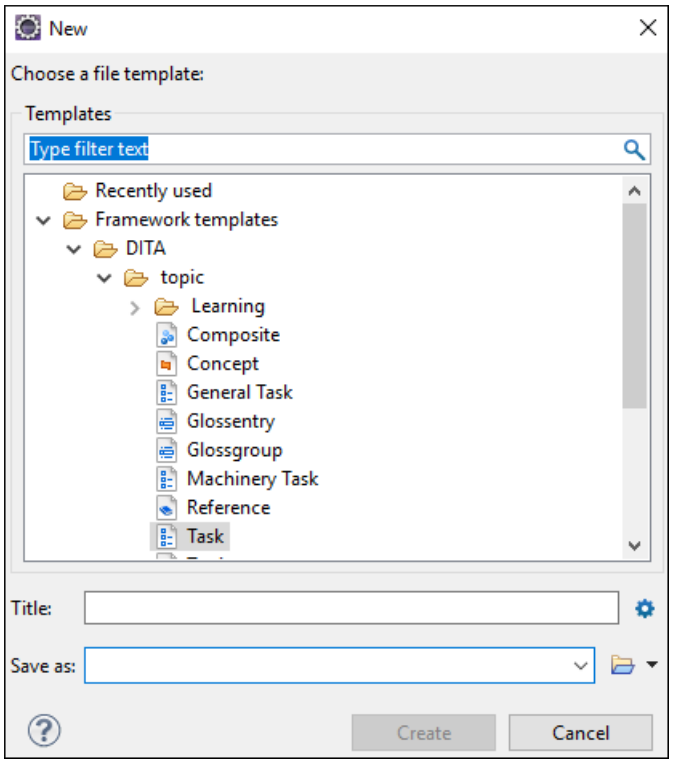

Figure 721: New DITA File Dialog Box

Note: The templates that appear in this dialog box include all templates that have an associated `.properties` file and the `type` property is set to **dita**, as well as templates that do not have an associated properties file or the `type` property is not defined. It will also include custom templates that you create using the procedures presented in Creating New Document Templates on page 366.

The **New** DITA file dialog box includes the following features and options:

Choose a file template

Use the template preview pane to select the appropriate type of DITA file you want to create. Once you select a template, the other options will appear below the preview pane.

Tip: You can use the text filter field at the top of the dialog box to search for a specific template.

Title

Depending on the selected file template, the value of the **Title** field is set in:

- the `title` element of a DITA topic file. The `title` element needs to be the first child of the root element.
- the `glossterm` element of a *Glossentry* file.

New Topics Preferences

Pressing this button opens the DITA New Topics preference page

Save as

Use this option to specify a file name and path for the new file. You can specify the path by using the text field, the history drop-down, or the browsing tools in the **Browse** drop-down menu.

Create

When you click this button, a reference (`topicref`) to the new topic is added to the current *DITA map* and the new topic is opened in the editor.

Getting Started with DITA on page 8
Adding Topics to a DITA Map on page 1476
Working with Markdown Documents in DITA on page 815
Fast Create Multiple DITA Topics on page 1504

Fast Create Multiple DITA Topics

The **DITA Maps Manager** includes a feature that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the *DITA map*. A common use-case for using this feature is when you need to insert a new chapter or section that will include multiple topics and you have the structure and titles planned out in advance.

Note: The **Fast Create Topics** feature works for the following types of local and remote resource protocols: *file*, *http*, *https*, *ftp*, *ftps*.

To access this feature, right-click a node in the **DITA Maps Manager** where you want the new topics to be inserted and select **Fast Create Topics**. This opens the **Fast Create Topics** dialog box where you can configure the structure for the new topics.

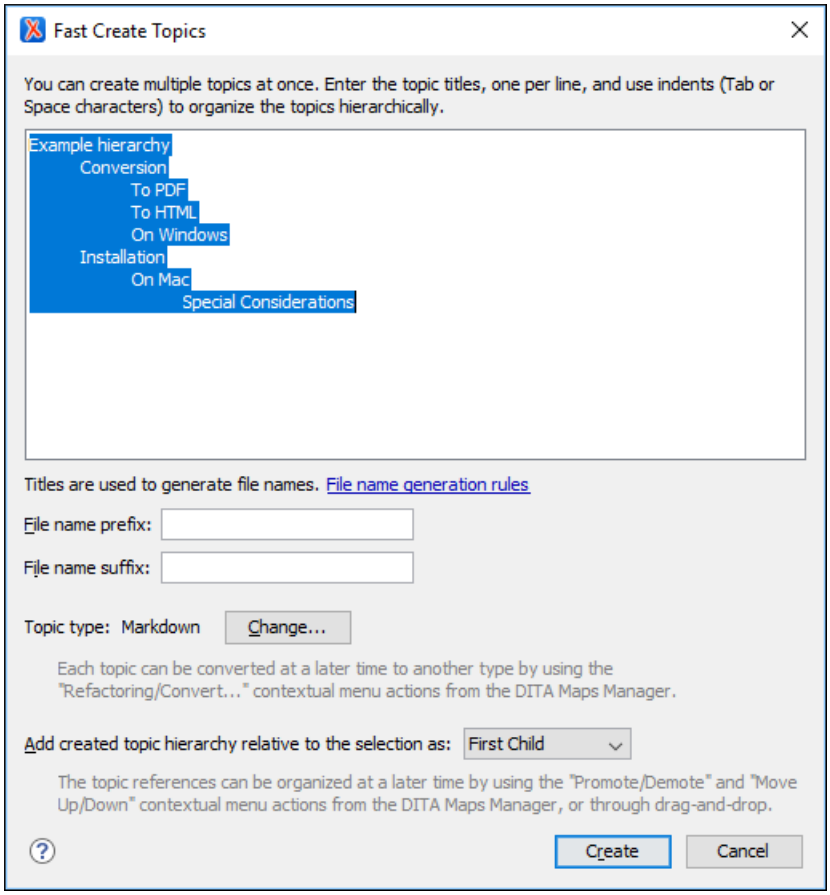

Figure 722: Fast Create Topics Dialog Box

The **Fast Create Topics** dialog box includes the following features and options:

Hierarchy Text Pane

Use this text area to enter the titles for your new topics, one per line, and specify the hierarchy by using indents (**Tab** or **Space**). Topic references will be created in the *DITA map* according to the hierarchy you enter in this section.

File name generation rules

The titles that you enter in the text pane will not only be used for the topic titles but also to generate their file names and you can click the **File name generation rules** link to configure the rules for how those file names will be generated.

Tip: If you have added a file name prefix or suffix to the properties file for DITA document templates, the generated file name will include that prefix or suffix.

File name prefix

Use this option to add a specified prefix to the file name. If you have added a file name prefix to the properties file for DITA document templates, the prefix you enter here will override the one from the properties file.

File name suffix

Use this option to add a specified suffix to the end of the file name. If you have added a file name suffix to the properties file for DITA document templates, the suffix you enter here will override the one from the properties file.

Topic type

All of the topics that will be created will have the same DITA topic type, which is detected from the most recently created topic. You can click the **Change** button to select a different type from a list of possible DITA templates.

Tip: You can convert any of these new files to a different DITA topic type at a later time by using another feature that allows you to easily convert DITA documents to other types.

Add created topic hierarchy relative to the selection as

By default, the hierarchy of topics will be added to the *DITA map* as the **First Child** of the node where the action was invoked. You can change this to **Last Child**, **Preceding Sibling**, or **Following Sibling** if the selected node allows topics to be inserted as such.

Create

When you click **Create**, the specified hierarchy is added as topic references in the *DITA map*. The new documents are created as bare skeleton topics with only the topic title and possibly the root ID populated.

Tip: You can easily change the order of the topics in the *DITA map* at a later time,

Adding Topics to a DITA Map on page 1476
Converting DITA Topics to Another Type on page 1507

Editing DITA Topics

Oxygen XML Editor plugin provides a number of features to help you edit DITA topics. A DITA topic is an XML document, thus all the editing features that Oxygen XML Editor plugin provides for editing XML documents also apply to DITA topics. Oxygen XML Editor plugin also provides extensive additional support specifically for DITA.

Opening a DITA Topic

There are several ways to open a DITA topic in the XML editor. Use any of the following methods to open a topic:

- Double-click the topic in the **DITA Maps Manager** (or right-click the topic and select **Open**).
- Double-click the file in the **Navigator** view (or right-click the file and select **Open**).
- If you have a *DITA map* opened in the XML editor, you can click the icon to the left of the topic.
- Drag a DITA file from your system browser and drop it in the XML editor.

Visual Editing in Author Mode

DITA is an XML format, although you do not have to write raw XML to create and edit DITA topics. Oxygen XML Editor plugin provides a graphical view of your topics in **Author** mode. Your topics will likely open in **Author** mode by default, so this is the first view you will see when you open or edit a DITA topic. If your topic does not open in **Author** mode, just click **Author** at the bottom left of the editor window to switch to this mode.

Author mode presents a graphical view of the document you are editing, similar to the view you would see in a word processor. However, there are some differences, including:

- **Author** mode is not a **WYSIWYG** view. It does not show you exactly what your content will look like when printed or displayed on-screen. The appearance of your output is determined by the DITA publishing process, and your organization may have modified that process to change how the output is displayed. Oxygen XML Editor plugin has no way of determining what your final output will look like or where line breaks or page breaks will fall. Treat **Author** mode as a friendly visual editing environment, not a faithful preview of your output.

- Your document is still an XML document. **Author** mode creates a visual representation of your document by applying a CSS stylesheet to the XML. You can see the XML at any time by switching to **Text** mode. You, or someone in your organization, can change how the **Author** view looks by changing the CSS stylesheet or providing an alternate stylesheet.
- Your aim in editing a DITA document is not to make it look right, but to create a complete and correct DITA XML document. **Author** mode keeps you informed of the correctness of your content by highlighting XML errors in the text and showing you the current status in a box at the top right of the editor window. Green means that your document is valid, yellow means valid with warnings, and red means invalid. Warnings and errors are displayed when you place the cursor on the error location.
- Your XML elements may have attributes set on them. Conventionally, attributes are used to contain metadata that is not displayed to the reader. By default, attributes are not displayed in the **Author** view (though there are some exceptions) and cannot be edited directly in the **Author** view (though in some cases the CSS that drives the display may use form controls to let you edit attributes directly). To edit the attributes of an element, place your cursor on the element and press **Alt+Enter** to bring up the attribute editor. Alternatively, you can use the **Attributes** view to edit attributes.

Tip: You can select **Hints** from the **Styles** drop-down menu (available on the **Author Styles** toolbar) to display tooltips throughout the DITA document that offers additional information to help you with the DITA structure. For more information, see the Selecting and Combining Multiple CSS Styles section.

Content Completion Assistance

Since it is a structured format, DITA only allows certain elements in certain places. The set of elements allowed differ from one DITA topic type to another (this is what makes one topic type different from another). To help you figure out which elements you can add in any given place and help you understand what they mean, Oxygen XML Editor plugin has a number of *Content Completion Assistant* features.

- **The Enter key:** In **Author** mode, the **Enter** key does not create line breaks, it brings up the *Content Completion Assistant* to help you enter a new element. In XML, you do not use line breaks to separate paragraphs. You create paragraphs by creating paragraph elements (element p in DITA) and tools insert the line breaks in the output and on-screen.

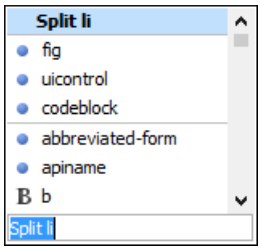

Figure 723: Content Completion Assistant

The *Content Completion Assistant* not only suggests new elements you can add. If you press **Enter** at the end of a *block element* (such as a paragraph) it suggests creating a new element of the same type. If you press **Enter** in the middle of a *block element*, it suggests splitting that element into two elements.

A useful consequence of this behavior is that you can create a new paragraph simply by hitting **Enter** twice (just as you might in a text editor).

As you highlight an element name, a basic description of the element is displayed. Select the desired element and press **Enter** to create it.

To wrap an element around an existing element or piece of text, simply select it and press **Enter** and use the *Content Completion Assistant* to choose the wrapper element.

- **The Model view:** You can see the entire model of the current element by opening the **Model** view (**Window** > **Show View** > **Model**, if the view is not already open). The **Model** view shows you what type of content the current element can contain, all the child elements it can contain, all its permitted attributes, and their types.

Tip: You can also select **Inline actions** from the **Styles** drop-down menu (available on the **Author Styles** toolbar) to display possible elements that are allowed to be inserted at various locations throughout the DITA document. For more information, see the Selecting and Combining Multiple CSS Styles section.

DITA Editing Actions

A variety of actions are available in the DITA *framework* to specifically assist you with editing DITA documents. These various actions are available in the contextual menu, the **DITA** menu, the **DITA (Author Custom Actions)** toolbar, or the *Content Completion Assistant*.

The **DITA** toolbar contains buttons for inserting a number of common DITA elements (elements that are found in most DITA topic types).

If the **DITA** toolbar is not displayed, right-click anywhere on the toolbar area, select **Configure Toolbars**, and select it from the displayed dialog box.

Note: The **DITA** toolbar contains a list of the most common elements and actions for DITA, such as inserting an image, creating a link, inserting a content reference, or creating a table. It does not contain a button for inserting every possible DITA element. For a complete list of elements that you can insert at the current location in your document, press **Enter** to open the *Content Completion Assistant*.

Whenever the current document in the editor is a DITA document, the **DITA** menu is displayed in the menu bar. It contains a large number of actions for inserting elements, creating content references and keys, editing DITA documents, and controlling the display. These actions are specific to DITA and supplement the general editing commands available for all document types. Many of these actions are also conveniently available in the contextual menu. In addition to the DITA *framework*-specific actions, the contextual menu also includes various *general* **Author** mode contextual menu actions.

DITA Author Mode Actions on page 850

Converting DITA Topics to Another Type

Oxygen XML Editor plugin includes a features that allows you to convert an existing DITA document to a different topic type. For example, if you want to convert a DITA Task to a DITA Topic, or vice versa. There are several ways to access these refactoring actions and you can choose a scope for the operation and some filtering options.

DITA Conversion Refactoring Operations for *DITA*

The following conversion operations are available:

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Methods for Accessing the DITA Conversion Refactoring Operations

To access the conversion operations, use one of the following methods:

Single Document Method

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the **DITA Maps Manager**), go to the **Refactoring** submenu, and choose whichever operation is appropriate for your needs.

Multiple Documents At Once Method

Select **XML Refactoring** from the **XML Tools** menu (or from the **Refactoring** submenu when you right-click one or more documents in the **Navigator** viewor the **DITA Maps Manager** view). Then select whichever operation is appropriate for your needs.

XML Refactoring Wizard Dialog Box

When you select any of the operations, Oxygen XML Editor plugin proceeds to the **XML Refactoring Wizard**. If you used the **Multiple Documents At Once Method**, the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as ***** or **?**).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.

If you used the **Single Document Method**, the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

Preview

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

Warning: It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

Finish

When you use the **Finish** button, behind the scenes Oxygen XML Editor plugin maps the structure of the previous DITA document type to a structure that fits the new type. In some cases, especially when the previous structure was very complex, the conversion might result in an invalid structure and some manual adjustments might be required.

Converting To and From DITA Specialization Document Types

If you use your own DITA specialization document type, you can modify the built-in, predefined conversion operations to work with your specialization by customizing the values of particular variables.

To use the conversion operations with your DITA specialization, follow these steps:

1. Locate the conversion stylesheets in the following directory: *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/refactoring/dita-files-conversion-systlesheets`.
2. Each conversion operation has a stylesheet with the word **entrypoint** at the end of its name. Edit the appropriate `*-entrypoint.xsl` file (for example, to modify the **Convert to Task** operation, edit the `convert-resource-to-task-entrypoint.xsl` file).
3. Depending on whether you use a DTD, XML Schema, or Relax NG-based specialization, you can:
   a. Modify the values of the declared **root-element**, **public-literal-target**, and **system-literal-target** variables to match your specialization's DTD information.
   b. Modify the value of the declared **schema-location** variable to match the location of your specialization's XML schema.
   c. Modify the value of the declared **xml-model-location** variable to match your Relax NG specialization.

4. Save your changes to the stylesheet.
5. If you want to change the name of the operation that will be displayed in Oxygen XML Editor plugin, follow these substeps:
   a. Locate the resource XML file for the same conversion operation in the following directory: *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/refactoring/` (for example, for the **Convert to Task** operation, it is `convertResource2Task.xml`).
   b. Edit that XML file and change the **name** attribute to match whatever you want to be displayed for that operation (for example, `name="Convert to My DocType"`).
   c. Save your changes to the XML file.
6. Restart Oxygen XML Editor plugin

Result: You should now see your changes when accessing the conversion operations.

Tip: You can also create your own customized refactoring operations. For more information, see Custom Refactoring Operations on page 603.

Editing DITA Topics on page 1505
Refactoring XML Documents on page 596

Adding Images in DITA Topics

There are several ways to add images to a DITA topic, depending on if you want to create a figure element (with a title and caption), just insert an image inline, or if you want to use multiple versions of a graphic depending on the situation. For instance, you might want to use a specific image for each different product version or output media.

Adding an Image Inline with the Insert Image Dialog Box

Use the following procedure to add an image inline:

1. Place the cursor in the position you want the graphic to be inserted.
2. Select the **Insert Image** action. The **Insert Image** dialog box appears.

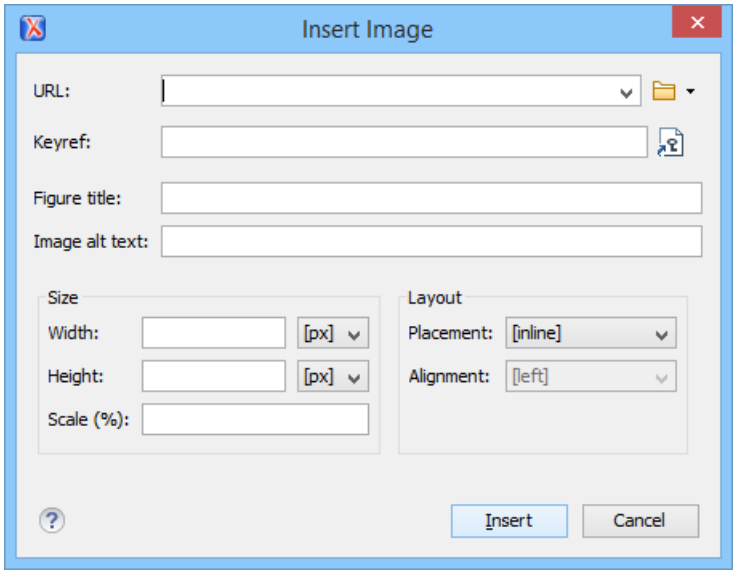

Figure 724: Insert Image Dialog Box

3. Configure the options in this dialog box and click **Insert**.

   The **Insert Image** dialog box includes the following options for inserting images into a DITA document:

   URL

   Use this option to specify a URL for the image. It will insert the URL as the value of an `href` attribute inside an `image` element. You can type the URL of the image you want to insert or use browsing tools in the **Browse** drop-down menu.

Keyref

You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that presents the list of keys available in the selected *root map*. Use this dialog box to insert the selected key as the value of a `keyref` attribute inside an `image` element. All keys that are presented in the dialog box are gathered from the *root map* of the current *DITA map*. Elements that have the `keyref` attribute set are displayed as links.

Note: If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong *root map*. You can change the *root map* by using the **Change Root Map** link.

Figure title

Use this text box to insert a `title` and `image` element inside a `fig` element.

Alternate text

Use this text box to insert an `alt` element inside the `image` element.

Size

Use this section to configure the **Width** and **Height** of the image, or **Scale** the image. Specifying a value in these options inserts a `width`, `height`, and `scale` attribute, respectively.

Layout

Use the options in this section to insert `placement` and `align` attributes into the `image` element.

Adding an Image Inline with Drag/Drop (or Copy/Paste) Actions

You can drag images from your system explorer or the **Navigator** view and drop them into a DITA document (or copy and paste). This will insert the path of the image file as the value of the `href` attribute in a DITA `image` element:

```
<image href="../images/image_file.png"/>
```

Tip: To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor plugin will automatically update the reference to the new image.

Adding an Image in a Figure Element

To add an image in a figure:

1. Add a `fig` element to your document at the appropriate place.
2. Add a `title` and/or `desc` element to the `fig` element, according to your needs.
3. Add an *image* element to the `fig` element.

Note: The `fig` element has a number of other child elements that may be appropriate to your content. See the DITA documentation for complete information about the `fig` element.

Note: The order in which the `image`, `title`, and `desc` content are presented in output is determined by the output transformation. If you want to change how they are output, you may have to modify the output transformation, rather than your source content.

Related Information:

Image Maps in DITA on page 530
Floating Images in DITA Topics for PDF or XHTML Output on page 1510

Floating Images in DITA Topics for PDF or XHTML Output

Oxygen XML Editor plugin provides the possibility of floating an image to the left or right of blocks of content in DITA topics for both PDF and XHTML output.

To float an image, you simply need to set the `outputclass` attribute on the `image` element. The possible values are:

- **float-left**
- **float-right**

For example, the following DITA structure will present the image to the right of the paragraph content in the output:

```
<p><image href="../../images/Lilac.jpg" scale="45" outputclass="float-right"/>
  <b>Lilac</b> (<b>Syringa</b>) is a genus of about 20–25 species of flowering plants
  in the olive family (<b>Oleaceae</b>), native to Europe and Asia.
</p>
```

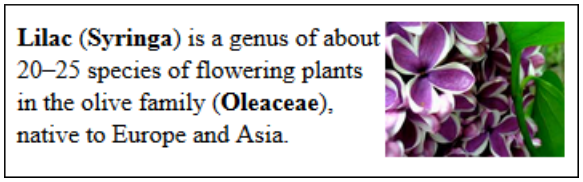

Figure 725: Image Floated to the Right

Adding Video, Audio, and Embedded HTML Resources in DITA Topics

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics. The media resources can be played directly in **Author** mode and in all HTML5-based outputs. There is a toolbar button ( ) that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the **Navigator** view and drop them into your documents (or copy and paste them).

Table 73: Supported Media Types

Media	Description	Type	Supported Size Properties
mp3	Moving Picture Experts Group Layer-3 Audio	audio	Width
wav	Windows Wave	audio	Width
pcm	Pulse Code Modulation	audio	Width
m4a	Moving Picture Experts Group Layer-4 Audio	audio	Width
aif	Audio Interchange Format	audio	Width
mp4	Moving Picture Experts Group Layer-4 Video	video	Width & Height
flv	Flash Video	video	Width & Height
m4v	Itunes Video File	video	Width & Height
avi	Audio Video Interleaved	video	Width & Height
embedded video (such as YouTube or Vimeo)	Embedded Iframe Code	iframe	Width & Height

Adding a Media Resource

To insert a media resource in a DITA document, use the following procedure:

1. Place the cursor at the location where you want the media resource.

2. Select the **Insert Media Resource** action from the toolbar. The **Insert Media** dialog box appears.

   Note: You can also drag media files from your system explorer or the **Navigator** view and drop them into your documents (or copy and paste them). Note that this method will bypass the **Insert Media** dialog box, so if you need to adjust the size you will need to adjust the `width` or `height` attributes manually.

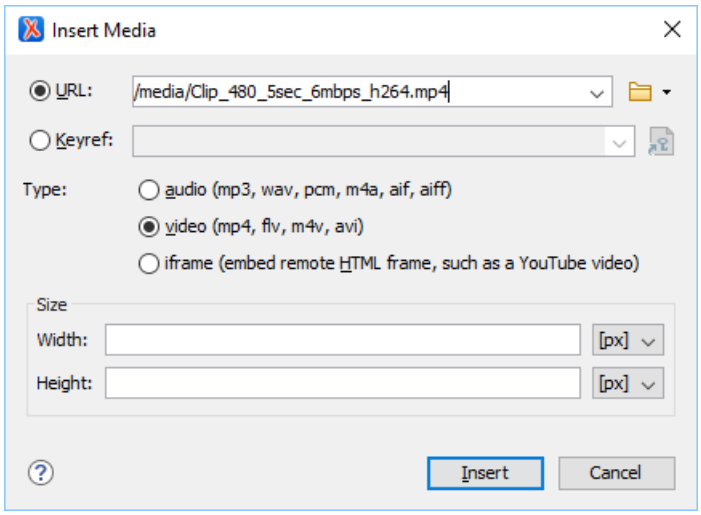

Figure 726: Insert Media Dialog Box

3. Configure the options in this dialog box and click **Insert**.

   The **Insert Media** dialog box includes the following options:

   URL

   Use this option to specify a URL for a media resource. It will insert the URL as the value of a `data` attribute of an `object` element. You can type the URL of the resource you want to insert or use the **Browse** drop-down menu to select it.

   Keyref

   You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that presents the list of keys available in the selected *root map*. Use this dialog box to insert the selected key as the value of the `datakeyref` attribute of an `object` element. All keys that are presented in the dialog box are gathered from the *root map* of the current *DITA map*.

   Tip: If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong *root map*. You can change the *root map* by using the **Change Root Map** link.

   Type

   Oxygen XML Editor plugin detects and automatically selects the media type based upon the specified resource in the URL field. You can manually change the type, but keep in mind that in the publishing stage the *object* element is converted to an HTML5 element based upon the type selected here. You can choose between: **audio**, **video**, or **iframe**.

   Size

   Use this section to configure the **Width** and **Height** of the frame for the media resource. Specifying a value in these options inserts a `width` and `height` attribute, respectively. For audio clips, only the **Width** can be adjusted.

Result in Author Mode: A reference to the specified video, audio, or embedded HTML frame is inserted in an `object` element and it is rendered in **Author** mode so that it can be played directly from there.

Attention: On Mac OS X, if you receive a **Blocked Plug-in** error message, you need to updated your *Flash Player* to the latest version.

Result in Output: In the publishing stage, the `object` element is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

- **Videos** - The `object` element is converted to an HTML5 `video` element.

- **Audio Clips** - The `object` element is converted to an HTML5 `audio` element.
- **Embedded HTML Frames** - The `object` element is converted to an HTML5 `iframe` element.

Tip: There is an even faster way of inserting an embedded video (such as a YouTube or Vimeo). If you copy the embed code from the source (for example, you can right-click on a YouTube video and select **Copy embed code**), you can then paste the contents of the clipboard in the **URL** field and the **Type** will automatically be set on **iframe**, while the **Width** and **Height** will be populated according to the detected size, and an `allowfullscreen` parameter will automatically be added (set the value of this parameter to **true** to allow videos to play in full screen mode once the document is converted to XHTML output).

Inserting Media in HTML Outputs That Do Not Support Embedded Media

For certain types of HTML output (for example, CHM) that do not support embedded media (such as videos or audio files), Oxygen XML Editor plugin provides a parameter that can be set in the transformation scenario to present the media object as a plain link in the output.

This can be achieved by following these steps:

1. Edit the DITA transformation scenario for the output type that does not support embedded objects (for example, **DITA Map CHM**).
2. Go to the **Parameters** tab and click the **New** button to add a new parameter.
3. For the **Name**, enter: **com.oxygenxml.xhtml.linkToMediaResources**.
4. For the **Value**, enter: **true**.
5. Click **OK** and continue on to run the transformation.

   Result: The media object will appear in the output as a plain link instead of an embedded object.

For more information, see the following video demonstration:

https://www.youtube.com/embed/llX11gS4WaU

Adding Images in DITA Topics on page 1509
How to Add Video and Audio Objects in DITA WebHelp Output on page 1095

Image Maps in DITA

Oxygen XML Editor plugin includes support for **image maps** in DITA documents through the use of the `imagemap` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

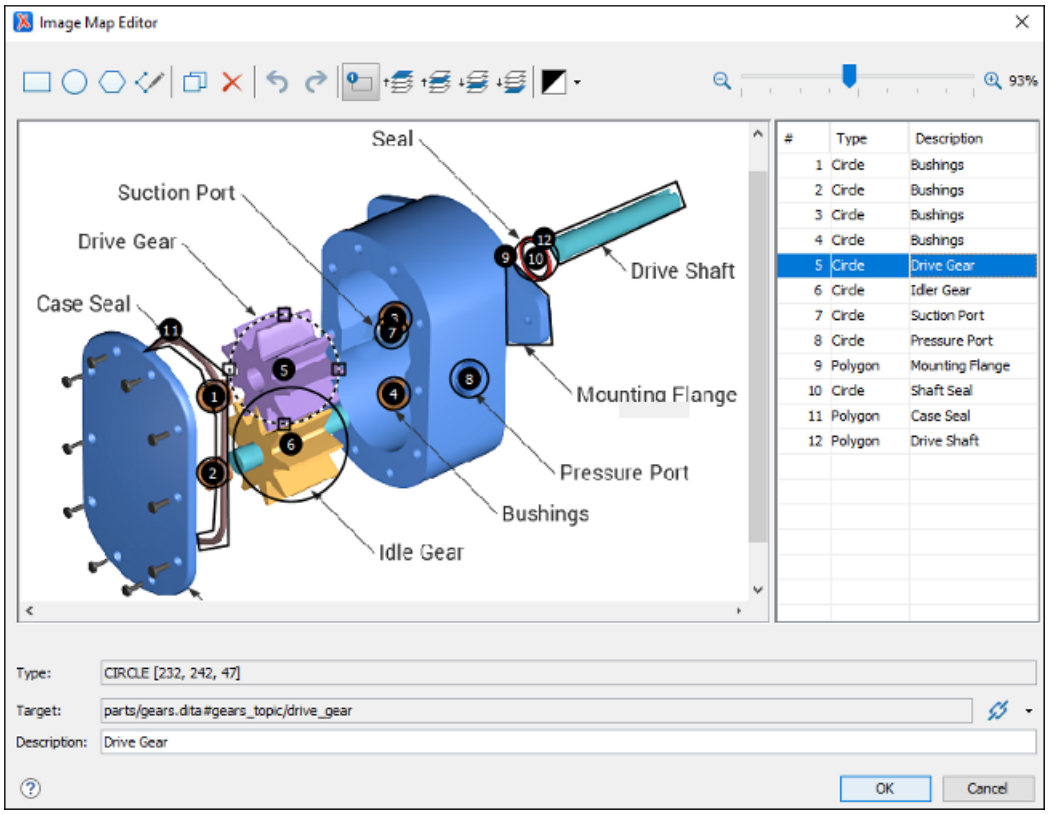

Figure 727: Image Map Editor in DITA

Image Map Editor Interface in DITA

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar

New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Use this button to draw a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

New Free Form Shape

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

Duplicate

Use this button to create a duplicate of the currently selected shape.

Delete

Use this button to delete the currently selected shape.

Undo

Use this button to undo the last action.

Redo

Use this button to redo the last action that was undone.

Show/Hide Numbers

Use this button to toggle between showing or hiding the numbers for the shapes.

Bring Shape to Front

Use this button to bring the currently selected shape forward to the top layer.

Bring Shape Forward

Use this button to bring the currently selected shape forward one layer.

Send Shape Backward

Use this button to send the currently selected shape back one layer.

Send Shape to Back

Use this button to send the currently selected shape back to the bottom layer.

Color Chooser

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

Zoom Slider

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape farther or **Alt** to move it 1 pixel at a time.
- To zoom in or out, you can use the **NumPad +** or **NumPad -** keys respectively. Use **Ctrl + NumPad 0** to reset the zoom level to its default value.
- You can use **Ctrl + Z** to undo an action or **Ctrl + Y** to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

Add Point

Adds a point to *Polygon* or *Free Form* shapes.

Remove Point

Removes the current point from *Polygon* or *Free Form* shapes.

Duplicate

Create a duplicate of the currently selected shape.

Delete

Delete the currently selected shape.

New Rectangle

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Creates a polygon shape over an area in the image. This actions opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo

Use this action to undo the last action.

Redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

Properties

Type

Displays information about the selected coordinate.

Target

Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the **Link** drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference**, **File Reference**, or **Web Link**. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of inserting links in DITA by using the identical **Link** drop-down menu from the main toolbar.

When you click **OK** to finalize your changes in the **Image Map Editor**, an `xref` element will be inserted with either an `href` attribute or a `keyref` attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see Inserting a Link in Oxygen XML Editor plugin on page 1564.

Description

You can enter an optional description for the selected area (shape) that will be displayed in the **Image Map Details** section in **Author** mode and as a tooltip message when the end user hovers over the hyperlink in the output.

How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

   Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (**New Rectangle**, **New Circle**, or **New Polygon**).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the other buttons on the toolbar to adjust its layer and color, or to perform other editing actions.

   Tip: You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful contextual menu actions. For example, the easiest way to remove a point is to right-click the point and select **Remove Point**.
4. With the shape selected, use one of the linking options in the **Link** drop-down menu to select a target resource (or enter its path in the **Target** text field).
5. (Optional) Enter a **Description** for the selected area (shape).
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `alt` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

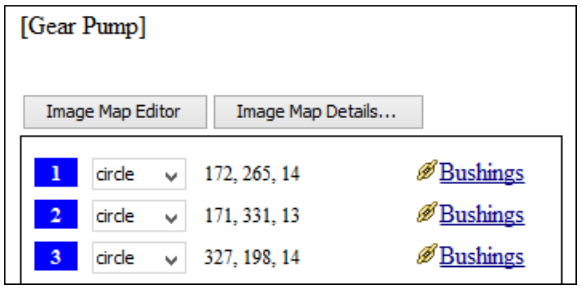

Figure 728: Image Map Details

How to Edit an Existing Image Map in DITA

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represent its layer (if the numbers are not displayed, click the **Show/Hide Numbers**

button on the **Image Map Editor** toolbar). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar (, , ,).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

DITA 'imagemap' Element Specifications

Adding Images in DITA Topics on page 1509

Adding Tables in DITA Topics

You can use the **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- DITA *Simple* table model - This is the most commonly used model for basic tables.
- CALS table model (OASIS Exchange Table Model) - This is used for more advanced functionality.
- DITA *Choice* table model - This is used within a `step` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- DITA *Properties* table model - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor plugin toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

Inserting a Simple Table Model

To insert a **Simple** DITA table, select the **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

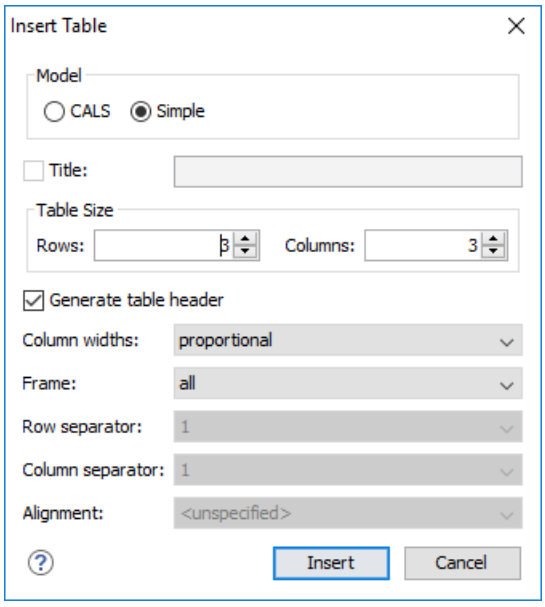

Figure 729: Insert Table Dialog Box - Simple Model

The dialog box allows you to configure the following options when you select the **Simple** table model:

Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Note: The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

Inserting a CALS Table Model (OASIS Exchange Table)

To insert an OASIS Exchange Table (**CALS**), select the **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the *Simple* model.

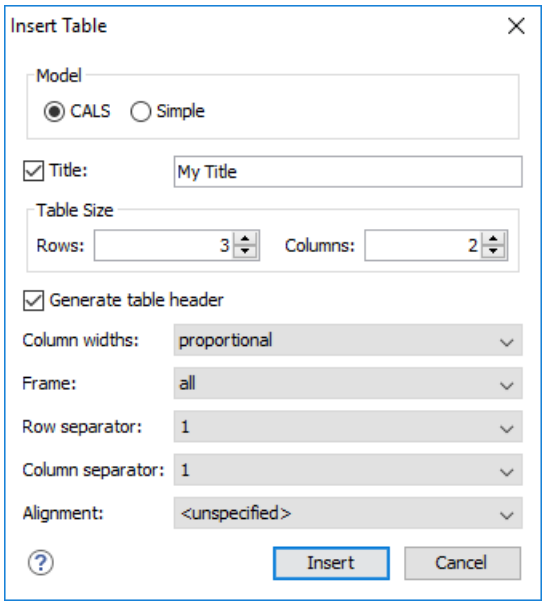

Figure 730: Insert Table Dialog Box - CALS Model

The dialog box allows you to configure the following options when you select the **CALS** table model:

Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `colwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width (`colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.

- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Row separator

Specifies whether or not to include row separators (`rowsep` attribute). The allowed values are: `0` (no separator) and 1 (include separators).

Column separator

Specifies whether or not to include column separators (`colsep` attribute). The allowed values are: `0` (no separator) and 1 (include separators).

Alignment

Specifies the alignment of the text within the table (`align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

  Note: The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Note: The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author** mode, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

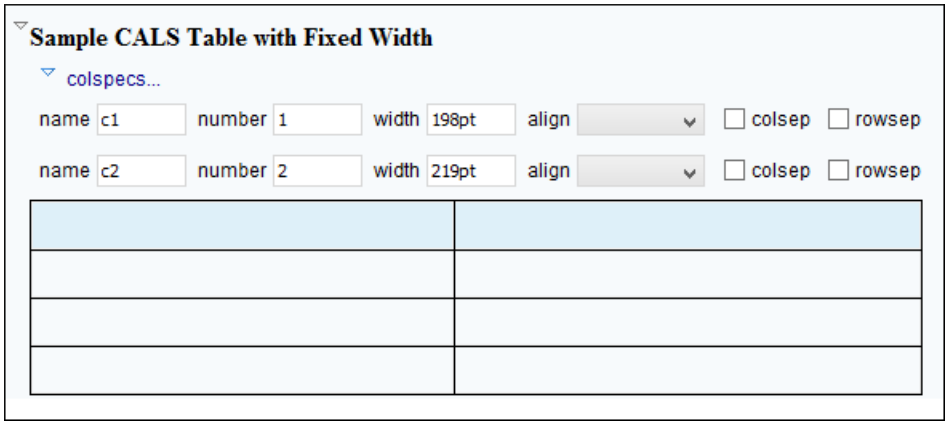

Figure 731: CALS Table in DITA

Inserting a Choice Table Model

To insert a **Choice** table within a `step` element in a DITA Task document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **choicetable** from the *Content Completion Assistant*. The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

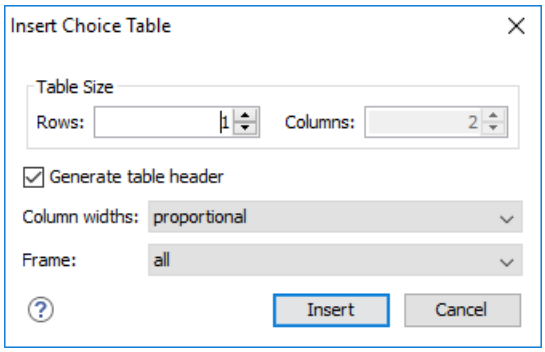

Figure 732: Insert Table Dialog Box - Choice Model

The dialog box allows you to configure the following options when you insert a *Choice* table model within a DITA Task:

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares are totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click **Insert**, a *Choice* table is inserted into your DITA Task document at the current cursor position (within a `step` element).

Inserting a Properties Table Model

To insert a **Properties** table within a `refbody` element in a DITA Reference document, select the **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **properties(wizard)** from the *Content Completion Assistant*. The **Insert Table** dialog box appears. Select **Properties** for the table **Model**.

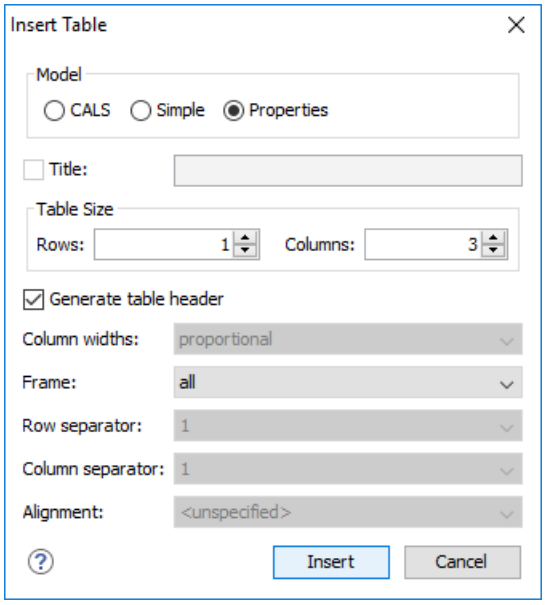

Figure 733: Insert Table Dialog Box - Properties Model

The dialog box allows you to configure the following options when you insert a *Properties* table model within a DITA Reference:

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

When you click **Insert**, a *Properties* table is inserted into your DITA Reference document at the current cursor position (within a `refbody` element).

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes** view (**Window** > **Show View** > **Attributes**). See the DITA documentation for a full explanation of these attributes.

You can also use the **Table Properties (Ctrl + T (Command + T on OS X))** action from the toolbar or contextual menu (or **DITA** menu) to modify many of the properties of the table.

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text** mode.

Related Information:

Editing Tables in Author Mode on page 499

DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- *CALS* table model
- *Simple* table model
- *Choice* table model
- *Properties* table model

CALS Table Model Layout

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`colwidth` attribute) or the text alignment (`align` attribute). Although they appear as part of the **Author** mode, the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

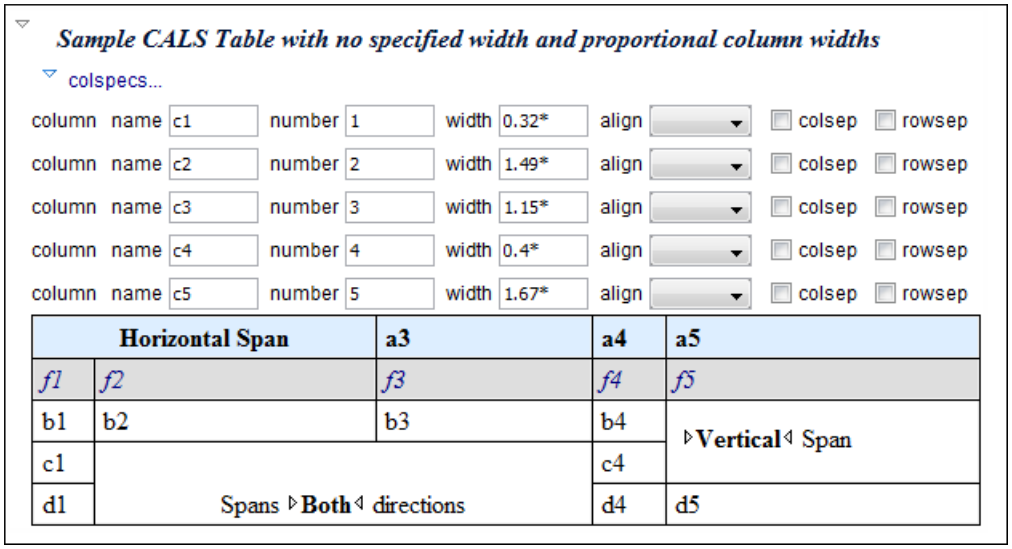

Figure 734: CALS Table in DITA

Simple Table Model Layout

When choosing a **Simple** table model from the **Insert Table** dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Header 1	Header 2
Column 1	Column 2

Figure 735: DITA Simple Table

Choice Table Model Layout

A **Choice** table model is used within a `step` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The `choicetable` element is a useful device for documenting options within a single step of a task. You can insert *Choice* tables in DITA Task documents either by selecting **choicetable** from the *Content Completion Assistant* (within a `step` element) or by using the **Insert Table** action on the toolbar or from the contextual menu). The options and layout of a *Choice* table is similar to the *Simple* table model.

Option	Description
Opt A	
Opt B	
Opt C	

Figure 736: DITA Choice Table

Properties Table Model Layout

A **Properties** table model is used within a `refbody` element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert *Properties* tables in DITA Reference documents either by selecting **properties(wizard)** from the *Content Completion Assistant* (within a `refbody` element) or by using the **Insert Table** action on the toolbar (or from the contextual menu) and selecting **Properties** for the **Model**. The layout of a *Properties* table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Property Type	Property Value	Property Description
A	B	C

Figure 737: DITA Properties Table

Table Validation in DITA

Oxygen XML Editor plugin reports table layout problems that are detected in manual or automatic validations.

When you validate a *DITA map* with the **Validate and Check for Completeness** action, if the **Report table layout problems** option is selected in the **DITA Map Completeness Check** dialog box, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

CALS Tables

- A row has fewer cells than the number of columns detected from the table `cols` attribute.
- A row has more cells than the number of columns detected from the table `cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `colspecs` is different than the number of columns detected from the table `cols` attribute.
- The number of columns detected from the table `cols` attribute is different than the number of columns detected in the table structure.
- The value of the `cols`, `rowsep`, or `colsep` attributes are not numeric.
- The `namest`, `nameend`, or `colname` attributes point to an incorrect column name.

Simple or Choice Tables

- A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the **Table Properties (Ctrl + T (Command + T on OS X))** action from the toolbar or the **Table** submenu of the contextual menu (or **DITA** menu). This opens the **Table properties** dialog box.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table in which the action was invoked.

Note: Some properties allow the following special values, depending on the context and the current properties or values:

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

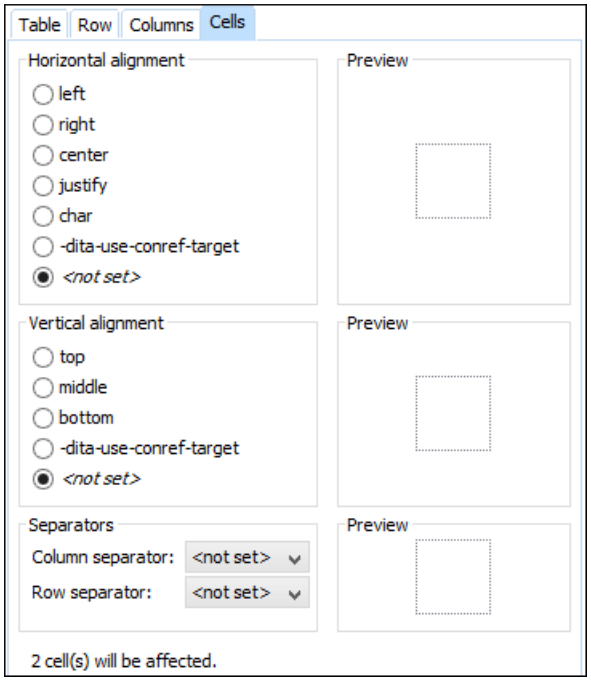

Figure 738: Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)

The options in the four tabs include the following:

Horizontal alignment (Available in the Table, Column, and Cell tabs)

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`align` attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

  Note: The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `char` attribute for alignment.

- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Vertical alignment (Available in the Row and Cell tabs)

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (`valign` attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Column separator (Available in the Table, Column, and Cell tabs)

Specifies whether or not to include column separators (borders/grid lines) in the form of the `colsep` attribute. The allowed values are: `0` (no separator) and 1 (include separators).

Row separator (Available in all four tabs)

Specifies whether or not to include row separators (borders/grid lines) in the form of the `rowsep` attribute. The allowed values are: `0` (no separator) and 1 (include separators).

Frame (Available only in the Table tab)

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Edit Table Properties for a Simple, Choice, or Properties Table Model

For a *Simple*, *Choice*, *Properties* table model, the **Table properties** dialog box only allows you to edit a few options.

Table tab

Frame

Allows you to specify a value for the `frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `conref` target. For more information, see https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html.

Row tab (not available for *Properties* tables)

Row type

Allows you change the row to a body or header type of row.

Related Information:

Adding Tables in DITA Topics on page 509
Editing Tables in Author Mode on page 499

Adding MathML Equations in DITA Topics

You can add MathML equations in a DITA document using one of the following methods:

- Embed MathML directly into a DITA topic. You can start with the **Framework templates / DITA / topic / Composite with MathML** document template, available from the **New** file action wizard.
- Reference an external MathML file as an image, using the **Insert Image** action that is available on the DITA toolbar (or from the **DITA** > **Insert** menu).

Note: MathML equations contained in DITA topics can only be published out-of-the-box in PDF using the **DITA PDF** transformation scenario. For other publishing formats, you must employ additional customizations for handling MathML content.

DITA Author Mode Actions

A variety of actions are available in the DITA *framework* that can be added to the **DITA** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant*.

DITA Toolbar Actions

The following default actions are readily available on the **DITA (Author Custom Actions)** toolbar when editing in **Author** mode (by default, most of them are also available in the **DITA** menu and in various submenus of the contextual menu):

Bold

Surrounds the selected text with a b tag. You can use this action on multiple non-contiguous selections.

Italic

Surrounds the selected text with an `i` tag. You can use this action on multiple non-contiguous selections.

Underline

Surrounds the selected text with a u tag. You can use this action on multiple non-contiguous selections.

Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross Reference

Opens the **Cross Reference (xref)** dialog box that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics on page 1563.

File Reference

Opens the **File Reference** dialog box that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. For more information, see Linking in DITA Topics on page 1563.

Web Link

Opens the **Web Link** dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. For more information, see Linking in DITA Topics on page 1563.

Related Link to Topic

Opens the **Cross Reference (xref)** dialog box that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics on page 1563.

Related Link to File

Opens the **File Reference** dialog box that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics on page 1563.

Related Link to Web Page

Opens the **Web Link** dialog box that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics on page 1563.

Insert Image

Opens the **Insert Image** dialog box that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

Insert Media Resource

Opens the **Insert Media** dialog box that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an `object` element and it is rendered in **Author** mode so that it can be played directly from there.

Insert Section Drop-Down Menu

The following insert actions are available from this menu:

Insert Section

Inserts a new `section` element in the document, depending on the current context.

Insert Concept

Inserts a new `concept` element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

Insert Task

Inserts a new `task` element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

Insert Topic

Inserts a new `topic` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Reference

Inserts a new `reference` element, depending on the current context. A reference is a top-level container for a reference topic.

Insert Paragraph

Inserts a new paragraph at current cursor position.

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the **Reuse Content** dialog box that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (*conref*), content key references (*conkeyref*), or key references to metadata (*keyref*).

Insert step or list item

Inserts a new list or step item in the current list type.

Insert Unordered List

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a *block element*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DITA Menu Actions

The following additional actions can be found in the **DITA** menu when editing in **Author** mode:

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the **Reuse Content** dialog box that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (*conref*), content key references (*conkeyref*), or key references to metadata (*keyref*).

Push Current Element

Opens the **Push current element** dialog box that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

Edit Content Reference

This action is available for elements with a `conref` or `conkeyref` attribute. it opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`conref`/`conkeyref` and `conrefend` attributes). For more information, see Reuse Content Dialog Box on page 1545.

Replace Reference with content

Replaces the referenced fragment (`conref` or `conkeyref`) at the cursor position with its content. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location.

Remove Content Reference

Removes the content reference (`conref` or `conkeyref`) inside the element at the cursor position.

Create Reusable Component

Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component on page 1554.

Insert Reusable Component

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component on page 1555.

Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA *framework*:

Paste as content reference

Inserts a content reference (a DITA element with a `conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the `conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from *DITA maps*. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an `xref` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Subscript

Surrounds the selected text with a *subscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

Superscript

Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor plugin a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Insert > Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations.

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor plugin Editor Variables.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note: This option does not have an effect on content that is *cut* and *pasted*.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.

- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Browse DITA Style Guide

Opens the **DITA Style Guide Best Practices for Authors** in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the **About Element** sub-menu), in the **DITA** menu, and in some of the documentation tips that are displayed by the *Content Completion Assistant*.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block* and *inline elements*.

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set to activate it.

Profiling Settings

Opens the profiling options preferences page, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page and the attributes rendering preferences page.

DITA Contextual Menu Actions

In addition to many of the DITA toolbar actions and the *general* **Author** mode contextual menu actions, the following DITA *framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA *framework*:

Paste as content reference

Inserts a content reference (a DITA element with a `conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the `conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from *DITA maps*. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an `xref` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Insert > Σ Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations.

Generate IDs

Oxygen XML Editor plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Reuse submenu

This submenu includes the following actions in regards to reusing content in DITA:

Push Current Element

Opens the **Push current element** dialog box that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

Edit Content Reference

This action is available for elements with a `conref` or `conkeyref` attribute. it opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`conref`/`conkeyref` and `conrefend` attributes). For more information, see Reuse Content Dialog Box on page 1545.

Replace Reference with content

Replaces the referenced fragment (`conref` or `conkeyref`) at the cursor position with its content. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location.

Remove Content Reference

Removes the content reference (`conref` or `conkeyref`) inside the element at the cursor position.

Create Reusable Component

Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component on page 1554.

Insert Reusable Component

Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component on page 1555.

Search References (Ctrl + Shift + G)

Finds the references to the `id` attribute value for the element at the current cursor position, in all the topics contained in the current *DITA map* (opened in the **DITA Maps Manager** view). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

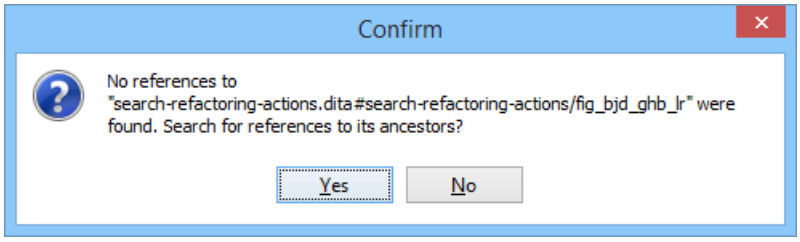

Figure 739: Search References to Ancestors Dialog Box

Show Key Definition

Available for elements that have a `conkeyref` or `keyref` attribute set (or elements with an ancestor element that has a `conkeyref` or `keyref` attribute). It computes the key name and opens the *DITA map* that contains the definition of the key with the element that defines that key selected.

About Element submenu

This submenu includes the following actions:

Style Guide

Opens the **DITA Style Guide Best Practices for Authors** in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the **About Element** sub-menu), in the **DITA** menu, and in some of the documentation tips that are displayed by the *Content Completion Assistant*.

Browse reference manual

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

Go to Definition

Moves the cursor to the definition of the current element.

DITA Drag/Drop (or Copy/Paste) Actions

Dragging a file from the **Navigator** view or **DITA Maps Manager** view and dropping it into a DITA document that is edited in **Author** mode, creates a link to the dragged file (the `xref` DITA element with the `href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Navigator** view and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA `image` element with an `href` attribute).

Working with Markdown Documents in DITA

Oxygen XML Editor plugin includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics and the **DITA** tab in the *Preview* pane provides a visualization of how the topic will look after conversion.

Export Markdown as a DITA Topic

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The **Export as DITA Topic** action is available in the contextual menu of the left-side text editor and the right-side *Preview* pane when the **DITA** tab selected.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the **Text** editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Editor plugin has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the **DITA Maps Manager**. The following features are available for Markdown documents in the **DITA Maps Manager** view:

- **Insert Reference to Markdown Document** - You can use the **New**, **Reference**, and **Reference to the currently edited file** actions from the **Append Child**, **Insert Before**, or **Insert After** submenu when invoking the contextual menu in the **DITA Maps Manager** to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (`topicref` element) with the `format` attribute set to `markdown`.
- **Validate Markdown Documents in DITA Maps** - When you use the **Validate and Check for Completeness** action from the **DITA Maps Manager** toolbar to check the integrity of the structure of a *DITA map*, Markdown documents that are referenced in the *DITA map* will be converted to DITA topics in the background and validated the same as any other DITA topic.
- **Transforming DITA Maps with Markdown Documents** - When transforming *DITA maps* that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.
- **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the **DITA Maps Manager** and select **Refactoring** > **Convert Markdown to DITA Topic**. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

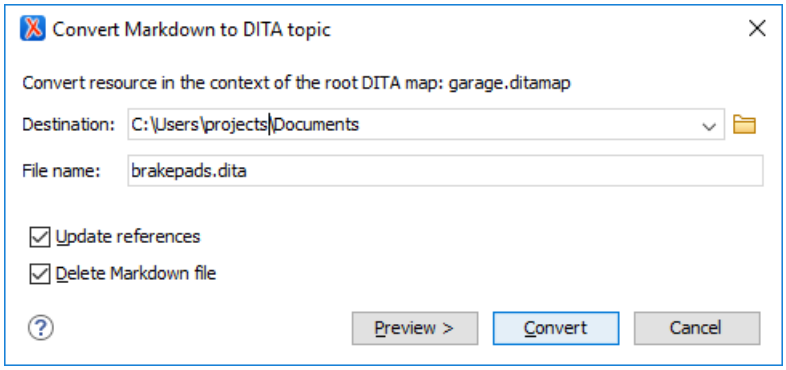

Figure 740: Convert Markdown to DITA Topic Dialog Box

This dialog box includes the following options:

Destination

The destination path for the new DITA topic.

File Name

Presents the current name and allows you to change it.

Update references

Select this option to update all references of the file in the *DITA map* and in the files referenced from the *DITA map*.

Delete Markdown file

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

Preview

Select this button to display a preview of the changes Oxygen XML Editor plugin is about to make.

Convert

Select this button to perform the conversion.

Tip: Oxygen XML Editor plugin comes with a sample ditamap project for converting Markdown to DITA. Go to the **Navigator** view, open the `sample.xpr` project, and navigate to the `dita/markdown-dita` folder.

Working with Keys

DITA uses keys to insert content that may have different values in various circumstances. Keys provide a way to reference something indirectly. This can make it easier to manage and to reuse content in a number of ways.

You can think of keys as like renting a post office box. Instead of the mail going directly from the sender to your house, it now goes to the post office box. You then go to the post office box and bring the mail back to your house. If you move to a new house, your mail still gets to you because it comes to the same post office box. You do not have to send change of address cards to all the people who send you mail. Your mailbox address is the key that makes sure your mail always reaches you, even if you move.

Similarly, if you use keys in your content to reference other content, you do not have to update the source content to change the value of the key or what it points to. You just change the definition of the key.

Using Keys for Values

You can use keys to represent values that may vary depending on the type of output. For instance, you may have several products that share a common feature. When you want to describe that feature, you need a way to insert the name of the product, even though that name is different depending on which product the feature description is being used for. For more information, see Working with Variable Text in DITA on page 1555.

Assigning Keys to Topics

You can assign a key to a topic and use that key to reference that topic for various purposes, such as reuse or linking. As always, keys are defined in maps, so the key definition is done using the keys attribute of the `topicref` element:

```
<topicref href="quick-heat.dita" keys="feature.quick-heat"/>
```

The easiest way to assign keys to a topic (and insert the `topicref` element in its *DITA map*) is to use the **Keys** tab in the **Edit Properties** dialog box. In the **DITA Maps Manager**, invoke the contextual menu on the topic for which you want to assign a key and select **Edit Properties**. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.

Once a key is assigned to a topic, you can use it to reference that topic for various purposes:

- You can create a link to it using `<xref keyref="feature.quick-heat"/>`. This allows you to change the target of the link by changing the topic that is pointed to by the key (for example, by profiling).
- You can use it in a map to create a reference to a topic by key: `<topicref keyref="feature.quick-heat"`. This allows you to change which topic is inserted in the map by the build, by changing the topic that is pointed to by the key.

- You can use it to insert a content reference. In this case, the content reference uses the key to locate the topic to pull content from. It uses a `conkeyref` attribute: `<procedure conkeyref="feature.quick-heat/preheat-procedure" />`. In this example, `feature.quick-heat` is the key, and `preheat-procedure` is the ID of a procedure within the topic for that key. Using this mechanism, you could have multiple versions of the preheat procedure in various topics and control which one is inserted by changing the topic that is pointed to by the key.

Assigning Keys to Graphics

You can assign a key to an image (using a map to point to the image file) and insert the image using the key.

DITA Reusable Components View on page 1558

Reusing DITA Content

Reusing content is one of the key features of DITA. DITA provides several methods for reusing content. Oxygen XML Editor plugin provides support for each of these methods.

Reusing Topics in DITA Maps

A DITA topic does not belong to any one publication. You add a DITA topic to a publication by referencing it in a map. You can reference the same topic in multiple maps.

Reusing Content with References and Keys

DITA allows you to reuse content by referencing it in another topic. DITA provides several mechanisms for including content by reference (`conref`, `conkeyref`, `coderef`). A `conref` creates a direct reference to a specific element of another topic. A `conkeyref` creates a reference to a key, which then points to a specific element in another topic. The advantage of using a `conkeyref` is that you can change the element that is included by changing the key reference. For example, since keys are defined in maps, if you include a topic in multiple maps, you can use a different key reference in each map. A `coderef` references an external file that contains literal code.

Oxygen XML Editor plugin provides support for all of these mechanisms.

While the `conref` and `conkeyref` mechanisms can be used to reference any content element, it is considered best practice to only *conref* or *conkeyref* content that is specifically set and managed as reusable content. This practice helps reduce expensive errors, such as an author accidentally deleting the source element that other topics are including by `conref`. Oxygen XML Editor plugin can help you create a reusable component from your current content.

Reusing Content with Reusable Components

DITA allows you to select content in a topic, create a reusable component from it and reference that component in other locations. Each reusable component is created as a separate file. Anytime the content needs to be edited, you only need to update it in the component file and all the locations in your topics that reference it will also be updated. This can help you to maintain continuity and accuracy throughout your documents.

Reusing Content with Variables

DITA allows you to replace the content of certain elements with a value that is pointed to by a key. This mechanism effectively means that you can create variables in your content, which you can then create multiple outputs by changing the value that the key points to. This is done by profiling the definition of the key value, or by substituting another map with a different key value.

Reusing Content with DITA 1.3 Concepts

DITA 1.3 allows you to use some advanced concepts to expand content reuse possibilities even further. *Key Scopes* (or scoped keys) allow you to reuse topics with variable content depending on the particular context and it maximizes reuse possibilities for keys. *Branch Filtering* allows you to reuse the same content that is profiled in multiple ways within the same publication, each time using a different filter.

Related Information:

Working with Keys on page 1538

Reusing DITA Topics in Multiple Maps

You can reuse an entire DITA topic simply by referencing it in multiple maps (or multiple locations within the same *map*) using one of the following procedures:

Reuse Topics Using the DITA Maps Manager

1. Make sure the *DITA map* is opened in the **DITA Maps Manager**.
2. Add a reference to an existing topic by using one of the following methods (depending on your particular situation):
   a. If the topic already exists in this *DITA map*, do one of the following:
      - Simply drag the topic and press **Ctrl** (or **Alt** on OS X) at the new location within the map (or use the **Copy** and **Paste** contextual menu actions).
      - If the topic is the currently opened document in the main editor, determine the new location in the map (in the **DITA Maps Manager**), right-click a parent or sibling topic, and select **Append Child** > **Reference to the currently edited file** or **Insert After** > **Reference to the currently edited file**.
   b. If the topic already exists in another *DITA map*, do one of the following:
      - Open the other map in the **DITA Maps Manager**, right-click the topic, select **Copy**, switch back to the original *DITA map* in the **DITA Maps Manager**, determine the new location in the map, right-click a parent or sibling topic, and use one of the **Paste** contextual menu actions (**Paste**, **Paste Before**, or **Paste After**).
      - If the topic is the currently opened document in the main editor, determine the new location in the map (in the **DITA Maps Manager**), right-click a parent or sibling topic, and select **Append Child** > **Reference to the currently edited file** or **Insert After** > **Reference to the currently edited file**.
   c. If the topic exists in the project, but has not yet been added to a *DITA map*, do one of the following:
      - Right-click the topic in the **Navigator** view (or the file system), select **Copy**, switch to the **DITA Maps Manager** view, determine the new location in the map, right-click a parent or sibling topic, and use one of the **Paste** contextual menu actions (**Paste**, **Paste Before**, or **Paste After**).
      - If the topic is the currently opened document in the main editor, determine the new location in the map (in the **DITA Maps Manager**), right-click a parent or sibling topic, and select **Append Child** > **Reference to the currently edited file** or **Insert After** > **Reference to the currently edited file**.
3. If your topic uses a key reference, set up the appropriate key definition in your map.
4. If you want to define relationships between topics, other than those defined in the topics themselves, you can add a relationship table to your map.
5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the **Validate and Check for Completeness** action on the toolbar in the **DITA Maps Manager**.

Reuse Topics Using Author Mode Editor

1. Open the *DITA map* in the **Author** mode editor.
2. Add a reference to an existing topic by dragging it from the **Navigator** view (or the file system) and dropping it in the desired location in the *DITA map* opened in **Author** mode. You can also accomplish the same thing by using the **Copy** and **Paste** contextual menu actions.

3. If your topic uses a key reference, set up the appropriate key definition in your map.
4. If you want to define relationships between topics, other than those defined in the topics themselves, you can add a relationship table to your map.
5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this validation, click the **Validate and Check for Completeness** action on the toolbar in the **DITA Maps Manager**.

Displaying Multiple References to the Same Topics

Whenever multiple references to the same topic are detected in the context of the current map in the **DITA Maps Manager**, an indicator will appear in the top-right corner of the **Author** mode editor that shows the number of times the current topic is referenced in the *DITA map*. It also includes navigation arrows that allow you to jump to the next or previous reference in the **DITA Maps Manager**.

Working with Content References

The DITA `conref` feature (short for *content reference*) lets you insert a piece of source content by referencing it from its source. When you need to update that content, you only need to do it in one place.

There are several strategies for managing content references:

- *Reusable components* - With this strategy, you create a new file for each piece of content that you want to reuse and you insert references from the content of the reusable component files. For example, suppose that you have a disclaimer that needs to be included in certain sections of your documentation. You can create a reusable component that contains your disclaimer and reuse it as often as you need to. If the disclaimer ever needed to be updated, you only have to edit it in one file.
- *Single-source content references* - You may prefer to keep many pieces of reusable content in one file. For example, you might want to create a single file that contains all the actions that are available in various menus or toolbars for your software application. Then, wherever you need to describe or display an action in your documentation, you can reuse content from that single file by inserting content references. This strategy requires more setup than reusable components, but might make it easier to centrally managing the reused content and it allows for more flexibility in the XML structure of the reusable content.
- *Arbitrary content references* - Although it is not recommended, you can create content references amongst topics without storing the reusable content in components or a single file. This strategy might make it difficult to manage content that is reused and to maintain continuity and accuracy, since you may not have any indication that content you are editing is reused elsewhere.

Oxygen XML Editor plugin creates a reference to the external content by adding a `conref` attribute to an element in the local document. The `conref` attribute defines a link to the referenced content, made up of a path to the file and the topic ID within the file. The path may also reference a specific element ID within the topic. Referenced content is not physically copied to the referencing file. However, by default Oxygen XML Editor plugin displays it in **Author** mode as if it is there in the referencing file. If you do not want referenced content displayed, open the **Preferences** dialog box , go to **Editor** > **Edit modes** > **Author**, and deselect the **Display referenced content** option.

Note: A reference also displays *tracked changes* and comments that are included in the source fragment. To edit these comments (or accept/reject changes) right-click the comment or tracked change and select **Edit Reference**.

Tip: To search for references made through a direct content references, use the **Search References** action from the contextual menu.

Creating a DITA Content Reference

DITA Content Reference

A DITA content reference, or `conref`, is one of the main content *reuse* features of DITA. It is a mechanism for re-using the same content in multiple topics (or even in multiple locations within the same topic).

For a `conref` to be created, the source content must have an `id` attribute that the `conref` can reference. Therefore, creating a `conref` requires that you add an `id` to the content to be reused before inserting a `conref` into the topic that reuses the referenced content.

Assigning an *ID* to the Referenced Content

To add an `id` to a DITA element in a topic, place the cursor on the element and select **Edit Attributes** from the contextual menu to open the in-place attribute editor. Enter `id` as the **Name** of the attribute and a value of your choice in the **Value** field. You can also use the **Attributes** view to enter a value in the **id** attribute.

Note: The element may already have an `id`, since in some cases Oxygen XML Editor plugin automatically generates an *ID* value when the `id` attribute is created.

Creating a Content Reference

To create a content reference (`conref`), follow these steps:

1. Make sure the element you want to reference has an *ID* assigned to it.
2. In **Author** mode, place the cursor at the location where you want the reused content to be inserted.
3. Select the **Reuse Content** action on the main toolbar (or from the **DITA** menu or **Reuse** submenu of the contextual menu). The **Reuse Content** dialog box is displayed.
4. In the **Location** field of the **Reuse Content** dialog box, select the topic that contains the element you want to reference. The elements that you can reference are presented in a table.
5. Select the **Target ID** of the element (or elements) from which you want to insert the content, and verify the content in the **Preview** pane. The `id` value of the element that you select is automatically added to the **Reference to (conref)** field.
6. Make any other selections you need in the **Reuse Content** dialog box. If you select multiple elements, the **Expand to (conrefend)** field is automatically filled with the `id` value of the last element in your selection.
7. Click **Insert** or **Insert and close** to create the content reference.

Using Copy/Paste Actions to Create a Content Reference

Oxygen XML Editor plugin also includes support for creating content references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute. Also, the location in the document where you paste the element must be valid, although as long as the **Smart paste and drag and drop** option is selected in the **Schema Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Editor plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content reference (`conref`) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an ID attribute assigned to it.
2. Place the cursor at a location where the copied element will be valid.
3. Select the **Paste as Content Reference** action from the **Paste Special** submenu from the contextual menu.

Other Ways to Reuse Content

- You can use the **Components** tab in the **DITA Reusable Components** view to easily insert content references.
- An alternate way to reuse content is to use the Oxygen XML Editor plugin **Create Reusable Component** and **Insert Reusable Component** actions (available in the **DITA** menu and the **Reuse** submenu of the contextual menu). They handle the details of creating an *ID* and *conref* and creates reusable component files, separate from your normal content files. This can help you manage your reusable content more effectively.

- You can also insert reusable content using content key references. This may also make reusable content easier to manage, depending on your particular situation and needs.
- Other topics in this section include information about more specialized or advanced ways or reusing content, such as *code references*, the *conref push mechanism*, *variable text*, *key scopes*, and *branch filtering*.

Creating a DITA Content Key Reference on page 1543

Creating a DITA Content Key Reference

DITA Content Key Reference

A DITA content key reference, or `conkeyref`, is a mechanism for inserting a piece of content from one topic into another. It is a version of the DITA content reference mechanism that uses keys to locate the content to reuse rather than direct references to topics that contain reused content.

As with a *conref*, a *conkeyref* requires that the element to be reused has an `id` attribute. It also requires the topic that contains the reusable content to be assigned a key in a map. As with all uses of keys, you can substitute multiple maps or use profiling to create multiple definitions of keys in a single map. This allows the same `conkeyref` to pull in content from various sources, depending on how your build is configured. This can make it easier to create and manage sophisticated content reuse scenarios.

Creating a Content Key Reference

To create a content key reference (`conkeyref`), follow these steps:

1. Make sure the topic that contains the reusable content is assigned a key in the *DITA map* and the element you want to reference has an *ID* assigned to it.
2. In **Author** mode, place the cursor at the location where you want the reused content to be inserted.
3. Select **Reuse Content** on the main toolbar (or from the **DITA** menu or **Reuse** submenu of the contextual menu). The **Reuse Content** dialog box is displayed.
4. Select the **Key** radio button for the content source and use the **Choose Key Reference** button to select the key for the topic that contains the reusable content (you can also select one from the drop-down list in the **Key** field). The elements that you can reference from the source are presented in the table in the middle of the **Reuse Content** dialog box.
5. Select the **Target ID** of the element (or elements) that you want to insert, and verify the content in the **Preview** pane. The `id` value of the element that you select is automatically added to the **Reference to (conkeyref)** field.
6. Make any other selections you need in the **Reuse Content** dialog box. If you select multiple elements, the **Expand to (conrefend)** field is automatically filled with the `id` value of the last element in your selection.
7. Click **Insert** or **Insert and close** to create the content reference.

Note: If you are using **Text** mode, when you insert a `conkeyref` attribute, after you enter the first quote (`conkeyref="`), the **Content Completion Assistant** will list all the defined keys that you can select from. Also, after you select the key, the **Content Completion Assistant** will then list the element IDs from the referenced topic, allowing you to insert an anchor. Note that this only works for local files.

Using Copy/Paste Actions to Create a Content Key Reference

Oxygen XML Editor plugin also includes support for creating content key references with simple copy/paste actions. When the DITA content is processed, the key references are resolved using key definitions from *DITA maps*. The copied content must be an entire DITA XML element with an ID attribute and the topic that contains the reusable content must have a key assigned in a *DITA map*. Also, the location in the document where you paste the element must be valid, although as long as the **Smart paste and drag and drop** option is selected in the **Schema Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Editor plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content key reference (`conkeyref`) using copy/paste actions, follow these steps:

1. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.
3. In a topic with an assigned key, copy an entire DITA element that has an ID attribute assigned to it.
4. Place the cursor at a location where the copied element will be valid.
5. Select the **Paste as Content Key Reference** action from the **Paste Special** submenu from the contextual menu.

Other Ways to Reuse Content

- You can use the **Components** tab in the **DITA Reusable Components** view to easily insert content key references.
- You can also insert reusable content using content references (*conref*).
- Other topics in this section include information about more specialized or advanced ways or reusing content, such as *code references*, the *conref push mechanism*, *variable text*, *key scopes*, and *branch filtering*.

Related Information:

Reuse Content Dialog Box on page 1545
Working with Reusable Components on page 1554
Editing DITA Content References on page 1544
DITA Reusable Components View on page 1558
Creating a DITA Content Reference on page 1542

Editing DITA Content References

Oxygen XML Editor plugin also includes some actions that allows you to quickly edit existing content references. When the element that contains a content reference (`conref` or `conkeyref`) is selected, the following actions are available in the **DITA** menu and the **Reuse** submenu of the contextual menu:

Edit Content Reference

This action is available for elements with a `conref` or `conkeyref` attribute. it opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`conref`/`conkeyref` and `conrefend` attributes). For more information, see Reuse Content Dialog Box on page 1545.

Replace Reference with content

Replaces the referenced fragment (`conref` or `conkeyref`) at the cursor position with its content. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location.

Remove Content Reference

Removes the content reference (`conref` or `conkeyref`) inside the element at the cursor position.

Converting Conrefs to Conkeyrefs

Oxygen XML Editor plugin includes a DITA refactoring operation called **Convert conrefs to conkeyrefs** that will find all *content references* (that reference content outside the current document) and convert them to *content key references*. You can also use it to quickly convert all *content references* in the current document or multiple documents at once.

To access the **Convert conrefs to conkeyrefs** operation, use one of the following methods:

Single Document Method

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the **DITA Maps Manager**), go to the **Refactoring** submenu, and choose **Convert conrefs to conkeyrefs**.

Multiple Documents At Once Method

Select **XML Refactoring** from the **XML Tools** menu (or from the **Refactoring** submenu when you right-click a document in the **Navigator** viewor the **DITA Maps Manager** view). Then select **Convert conrefs to conkeyrefs** from the **DITA** section and click **Next**.

Either method will proceed to the **XML Refactoring Wizard**. If you used the **Multiple Documents At Once Method**, the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.
- **Filters** section
  - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as ***** or **?**).
  - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.

If you used the **Single Document Method**, the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

Preview

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

Warning: It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

Finish

When you use the **Finish** button, the operation will be processed and all *content references* will be converted to *content key references* (either all *content references* in the current document or all *content references* in all of the documents specified in the scope). The file name for each converted document is used as the value for its new key. However, the operation does NOT automatically add the key to the *DITA Map*, so you still need to manually define each key in your *DITA map*.

Defining Keys in DITA Maps on page 1486

Reuse Content Dialog Box

The **Reuse Content** dialog box provides a mechanism for reusing content fragments. DITA `conref`, `conkeyref`, and `keyref` attributes can be used to insert references to reusable content. The `conref` attribute stores a reference to another element and is processed to replace the referencing element with the referenced element. The `conkeyref` attribute uses keys to locate the content to reuse rather than direct references to the topic that contains the reusable content. The `keyref` attribute also uses keys and can be used to indirectly reference metadata that may have different values in various circumstances.

Note: For a `conref` or `conkeyref`, to reference the content inside a DITA element, the source element must have an `id` attribute assigned to it. The element containing the content reference acts as a placeholder for the referenced element. For more details about DITA `conref` and `conkeyref` attributes, go to https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html.

Note: For the purposes of using a `keyref`, keys are defined at map level and referenced afterwards. For more information about the DITA `keyref` attribute, go to https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekeyrefattribute.html.

Oxygen XML Editor plugin displays the referenced content of a DITA content reference if it can resolve it to a valid resource. If you use URIs instead of local paths in your XML documents and your DITA OT transformation needs

an *XML Catalog* to map the URIs to local paths, you need to add the catalog to Oxygen XML Editor plugin. If the URIs can be resolved, the referenced content is displayed in **Author** mode and in the transformation output.

In **Author** mode, a references to reusable content (`conref`, `conkeyref`, or `keyref`) can easily be inserted at the cursor position by using the **Reuse Content** dialog box. It can be opened with any of the following methods:

- Go to **DITA** > **Reuse Content**.
- Click the **Reuse Content** action on the main toolbar.
- In the contextual menu of the editing area, go to **Reuse** > **Reuse Content**.

Your selection at the top of the dialog box for choosing the content source determines whether Oxygen XML Editor plugin will insert a `conref`, `conkeyref`, or `keyref`.

If you select **Location** for the content source, a *content reference* (`conref`) will be inserted. If you select **Key** for the content source, keys will be used to insert a *content key reference* (`conkeyref`) or a *key reference* (`keyref`).

Content Reference (`conref`) Options Using the Reuse Content Dialog Box

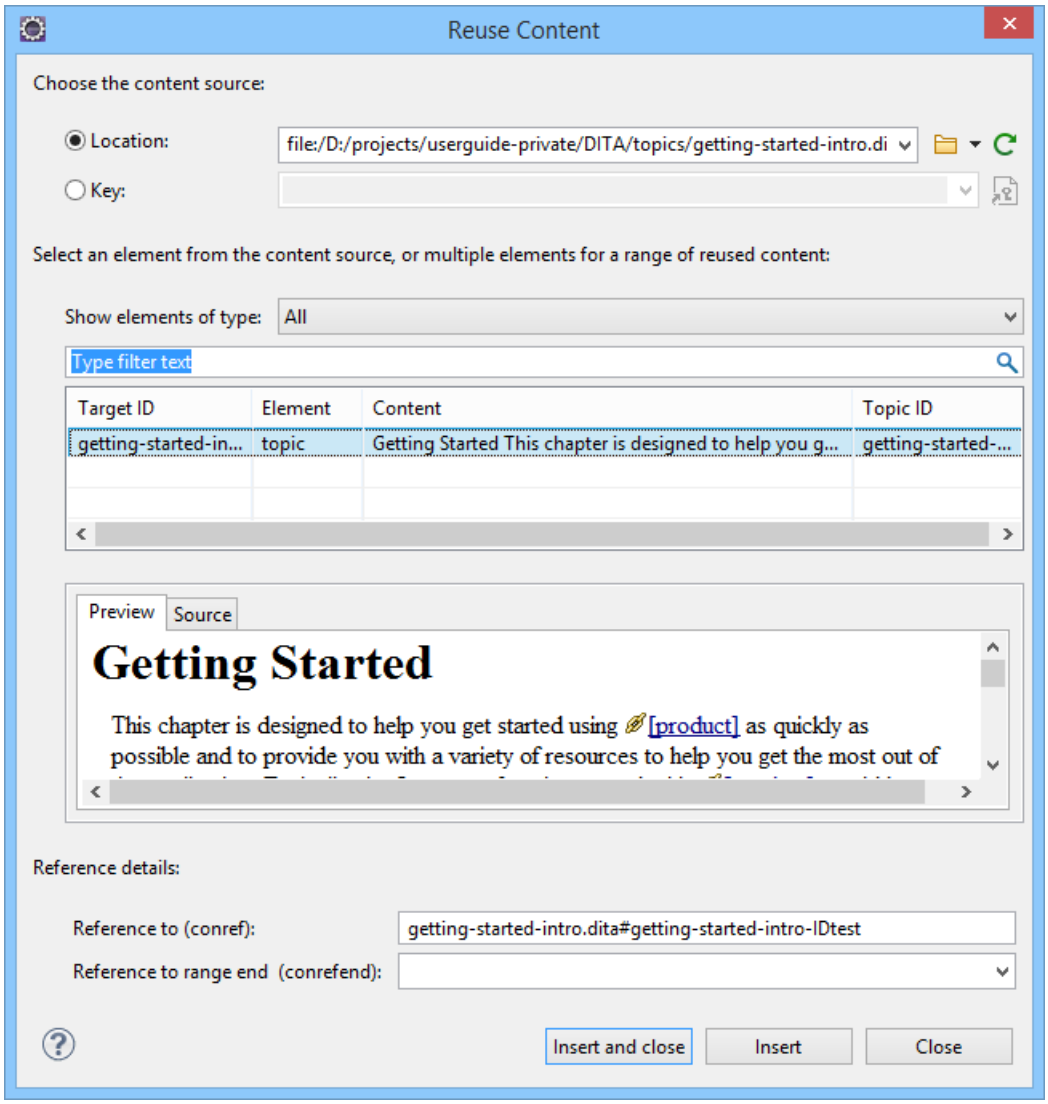

Figure 741: Reuse Content Dialog Box (with the Default Insert Content Reference Options Displayed)

Choose the content source Section

When **Location** is selected for the content source, a *content reference* (`conref`) will be inserted. Here you can specify the path of the topic that contains the content you want to reference.

The dialog box offers the following options:

Select an element from the content source Section

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane

Displays the source code of the element to be referenced.

Reference details Section

Reference to (conref)

Oxygen XML Editor plugin automatically fills this text field with the value of the `conref` attribute to be inserted. However, you can edit this value if need be.

Reference to range end (conrefend)

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor plugin automatically fills this text field with the `id` value of the last element in your selection. This value will be inserted as a `conrefend` attribute, defining the end of the `conref` range.

Content Key Reference (`conkeyref`) Options Using the Reuse Content Dialog Box

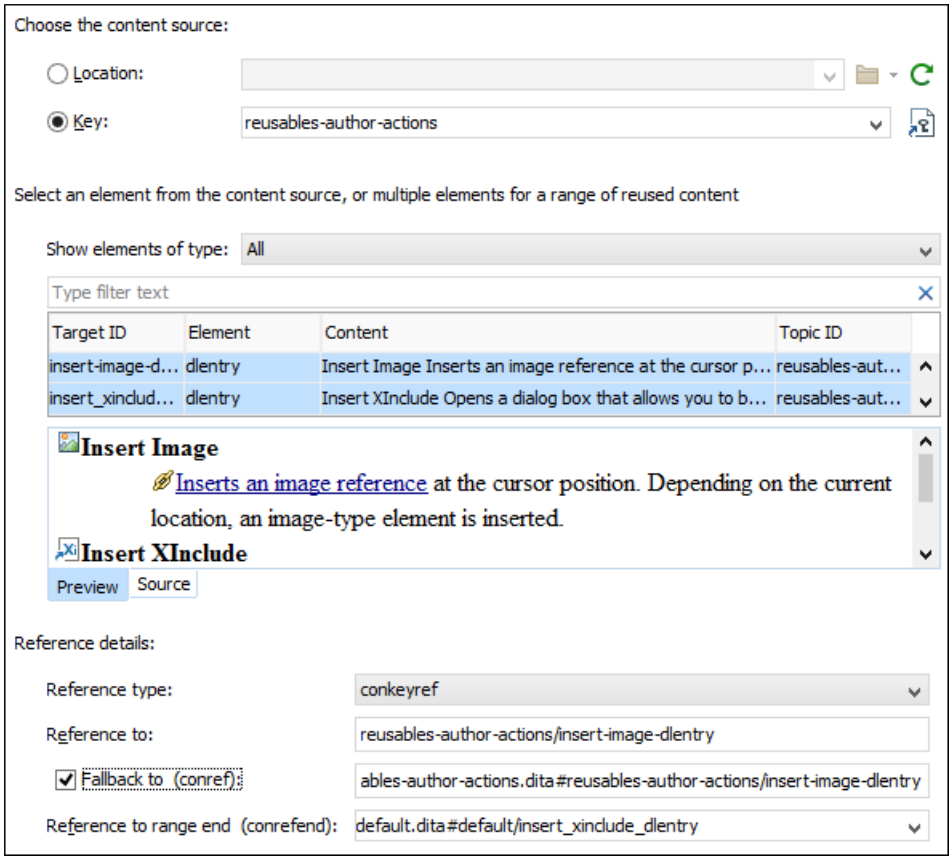

Figure 742: Insert Content Key Reference Options

Choose the content source Section

When **Key** is selected for the content source, you can use keys to reference content. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the *root map* (you can also select one from the drop-down list in the **Key** field).

Note: If the current *DITA map* is not selected as the *root map*, no keys will be listed.

Tip: You can also use the **DITA Reusable Components** view for similar purposes.

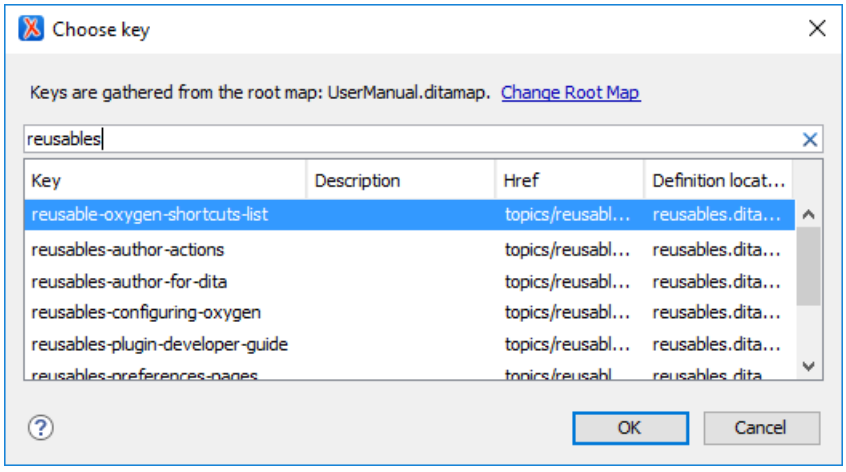

Figure 743: Choose Key Dialog Box

The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a *root map*.

- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific keys.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key.
  - **Description** - The description of the key that is obtained from the definition of the key (for example, the description for a *keydef* would be found in the `keyword` element inside *topicmeta*, or the description for a *topicref* would be found in a `navitle` element). For more information about where the data in this column is collected, see this note.
  - **Href** - The value of the *href* where the key points to.
  - **Definition Location** - The name of the *DITA map* where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

To insert a *content key reference* (`conkeyref`), select the key that contains the content you want to reference. Notice that the file path is shown in the **Href** column. Keys that do not have a value in the **Href** column are for referencing metadata with a `keyref` attribute. Therefore, to insert a `conkeyref`, you need to select a key that does have a value (file path) in the **Href** column.

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that is defined as a *content key reference* has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `conkeyref`:

Select an element from the content source Section

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane

Displays the source code of the element to be referenced.

Reference details Section

Reference type

The type of reference that will be inserted. If you selected a key that references a DITA resource, you will notice that **conkeyref** value is automatically selected.

Reference to

Oxygen XML Editor plugin automatically fills this text field with the value of the `conkeyref` attribute to be inserted. However, you can edit this value if need be.

Fallback to (conref)

You can select this option to define a `conref` attribute to be used as a fallback to determine the content reference relationship if the specified `conkeyref` cannot be resolved.

Reference to range end (conrefend)

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor plugin automatically fills this text field with the `id` value of the last element in your selection. This value will be inserted as a `conrefend` attribute, defining the end of the `conkeyref` range.

Key Reference to Metadata (`keyref`) Options Using the Reuse Content Dialog Box

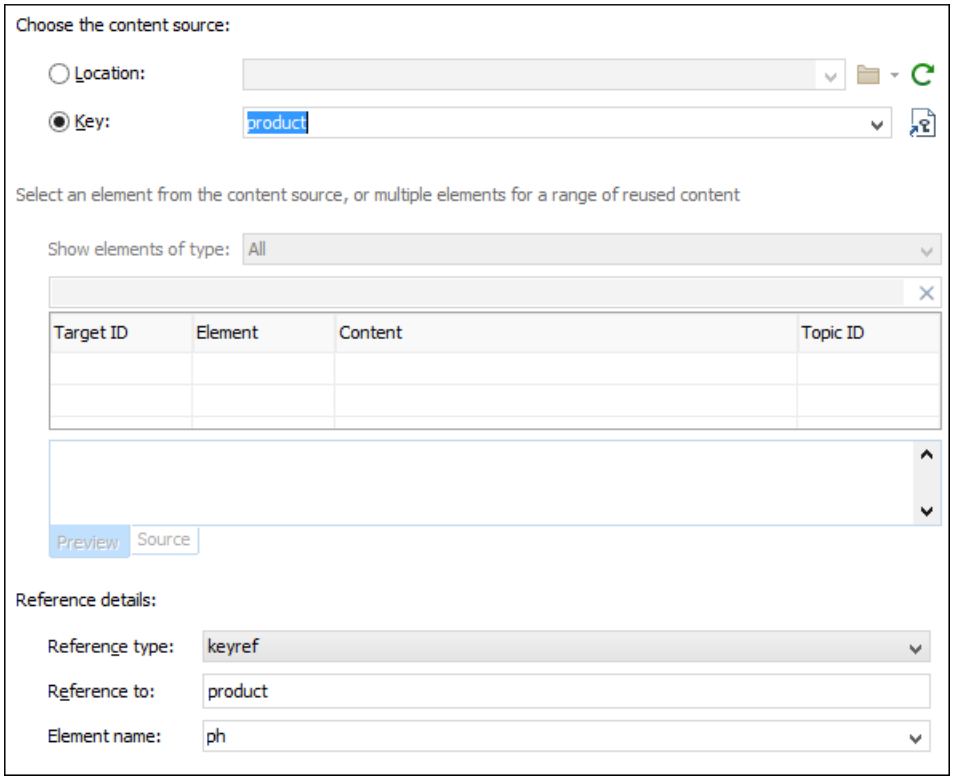

Figure 744: Insert Key Reference Options

Choose the content source Section

When **Key** is selected for the content source, you can use keys to reference content. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the *root map* (you can also select one from the drop-down list in the **Key** field).

Note: If the current *DITA map* is not selected as the *root map*, no keys will be listed.

Tip: You can also use the **DITA Reusable Components** view for similar purposes.

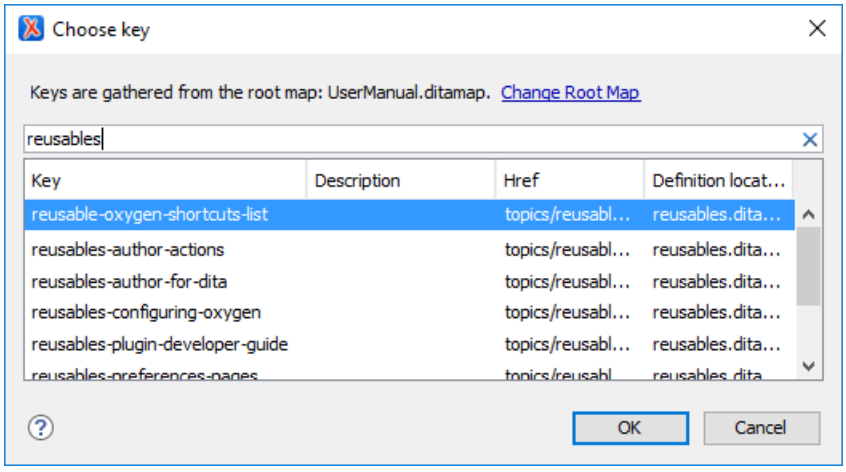

Figure 745: Choose Key Dialog Box

The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a *root map*.
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific keys.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key.
  - **Description** - The description of the key that is obtained from the definition of the key (for example, the description for a *keydef* would be found in the `keyword` element inside *topicmeta*, or the description for a *topicref* would be found in a `navitle` element). For more information about where the data in this column is collected, see this note.
  - **Href** - The value of the *href* where the key points to.
  - **Definition Location** - The name of the *DITA map* where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

To insert a *key reference* to metadata (`keyref`), select the key you want to reference. Keys that do not have a value in the **Href** column are for referencing metadata with a `keyref` attribute. Therefore, to insert a `keyref`, you need to select a key that does not have a value (file path) in the **Href** column.

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that references metadata has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `keyref`:

Select an element from the content source Section

This section is not used when referencing metadata.

Reference details Section

Reference type

The type of reference that will be inserted. If you selected a key that does not reference a DITA resource, you will notice that **keyref** value is automatically selected.

Reference to

Oxygen XML Editor plugin automatically fills this text field with the value of the `keyref` attribute to be inserted.

Element name

Oxygen XML Editor plugin automatically selects the element that is most commonly used for the selected type of key reference, but you can use the drop-down list to choose another element to use for the reference.

Finalizing Your Content Reference Configuration

Once you click **Insert** or **Insert and close**, the configured content reference is inserted into your document.

Tip: You can easily insert multiple content references by keeping the **Reuse Content** dialog box opened, using the **Insert** button.

Working with Code References

Code References

The DITA `coderef` element can be used to reference an external file that contains literal code. This is especially useful if you need to reference code from an external source that may occasionally change. Another advantage is that you don't have to convert illegal characters into their character equivalents. When the `coderef` is processed, the referenced code file is imported and delimiting characters (such as < or &) are displayed as standard text, rather than treated as XML markup.

For more information about code references, see DITA 1.3 Specification: Coderef.

Example of using a Coderef

```
<p>This code is an example of how to use a coderef.</p>
  <codeblock><coderef href="MyExternalCode.xsl"/></codeblock>
```

Defining Line Ranges

DITA-OT provides additional code reference processing support that allows you to define line ranges in case you only want to reference certain parts of the external file, rather than the whole file.

For information and examples of how to define line ranges, see DITA Open Toolkit Documentation: Extended Code Reference Processing.

Working with the Conref Push Mechanism

Content Reference Push Mechanism

The usual method of using content references pulls element content from a source element and inserts it in the current topic. DITA 1.2 introduced an alternative method of content referencing, allowing element content to be pushed, or injected, from a source topic to another topic without any special coding in the topic where the content will be re-used. This technique is known as a content reference *push* mechanism (*conref push*).

The *conref push* mechanism requires elements in the target topic (the topic where the content is to be pushed) to have ID elements, as the push mechanism inserts elements *before* or *after* a named element, or *replaces* the named element. Assuming the source topic is included in the *DITA map*, the *conref push* will be processed during publishing stage for the *DITA map*.

Example of a Conref Push Scenario

An example of a scenario in which a *conref push* would be useful is where a car manufacturer produces driver manuals that are distributed to various regions with their own specific regulations and certain sections need to be customized by the local car dealers before publishing. The local dealer could use a *conref push* technique to insert specific content without modifying the manufacturer-supplied content.

Push Current Element Action

Oxygen XML Editor plugin includes an action that allows you to easily reference content with a *conref push* mechanism. The **Push Current Element** action is available in the **DITA** menu and in the **Reuse** subfolder of the contextual menu when editing in **Author** mode. Selecting this action opens the **Push current element** dialog box that allows you to select a target resource and element, and where to insert the current element content.

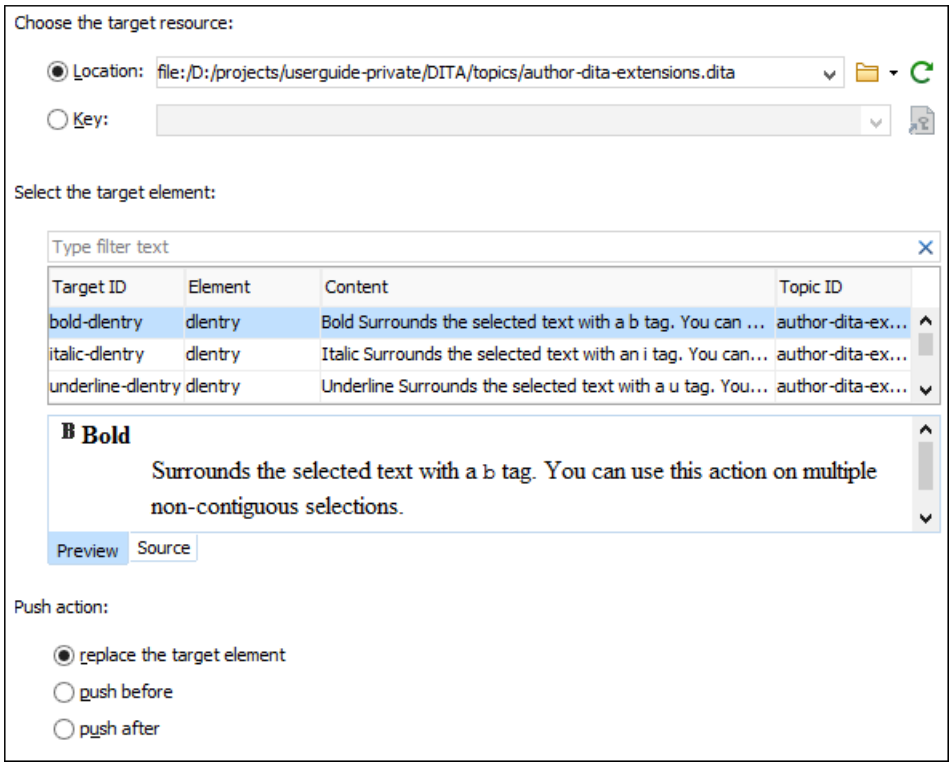

Figure 746: Push Current Element Dialog Box

This dialog box allows you to configure the following options for the *conref push* action:

Choose the target resource

Allows you to select a **Location** URL or a **Key** for the target resource and the table in the next section of the dialog box will be populated using the information from the specified resource.

Select the target element

The table in this section contains the available elements (identified by their ID) that belong to the same class as the current element on which the action was invoked.

Push action

Allows you to choose one of the following options for where you want to insert the current element content:

replace the target element

The target element will be replaced with the current element content.

On the technical side, the value of the `conaction` attribute in the current element will be set to `pushreplace` and the `conref` or `conkeyref` attribute will be set to the specified reference.

push before

The current element content will be inserted before the specified target element in the target resource.

On the technical side, the value of the `conaction` attribute in the current element will be set to `pushbefore`. Another element with the same name and class as the target element will be inserted in the document after the current element. The new element will have the `conaction` attribute set to `mark` and the `conref` or `conkeyref` attribute will be set to the specified reference.

push after

The current element content will be inserted after the specified target element in the target resource.

On the technical side, the value of the `conaction` attribute in the current element will be set to `pushafter`. Another element with the same name and class as the target element will be inserted in the document before the current element. The new element will have the `conaction` attribute set to `mark` and the `conref` or `conkeyref` attribute will be set to the specified reference.

You can also use the **Preview** panel to view the content that will be pushed and the **Source** panel to see the XML code for the content to be pushed. After you click **OK**, the *conref push* mechanism is inserted in the current document. The changes in the target resource will be processed when you transform the *DITA map*.

Related Information:

For more technical details about the conref push mechanism, refer to "The Conref Push Technique" section of The DITA Style Guide Best Practices for Authors.

Working with Reusable Components

In DITA, the content of almost any element can be made reusable simply by adding an `id` attribute to the element. The DITA content reference mechanism can reuse any element with an *ID*. However, it is not considered best practice to arbitrarily reuse pieces of text from random topics due to the difficulties this creates in trying to manage it. It also creates the possibility of authors deleting or changing content that is reused in other topics without being aware that the content is reused.

To prevent these types of problems, you can create reusable components to manage a separate set of topics that contain topics designed specifically for reuse. Then, all of your reusable content can be referenced from the reusable components and if the content needs to be updated you only need to edit it in one place.

Oxygen XML Editor plugin allows you to select content in a topic, create a reusable component from it and reference that component in other locations by using the **Create Reusable Component** and **Insert Reusable Component** actions.

Related Information:

DITA Reusable Components View on page 1558

Creating a Reusable Content Component

Oxygen XML Editor plugin makes it easy to create reusable content components from existing topic content.

Note: To ensure that the topic file that contains the reusable component is a valid container for just the reusable content component, without having to include the other elements required by a standard topic type, Oxygen XML Editor plugin creates a specialized topic type on the fly. This specialization is designed to make sure that the content is compatible with the topic type from which it is created.

Follow these steps to create a reusable component:

1. In **Author** mode, select the content you want to make into a reusable component.
2. Select the **Create Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu.
   The **Create Reusable Component** dialog box is displayed.
3. Use the **Reuse Content** drop-down list to select the scope of the content to be made reusable. It allows you to select how much of the current content you want to make reusable. The choices presented include the element at the current cursor position and its ancestor elements.
4. Add a description. This becomes the title of the topic that contains the reusable component, but is not part of the reusable content. It is just to help you identify the reusable content and will not become part of your output.
5. If you want to replace the extracted content with a reference to the new component you should leave the **Replace selection with content reference** option selected. This is recommended, since the point of reuse is to maintain only one copy of the content.
6. Select a file name and location to save the topic containing the reusable component and click **Save**. It is considered best practice to save or store reusable components in an area set aside for that purpose.
   If the **Replace selection with content reference** option was selected, Oxygen XML Editor plugin replaces the current content with a `conref` attribute. The content of the content reference will be displayed in your current topic with a gray background, but it will no longer be editable since it is stored in a separate file. To edit the source of the reusable component, click the **Edit Content** icon at the beginning of the inserted content.

You now have a reusable component that you can include in other topics by using the **Insert Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu. You can also reference this new reusable component by using a content reference or content key reference.

Inserting a Reusable Content Component

Oxygen XML Editor plugin includes an **Insert Reusable Content** action that allows you to easily insert a reusable content component that you created using the **Create Reusable Component** action.

CAUTION: This action is only designed to insert reusable components created using the Oxygen XML Editor plugin **Create Reusable Component** action. It assumes certain things about the structure of the reusable content file that may not be true of reusable content created by other methods and it may not provide the expected results if used with content that does not have the same structure.

The **Insert Reusable Content** action creates a DITA `conref` to insert the content, and creates a parent element for the `conref` attribute based on the type of the reusable element in the reusable component file. This action ensures that the correct element is used to create the `conref`. However, that element must still be inserted at a point in the current topic where that element type is permitted.

To insert a reusable component that was created using the **Create Reusable Component** action, follow these steps:

1. Place the cursor at the insertion point where you want the reusable component to be inserted.
2. Select the **Insert Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu.
   The **Insert Reusable Component** dialog box is displayed.
3. Locate the reusable content file in which you want to insert its content.
4. If you select **Content reference** in the **Insert as** drop-down list, the action will add a `conref` attribute to the DITA element at the current location. If you select **Copy** in the drop-down list, the content of the reusable component file will simply be pasted at the current location (assuming the content is valid at the current location).
5. Click **Insert** to perform the action.

Working with Variable Text in DITA

You may often find that you want a certain piece of text in a topic to have a different value in various circumstances. For example, if you are reusing a topic about a feature that is shared between several products, you might want to make the name of the product variable so that the correct product name is used in the manual for each product.

For example, you might have a sentence like this:

```
The quick-heat feature allows [product-name] to come up to temperature quickly.
```

You need a way to substitute the correct product name for each product.

One way to do this would be to use conditional profiling, as in the following example:

```
<p>The quick-heat feature allows
    <ph product="basic">Basic Widget</ph>
    <ph product="pro">Pro Widget</ph>
to come up to temperature quickly.</p>
```

Creating Variable Text Using Keys

In DITA, you can create variable text using keys.

One way to do this would be to provide conditional values using the `product` profiling attribute.

However, this approach means that you are repeating the product names over and over again everywhere the product name is mentioned. This is time consuming for authors and will create a maintenance problem if the product names change.

Creating Variable Content Using a Key Reference

The alternative is to use a key reference, as in the following example:

```
<p>The quick-heat feature allows <ph keyref="product"/>
   to come up to temperature quickly.</p>
```

The definition of the key reference determines the name of the product:

```
<keydef keys="product" product="basic">
    <topicmeta>
      <keywords>
        <keyword>Basic Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="product" product="pro">
    <topicmeta>
      <keywords>
        <keyword>Pro Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
```

When the content is published, the current value of the key `product` will be inserted.

Inserting a Keyref

To insert a key reference into a document in Oxygen XML Editor plugin **Author** mode, use one of the following methods:

- **DITA Reusable Components View Method**

  Use the **DITA Reusable Components** view to insert a *variable reference* to the defined key.
- **Code Template Method**

  Add the source code pattern of the defined key to a code template so that it appears in the list of proposals in the *Content Completion Assistant*.
- **Edit Attributes Method**

  Manually insert the `keyref` attribute using the attributes editor as follows:

  1. Press **Enter** and select any DITA element that supports the `keyref` attribute.
  2. Select **Edit Attributes** from the contextual menu to bring up the attributes editor.
  3. In the **Name** field, select `keyref`.
  4. In the **Value** field, select or enter the name of the defined key.
- **Text Mode Method**

  If you are using **Text** mode, when you insert a `keyref` attribute, after you enter the first quote (`keyref="`), the **Content Completion Assistant** will list all the defined keys that you can select from. Note that this only works for local files.

Defining Keys in DITA Maps on page 1486

Working with DITA 1.3 Key Scopes

DITA 1.3 includes the possibility of using a concept called *Key Scopes* (or scoped keys). It allows you to reuse a topic in multiple places within the same *DITA map*, but with slightly different content in each instance.

Key Scopes Use-Case

Suppose that you develop a software product and you have a topic in your user guide that explains how to install your product on a Windows operating system. Suppose that the steps are exactly the same for installing it on Linux and the only difference is the name of the operating system. Therefore, it would be helpful if you could reuse the exact same content in two different topics, but with the name of the operating system different in each instance. In DITA 1.2, this is not possible since keys can only be resolved to a single value. However, with the DITA 1.3 *Key Scopes* mechanism, you can define multiple values for the same key depending on the context.

How to Use Key Scopes in Oxygen XML Editor plugin

To use DITA 1.3 key scopes in Oxygen XML Editor plugin, follow these steps:

1. Define the keys to be used in multiple places within your *DITA map*.

2. For each particular topic that contains the keys, define the key scopes:
   a. Right-click the topic in the **DITA Maps Manager** and select **Edit properties**.
   b. In the **Keys** tab, enter a value (or multiple values) in the **Key scopes** field.

      Tip: If you do not see the **Key scopes** field, make sure the support for DITA 1.3 (DITA-OT 2.x) is enabled in the DITA preferences page.
   c. Click **OK** to save your changes.
3. Save the *DITA map*.

   Result: In the **DITA Maps Manager**, you can now see the key scopes in brackets and when you open each topic reference.

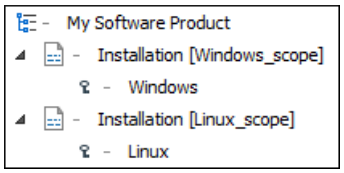

Figure 747: Key Scopes in DITA Maps Manager

The content will also be expanded in **Author** mode according to the context of the key scope you defined for that particular topic. Also, when you transform the *DITA map*, the scoped keys will be reflected in the published content.

Resources

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the *DITA 1.3 Key Scopes - Next Generation of Reuse* blog post.
- You can also watch our DITA 1.3 video tutorial to see how key scopes can be used in Oxygen XML Editor plugin.

Oxygen XML Blog: DITA 1.3 Key Scopes - Next Generation of Reuse
Oxygen Video Tutorial: DITA 1.3 (Key Scopes, Branch Filtering)

Working with DITA 1.3 Branch Filtering

DITA 1.3 allows you to use a mechanism called *Branch Filtering* that enables you to set filtering conditions for specific branches of a *DITA map*. This makes it possible for multiple conditional profiles to be applied within a single publication, each time with a different filter.

Branch Filtering Use-Case

Suppose that you sell two models of a mobile phone and you need to create a brochure for each model. You want both brochures to have the same structure and most of the content is the same for both brochures. The only differences are in the values for certain details (for example, the model name, size dimensions, battery life, etc.) Therefore, it would be helpful if you could use the same topic and reference it twice in the same map, with each reference using different filtering conditions. In DITA 1.2, this is not possible since you can only apply one DITAVAL filter to a map. However, with the DITA 1.3 *Branch Filtering* mechanism, you can reuse content multiple times within the same map, each time using different filters.

How to Use Branch Filtering in Oxygen XML Editor plugin

To use DITA 1.3 branch filtering in Oxygen XML Editor plugin, follow these steps:

1. The support for DITA 1.3 must be enabled in the DITA preferences page.
2. Assuming you have already defined your profiling attributes, create a DITAVAL filter file.
3. Insert a reference to the DITAVAL filter file in the *DITA map*:

a. Right-click the *DITA map* reference in the **DITA Maps Manager** and select **Append Child** > **DITAVAL Reference**.

   Tip: If you do not see the **DITAVAL Reference** option, make sure the support for DITA 1.3 (DITA-OT 2.x) is enabled in the DITA preferences page.

b. Select the DITAVAL file.

c. Click **Insert and Close**.

4. Save the *DITA map*.

   Result: You can now see the **ditaval** files referenced in the **DITA Maps Manager** and when you transform the *DITA map*, filtered content will be reflected in the published output.

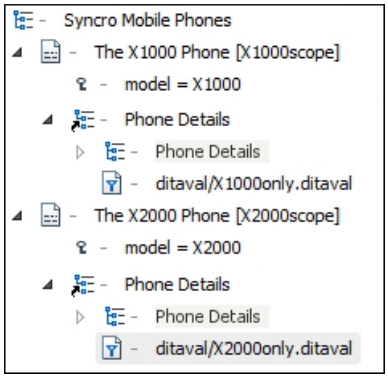

Figure 748: Branch Filtering in DITA Maps Manager

Resources

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the *DITA 1.3 Branch Filtering - Next Generation of Reuse* blog post.
- You can also watch our DITA 1.3 video tutorial to see how branch filtering can be used in Oxygen XML Editor plugin.

DITA Reusable Components View

The **DITA Reusable Components** view is helpful if you use a large amount of keys or reusable components in your DITA project. It collects all of the keys and reusable components that are defined in the *root map* and presents them in a dynamic table where you can easily locate and insert references to them. If the view is not displayed, it can be opened by selecting it from **Window** > **Show View** > **Other**. It will appear in the bottom-right section of the editor. It re-collects the keys anytime the *root map* is changed or you switch the editor focus to a different file.

It includes two tabs:

- **Keys** - Displays all the *keys* that are defined in the *root map* and provides ways to easily insert references to them as cross reference links, key references, or variables. It includes a search filter field to help you find particular keys and some contextual menu actions. It also supports drag and drop actions and double-clicking a key is the fastest way to insert a reference.
- **Components** - Displays all the topics (from the *root map*) that contain *reusable components* and provides ways to easily insert them as content references or content key references. To determine which topics to display in this tab, Oxygen XML Editor plugin looks for any *topicref* in the *root map* that is marked as *resource-only*. This tab includes a search field, some filtering options, and some simple links and contextual menu actions to quickly insert references or open their source file. It also supports drag and drop and double-clicking actions.

Keys Tab

The **DITA Reusable Components** view collects all the *keys* that are defined in the current *root map* and displays them in the **Keys** tab. Keys that are defined with a value have that value listed in the **Description** column while keys that are defined with an *href* pointing to their location have that href value listed in the **Href** column.

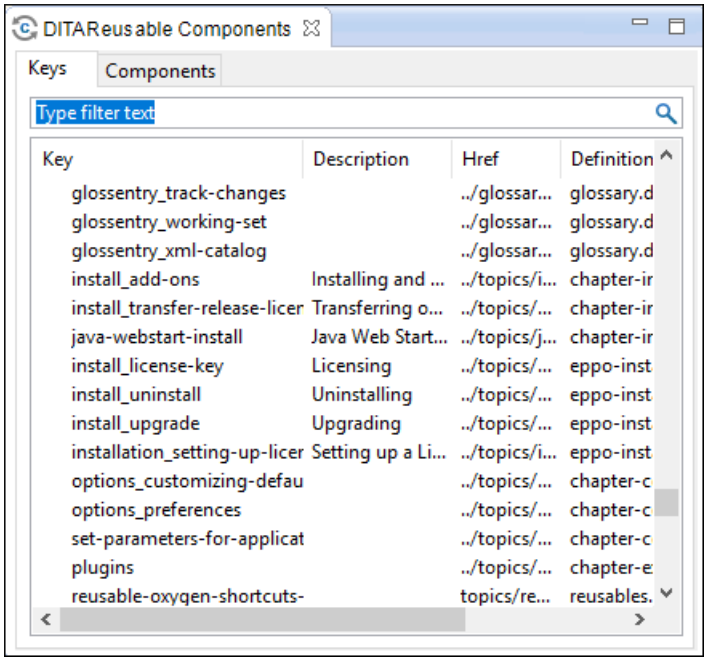

Figure 749: DITA Reusable Components View - Keys Tab

The **Keys** tab includes the following features and options:

Search Filter

You can enter text in the filter field at the top of this tab to filter the list and search for a specific keys.

Columns

This tab includes the following columns:

- **Key** - The name of the key.
- **Description** - The description of the key that is obtained from the definition of the key (for example, the description for a *keydef* would be found in the `keyword` element inside *topicmeta*, or the description for a *topicref* would be found in a `navitle` element). For more information about where the data in this column is collected, see this note.
- **Href** - The value of the *href* where the key points to.
- **Definition Location** - The name of the *DITA map* where the key is defined.

Note: The **Description** column collects data from the definition of the key, either from the `navtitle` element or, if missing, from the `keyword` element. The following example shows two key definitions that will be collected in the keys table. Their corresponding information from the **Description** column will display `oxygen.sh` and `oxygen.tar.gz` respectively.

```
<keydef keys="executableInstallLinux">
  <topicmeta>
    <keywords>
      <keyword>oxygen.sh</keyword>
    </keywords>
  </topicmeta>
</keydef>

<keydef keys="archiveInstallAll">
  <topicmeta>
    <navtitle>
      oxygen.tar.gz
    </navtitle>
  </topicmeta>
</keydef>
```

Double-Click Mechanism

You can double-click any key listed in this tab to insert a key reference at the current cursor position or surrounding the current selection.

- If the selected key points to an `href` value, it is inserted as a cross reference link (*xref*).
- If the selected key is a reference to an image, it is inserted as an `image` element.
- If the selected key does not have an associated `href`, it is inserted as a variable reference (*ph*).

Drag and Drop Mechanism

You can drag a key from this tab and drop it in the main editor to insert a key reference at the current cursor position.

- If the selected key points to an `href` value, it is inserted as a cross reference link (*xref*).
- If the selected key is a reference to an image, it is inserted as an `image` element.
- If the selected key does not have an associated `href`, it is inserted as a variable reference (*ph*).

Contextual Menu Actions

Insert as Link

Inserts a cross reference link (*xref*) to the selected key at the current cursor position or surrounding the current selection.

Insert as Variable

Inserts a variable reference (*ph*) to the selected key at the current cursor position or surrounding the current selection. However, if the selected key is a reference to an image, this action inserts the key reference in an `image` element.

Insert as Keyref

Presents a submenu with all the elements that can be inserted at the current cursor position. Selecting an element will insert that element at the current cursor position or surrounding the current selection with a `keyref` attribute and its value set to the selected key.

Go to Definition

Opens the *DITA map* where the key is defined.

Search References

Searches for all references to the selected key in the entire *DITA map* structure.

Group by Definition Location

A toggle action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

Components Tab

The **DITA Reusable Components** view collects all the topics from the current *root map* that are marked as *resource-only*, then collects the reusable components from those topics, and displays them in the **Components** tab. To set a topic as *resource-only*, the `topicref` in the DITA map file needs to have a `processing-role` attribute set like this:

```
<topicref href="topics/randomize-xml-content.dita" processing-role="resource-only"/>
```

The **DITA Reusable Components** view considers topic references that contain `processing-role="resource-only"` to be candidates to contain reusable components. The reusable components inside these topics are collected from all elements that have an *ID* specified. These reusable components are displayed in the **Components** tab along with the file name and the specific names of the elements that contain an *ID* attribute.

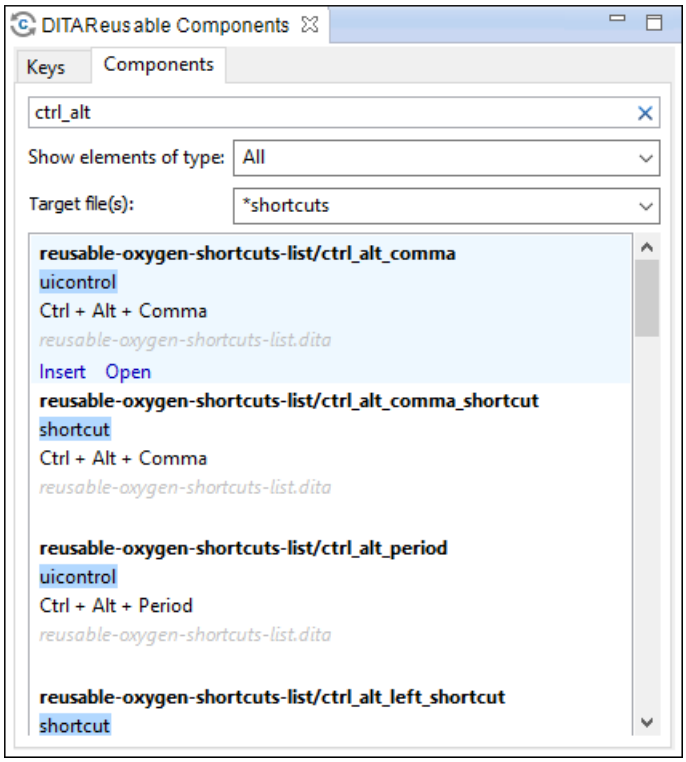

Figure 750: DITA Reusable Components View - Components Tab

The **Components** tab includes the following features and options:

Search Filter

You can enter text in the filter field at the top of this tab to filter the list and search for specific content inside the list of reusable components. This field supports many of the Lucene-based search patterns, such as wildcards (*, ?), boolean operators (AND, OR, NOT), fuzzy searches (~), boosting searches (^), and more.

Show Elements of Type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent preview window. This can help you narrow down the list of possible source elements that you can select.

Target File(s)

You can use this combo box to search for specific target files (the topics that contain reusable components) or select a file from its drop-down list. You can also use wildcards (such as * or ?) in this field.

Double-Click Mechanism

You can double-click any reusable component listed in preview window in this tab to insert it as a content reference or content key reference at the current cursor position or replace the current selection.

- If the parent topic of the selected component has a key defined, it is inserted as a content key reference (*conkeyref*).
- If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (*conref*).

Drag and Drop Mechanism

You can drag a reusable component from the preview window in this tab and drop it in the main editor to insert a content reference or content key reference at the current cursor position.

- If the parent topic of the selected component has a key defined, it is inserted as a content key reference (*conkeyref*).
- If the parent topic of the selected component does not have a key defined, it is inserted as a content reference (*conref*).

Hover and Click Actions

If you hover over a component shown in the preview window, you have access to the following link actions:

Insert

Inserts the component as a content reference or content key reference at the current cursor position or replaces the current selection. If the parent topic has a key defined, it is inserted as a content key reference (*conkeyref*). Otherwise, it is inserted as a content reference (*conref*).

Open

Opens the source file that contains the reusable component.

Contextual Menu Actions

Insert Content Reference

Inserts the component as a content reference (*conref*) at the current cursor position or replaces the current selection.

Insert Content Key Reference

Inserts the component as a content key reference (*conkeyref*) at the current cursor position or replaces the current selection. This action is only available if the parent topic has a key defined.

Go to Definition

Opens the source file that contains the reusable component.

Search References

Searches for all references to the selected component in the entire *DITA map* structure.

Linking in DITA

DITA provides support for various types of linking between topics, some of which is automated, while others are specified by the author. Oxygen XML Editor plugin provides support for all forms of linking in DITA.

Linking Between Parent, Child, and Sibling Topics

A *DITA map* creates a hierarchical relationship between topics. That relationship map expresses a narrative flow from one topic to another, or it may be used as a classification system to help the reader find topics based on their classification, without creating a narrative flow. Since there may be various types of relationships between topics in a hierarchy, you may want to create links between topics in a variety of ways. For instance, if your topics are supposed to be organized into a narrative flow, you may want to have links to the next and previous topics in that flow. If your topics are part of a hierarchical classification, you may want links from parent to child topics, and vice versa, but not to the next and previous topics.

Parent, child, and sibling links are created automatically by the DITA output transformations (and may differ between various output formats). The kinds of links that are created are determined by the DITA *collection-type* attribute.

In-Line Linking in the Content of a Topic

DITA supports linking within the text of a topic using the `xref` element. The destination of the link can be expressed directly using the `href` attribute or indirectly using the `keyref` attribute. If you use the `keyref` attribute, you link to a key rather than directly to a topic. That key is then assigned to a topic in a map that includes that topic. This means that you can change the destination that a key points to by editing the key definition in the map or by substituting another map in the build.

Linking Between Related Topics

In addition to the relationships between topics that expressed by their place in the hierarchy of a map, a topic may be related to other topics in various ways. For instance, a task topic may be related to a concept topic that gives the background of the task, or to a reference topic that provides data needed to complete the task. Task topics may also be related to other tasks in a related area, or concepts to related concepts.

Typically, they are grouped in a list at the end of the topic, although this depends on the behavior of the output transformation. DITA provides two mechanisms for expressing relationships between topics at the topic level: the **Related Links** section of a topic and relationship tables in maps.

Managing Links

Links can break for a variety of reasons. The topic that a link points to may be renamed or removed. A topic may be used in a map that does not include a linked topic. A topic or a key may not exist in a map when a particular profile is applied. The **DITA Maps Manager** provides a way to validate all the links in the documents that are included in the map. This can include validating all the profiling conditions that are applied.

Hierarchical Linking in DITA Maps

To create hierarchical linking between the topics in a *DITA map*, you set the appropriate value of the `collection-type` attribute on the map. See the DITA documentation for the meaning of each of the values of the `collection-type` attribute.

Note: Publishing scripts determine when and how to create hierarchical links. The `collection-type` attribute does not force a particular style of linking. Instead, it declares what the nature of the relationship is between the topics. The publishing scripts use that information to determine how to link topics. Scripts for different types of media might make the determination depending on what is appropriate for the particular type of media. You can provide additional instructions to the scripts using the `linking` attribute.

To add the `collection-type` to an item in a map:

1. Right-click the topic and choose **Edit Properties**. The **Edit Properties** dialog box is displayed.
2. In the **Attributes** tab, select the appropriate value from the **Collection type** drop-down list.
3. You can use the **Other attributes** table to add a value to the `linking` attribute.

Linking in DITA Topics

Direct Links

You can create inline links in the content of a DITA topic using the `xref` element. The destination of the link can be expressed directly by using the `href` attribute and the target can be another topic or a specific element within the other topic, another location within the same topic, a file, or a web link. You can also create direct *related links* to topics, files, or websites in a DITA topic using the `related-links` element.

Indirect Links Using Keys

The destination of the link can also be expressed indirectly by using keys to create either inline links or *related links* (with the `keyref` attribute). By using keys, you avoid creating a direct dependency between topics. This makes links easier to manage and can make it easier to reuse topics in various publications. It can also be helpful in verifying the completeness of a publication, by ensuring that a publication map provides a key definition for every key reference used in the content.

Links based on keys require two pieces:

- Key Definition - Assigns a key to a topic so that other topics can link to it. For more information, see Defining Keys in DITA Maps on page 1486.
- Key Reference - Created in an `xref` element and specifies the key to link to.

The key reference points to a key definition, and the key definition points to a topic. Key definitions are created in maps, as an element on the `topicref` element that points to a topic. This allows you to assign a particular key to one topic in one map and to another topic in another map. When a topic that links to that key is used in each of these maps, the links work correctly in both maps.

Inserting a Link in Oxygen XML Editor plugin

To insert a link in **Author** mode, use the actions available in the **Link** drop-down menu from the toolbar (or the **Link** submenu in the contextual menu or **DITA** menu). You can choose between the following types of inline links:

Cross Reference

Opens the **Cross Reference (xref)** dialog box that allows you to insert a cross reference link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. Depending on the context where it is invoked, the action inserts one of the following two elements:

- `xref` - Used to link to other topics or another location within the same topic and points to the target using the `href` or `keyref` attribute.
- `fragref` - A logical reference to a fragment element within a syntax diagram and points to the target using the `href` or `keyref` attribute.

File Reference

Opens a dialog box that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. It inserts an `xref` element with either an `href` attribute or a `keyref` attribute. If you select **Location** for the target, the link is expressed in an `href` attribute. If you select **Key** for the target, keys will be used to express the link in a `keyref` attribute. You can select a key from the drop-down list or click the **Choose Key Reference** button to use the **Choose Key** dialog box.

Web Link

Opens a dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. It inserts an `xref` element with either an `href` attribute or a `keyref` attribute. If you select **URL** for the target resource, the link is expressed in an `href` attribute. If you select **Key** for the target, keys will be used to express the link in a `keyref` attribute. You can select a key from the drop-down list or click the **Choose Key Reference** button to use the **Choose Key** dialog box.

Related Link to Topic

Opens the **Cross Reference (xref)** dialog box that allows you to insert a link to a target DITA resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. Specifically, it inserts a `link` element inside a *related-links* element.

Related Link to File

Opens a dialog box that allows you to insert a link to a target non-DITA file resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `link` element inside a *related-links* element. If you select **Location** for the target, the link is expressed in an `href` attribute. If you select **Key** for the target, keys will be used to express the link in a `keyref` attribute. You can select a key from the drop-down list or click the **Choose Key Reference** button to use the **Choose Key** dialog box.

Related Link to Web Page

Opens the **Web Link** dialog box that allows you to insert a link to a target web-related resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be a URL or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `link` element inside a *related-links* element. If you select **URL** for the target resource, the link is expressed in an `href` attribute. If you select **Key** for the target, keys will be used to express the link in a `keyref` attribute. You can

select a key from the drop-down list or click the **Choose Key Reference** button to use the **Choose Key** dialog box.

Cross Reference (xref) Dialog Box

The **Cross Reference (xref)** dialog box is displayed when you insert a **Cross Reference** or **Related Link to Topic** (from the **Link** drop-down menu). It allows you to insert a link to a target resource at the current location within a document (for a **Cross Reference** link) or in a related links section (for a **Related Link to Topic**). The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource.

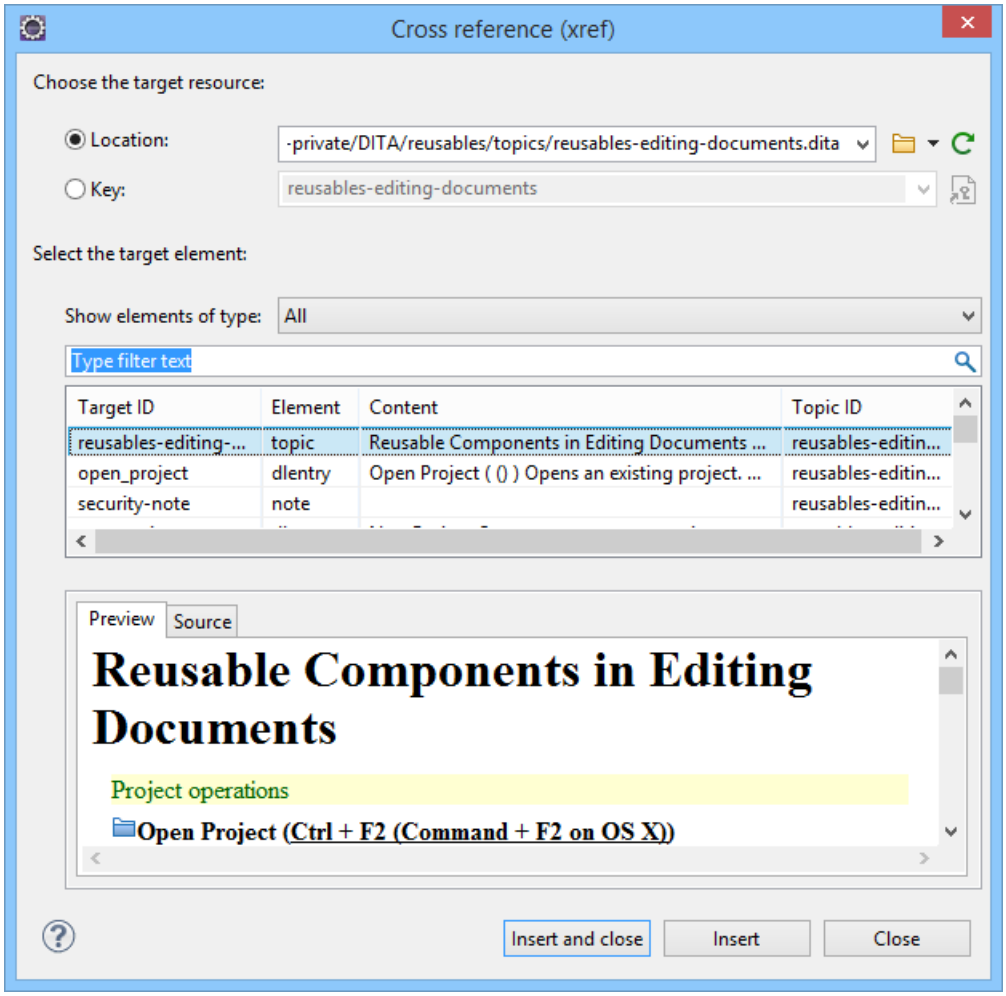

Figure 751: Cross Reference (xref) Dialog Box

This dialog box includes the following sections and fields:

Choose the Target Resource Section

Location

If you select **Location** for the target, the link is expressed in an `href` attribute.

Key

If you select **Key** for the target, keys will be used to express the link in a `keyref` attribute. You can use the **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the *root map* (you can also select one from the drop-down list in the **Key** field).

Tip: You can also use the **DITA Reusable Components** view for similar purposes.

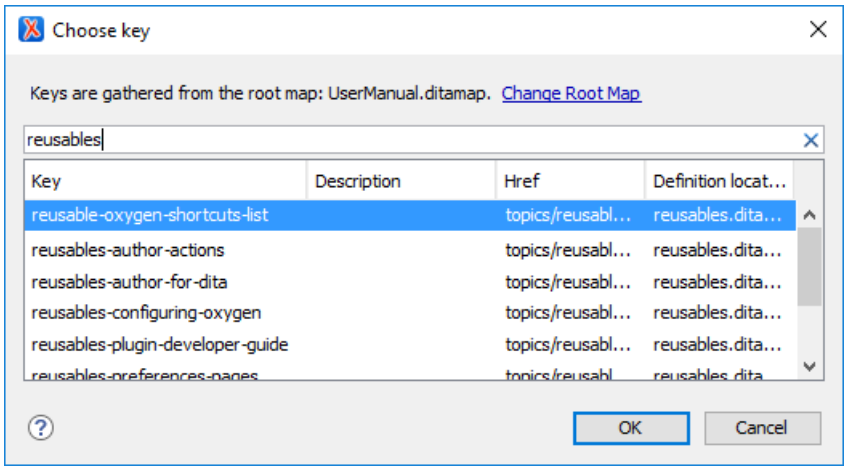

Figure 752: Choose Key Dialog Box

The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to select a *root map*.
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific keys.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
  - **Key** - The name of the key.
  - **Description** - The description of the key that is obtained from the definition of the key (for example, the description for a *keydef* would be found in the `keyword` element inside *topicmeta*, or the description for a *topicref* would be found in a `navitle` element). For more information about where the data in this column is collected, see this note.
  - **Href** - The value of the *href* where the key points to.
  - **Definition Location** - The name of the *DITA map* where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

Select the Target Element Section

This section can be used to target a specific element inside the target resource.

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference.

Preview Pane

Displays the content that will be references.

Source Pane

Displays the XML source code of the element to be referenced.

Once you click **Insert** or **Insert and close**, the configured cross reference is inserted into your document.

Tip: You can easily insert multiple cross references by keeping the dialog box opened, using the **Insert** button.

Using Copy/Paste Actions to Insert a Cross Reference

Oxygen XML Editor plugin also includes support for inserting cross references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute or a `topicref`. Also, the location in the document where you paste the link must be valid, although as long as the **Smart paste and drag and drop** option is selected in the **Schema Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Editor plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it. You can paste the link as a cross reference with the link expressed in an `href` attribute or in a `keyref` attribute.

To insert a cross reference link (expressed in an `href` attribute) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an ID attribute assigned to it or a `topicref`.
2. Place the cursor at a location, where you want to insert the link.
3. Select the **Paste as Link** action from the **Paste Special** submenu from the contextual menu.

To insert a cross reference link (expressed in a `keyref` attribute) using copy/paste actions, follow these steps:

1. In the **DITA Maps Manager** view, make sure that the **Root map** combo box points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.
3. Copy an entire DITA element that has an ID attribute assigned to it from a topic with an assigned key, or a `topicref` from a *DITA map*.
4. Place the cursor at a location, where you want to insert the link.
5. Select the **Paste as Link (keyref)** action from the **Paste Special** submenu from the contextual menu.

Linking with Relationship Tables in DITA

A relationship table is used to express relationships between topics outside of the topics themselves. The DITA publishing scripts can then create links between related topics when the content is published.

The reason for using a relationship table is to help make topics easier to reuse. If a topic links directly to another topic, this creates a dependency between the topics. If one topic is reused in a publication where the other is not used, the link is broken. By defining relationships between topics in a relationship table, you avoid creating this dependency.

To create an appropriate set of links between topics in multiple publications, you can create a separate relationship table for each publication. If you are creating multiple publications by applying profiling conditions to a single map, you can also profile your relationship table.

To create a relationship table, follow these steps :

1. If the map is currently open in the **DITA Maps Manager**, double-click the map icon () to open the map in **Author** mode. If it opens in **Text** mode, click **Author** at the bottom left to switch to **Author** mode.
2. Move the insertion point inside the *map* root element (usually `map`, but it might be `bookmap`, or another specialization of the `map` element). The easiest way to do this is to click below the title of the map in the editor and then press the up arrow once. Confirm that you are inside the *map* root element by checking the breadcrumbs at the top left of the editor window. You should only see the name of the *map* root element.
3. Select the **Insert Relationship Table** action on the toolbar or from the **Relationship Table** submenu of the contextual menu.
   The **Insert Relationship Table** dialog box is displayed.
4. Set the number of rows, the number of columns, a table title (optional), and select whether or not you want a table header. Click **Insert**.
5. Enter the type of the topics in the header of each column.

The header of the table (the `relheader` element) already contains a `relcolspec` element for each table column. You should set the value of the attribute `type` of each `relcolspec` element to a value such as *concept*, *task*, or *reference*. When you click in the header cell of a column (that is a `relcolspec` element), you can see all the attributes of that `relcolspec` element, including the `type` attribute in the **Attributes** view. You can edit the attribute type in this view.

6. To insert a topic reference in a cell, place the cursor in a table cell and select **Insert Reference** from the contextual menu or the **DITA Map** toolbar.
7. To add a new row to the table or remove an existing row use **Insert Relationship Row**/**Delete Relationship Row** from the contextual menu or the **DITA Map** toolbar.
8. To add a new column to the table or remove an existing column, use **Insert Relationship Column**/**Delete Relationship Column** contextual menu or the **DITA Map** toolbar. If you double-click the relationship table (or select it and press **Enter**, or choose **Open** from the contextual menu) the *DITA map* is opened in the editor with the cursor positioned inside the corresponding relationship table.
9. To add topic references to your relationship table, drag and drop topics from the **DITA Maps Manager** or the **Navigator** view into the appropriate cell in the relationship table.

   See the DITA documentation for a full explanation of the relationship table format and its options. Note that you can change all the selections that you make here later by using the actions on the toolbar (or in the **Relationship Table** submenu of the contextual menu) or by editing the underlying XML in **Text** mode.
10. Save the *DITA map*.
    Relationship tables are also displayed in the **DITA Maps Manager** view, along with the other elements in its *DITA map*.

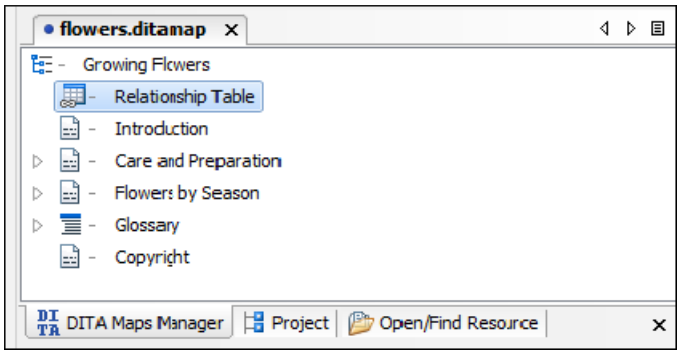

Figure 753: Relationship Table

You can open the DITA map to edit the relationship table by doing one of the following:

- Double-click the appropriate relationship table in the **DITA Maps Manager**.
- Select the relationship table in the **DITA Maps Manager** and press **Enter**.
- Select **Open** from the contextual menu of the relationship table in the **DITA Maps Manager**.

Publishing DITA Output

As a structured writing format, DITA produces structured content (content that is annotated with specific structural and semantic information rather than with formatting information). To create a publication, your *DITA map* and its associated topics must be processed by a transformation script. That script is responsible for how the structural and semantic information in the DITA files is converted into formatting information for display.

This means that you can display the same DITA content in multiple ways, types of media, or publications. It also means that you cannot control every aspect of the presentation of your content in your DITA files. The only way to change the formatting is to change the transformation routines that create it.

Therefore, to create output from your DITA content you have to run a transformation on your content. Transformations for various types of output are provided by the DITA Open Toolkit. Oxygen XML Editor plugin provides a mechanism called transformation scenarios to help you configure and run transformations.

Note: Oxygen XML Editor plugin does not create any output formats itself. Oxygen XML Editor plugin runs externally defined transformations that produce output, and displays the result in the appropriate application, but the output itself is produced by the external transformation, not by Oxygen XML Editor plugin.

Running a Transformation Scenario

To select and run a transformation scenario on your map, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button on the **DITA Maps Manager** toolbar. The **Configure Transformation Scenario(s)** dialog box appears. This dialog box lists all the transformation scenarios that have been configured in your project. Oxygen XML Editor plugin provides a default set of transformation scenarios, but the people in charge of your DITA system may have provided others that are specifically configured for your needs.
2. Select the transformation scenario you want to run and click **Apply Associated**. The transformation scenario runs in the background. You can continue to work in Oxygen XML Editor plugin while the transformation is running. If there are errors or warnings, Oxygen XML Editor plugin displays them when the transformation is complete. If the transformation is successful, Oxygen XML Editor plugin opens the output in the appropriate application.
3. To rerun the same scenario again, click the **Apply Transformation Scenario(s)** button.

Transforming DITA Content

Oxygen XML Editor plugin uses the DITA Open Toolkit (DITA-OT) to transform *DITA maps* and topics into an output format. For this purpose, both the DITA Open Toolkit and Ant come bundled in Oxygen XML Editor plugin. For more information about the DITA Open Toolkit, see DITA Open Toolkit Documentation.

This section includes information about the built-in DITA transformation scenarios, how to create a DITA OT transformation, and how to customize DITA transformations.

Related Information:

Transforming Documents on page 884

DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform *DITA maps* to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Editor plugin also includes a special **Run DITA-OT Integrator** that can be used to integrate a DITA-OT plugin and a **DITA Map Metrics Report** transformation that generates a statistics report for your DITA map. All of them are listed in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.

A variety of transformations scenarios are available for *DITA maps*:

- Predefined transformation scenarios allow you to transform a *DITA map* to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word.
- **Run DITA-OT Integrator** - Use this transformation scenario if you want to integrate a DITA-OT plugin. This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- **DITA Map Metrics Report** - Use this type of transformation scenario if you want to generate a *DITA map* statistics report. They contain information such as the number of processed maps and topics, content reuse percentage, number of elements, attributes, words, and characters used in the entire *DITA map* structure, DITA conditional processing attributes used in the *DITA maps*, and more.

DITA Map to WebHelp Responsive Transformation

DITA content can be transformed into several types of WebHelp Responsive systems.

WebHelp Responsive Output

To publish a *DITA map* as **WebHelp Responsive** output, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

   - Templates Tab - This tab contains a set of predefined publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones.
   - Parameters Tab - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section below for details about the most commonly used parameters for WebHelp Responsive transformations.
   - Filters Tab - This tab allows you to filter certain content elements from the generated output.
   - Advanced Tab - This tab allows you to specify some advanced options for the transformation scenario.
   - Output Tab - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to process the transformation.

   When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

WebHelp Responsive with Feedback Output

To publish a *DITA map* as a **WebHelp Responsive with Feedback** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

   - Templates Tab - This tab contains a set of predefined publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones.
   - Parameters Tab - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section below for details about the most commonly used parameters for WebHelp Responsive transformations.
   - Filters Tab - This tab allows you to filter certain content elements from the generated output.
   - Advanced Tab - This tab allows you to specify some advanced options for the transformation scenario.
   - Output Tab - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to begin the transformation.
5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

   When the **DITA Map WebHelp Responsive with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment.

Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only no and `yes` values are valid and the default value is no).

editlink.remote.ditamap.url

Use this parameter in conjunction with `editlink.web.author.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the *main DITA map*. For example, a GitHub custom URL might look like this: `https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap`.

editlink.web.author.url

This parameter needs to be used in conjunction with `editlink.remote.ditamap.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: `https://www.oxygenxml.com/oxygen-xml-web-author/`.

editlink.present.only.path.to.topic

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the **editlink.remote.ditamap.url** and **editlink.web.author.url** parameters are ignored.

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor plugin)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed *DITA map*. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

force.unique

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.reload.stylesheet

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

webhelp.search.custom.excludes.file

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `'*'` (matches zero or more characters) or `'?'` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages.

webhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or no.

webhelp.search.page.numberOfItems

Specifies the number of search results items displayed on each page. This parameter is only used when the **webhelp.search.enable.pagination** parameter is enabled.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.show.changes.and.comments

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

webhelp.sitemap.base.url

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the *DITA map*, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

webhelp.sitemap.change.frequency

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

webhelp.sitemap.priority

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

Parameters Specific to WebHelp Responsive Output

webhelp.default.collection.type.sequence

Specifies if the **sequence** value will be used by default when the `collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.

webhelp.enable.search.autocomplete

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is `yes`.

webhelp.fragment.after.body

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.logo_and_title

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.main.page.search

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.toc_or_tiles

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.top_menu

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.logo_and_title

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.page.search

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.toc_or_tiles

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.top_menu

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head

In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is `yes`.

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is `yes`.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is `no`.

webhelp.show.indexterms.link

Specifies if an icon that links to the index will be presented in the output. The default value is `yes`.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a *tree* style layout, this parameter should be set to `no`.

webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is `yes`.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is `yes`.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is `yes`.

webhelp.show.related.links

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is `yes`. The `webhelp.merge.nested.topics.related.links` parameter can used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is `yes`.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. The default value is `yes`.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is `yes`.

webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for *chunked* topics. The default value is `yes`.

webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

webhelp.publication.toc.tooltip.position

By default, if a topic contains a `shortdesc` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left** (default)
- **right**
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is `3`. A value of `0` means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are `collapsed` or `expanded` (default value).

DITA Map to WebHelp Classic Transformation

DITA content can be transformed into several types of WebHelp Classic systems.

WebHelp Classic Output

To publish a *DITA map* as a **WebHelp Classic** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

   - Skins Tab - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
   - Parameters Tab - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section below for details about the most commonly used parameters for WebHelp Responsive transformations.

- Filters Tab - This tab allows you to filter certain content elements from the generated output.
- Advanced Tab - This tab allows you to specify some advanced options for the transformation scenario.
- Output Tab - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

   When the **DITA Map WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Output

To publish a *DITA map* as a **WebHelp Classic with Feedback** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

   - Skins Tab - This tab contains a set of predefined skins that you can use for the layout of your WebHelp system output.
   - Parameters Tab - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section below for details about the most commonly used parameters for WebHelp Responsive transformations.
   - Filters Tab - This tab allows you to filter certain content elements from the generated output.
   - Advanced Tab - This tab allows you to specify some advanced options for the transformation scenario.
   - Output Tab - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.
5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

   When the **DITA Map WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment.

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

https://www.youtube.com/embed/eoQ2uxHvppE

Parameters for Customizing WebHelp Classic Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

args.default.language

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor plugin)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed *DITA map*. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

force.unique

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.body.script

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<body>` section of every WebHelp page.

webhelp.copyright

Adds a small copyright text that appears at the end of the **Table of Contents** pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); }
       (document, 'script', 'facebook-jssdk')); -->
    </script>
    <div data-share="true" data-show-faces="true" data-action="like"
       data-layout="standard" class="fb-like"/>
</div>
```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, no. If set to no, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then a default **Oxygen** footer is inserted in each WebHelp page.

webhelp.google.search.results

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommend to set the `linkTarget` attribute to `frm` for frameless (*iframe*) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`

webhelp.google.search.script

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

webhelp.head.script

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<head>` section of every WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.reload.stylesheet

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

webhelp.search.custom.excludes.file

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `'*'` (matches zero or more characters) or `'?'` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.show.changes.and.comments

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is no.

webhelp.sitemap.base.url

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the *DITA map*, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

webhelp.sitemap.change.frequency

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

webhelp.sitemap.priority

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

DITA Map to PDF Transformation

Oxygen XML Editor plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting *DITA maps* to PDF output.

Creating a DITA Map to PDF Transformation Scenario

To create a *DITA Map to PDF* transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** toolbar.
2. Select **DITA Map PDF** and click the **Edit** button (or use the **Duplicate** button if your *framework* is read-only).

3. Use the various tabs to configure the transformation scenario. In the **Parameters** tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
   - `show.changes.and.comments` - If set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output.
   - `customization.dir` - Specifies the path to a customization directory.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

Related Information:
DITA Map to PDF Output Customization on page 1117

DITA Map to PDF WYSIWYG Transformation

Oxygen XML Editor plugin comes bundled with a **DITA-OT CSS Publishing to PDF plugin** that allows you to convert *DITA maps* to PDF using a CSS layout processor. Oxygen XML Editor plugin also comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xsl:fo* customizations. Oxygen XML Editor plugin also supports a few third-party processors.

The following processors are supported:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Editor plugin. For more information, see the Oxygen PDF Chemistry User Guide.
- **Prince Print with CSS** (not included in the Oxygen XML Editor plugin installation kit) - A third-party component that needs to be purchased from http://www.princexml.com.
- **Antenna House Formatter** (not included in the Oxygen XML Editor plugin installation kit) - A third-party component that needs to be purchased from http://www.antennahouse.com/antenna1/formatter/.

The **DITA-OT CSS Publishing to PDF plugin** is located in the following directory: *`DITA-OT-DIR`*`/plugins/com.oxygenxml.pdf.css`. Although it includes a set of CSS files in its `css` subfolder, when this plugin is used in Oxygen XML Editor plugin, the CSS files located in the `${frameworks}` directory take precedence.

Creating the Transformation Scenario

To create an **DITA Map to PDF WYSIWYG** transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** toolbar.
2. Select **DITA Map PDF - WYSIWYG**.
3. In the **CSS Processor** tab, choose the processor type. You can select between **Oxygen PDF Chemistry**, **Prince XML**, or **Antenna House**.
4. In the **Parameters** tab, configure any of the following parameters (if applicable):
   - **css.processor.path.chemistry** (if you are using the **Oxygen PDF Chemistry** processor) - Specifies the path to the **Oxygen PDF Chemistry** executable file that will be run to generate the PDF. If this parameter is not set, your system's PATH environment variable will be used to find and start the **Oxygen PDF Chemistry** processor.
   - **css.processor.path.prince** (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
   - **css.processor.path.antenna-house** (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
   - **show.changes.and.comments** - When set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output. The default value is no.
   - **dita.css.list** - Allows you to specify a list of CSS URLs to be used by the PDF processor (instead of the default CSS files). The files must have URL syntax and be separated using semicolons. If the value is empty, the CSS associated with the current selection from the **Styles** drop-down menu is used.
   - **args.css** - Allows you to specify a path to a custom CSS to be used in addition to those specified in the `dita.css.list` parameter OR in addition to the CSS that is currently selected in the **Styles** drop-down

menu. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.

5. Click **OK** and run the transformation scenario.

Customizing the Output

The **DITA-OT CSS Publishing to PDF plugin** makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xsl:fo* customizations. You can style the PDF output by simply using a custom CSS to change the styling and then re-running the transformation scenario until you get the desired result.

For more information, see the Customization CSS section. It offers numerous tips and examples for customizing the CSS for the PDF output.

Changing the Style of an Element

To change the style of a particular element, you need to create an additional CSS file that will store the customization rules. Once you have created this file, you need to instruct the editor how to use this additional CSS. This can be done in two ways:

- Specify the path to your custom CSS using the `args.css` parameter:
  1. Edit a **DITA map to PDF WYSIWYG** transformation scenario.
  2. In the **Parameters** tab, specify the path to your custom CSS files in the `args.css` parameter.
  3. Click **OK** and run the transformation scenario.

  This method is appropriate if you just want to apply the styling customization to the output.
- Create an alternate CSS for the DITA document type:
  1. Follow the procedure for adding an alternate CSS file in Customizing the Main CSS of a Framework on page 1297.
  2. Once you have configured your CSS as an additional layer, you can select it from the **Styles** drop-down menu (on the toolbar).
  3. Run the **DITA Map PDF - WYSIWYG** transformation scenario and the customization rules from the additional CSS will be visible in the produced PDF.

  This method allows you to have many customization CSS files and simply select the one that you need at any time for both the output and the rendering in **Author** mode.

Using the CSS Inspector to See the Style Associated with an Element

To find the styles associated with an element, follow this procedure:

1. Open a document in the editor and select **Inspect Styles** from the contextual menu. This opens the **CSS Inspector** view that shows all the CSS rules that apply to the selected element.
2. Click the particular link for the CSS selector that you need to change and Oxygen XML Editor plugin will open the CSS file and position the cursor at that selector.
3. After you identify the source of the styles you want to modify, copy the CSS rule in your customization CSS file and modify it according to your needs.

   To see the changes in **Author** mode, press **F5** to reload the document.

DITA Map to MS Office Word Transformation

Oxygen XML Editor plugin comes bundled with a transformation scenario that allows you to convert *DITA maps* to Microsoft Office Word documents. It utilizes the **DITA to Word plugin** created by Jarno Elovirta. This *plugin* contains a Word document named **Normal.docx** (located in: *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/DITA-OT2.x/plugins/com.elovirta.ooxml/resources`) that is used by the transformation scenario as a template to generate the final Word document.

Tip: You can make general modifications to the **Normal.docx** template file to alter the published output.

Configuring the Transformation Scenario

To configure an **DITA Map to MS Office Word** transformation scenario, follow these steps:

1. Open the DITA map in the **DITA Maps Manager**.
2. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** toolbar.
3. Select **DITA Map MS Office Word**.
4. For advanced customizations, in the **Parameters** tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
   - `dotx.file` - Specifies the path to a Word template file (`.docx`) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the **Normal.docx** file that is used by default.
   - `document.flat.xsl` - Specifies the path to a pre-process clean-up stylesheet.
   - `core.xsl` - Specifies the path to a core metadata stylesheet.
   - `custom.xsl` - Specifies the path to a custom metadata stylesheet.
   - `document.xsl` - Specifies the path to a main document stylesheet.
   - `comments.xsl` - Specifies the path to a comments stylesheet.
   - `numbering.xsl` - Specifies the path to a list and title numbering stylesheet.
   - `footnotes.xsl` - Specifies the path to a footnote stylesheet.
   - `document.xml.xsl` - Specifies the path to a document relations metadata stylesheet.
   - `inkscape.exec` - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.
5. Click **OK** and run the transformation scenario.

Result: The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

Editing a Transformation Scenario on page 980
Configure Transformation Scenario(s) Dialog Box on page 982
Migrating MS Office Documents to DITA on page 1616

DITA Map to CHM (Compiled HTML Help) Transformation

To perform a *Compiled HTML Help (CHM)* transformation, Oxygen XML Editor plugin needs `Microsoft HTML Help Workshop` to be installed on your computer. Oxygen XML Editor plugin automatically detects `HTML Help Workshop` and uses it.

Note: `HTML Help Workshop` might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the *.hhp* and *.hhc* files. If the transformation fails to produce the CHM output but the *.hhp* (HTML Help Project) file is already generated, you can manually try to build the CHM output using `HTML Help Workshop`.

Changing the Output Encoding

Oxygen XML Editor plugin uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the *Compiled HTML Help (CHM)* transformation. By default, the **DITA Map CHM** transformation scenario that comes bundled with Oxygen XML Editor plugin has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the toolbar or the **XML** menu.
2. Select the **DITA Map CHM** transformation scenario and click the **Edit** button.
3. In the **Parameter** tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

   Note: The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (en, for example) and `CC` represents the country code (US, for example). The language codes are contained in the `ISO 639-1` standard and the country codes are contained in the `ISO 3166-1` standard. For further details about language tags, go to http://www.rfc-editor.org/rfc/rfc5646.txt.

DITA Map to Kindle Transformation

Oxygen XML Editor plugin requires *KindleGen* to generate Kindle output from *DITA maps*. To install *KindleGen* for use by Oxygen XML Editor plugin, follow these steps:

1. Go to www.amazon.com/kindleformat/kindlegen and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Editor plugin and open a *DITA map* in the **DITA Maps Manager** view.
4. Click the **Configure Transformation Scenario(s)** button.
5. Select the **DITA Map Kindle** transformation and press the **Edit** button to edit it.
6. Go to **Parameters** tab and set the **kindlegen.executable** parameter as the path to the *KindleGen* directory.
7. Accept the changes.

Creating or Editing a DITA OT Transformation

Creating a DITA OT Transformation Scenario

To create a **DITA OT Transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the **DITA Maps Manager** toolbar, main toolbar, or the **XML** menu. Then click the **New** button and select **DITA OT Transformation**.
- Go to **Window** > **Show View** and select **Transformation Scenarios** to display this view. Click the **New Scenario** drop-down menu button and select **DITA OT Transformation**.

Both methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

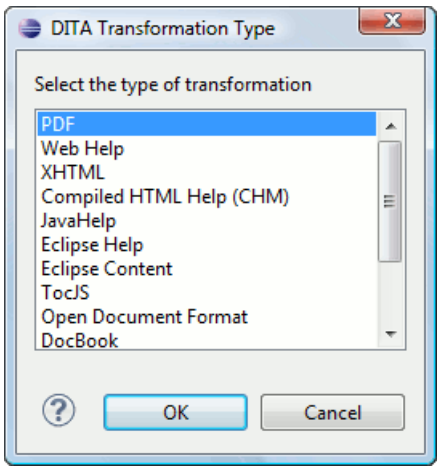

Figure 754: DITA Transformation Type Dialog Box

Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a **Skins** tab is only available for **WebHelp Classic** and **WebHelp Classic with Feedback** output types, a **Templates** tab is available only for **WebHelp Responsive** and **WebHelp Responsive with Feedback**, and a **FO Processor** tab is available for PDF output).

Editing a DITA OT Transformation Scenario

Editing a transformation scenario is useful if you need to configure some of its parameters.

To configure an existing transformation scenario, follow these steps:

1. Select the **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Alt + T, C on OS X))** action from the **DITA Maps Manager** toolbar, main toolbar, or the **XML** menu.

   Step Result: The **Configure Transformation Scenario(s)** dialog box is opened.
2. Select the particular transformation scenario and click the **Edit** button at the bottom of the dialog box or from the contextual menu.

   Note: Since transformation scenarios that are associated with predefined *frameworks* are read-only, these scenarios will prompt you to use the **Duplicate** button and then edit the duplicated scenario.

Result: This will open an **Edit scenario** configuration dialog box that contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a **Skins** tab is only available for **WebHelp Classic** and **WebHelp Classic with Feedback** output types, a **Templates** tab is available only for **WebHelp Responsive** and **WebHelp Responsive with Feedback**, and a **FO Processor** tab is available for PDF output).

Installing a DITA-OT Plugin on page 1608
DITA Open Toolkit Documentation

Skins Tab (DITA OT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Skins** tab is available for DITA OT transformations with **WebHelp Classic** or **WebHelp Classic with Feedback** output types and it provides a set of predefined skins that you can use as a base for your WebHelp system output.

A *skin* is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

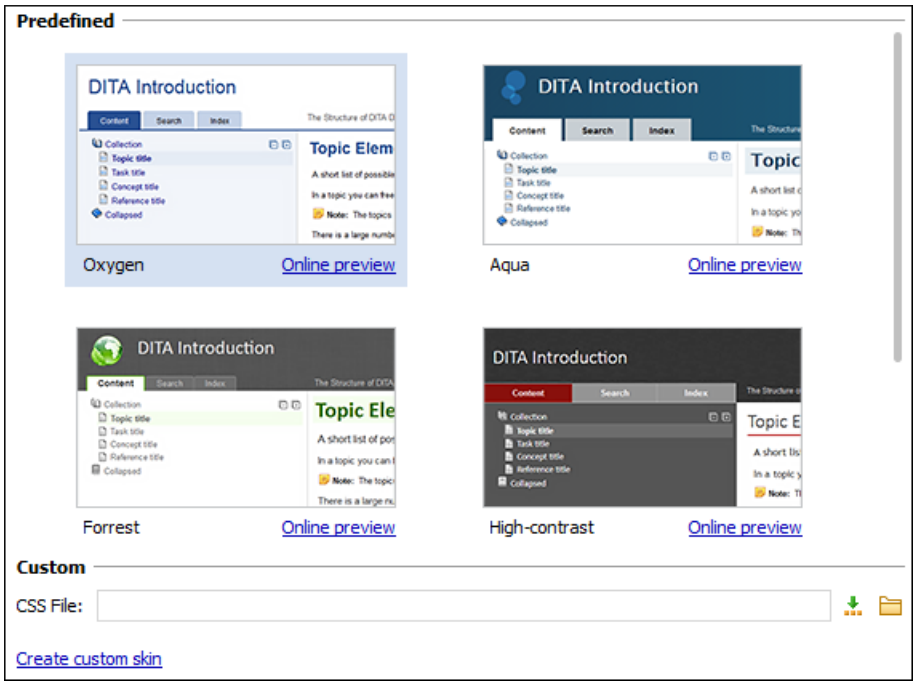

Figure 755: Skins Tab

The **Skins** tab includes the following sections:

Predefined Skins

This sections presents the predefined skins that are included in Oxygen XML Editor plugin. The predefined skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the *skin* looks when applied on a sample documentation project that is stored on the Oxygen XML Editor plugin website, press the **Online preview** link.

Custom Skins

You can use this section to customize the look of the output.

CSS File

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.

Note: The output can also be styled by setting the `args.css` parameter in the **Parameters tab**. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the **Skins tab**.

Create custom skin

Use this link to open the **WebHelp Skin Builder** tool.

Templates Tab (DITA OT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Templates** tab is available for DITA OT transformations with **WebHelp Responsive** or **WebHelp Responsive with Feedback** output types and it provides a set of predefined publishing templates. You can use one of them to publish your documentation or as a starting point for a new publishing template.

There are two main types of templates, *Tiles* and *Tree* and each of the built-in templates includes of version of each type. You can click on the tags at the top of the pane to filter the templates and narrow your search. You can filter them by either **tiles** or **tree** and then various color schemes. Each built-in template also includes an **Online preview** link that opens a webpage in your default browser that provides a sample of how the main page will look when that particular template is used to generate the output.

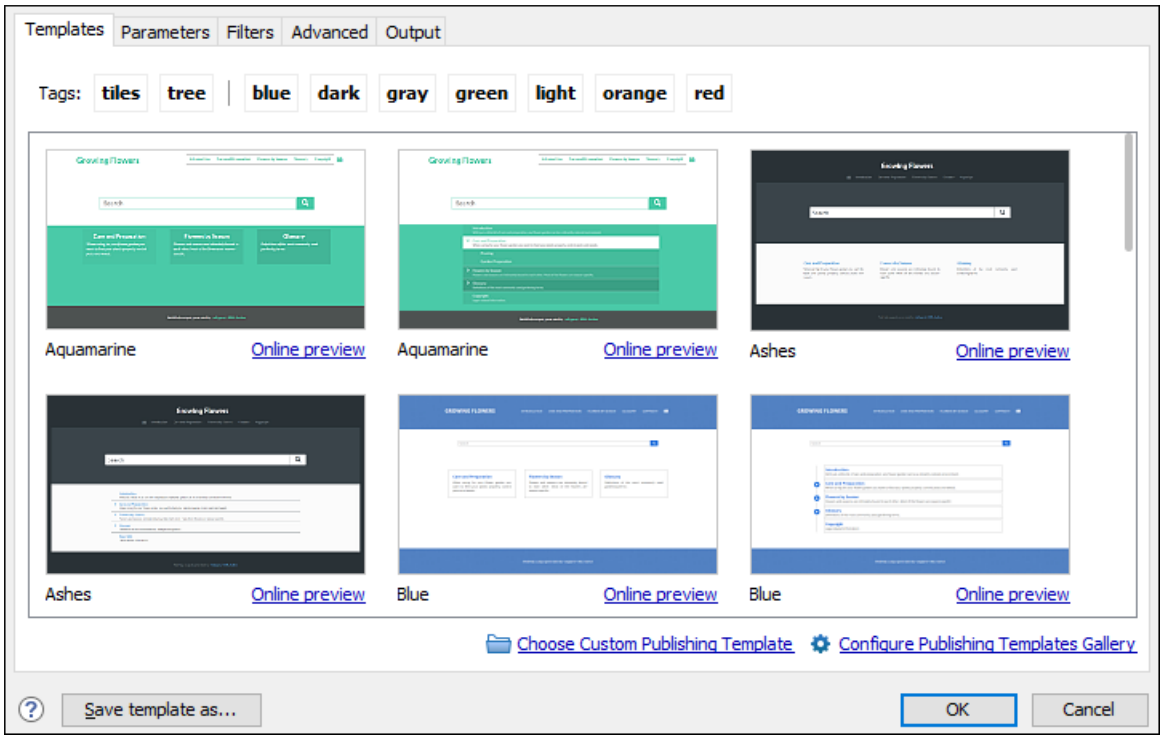

Figure 756: Templates Tab

The two main types of layouts:

Tiles

The main page in the WebHelp output presents a tile for each main topic (chapter) of the documentation. Each tile includes a link to the topic and a short description.

Tree

The main page in the WebHelp output presents a tree-like table of contents with links to the first and second level topics in the publication.

Built-in Templates Location

All built-in templates are stored in the following directory: *DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.responsive/templates`.

Save Template As Button

You can use the **Save template as** button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template. Clicking this button will open a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

Selecting Custom Templates

Once you are finished configuring your template, you can click the **Choose Custom Publishing Template** link to select your template.

You can also add your custom templates to the list of templates displayed in the **Templates** tab. To do this, store them in a directory, then click the **Configure Publishing Templates Gallery** link and add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Template Errors

When the **Templates** tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

If you click the **More details** link, a window will open with more information about the encountered error. For example, it might offer a hint for which element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠) will be displayed on the template's image (in the **Templates** tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to **Options** > **Preferences** > **DITA** > **Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

FO Processor Tab (DITA OT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.

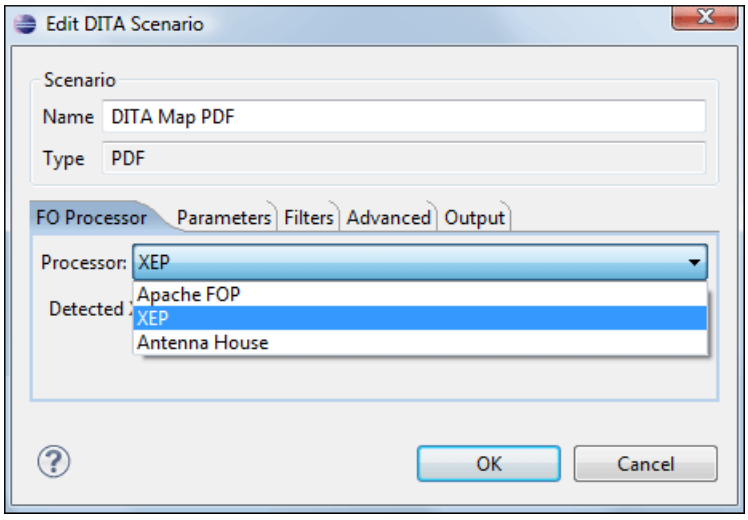

Figure 757: FO Processor Configuration Tab

You can choose one of the following processors:

Apache FOP

The default processor that comes bundled with Oxygen XML Editor plugin.

XEP

The RenderX XEP processor. If XEP is already installed, Oxygen XML Editor plugin displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the **FO Processors** option page.
- The system property *com.oxygenxml.xep.location* was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the *`DITA-OT-DIR`*`/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Editor plugin installation directory.

Antenna House

The Antenna House (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor plugindisplays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Editor plugin preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters** tab.
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

Related Information:

FO Processors Preferences on page 111
Generating PDF Output Using an XSL-FO Processor on page 1123

Parameters Tab (DITA OT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA OT Documentation. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the *ask* editor variable in the **Value** column.

Below the table, the following actions are available for managing parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the **Insert Editor Variables** button or the **Browse** button.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

WebHelp Responsive Parameters Contributed by an Oxygen Publishing Template

WebHelp Responsive transformation parameters that are defined in an *Oxygen Publishing Template* descriptor file are displayed in italics. After creating a publishing template and adding it to the templates gallery, when you select the template in the **Templates** tab, the **Parameters** tab will automatically be updated to include the parameters defined in the template descriptor file.

Related Information:

DITA Open Toolkit Documentation

Filters Tab (DITA Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.

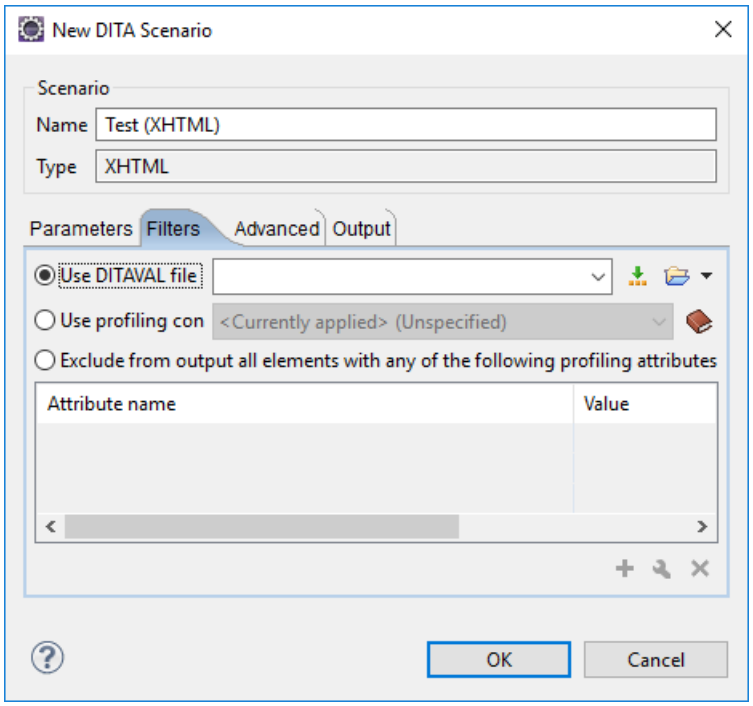

Figure 758: Edit Filters Tab

You can choose one of the following options to define filters:

Use DITAVAL file

If you already have a *DITAVAL* file associated with the *DITA map*, you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list. You can find out more about constructing a *DITAVAL* file in the DITA Documentation.

Attention: If a filter file is specified in the `args.filter` parameter (in the **Parameters** tab), that file takes precedence over a *DITAVAL* file specified here.

Use profiling condition set

Sets the profiling condition set that will be applied to your transformation.

Exclude from output all elements with any of the following attributes

By using the **New**, **Edit**, or **Delete** buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

Advanced Tab (DITA OT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Advanced** tab allows you to specify advanced options for the transformation scenario.

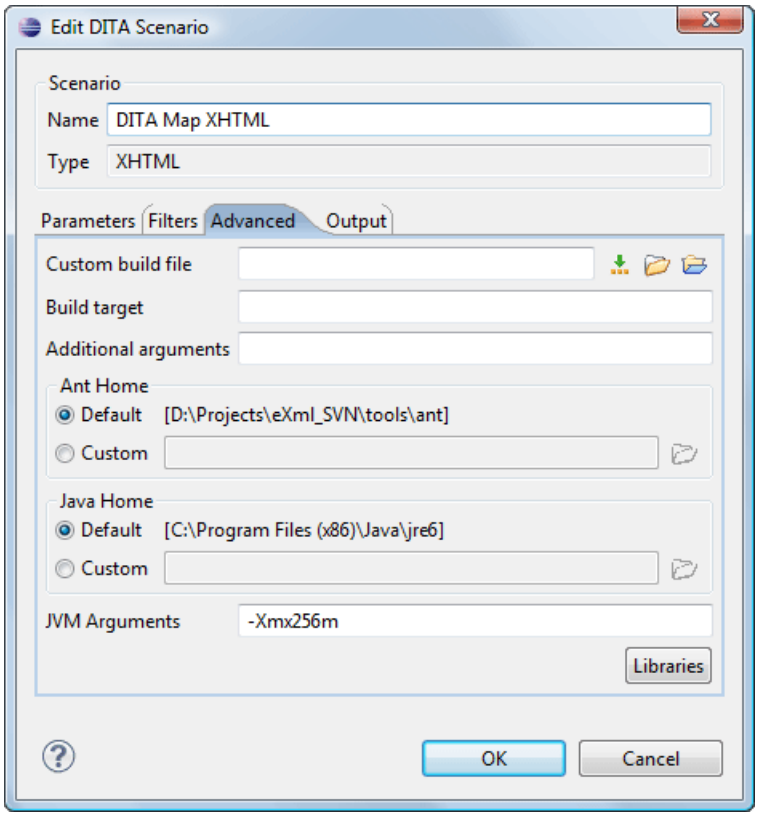

Figure 759: Advanced Settings Tab

You can specify the following parameters:

Custom build file

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the **Parameters** tab is used. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Build target

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

Additional arguments

You can specify additional command line arguments to be passed to the transformation (such as `-verbose`).

Ant Home

You can choose between the default or custom Ant installation to run the transformation.

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor plugin.

Note: It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA-OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA OT publishing engine and using it in the **Java Home** text field.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to **-Xmx384m**, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (**OutOfMemoryError**).

Libraries

By default, Oxygen XML Editor plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (*JAR* files or additional class paths) to be used by the Ant transformer.

Tip: You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

Output Tab (DITA OT Transformations)

When you create a new transformation scenario or edit an existing one, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.

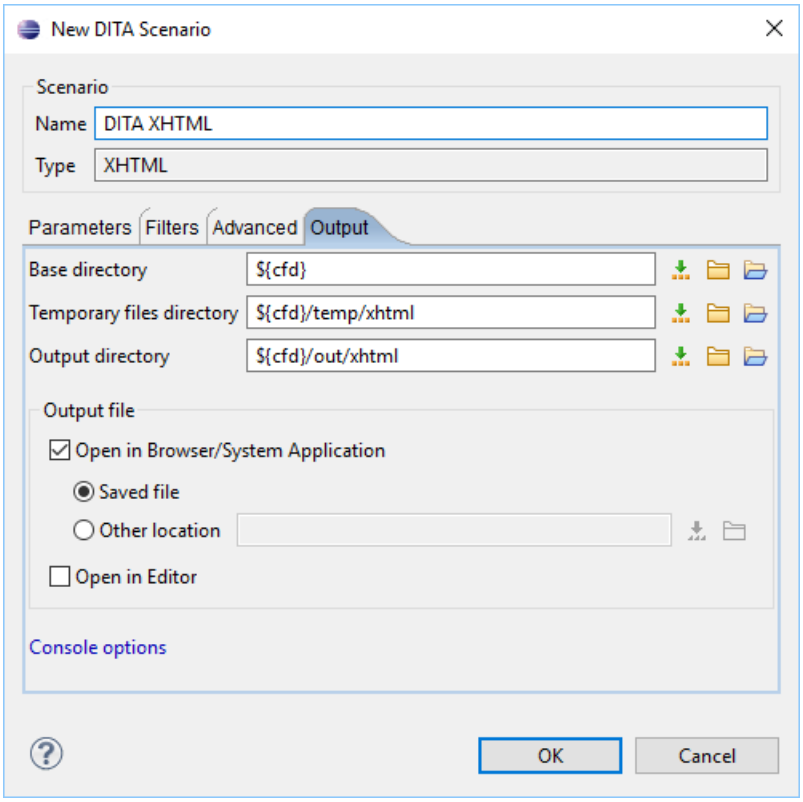

Figure 760: Output Settings Tab

You can specify the following parameters:

Base directory

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Temporary files directory

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Output directory

The folder where the content of the final output is stored. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Note: If the *DITA map* or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

Open in Browser/System Application

If selected, Oxygen XML Editor plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to **Window** > **Preferences** > **General** > **Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** button, or the **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Customizing DITA Transformations

You can customize the appearance of any of the output types by customizing the output transformations. There are several ways to do this:

- Most transformations are configurable by passing parameters to the transformation script. Oxygen XML Editor plugin allows you to set parameters on a transformation scenario and you can save and share them with others. You can also use the **${ask}** editor variable in the **Parameters** tab to instruct Oxygen XML Editor plugin to prompt you for a particular parameter whenever a transformation scenario is run. You can set up multiple transformation scenarios for a given output type, allowing you to maintain several customized transformation scenarios for multiple types of output configurations.
- If you want to customize an output in a way not supported by the built-in customization options, you can create a modified version of the transformation code and execute it using a custom build file. Sometimes the transformation code exports specific forms of extensions or customizations. You should consult the DITA Open Toolkit for the transformation type that you are interested in to see what customization options are supported. Oxygen XML Editor plugin provides full editing and debugging support from XSLT and CSS stylesheets, which you can use to modify transformation code.
- You can also write your own transformation code (and execute it using a custom build file) to produce a type of output not supported by the DITA Open Toolkit. Oxygen XML Editor plugin provides a full source editing environment for developing such transformations. You can create Oxygen XML Editor plugin transformation scenarios to run these scripts once they are complete.

There are also many other ways to customize specific types of output generated from DITA transformations:

- **WebHelp** - For information about customizing WebHelp output, see the WebHelp Output section.
- **PDF** - For information about customizing PDF output generated from DITA content, see DITA Map to PDF Output Customization on page 1117.

Transforming DITA Content on page 1569

DITA Open Toolkit Documentation

Using a Custom Build File

You can use a *Custom Build File* to customize transformation scenarios.

To use a custom build file in a DITA-OT transformation, follow these steps:

1. Use the **Configure Transformation Scenario(s)** action to open the **Configure Transformation Scenario(s)** dialog box.
2. Select the transformation scenario and click **Edit**.
3. Go to the **Advanced** tab and change the **Custom build file** path to point to the custom build file.

As an example, if you want to call a custom script before running the DITA OT, your custom build file would have the following content:

```
<project basedir="." default="dist">
<!--The DITA OT default build file-->
 <import file="build.xml"/>
 <target name="dist">
  <!-- You could run your script here -->
  <!--<exec></exec>-->
   <!--Call the DITA OT default target-->
   <antcall target="init"/>
 </target>
</project>
```

Note: If you use the built-in Ant 1.9.8 build tool that comes bundled with Oxygen XML Editor plugin, it is located in the *[OXYGEN_INSTALL_DIR]*`/tools/ant` directory. Any additional libraries for Ant must be copied to the Oxygen XML Editor plugin Ant `lib` directory.

Adding a Watermark in DITA Map to XHTML Output

To add a watermark to the XHTML output of a *DITA map* transformation, follow these steps:

1. Create a custom CSS stylesheet that includes the watermark image, as in the following example:

   ```
   body {
    background-image: url(MyWatermarkImage.png);
   }
   ```

2. Edit a **DITA Map XHTML** transformation scenario and in the **Parameters** tab set the value of the `args.css` parameter as the path to your watermark image.
3. Set the value of the `args.copycss` parameter to **yes**.
4. Apply the transformation scenario.
5. Copy the watermark image in the output directory of the transformation scenario, next to the CSS file created in step 1.

Related Information:

Adding a Watermark to PDF Output on page 1118

DITA Profiling / Conditional Text

DITA offers support for conditionally profiling content by using profiling attributes. With Oxygen XML Editor plugin, you can define values for the DITA profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing.

Oxygen XML Editor plugin includes a **Profiling/Conditional Text** preferences page where you can create and manage profiling attributes and condition sets. Oxygen XML Editor plugin also offers convenient support for customizing and controlling profiling attribute values with a subject scheme or DITAVAL file.

Profiling Attributes

You can profile content elements or map elements by adding one or more of the default DITA profiling attributes (`product`, `platform`, `audience`, `rev`, `props`, and `otherprops`). You can also create your own custom profiling attributes and profiling condition sets. The profiling attributes may contain one or more tokens that represent conditions to be applied to the content when a publication is built.

For example, you could define a section of a topic that would only be included for a publication related to the Windows platform by adding the `platform` profiling attribute:

```
<section platform="windows">
```

For information about creating and editing profiling attributes, see Creating and Editing Profiling Attributes in DITA on page 1592.

Profiling Conditions

DITA allows you to conditionally profile parts of a topic so that certain parts of the topic are displayed when certain profiling conditions are set. Profiling conditions can be set both within topics and in maps. When set in a topic, they allow you to suppress an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, they allow you to suppress an entire topic or group of topics. You can then create a variety of publications from a single map by applying profiling conditions to the build.

For information about creating and editing condition sets, see Creating and Editing Profiling Condition Sets in DITA on page 1595 .

For more information about DITA profiling, watch our video demonstration:

https://www.youtube.com/embed/Gfyd4TkRQAw

Creating and Editing Profiling Attributes in DITA

You can filter DITA content or the structure of a document by using profiling attributes or profiling conditions sets.

Defining Profiling Attributes for DITA Content

To define or edit profiling attributes for filtering DITA content, follow these steps:

1. Open the **Preferences** dialog box and go to **Editor** > **Edit modes** > **Author** > **Profiling / Conditional Text**.
2. In the **Profiling Attributes** section, there are already some default attributes for DITA documents (`audience`, `platform`, `product`, `otherprops`, and `rev`), although if a *Subject Scheme Map* is used for profiling your content, you will see the attributes defined in your *subject scheme map* instead. You can add new attributes and values by clicking the **New** button at the bottom of the table, or customize existing attributes and their values by selecting an attribute and clicking the **Edit** button.

   Step Result: This opens a **Profiling Attribute** configuration dialog box that allows you to define attributes that exist in your schema.
3. In this configuration dialog box, use the **New**, **Edit**, **Delete** buttons to add, edit, or delete possible values of the selected attribute. You can also specify an optional description for each attribute value and you can choose whether the attribute accepts a **Single value** or **Multiple values separated by** a delimiter (DITA only accepts *space* as delimiters for attribute values).
4. Click **OK** to accept your changes.

Result: You should see your changes in the **Profiling Attribute** table.

You can also use the **Profiling Condition Sets** section to apply more complex filters on you DITA content.

Editing Profiling Attribute Values

There are several ways to add values to existing profiling attributes.

- Use the procedure in Defining Profiling Attributes for DITA Content on page 1592 to edit an existing attribute and use the **Profiling Attribute** configuration dialog box to add, edit, or delete values for existing profiling attributes.
- You can add values directly to the existing profiling attributes in a document using the In-Place Attributes Editor in **Author** mode, the **Attributes** view, or in the source code in **Text** mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the **Edit Profiling Attributes** action (from the contextual menu in **Author** mode) on the new value, the **Profiling Values Conflict**

dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the **Profiling / Conditional Text** preferences page where you can edit the profiling configuration. The action selected by default is to preserve the current configuration.

Note: If the **Allow additional profiling attribute values collected from the document** option is not selected in the **Profiling / Conditional Text** preferences page, the **Profiling Values Conflict** dialog box will never appear, the current conditional text configuration will be preserved, and therefore the second method mentioned above will not be available.

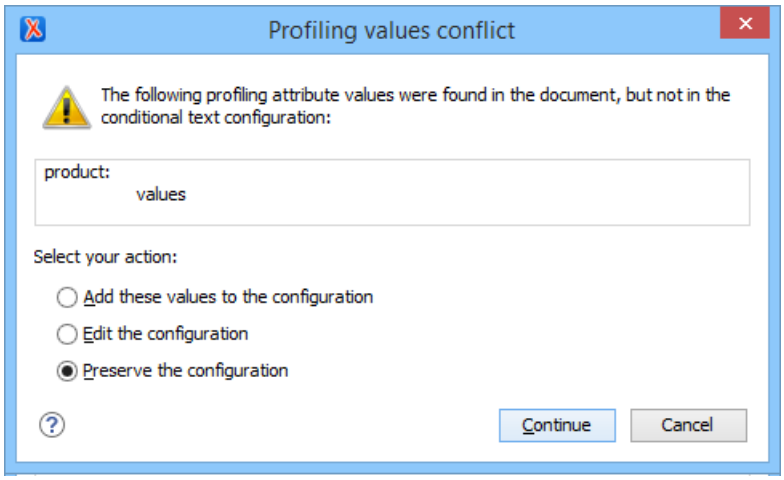

Figure 761: Profiling Values Conflict Dialog Box

Customizing Colors and Styles for Rendering Profiling in Author Mode on page 1600

Applying Profiling Attributes in DITA

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements in the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

You can apply defined DITA profiling attributes as follows:

DITA Topics

To profile DITA topics, right-click a topic reference in the **DITA Maps Manager**, select **Edit Properties** from the contextual menu, go to the **Profiling** tab, and select the appropriate values.

DITA Content

To profile DITA content in **Author** mode, highlight the content and select **Edit Profiling Attributes** from the contextual menu and select the appropriate values in the **Edit Profiling Attributes** dialog box.

DITA Elements

To profile specific XML elements in **Author** mode, position the cursor inside the element, right-click, select **Edit Profiling Attributes** (you can also right-click the element in the *breadcrumb* or **Outline** view), and select the appropriate values in the **Edit Profiling Attributes** dialog box. You can also use the **Attributes** view to set the profiling attributes on the element at the current cursor position.

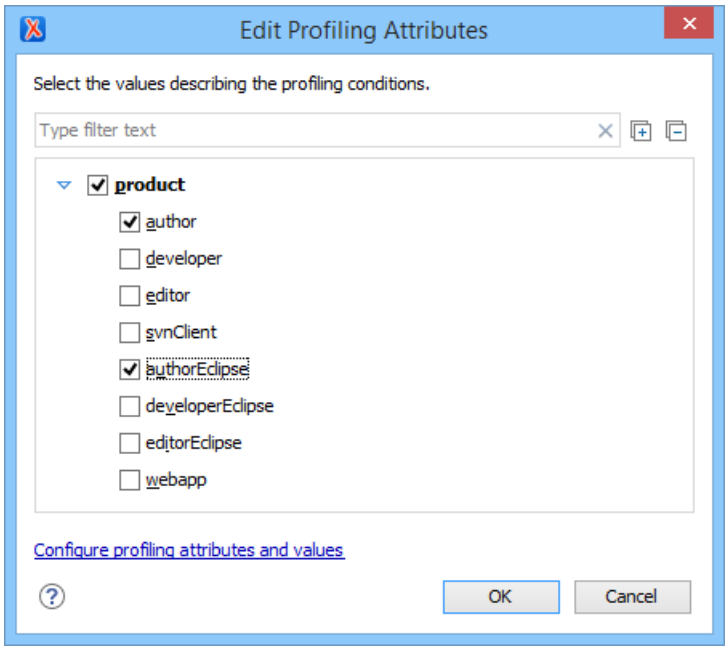

Figure 762: Edit Profiling Attributes Dialog Box

The profiling attributes, and their potential values, that appear in this dialog box depend on what has been configured in Oxygen XML Editor plugin. If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **Expand All**/**Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If your *root map* references a DITA *subject scheme map* that defines values for the profiling attributes, those values are used. Oxygen XML Editor plugin collects all the profiling values from the *subject scheme map* that is referenced in the map that is currently opened in the **DITA Maps Manager** (or set as the *root map*). In the image above (taken from the Oxygen XML Editor plugin documentation project), you see values for eight products. They are the only values that are defined in the *subject scheme map* and thus, are the only ones that appear in the dialog box.
- If you have defined profiling attribute values for the DITA document type in the **Profiling/Conditional Text** preferences page, those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

If the **Show Profiling Attributes** option (available in the **Profiling / Conditional Text** toolbar menu) is selected, a green border is painted around profiled text in the **Author** mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

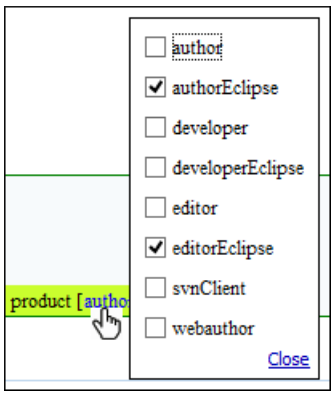

Figure 763: Profiling Attribute Value Form Control Pop Up

Related Information:

Creating and Editing Profiling Attributes in DITA on page 1592

Customizing Colors and Styles for Rendering Profiling in Author Mode on page 1600

Creating and Editing Profiling Condition Sets in DITA

In DITA, profiling conditions can be set both within topics and in maps. When set in a topic, they allow you to suppress an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, they allow you to suppress an entire topic or group of topics.

Creating Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the **Preferences** dialog box and go to **Editor** > **Edit modes** > **Author** > **Profiling/Conditional Text**.
2. In the **Profiling Condition Sets** section, press the **New** button.

   Step Result: The **Condition Set** configuration dialog box is opened.

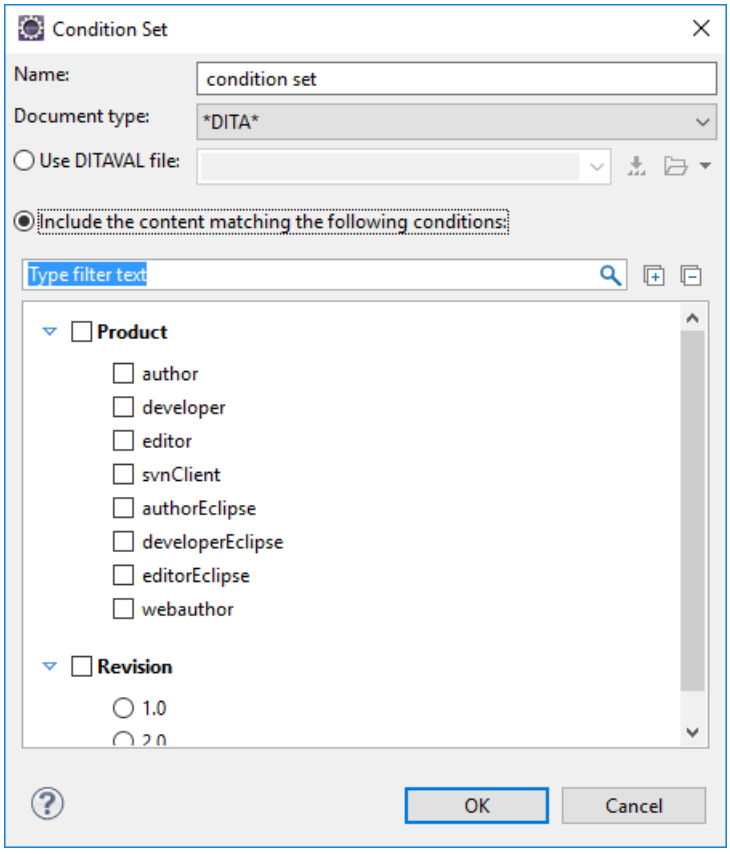

Figure 764: Condition Set Dialog Box

3. Configure your condition set as desired. The following options are available in this dialog box:

   Name

   The name of the new condition set.

   Document type

   Select the document type (*framework*) for which you have defined profiling attributes.

Use DITAVAL file

Select this option if you want the *Profiling Condition Set* to reference a DITAVAL file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** button, or the browsing tools in the **Browse** drop-down list.

Include the content matching the following conditions

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the **filter** text field to search for specific conditions.

4. Click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
5. Click **Apply** to save the condition set. All saved profiling condition sets are available in the **Profiling / Conditional Text** toolbar drop-down menu.

Editing Existing Profiling Condition Sets

To modify an existing profiling condition set, follow these steps:

1. Open the **Preferences** dialog box and go to **Editor** > **Edit modes** > **Author** > **Profiling/Conditional Text**.
2. In the **Profiling Condition Sets** section, the **Edit** button to modify an existing condition set (you can also use **Delete** button to remove a condition set or the **Up** and **Down** buttons to change their priority).

Step Result: If you use the **Edit** button, the **Condition Set** configuration dialog box is opened:

3. Modify your condition set as desired.
4. Click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
5. Click **Apply** to save your modifications.

Related Information:

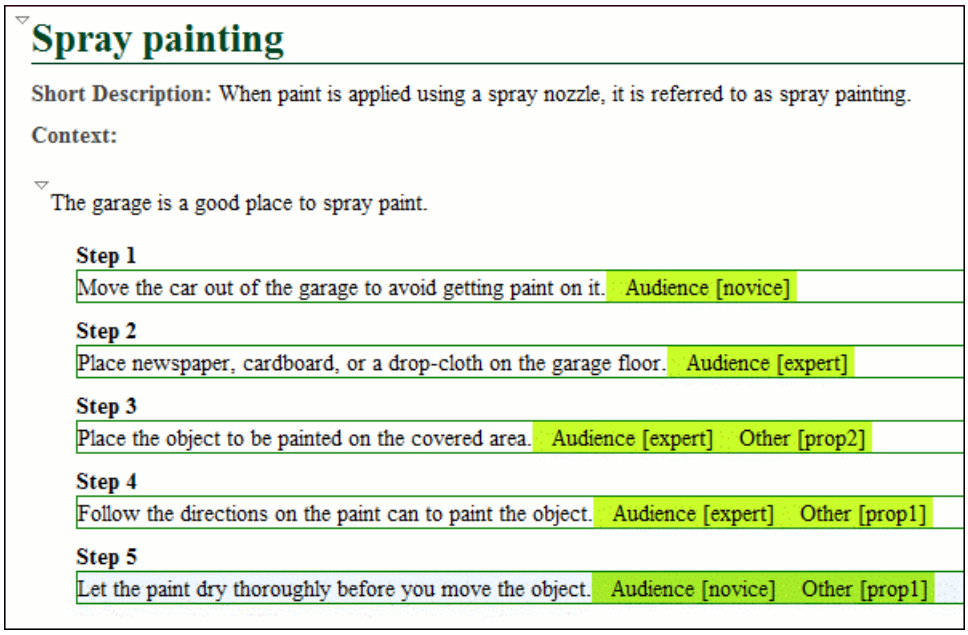
Applying Profiling Condition Sets in DITA on page 1596
Creating and Editing Profiling Attributes in DITA on page 1592
Applying Profiling Attributes in DITA on page 1593
Showing and Filtering Profiled Content in DITA on page 1598
Customizing Colors and Styles for Rendering Profiling in Author Mode on page 1600

Applying Profiling Condition Sets in DITA

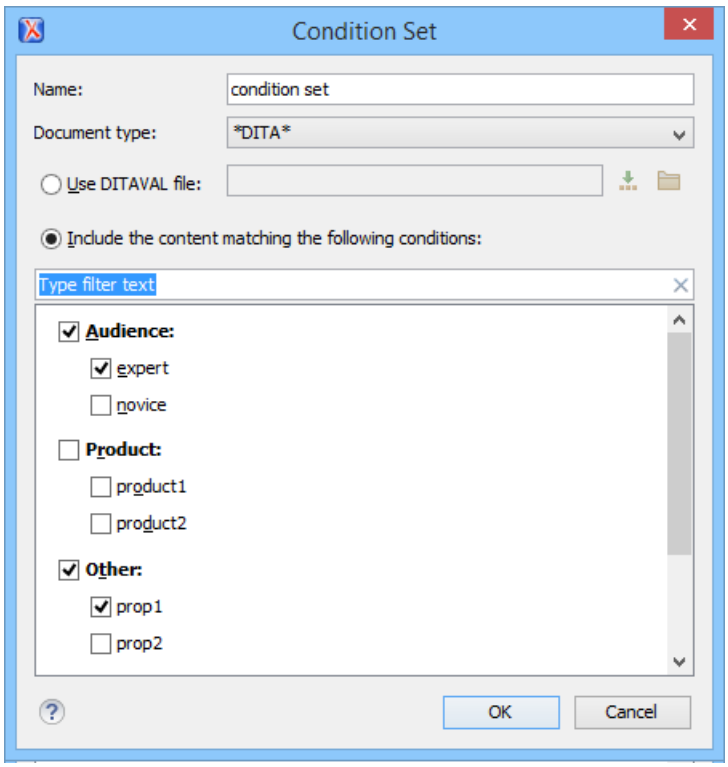
All defined Profiling Condition Sets are available as shortcuts in the **Profiling / Conditional Text** toolbar menu. Select a menu entry to apply the condition set. The filtered content is then grayed-out in the **Author** mode, **Outline** view, and **DITA Maps Manager** view (for DITA documents). Your selection will also be used as the default condition set in transformation scenarios. An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the value covered by the condition set.

EXAMPLE:

Suppose that you have the following document:



If you apply the following condition set, it means that you want to filter out the content to only include content written for an expert audience and content that has the *Other* attribute value of *prop1*.



This is how the document looks after you apply the condition set:

Showing and Filtering Profiled Content in DITA on page 1598
Customizing Colors and Styles for Rendering Profiling in Author Mode on page 1600

Showing and Filtering Profiled Content in DITA

You can visualize the effect of profiling content by using the profiling tools in the **Profiling/Conditional Text** drop-down menu that is located on the **DITA Maps Manager** toolbar and on the main toolbar. This drop-down menu includes the following filtering options:

Show Profiling Colors and Styles

Select this option to show colors and styles for profiled content in **Author** mode and the **DITA Maps Manager**. You can configure the colors and styles or specify whether or not this option is selected by default in the **Profiling/Conditional Text** > **Colors and Styles** preferences page.

Show Profiling Attributes

Select this option to display the values of the profiling attributes at the end of profiled content in **Author** mode and next to the nodes in the **DITA Maps Manager**. You can specify whether or not this option is selected by default in the **Profiling/Conditional Text** > **Attributes Rendering** preferences page.

Show Excluded Content

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in **Author** mode, the **DITA Maps Manager**, and the **Outline** view. When this option is selected and a condition set is selected in this drop-down menu, the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu, the filtered content is hidden. You can specify whether or not this option is selected by default in the **Profiling/Conditional Text** preferences page.

Choose Condition Set (Available if more than 15 condition sets are defined)

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

List of Defined Condition Sets

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in **Author** mode and the **DITA Maps Manager** to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed

in the **More** submenu or by using the **Choose Condition Set** option to access a dialog box that presents all of them.

Profiling Settings

Opens the **Profiling/Conditional Text** preferences page where you can add and edit profiling attributes and condition sets.

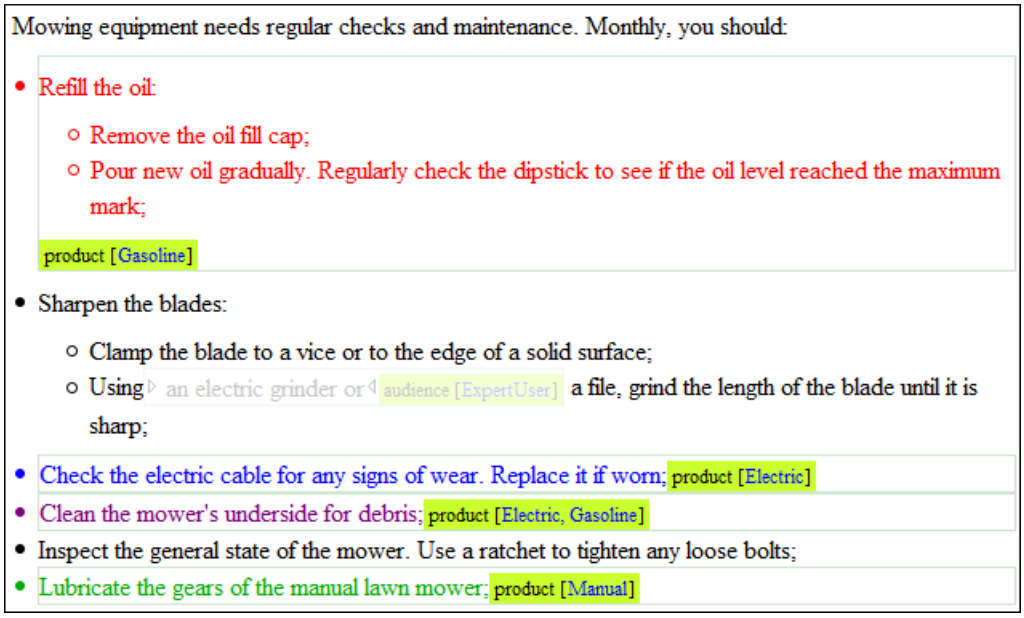

Figure 765: Example: Profiling Controls in Author Mode

If the **Show Profiling Attributes** option is selected, a green border is painted around profiled text in the **Author** mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

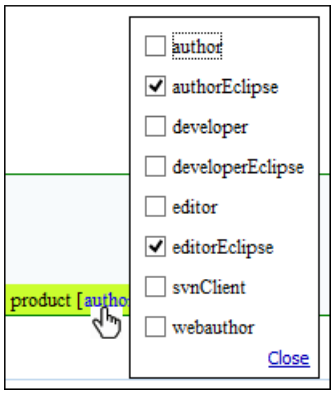

Figure 766: Profiling Attribute Value Form Control Pop Up

Also, the following icons are used to mark profiled and non-profiled topics in the **DITA Maps Manager**:

- - The topic contains profiling attributes.
- - The topic inherits profiling attribute from its ancestors.
- - The topic contains and inherits profiling attributes.
- - (dash) - The topic neither contains, nor inherits profiling attributes.

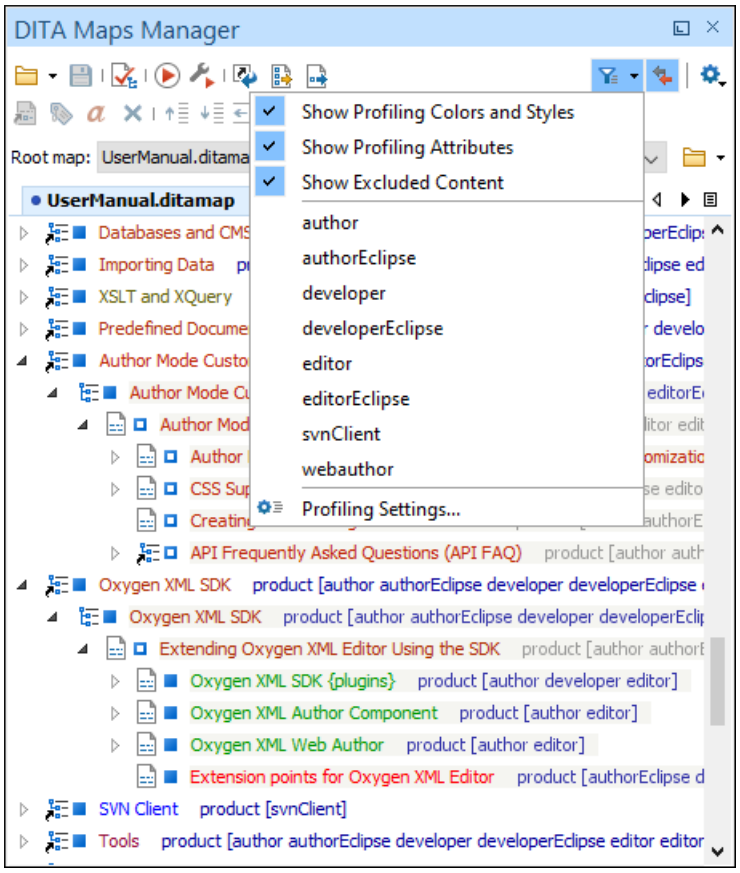

Figure 767: Rendering Profiled Topics in DITA Maps Manager

Related Information:

Creating and Editing Profiling Condition Sets in DITA on page 1595
Applying Profiling Attributes in DITA on page 1593

Applying Profiling Condition Sets in DITA on page 1596
Customizing Colors and Styles for Rendering Profiling in Author Mode on page 1600

Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in **Author** mode and the **DITA Maps Manager** so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in **Author** mode and excluded nodes are grayed-out or hidden in the **DITA Maps Manager**.

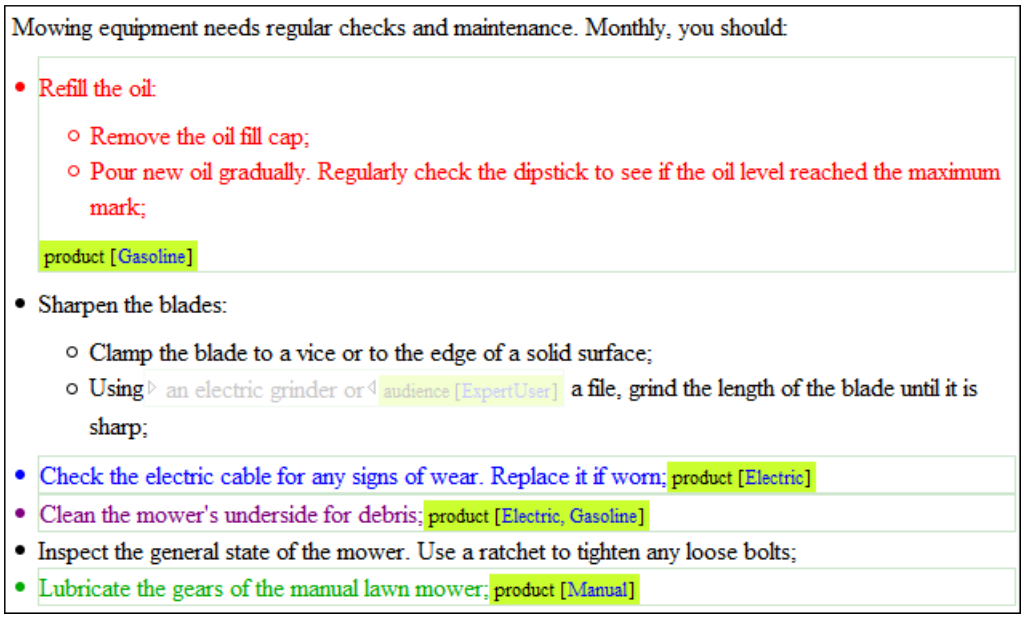

Figure 768: Example: Profiling Colors and Styles in Author Mode

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

Styling Profiling Attribute Values

To set colors and styles for profiling attribute values, follow these steps:

1. Select the **Show Profiling Colors and Styles** option from the **Profiling / Conditional Text** toolbar drop-down menu.
2. Select **Profiling Settings** from the **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Profiling/Conditional Text** preferences page.
3. Go to the **Colors and Styles** preferences page to configure the colors and styling for the profiling attributes.
4. Go to the **Attributes Rendering** preferences page to configure how you want the profiling attributes to appear in Oxygen XML Editor plugin.

Result: The styling is now applied in the **Author** editing mode, the **Outline** view, and in the **DITA Maps Manager** view. Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the **Edit Profiling Attributes** dialog box and in the inline form control pop up that allows you to quickly set the profiling attributes.

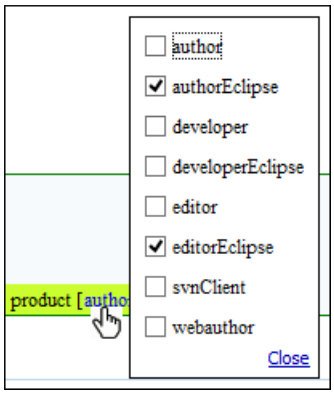

Figure 769: Profiling Attribute Value Form Control Pop Up

Alternate Method with a DITAVAL File: If you are using a DITAVAL filter file to control the filtering of profiled content in DITA topics, you can use a flag filter to define the colors and styles that will be used when rendering the profiling. For detailed information about this alternate method, see the procedure in the Styling the Rendering of Profiled Content Using a DITAVAL File on page 1607 topic.

Customizing Profiling Values with a Subject Scheme Map

A *subject scheme map* allows you to create and manage custom profiling values in DITA documents without having to write a DITA specialization. Ultimately, this allows you to filter and flag content in **Author** mode or in transformed output.

Advantages of Using a Subject Scheme Map

The advantages of using a subject scheme to control profiling attribute values include:

- You can create a hierarchy of profiling attribute values and use a DITAVAL file to filter or flag the tree of values.
- You can share the subject scheme files with others without having to share preferences or the entire project.
- The subject scheme offers validation support so you are notified if an undefined value is used.

Overview

Subject scheme maps use key definitions to define a collection of profiling values. You can also use *subject scheme maps* to filter out (reject) the values for certain attributes so that you only see the attributes or values that you want to use in **Author** mode or the transformed output.

The highest level of map (*main DITA map*) that uses the set of profiling values must reference the *subject scheme map* where the profiling values are defined and the `type` attribute needs to be set to `subjectScheme` for the reference, as in the following example:

```
<topicref href="test.ditamap" format="ditamap" type="subjectScheme"/>
```

Creating a Subject Scheme Map

To create and configure a *subject scheme map*, follow this procedure:

1. Use the **New Document** wizard to create a new **Subject Scheme** document (**New from Templates** > **Framework templates** > **DITA Map** > **map** > **Subject Scheme**).

2. Use the controls in **Author** mode to define the hierarchical tree of values for your *subject scheme* (see the Author mode example below) or switch to **Text** mode and define it there if you prefer (see the Text mode example below).

   Note: The pre-defined subject scheme template includes Navigation Titles (`navtitle` element). This element is not required, but if you use it, the text that you enter for the `navtitle` will be used (instead of the name of the value) in the various places where profiling attributes are presented in Oxygen XML Editor plugin. An example of when this might be helpful is if you want to use abbreviations for the name of a value, but you want to see its full name in Oxygen XML Editor plugin.
3. Bind the particular attribute to the key you define for the tree of values. Notice that in the examples below, the `audience` attribute is bound to the `audienceKey` value.
4. If you want to filter out (reject) values for certain attributes, bind the attributes to a blank value (as you see for the `props` and `otherprops` attributes in the examples below). This means that those attributes will not appear in the various places where profiling attributes are presented in Oxygen XML Editor plugin.
5. Save your *subject scheme* file.
6. Reference your *subject scheme* in the highest level of map (*main DITA map*) that will use the set of profiling values and set its type to `subjectScheme`. The easiest way to do this is:
   a. With your *subject scheme* file opened in the editor, go to the **DITA Maps Manager** view, right-click the *main DITA map*, and select **Append Child** > **Reference to the currently edited file**.
   b. In the **Insert Topic Reference** dialog box, go to the **Attributes** tab and in the **Type** field, enter or select **subjectScheme**.
   c. Click the **Insert and Close** button and save your main DITA map.

Using a Subject Scheme in Conjunction with a DITAVAL File

You can use a subject scheme to customize a hierarchy of profiling attribute values and then use it in conjunction with a DITAVAL file to filter or flag the entire tree of values. For example, suppose one of the values for the `audience` attribute in a hierarchical subject scheme is `surgeon` and it has two subordinate values of `neuro-surgeon` and `plastic-surgeon` (see the examples below). You could create a DITAVAL file with the following content:

```
<val>
     <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

That DITAVAL file could then be used for a condition set to filter content in **Author** mode or during the transformation stage to filter content in the output and the `neuro-surgeon` and `plastic-surgeon` values would be excluded by the filter since the subject scheme defines them as subordinate values of the `surgeon` value.

Example: Subject Scheme Map that Defines Custom Values for the Audience Attribute

This example uses typical audience values for medical personnel (`therapist`, `oncologist`, `physicist`, `radiologist`, `surgeon`, and so on). The `audience` attribute is bound to the `audienceKey` value (which defines the tree of values). You can also see that it filters out all possible values for other attributes (`props` and `otherprops`) so that they won't be available in the various places where profiling attributes are presented in Oxygen XML Editor plugin.

Example using Author mode controls:

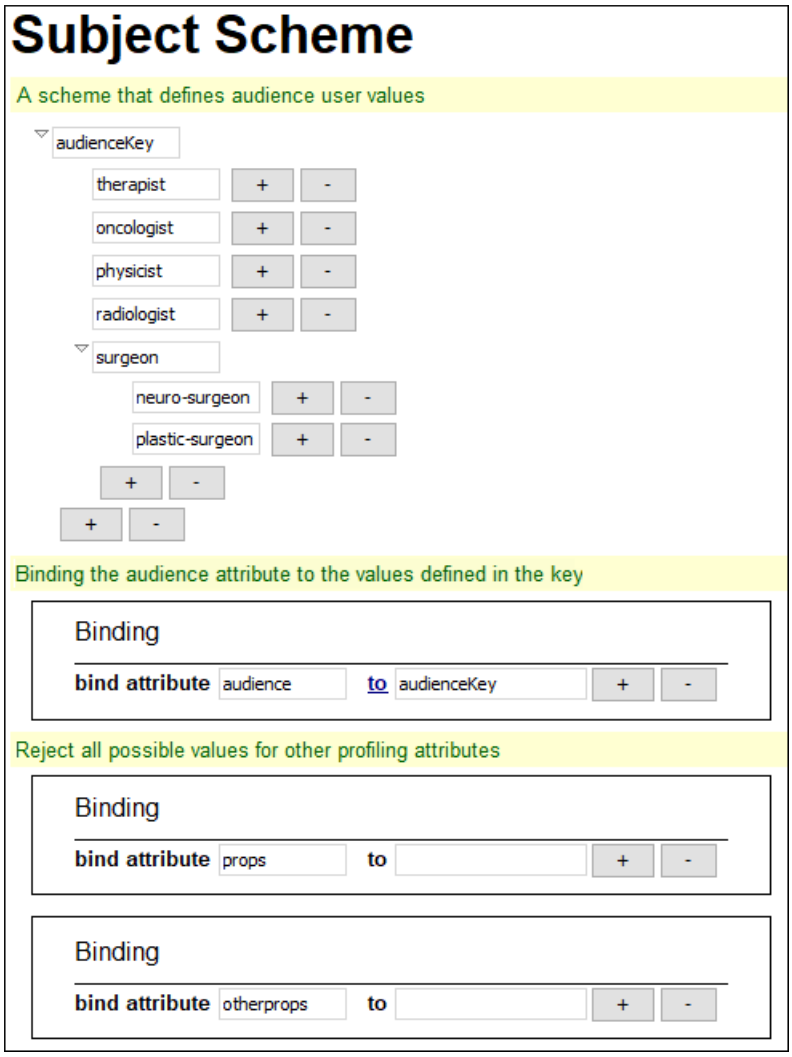

Figure 770: Subject Scheme Author Mode Controls

Example code in Text mode:

```
<subjectScheme>
  <!-- A scheme that defines audience user values -->
  <subjectdef keys="audienceKey">
    <subjectdef keys="therapist"/>
    <subjectdef keys="oncologist"/>
    <subjectdef keys="physicist"/>
    <subjectdef keys="radiologist"/>
    <subjectdef keys="surgeon">
      <subjectdef keys="neuro-surgeon"/>
      <subjectdef keys="plastic-surgeon"/>
    </subjectdef>
  </subjectdef>
  <!-- Binding the audience attribute to the values defined in the key -->
  <enumerationdef>
    <attributedef name="audience"/>
    <subjectdef keyref="audienceKey"/>
  </enumerationdef>

  <!--Reject all possible values for other profiling attributes-->
  <enumerationdef>
    <attributedef name="props"/>
    <subjectdef/>
  </enumerationdef>
  <enumerationdef>
    <attributedef name="otherprops"/>
    <subjectdef/>
  </enumerationdef>
</subjectScheme>
```

Where the Profiling Attributes are Available in Oxygen XML Editor plugin

When you edit a DITA topic in the **Text** or **Author** mode, Oxygen XML Editor plugin collects all the profiling values from the *subject scheme map* that is referenced in the map that is currently opened in the **DITA Maps Manager** (or set as the *root map*). The values of profiling attributes defined in a *Subject Scheme Map* are available in the following places in Oxygen XML Editor plugin (regardless of their mapping in the **Profiling/Conditional Text** preferences page):

- The **Profiling** tab of the **Edit Properties** dialog box.
- The **Edit Profiling Attribute** dialog box.
- The inline profiling controls in **Author** mode.
- The proposals for the attribute values in the *Content Completion Assistant*.

More Details

For more details about hierarchical filtering, defining controlled values, and using *subject scheme maps*, refer to the following resources:

- DITA 1.3 Specifications: Subject Scheme Maps
- Oxygen Video Tutorial: DITA Subject Scheme

Related Information:

Filtering Profiling Values with a DITAVAL File on page 1605

Filtering Profiling Values with a DITAVAL File

You can use a DITAVAL filter file to control the filtering or flagging of profiled content or to identify which values are to be used for conditional processing during a particular output.

DITAVAL Filtering Use-Case

Suppose that a medical publication uses the `audience` attribute to profile the content for the following types of users: *therapist*, *physician*, and *surgeon*. Suppose that in the output, you want to exclude any content that is profiled as `surgeon` value for the `audience` attribute.

You could use a DITAVAL filter file to exclude anything that is profiled as `surgeon`:

```
<val>
     <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

If you then transform the main *DITA map* and specify the DITAVAL filter file in the transformation scenario, the output will exclude anything that is profiled as `surgeon`).

DITAVAL Filter File Editor in Author Mode

The **Author** editing mode in Oxygen XML Editor plugin offer a simple and intuitive editor for creating or modifying DITAVAL files. It provides a series of drop-down menus and text fields that allow you to easily define the filters.

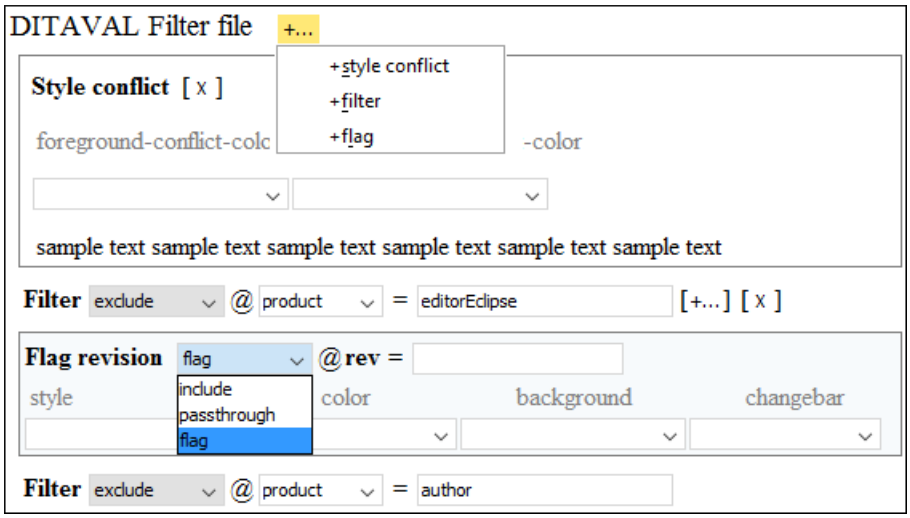

Figure 771: DITAVAL File Editor in Author Mode

Use the **+...** button to display a drop-down list that contains elements that you can add at that particular location in the DITAVAL file. Clicking this button at the top (next to the **DITAVAL FILTER File** title, allows you to insert the following elements:

- **Style Conflict** - Inserts a *style-conflict* element that declares behavior to be used when one or more flagging methods collide on a single content element. You can use the simple drop-down menus to select values for the `foreground-conflict-color` and `background-conflict-color` attributes.
- **Filter** - Inserts a *prop* element that identifies an attribute to apply a filtering action on. The possible actions that you can select are *include*, *exclude*, *passthrough*, and *flag*. If you select the *flag* action, you can use the drop-down menus to select values for the `style`, `color`, and `background` attributes.
- **Flag** - Inserts a *revprop* element that Identifies a value in the `rev` attribute that should be flagged in some manner. The allows actions are *include*, *passthrough*, and *flag*. If you select the *flag* action, you can use the drop-down menus to select values for the `style`, `color`, `background`, and `changebar` attributes.

See the DITAVAL Element Specifications for more details about the allowed filters and flags.

How to Create a DITAVAL Filter File

To create a DITAVAL filter file, follow these steps:

1. Go to **File** > **New**.
2. Scroll to the **Framework templates** > **DITAVAL** folder.
3. Select the **Filter** template file and click **Create**.
4. Define your filters in the DITAVAL file (in **Text** or **Author** mode).
5. Save the DITAVAL file.

Result: The DITAVAL filter file can now be used for all of the following:

- To apply a reference to the DITAVAL file in a *Profiling Condition Set* using the **Use DITAVAL File** option in the **Condition Set** configuration dialog box.
- You can use the **Import from DITAVAL** option in the **Profiling/Conditional Text** preferences page to use the DITAVAL file to define profiling attributes.
- You can use the DITAVAL file to apply the filters to the output by specifying the DITAVAL file in the transformation scenario.
- You can use the filter file in the **DITA Map Completeness Check** dialog box when validating your *DITA map*.
- DITAVAL files are also used when working with the DITA 1.3 *Branch Filtering* mechanism. For more details, see: Working with DITA 1.3 Branch Filtering on page 1557.
- You can define the colors and styles to be used for rendering profiled condition sets in **Author** mode and the **DITA Maps Manager** view by using a **Flag** filter in the DITAVAL file.

Customizing Profiling Values with a Subject Scheme Map on page 1602
Styling the Rendering of Profiled Content Using a DITAVAL File on page 1607

Styling the Rendering of Profiled Content Using a DITAVAL File

If you are using a DITAVAL filter file to control the filtering of profiled content, you can define the colors and styles to be used for rendering profiled condition sets in **Author** mode and the **DITA Maps Manager** by defining the styles in a flag filter that is set in a DITAVAL filter file.

How to Define a Flag for a Condition Set in a DITAVAL Filter File

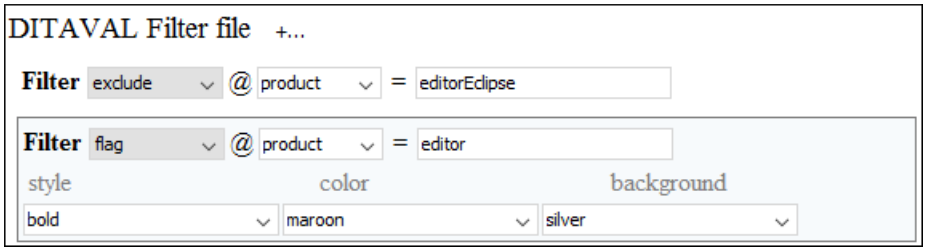
To define the colors and styles to be used for rendering profiled condition sets by using a flag filter in a DITAVAL filter file, follow these steps:

1. Create or edit your DITAVAL file to define your profiling condition set.
2. In **Author** mode, define the filters for your condition set.
3. Select **Flag** from the drop-down menu on in a particular **Filter** or **Flag Revision** to present additional drop-down menus that allow you to configure the colors and styles for the particular condition set.
4. Save the DITAVAL file.

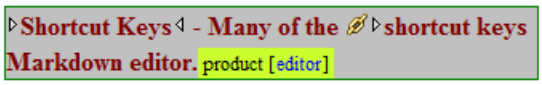
Result: Test your changes by opening profiled content in **Author** mode or the **DITA Maps Manager** and use the options in the **Profiling / Conditional Text** drop-down menu to see how the changes in your DITAVAL flag are rendered.

EXAMPLE:

Using a **Flag** on a **Filter** to define the styling for a condition set like this:



will render the styling of the profiled content in **Author** mode to look like this:



and will render the styling in the **DITA Maps Manager** view to look like this:

Filtering Profiling Values with a DITAVAL File on page 1605

Publishing Profiled DITA Content

You can create a variety of publications or versions of your documentation from a single map by applying profiling conditions to the build.

Oxygen XML Editor plugin includes preconfigured transformation scenarios for DITA. By default, these scenarios take the current profiling condition set into account during the transformation, as defined in the **Filters** tab when creating a DITA transformation. You can also specify a DITAVAL file that defines filters for your profiled content.

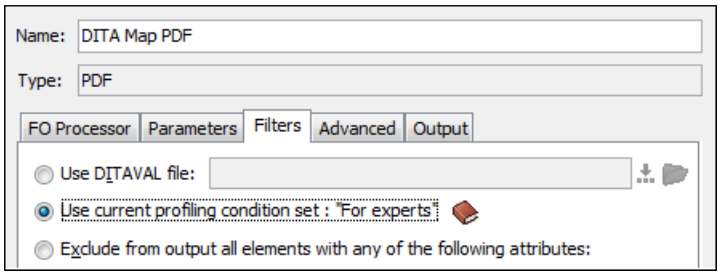

Figure 772: Profiling Option in the Filters Tab (DITA OT Transformations)

DITA Open Toolkit Support

Oxygen XML Editor plugin includes support for the DITA Open Toolkit. This section includes information about how to install and create a DITA OT *plugin*, and how to use an external instance of the DITA Open Toolkit.

Related Information:

DITA Open Toolkit Documentation

Installing a DITA-OT Plugin

Oxygen XML Editor plugin comes bundled with various DITA-OT *plugins*, but the architecture of the **DITA Open Toolkit** also allows you to install additional *plugins* that can be found from various sources (for example, *Oxygen's* public GitHub repository includes some DITA-OT plugins).

Installing a DITA-OT Plugin

To install a DITA-OT plugin, following this procedure:

1. Copy the additional *plugin* to the location of the DITA OT version you are using (by default, *`DITA-OT-DIR`*`\plugins` directory).

   Note: If the *plugin* is only supported in DITA-OT 2.5.4 version, make sure that you copy the *plugin* to the *`[OXYGEN_INSTALL_DIR]`*`/frameworks/dita/DITA-OT2.x` directory.
2. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar (you could also use the same action on the main toolbar or open the **Transformation Scenarios** view).
3. Select the **Run DITA-OT Integrator** transformation scenario. If the *integrator* is not visible, select the **Show all scenarios** option that is available in the **Settings** drop-down menu.

   Important: The folder where the **DITA OT** is located needs to have full write access permissions set to it. For example, in **Windows**, if you are integrating *plugins* in the **DITA OT** folder bundled with Oxygen XML Editor plugin and your application is installed in the **Program Files** folder, you can start the Oxygen XML Editor plugin main executable with administrative rights for the integrator process to be able to modify resources in the **DITA OT** folder.
4. Apply the scenario.
5. Check the **Results** panel at the bottom of the application to make sure the build was successful.

Details About the Transformation Type (transtype)

Starting with version 17.0, if the DITA-OT plugin declares a **transtype** (transformation type), Oxygen XML Editor plugin detects that transformation type declaration from the **DITA OT** *plugin* and presents descriptions (contributed in the `transtype` declarations) in the **DITA Transformation Type** dialog box. Oxygen XML Editor plugin also shows the contributed parameters from the **DITA OT** *plugin* in the transformation scenario's **Parameters** tab.

If the *plugin* contributed a new transformation type that is not detected (for instance, if you are using a previous version of Oxygen XML Editor plugin that does not detect the `transtype` declarations), you can set the transformation type by following this procedure:

1. Create a new **DITA OT** transformation scenario with a predefined type that is similar to the new transformation type.
2. Edit the transformation scenario and in the **Parameters** tab, add a `transtype` parameter with the value of the new transformation type. Click **OK** to save your changes.

   Note: A transformation type can also extend another `transtype`. For example, the *pdf-prince* `transtype` extends a `commons` transformation type that contains all the common DITA OT parameters.

   Example:

```
<plugin id="com.oxygenxml.pdf.prince">
  <!-- extensions -->
  <feature extension="dita.conductor.transtype.check" value="pdf-prince"
 type="txt"/>
  <feature extension="dita.conductor.target.relative" value="integrator.xml"
 type="file"/>
  <feature extension="dita.transtype.print" value="pdf-prince"/>
  <transtype name="pdf-prince"extends="commons" desc="PDF (Prince XML)">
    <param name="princeExecPath" type="file" desc="Path to the Prince executable
 file that will produce the PDF"/>
  </ Transtype>
</plugin>
```

Creating a DITA OT Plugin on page 1609

Installing the DITA For Publishers Package

DITA Open Toolkit Documentation

Creating a DITA OT Plugin

Oxygen XML Editor plugin provides the ability to install additional **DITA Open Toolkit** *plugins* that can be found from various sources (for example, *Oxygen's* public GitHub repository includes some DITA-OT plugins). It is also possible to create your own *plugin*.

To create a DITA-OT *plugin*, follow these steps:

1. Create a new folder in the **plugins** folder located in your DITA OT directory (for example, if you are using DITA 2.5.4, the path would look like this: *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/DITA-OT2.x/plugins/MyNewPlugin`).
2. Create a **plugin.xml** file in that same folder. This file will contain the extension points for the *plugin*. For example, references to the XSLT stylesheets that will be used to style the output.

   Note: You can easily create this file by using the **DITA OT Plugin** new document template that is included in Oxygen XML Editor plugin (from the **New from templates** wizard you can find this template in **Framework templates** > **DITA** > **plugin**.

   Example: A *plugin.xml* file for a syntax highlighting plugin.

```
<plugin id="com.oxygenxml.highlight">
  <feature extension="package.support.name" value="Oxygen XML Editor Support"/>
  <feature extension="package.support.email" value="support@oxygenxml.com"/>
  <feature extension="package.version" value="20.0"/>
  <feature extension="dita.xsl.xhtml" value="xhtmlHighlight.xsl" type="file"/>
  <feature extension="dita.xsl.xslfo" value="pdfHighlight.xsl" type="file"/>
  <feature extension="dita.conductor.lib.import" file="lib/xslthl-2.1.1.jar"/>
</plugin>
```

   Tip: For more information about extension points that are available to use in the *plugin.xml* file, see: http://dita-ot.sourceforge.net/1.5.3/dev_ref/extension-points.html.
3. Install the newly created DITA-OT *plugin* by running the predefined transformation scenario called **Run DITA-OT Integrator** from the **Apply Transformation Scenario(s)** or **Configure Transformation Scenario(s)** dialog box.

   Note: If the *integrator* is not visible, select the **Show all scenarios** option in the **Settings** drop-down menu.

You can share your new plugin with other users who have the same DITA-OT distribution by sending them your newly created folder along with the installation instructions.

Related Information:
DITA Open Toolkit Documentation

Example: Creating a Custom Syntax Highlighting DITA OT Plugin

To offer a detailed example of the steps required to create a new **DITA Open Toolkit** *plugin*, this topic uses an example of creating an **XSLT** customization *plugin* that provides syntax highlighting when publishing DITA `codeblock` elements to **HTML** and **PDF** output formats. This *plugin* (**com.oxygenxml.highlight**) is actually available in the **DITA Open Toolkit** distribution that comes bundled with the latest version of Oxygen XML Editor plugin, but these instructions show you how you could create it if it were not included.

The steps to help you to create the *plugin* are as follows:

1. Create a folder for your *plugin* in the DITA OT **plugins** folder (*DITA-OT-DIR*`/plugins/`).

   For example, if you are using DITA 1.8.5, the path would look like this:

   [OXYGEN_INSTALL_DIR]`/frameworks/dita/DITA-OT/plugins/com.oxygenxml.highlight`
2. Create a **plugin.xml** file (in the same *plugin* folder) that contains the extension points of the *plugin*.

   Note: You can easily create this file by using the **DITA OT Plugin** template that is included in Oxygen XML Editor plugin (from the **New from templates** wizard you can find this template in **Framework templates** > **DITA** > **plugin**).

   For example, our syntax highlighting plugin example contains the following:

   ```
   <plugin id="com.oxygenxml.highlight">
     <feature extension="package.support.name" value="Oxygen XML Editor Support"/>
     <feature extension="package.support.email" value="support@oxygenxml.com"/>
     <feature extension="package.version" value="1.0.0"/>
     <feature extension="dita.xsl.xhtml" value="xhtmlHighlight.xsl" type="file"/>
     <feature extension="dita.xsl.xslfo" value="pdfHighlight.xsl" type="file"/>
   </plugin>
   ```

   The most important extensions in it are the references to the XSLT stylesheets that will be used to style the HTML and PDF outputs.

   You can find other **DITA OT** *plugin* extension points here: http://dita-ot.sourceforge.net/1.5.3/dev_ref/extension-points.html
3. Create an XSLT stylesheet to customize the output types. In our example, to customize the HTML output we need to create an XSLT stylesheet called **xhtmlHighlight.xsl** (in the same *plugin* folder).

   Tip: You can find an XSLT stylesheet with content that is similar to the desired output and use it as a template to overwrite parts of your stylesheet. In our example we want to overwrite the creation of the HTML content from a DITA **codeblock** element. Since a DITA `codeblock` element has the `class` attribute value `+ topic/pre pr-d/codeblock` we can take part of the class attribute value (**topic/pre**) and search the **DITA OT** resources for a similar stylesheet.

   Our search found the XSLT stylesheet *DITA-OT-DIR*`/org.dita.xhtml/xsl/xslhtml/dita2htmlImpl.xsl` that contains:

   ```
   <xsl:template match="*[contains(@class,' topic/pre ')]" name="topic.pre">
     <xsl:apply-templates select="."  mode="pre-fmt" />
   </xsl:template>
   ```

   We use it to overwrite our **xhtmlHighlight.xsl** stylesheet, which results in the following:

   ```
   <xsl:template match="*[contains(@class,' topic/pre ')]" name="topic.pre">
       <!-- This template is deprecated in DITA-OT 1.7.
            Processing will moved into the main element rule. -->
       <xsl:if test="contains(@frame,'top')"><hr /></xsl:if>
       <xsl:apply-templates select="*[contains(@class,' ditaot-d/ditaval-startprop ')]"
             mode="out-of-line"/>
       <xsl:call-template name="spec-title-nospace"/>
       <pre>
         <xsl:attribute name="class"><xsl:value-of select="name()"/></xsl:attribute>
         <xsl:call-template name="commonattributes"/>
         <xsl:call-template name="setscale"/>
         <xsl:call-template name="setidaname"/>
        <!--Here I'm calling the styler of the content inside the codeblock.-->
   ```

```
      <xsl:call-template name="outputStyling"/>
    </pre>
    <xsl:apply-templates select="*[contains(@class,' ditaot-d/ditaval-endprop ')]"
          mode="out-of-line"/>
    <xsl:if test="contains(@frame,'bot')"><hr /></xsl:if><xsl:value-of select="$newline"/>
  </xsl:template>
```

You could also use another XSLT template that applies the XSLTHL library as a Java extension to style the content.

4. Create additional XSLT stylesheets to customize all other desired output types. In our example, to customize the PDF output we need to create an XSLT stylesheet called **pdfHighlight.xsl** (in the same *plugin* folder).

   In this case we found an appropriate XSLT stylesheet *DITA-OT-DIR*`/plugins/legacypdf/xslfo/dita2fo-elems.xsl` to use as a template that we use to overwrite our **pdfHighlight.xsl** stylesheet, which results in the following:

```
<xsl:template match="*[contains(@class,' topic/pre ')]">
  <xsl:call-template name="gen-att-label"/>
  <fo:block xsl:use-attribute-sets="pre">
    <!-- setclass -->
    <!-- set id -->
    <xsl:call-template name="setscale"/>
    <xsl:call-template name="setframe"/>
    <xsl:apply-templates/>
  </fo:block>
</xsl:template>
```

   Note: You can edit the newly created stylesheets to customize multiple outputs in a variety of ways. For example, in our case you could edit the **xhtmlHighlight.xsl** or **pdfHighlight.xsl** stylesheets that we created to customize various colors for syntax highlighting.

5. To install the created *plugin* in the **DITA OT**, run the predefined transformation scenario called **Run DITA-OT Integrator** by executing it from the **Apply Transformation Scenario(s)** dialog box. If the integrator is not visible, select the **Show all scenarios** option that is available in the **Settings** drop-down menu. For more information, see Installing a DITA-OT Plugin on page 1608.

   Results of running the integrator using our example:

   XSLT content is applied with priority when publishing to both HTML and PDF outputs.

   a. For the HTML output, in the XSLT stylesheet *DITA-OT-DIR*`/xsl/dita2html-base.xsl` a new import automatically appeared:

```
<xsl:import href="../plugins/com.oxygenxml.highlight/xhtmlHighlight.xsl"/>
```

      This import is placed after all base imports and thus has a higher priority. For more information about imported template precedence, see: http://www.w3.org/TR/xslt#import.

   b. Likewise, for the PDF output, in the top-level stylesheet *DITA-OT-DIR*`/plugins/org.dita.pdf2/xsl/fo/topic2fo_shell_fop.xsl` a new import statement appeared:

```
<xsl:import href="../../../com.oxygenxml.highlight/pdfHighlight.xsl"/>
```

Now, you can distribute your *plugin* folder to anyone that has a DITA OT installation along with some simple installation notes. Your customization will work provided that the templates you are overwriting have not changed from one DITA OT distribution to the other.

DITA Open Toolkit Documentation

Using an External DITA Open Toolkit in Oxygen XML Editor plugin

Oxygen XML Editor plugin comes bundled with a DITA Open Toolkit, located in the *DITA-OT-DIR* directory. Starting with Oxygen XML Editor plugin version 17, if you want to use an external DITA OT for all transformations and validations, you can open the **Preferences** dialog box and go to the **DITA** page, where you can specify the DITA OT to be used. Otherwise, to use an external DITA Open Toolkit, follow these steps:

1. Edit your transformation scenarios and in the **Parameters** tab change the value for the **dita.dir** parameter to point to the new directory.

2. To make changes in the libraries that come with the DITA Open Toolkit and are used by the Ant process, go to the **Advanced** tab, click the **Libraries** button and deselect **Allow Oxygen to add high priority libraries to classpath**.
3. If there are also changes in the DTDs and you want to use the new versions for content completion and validation, go to the **Document Type Association** preferences page, edit the **DITA** and **DITA Map** document types and modify the catalog entry in the **Catalogs** tab to point to the custom catalog file `catalog-dita.xml`.

DITA Open Toolkit Documentation

Built-in Third-Party DITA Open Toolkit Plugins

The DITA Open Toolkit 1.8.5 and 2.5.4 distributions that are bundled with Oxygen XML Editor plugin include some pre-installed third-party open-source *plugins* that add extra publishing formats and functionality.

The *plugins* that come bundled with Oxygen XML Editor plugin include:

- **DITA For Publishers** (installed only in DITA OT 1.8.5) - These *plugins* allow DITA content to be published to additional formats, such as EPUB 2.0 and Kindle.
- **DITA to Word** (installed only in DITA OT 2.5.4) - This *plugin* allows users to publish DITA content to MS Word.
- **DITA Markdown** (installed only in DITA OT 2.5.4) - This *plugin* allows users to publish DITA content to *Markdown*, or to publish *DITA maps* that reference *Markdown* resources.
- **Lightweight DITA** (installed only in DITA OT 2.5.4) - This *plugin* allows users to create, edit, and validate *Lightweight* DITA topics and *maps*.
- **DITA Community** (installed only in DITA OT 2.5.4) - These *plugins* allow support for DITA 1.3 with embedded or referenced MathML and SVG images.

DITA Specialization Support

DITA is designed to let you design new markup and new document types that allow any general-purpose DITA processor to process documents that use the new markup. This in turn enables blind interchange of DITA documents from any source. In particular, in the context of a map, you can combine topics of any type and get usable results from any general-purpose DITA processor. Specialization is the one truly unique and distinguishing aspect of DITA. Even if you have no use for any aspect of DITA modularity or reuse, you still have a use for specialization simply because it enables reliable interchange in a way that no other XML application does.

For detailed information and step-by-step tutorials about DITA specializations, see DITA 4 Practitioners: DITA Configuration and Specialization Tutorials.

In addition, the topics in this section contain information about using DITA specializations in Oxygen XML Editor plugin.

Integrating a DITA Specialization

A DITA specialization can have its document type defined with any of the following::

- **DTD** - For configuration and specialization tutorials, see http://dita4practitioners.github.io/dita-specialization-tutorials/.
- **XSD** - For configuration and specialization tutorials, see http://dita4practitioners.github.io/dita-specialization-tutorials/.
- **Relax NG** - For more information, see the following presentation: Creating DITA-OT Constraint/Specialization Plugins. For Relax NG coding requirements, see https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/relax-ng-requirements.html.

A DITA specialization may optionally include specialized processing, that is new XSLT template rules that match the extension part of the `class` attribute values of the new elements, and thus extend the default processing available in the DITA Open Toolkit.

To integrate a DITA specialization into Oxygen XML Editor plugin, use one of the following methods:

DITA-OT Plugin Method

If the DITA specialization is available as a DITA Open Toolkit plugin, follow this procedure:

1. Copy the additional *plugin* to the location of the DITA OT version you are using (by default, *`DITA-OT-DIR`*`\plugins` directory).

   Important: The application needs to have full write access permissions to the DITA OT directory.
2. If Oxygen XML Editor plugin was installed in the default location, you may need to restart and run it as an administrator.
3. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar (you could also use the same action on the main toolbar or open the **Transformation Scenarios** view).
4. Select the **Run DITA-OT Integrator** transformation scenario.

   Tip: If you don't see that scenario in the **Configure Transformation Scenario(s)** dialog box or **Transformation Scenarios** view, click the **Settings** button and select the **Show all scenarios** option, but don't forget to change it back to **Show only the scenarios available for the editor** after you are finished with this procedure.
5. Apply the scenario.
6. Check the **Results** panel at the bottom of the application to make sure the build was successful.
7. Restart Oxygen XML Editor plugin with your normal permissions.

Tip: Oxygen XML Editor plugin detects new document templates contributed by the DITA OT plugin as long as you do the following:

1. Create a new folder called **template_folders** inside the *`DITA-OT-DIR`*`\plugins` directory.
2. Create one or more subfolders inside the **template_folders** directory that contain the new document templates. The new document templates found in those subfolders will be available in the **New** document wizard.

Alternative Methods

If the DITA specialization is not available as a DITA OT plugin, you have the following options:

- If the DTDs that define the extension elements are located in a folder outside the DITA Open Toolkit folder, add new rules to the DITA OT catalog file. These rules are meant for resolving the DTD references from the DITA files that use the specialized elements to that folder. This allows for correct resolution of DTD references to your local DTD files and is needed for both validation and transformation of the *DITA maps* or topics. The DITA OT catalog file is called `catalog-dita.xml` and is located in the root folder of the DITA Open Toolkit.
- If there is specialized processing provided by XSLT stylesheets that override the default stylesheets from DITA OT, these new stylesheets must be called from the DITA OT Ant build scripts.

  Important: If you are using DITA specialization elements in your DITA files, it is recommended that you activate the **Enable DTD/XML Schema processing in document type detection** option in the **Document Type Association** preferences page.
- You could create your own document templates, store them in a custom direction, then add that directory to the list of template directories that Oxygen XML Editor plugin uses by adding the directory to the list in the Document Templates Preferences on page 97.

DITA Configuration and Specialization Tutorials

Editing DITA Map Specializations

In addition to recognizing the default *DITA map* formats (`map` and `bookmap`), the **DITA Maps Manager** view can also be used to open and edit specializations of *DITA maps*.

All advanced edit actions available for the map (such as insertion of topic refs, heads, properties editing) allow you to specify the element in an editable combo box. Moreover the elements that appear initially in the combo are all the elements that are allowed to appear at the insert position for the given specialization.

The topic titles rendered in the **DITA Maps Manager** view are collected from the target files by matching the `class` attribute and not a specific element name.

When editing DITA specializations of maps in the main editor the insertions of topic reference, topic heading, topic group and conref actions should work without modification. For the table actions, you have to modify each action manually to insert the correct element name at cursor position. You can go to the **DITA Map** document type from the **Document Type Association** preferences page and edit the table actions to insert the element names as specified in your specialization. See Adding/Editing a Framework (Document Type) on page 1237 for more details.

Related Information:

DITA Configuration and Specialization Tutorials

Integrating a DITA Specialization on page 1612

Editing DITA Topic Specializations

In addition to recognizing the default DITA topic formats, topic specializations can also be edited in the **Author** mode.

The content completion should work without additional modifications and you can choose the tags that are allowed at the cursor position.

The CSS styles in which the elements are rendered should also work on the specialized topics without additional modifications.

The toolbar/menu actions should be customized to insert the correct element names. You can go to the `DITA` document type from the **Document Type Association** preferences page and edit the actions to insert the element names, as specified in your specialization. See Adding/Editing a Framework (Document Type) on page 1237 for more details.

Master Files Support in DITA

Oxygen XML Editor plugin includes a feature that allows you to define *Master Files* at project level. This feature is typically used in Oxygen XML Editor plugin for XML documents to determine the context for operations such as validation, content completion, refactoring, searches, or displaying components collected from various modules. For DITA projects, this feature has a more limited purpose in Oxygen XML Editor plugin since it is mainly used to provide the means for updating references to moved or renamed resources.

Since you can move or rename DITA resources (such as topics and maps) in the **DITA Maps Manager**, the *root map* is used as the scope to update all the references to the moved or renamed resources. However, you do not have this option for non-DITA resources (such as folders, images, html files, audio, video, text files, Markdown documents) since they do not appear in the **DITA Maps Manager**. Also, when moving DITA resources in the **DITA Maps Manager**, you have to do it one at a time.

You can use the *Master Files* support in DITA to update all the references to moved or renamed resources in the scope of the *Master Files*, and since the *root map* will be set as the *Master File*, you achieve the same result as if you were moving or renaming them in the **DITA Maps Manager**. It also allows you to move multiple DITA resources (or entire folders) at once in the **Navigator** view, instead of the **DITA Maps Manager**, while still giving you the option of updating all the references.

How to Enable Master Files Support in DITA

To use the *Master Files* support in DITA, follow these steps:

1. Go to the **Navigator** view and select **Enable Master Files Support** from the contextual menu of the project root folder.
2. Add the main DITA map (*root map*) to the Master Files folder by doing one of the following:
   - Right-click the project root folder or the *Master Files* folder and select **Detect Master Files from Project**.
   - Manually add the *root map* to the *Master Files* folder by right-clicking a file from your project and selecting **Add to Master Files** from the contextual menu (or simply drag and drop it into the *Master Files* folder).

   Tip: You can set multiple maps in the *Master Files* folder and all of them will automatically be added to the list of root maps you can select from the drop-down menu in the **DITA Maps Manager** toolbar.

Moving or Renaming Non-DITA Resources and Updating the References to Them

With the *Master Files* support enabled, you can move or rename non-DITA resources (such as folders, images, html files, audio, video, text files, Markdown documents) or move multiple normal DITA resources (or entire folders) in the **Navigator** view and Oxygen XML Editor plugin will offer the option of updating all the references to the moved or renamed resources in the scope of the *Master Files* (in this case, the *main DITA map (root map)*).

To move or rename non-DITA resources (or move multiple DITA resources) and update the references to them, follow these steps:

1. Enable *Master Files* support and add your *root DITA map* to the *Master Files* folder as described in the How to Enable Master Files Support in DITA on page 1614 section above.
2. Go to the **Navigator** view, and use one of the following methods to move or rename the resources:

   Moving Resources

   To move resources in the **Navigator** view, do one of the following:

   - Simply drag and drop the resource to the new location in the tree structure.
   - Use the **Move** action (or **Copy** and **Paste** actions) from the contextual menu.
   - Right-click the resource and select **Refactoring** > **Move resource** action from the contextual menu. Note that this method also allows you to specify a new name and destination path in the **Move resource** dialog box.

   Result: In all cases, a **Move resource** dialog box will be presented.

   Renaming Resources

   To rename resources in the **Navigator** view, do one of the following:

   - Select the resource and press **F2**, or simply left-click again, until the in-place editor allows you to change the title.
   - Right-click the resource and select **Rename** or **Refactoring** > **Rename resource** .

   Result: In all cases, a **Rename resource** dialog box will be presented.
3. Make sure the **Update references of the moved resource(s)** option is selected in the resulting **Move** or **Rename** dialog box and keep the scope as **master files** to make sure all the references to the moved or renamed resource are updated.

Metadata

Metadata is a broad concept that describes data that explains or identifies other data. Metadata can be used for many purposes, from driving automation of document builds to enabling authors and readers to find content more easily. DITA provides numerous types of metadata, each of which is used and created differently. Some of the most important forms of metadata in DITA are topic and taxonomy.

Topic Metadata

Topic metadata describes the topic and what it is about. Topic metadata can be inserted in the `prolog` element of a topic or inside the `topicref` element that points to a topic from a map. In other words, metadata about the topic can be asserted by the topic itself, or can be assigned to it by the map that includes it in the build. This

allows multiple maps to assign different metadata to the same topic. This may be appropriate when you want to describe a topic differently in various documents.

Taxonomy and Subject Scheme

A taxonomy is a controlled vocabulary. It can be used to standardize how many things in your content and metadata are named. This consistency in naming can help ensure that automated processes work correctly, and that consistent terminology is used in content, and in metadata. In DITA, taxonomies are created using *subject scheme maps*. When you are authoring, many of the values you choose from have been defined in *subject scheme maps*.

Migrating MS Office Documents to DITA

Oxygen XML Editor plugin integrates the entire DITA for Publishers plugins suite and includes some helpful tools that allows you to migrate content from Microsoft Office® Word (and other similar types of documents) to DITA. Migration from proprietary formats to XML is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case:

Method 1

1. Open the document in MS Office (or other similar application), select all the content, and copy it.
2. Open Oxygen XML Editor plugin and create a new DITA topic.
3. Paste the selected content in **Author** mode. The *Smart Paste* functionality will attempt to convert the content to DITA.

Method 2

1. Save your document as HTML.
2. Once you have converted it to HTML, you have two possibilities:
   - In Oxygen XML Editor plugin, select **File** > **Import** > **HTML File** to import it as XHTML. Then, open the XHTML in Oxygen XML Editor plugin and use one of the **XHTML to DITA** Transformation Scenarios to convert the content to DITA.
   - Open the HTML file in any Web browser, select all of its content, and copy it. Then, open Oxygen XML Editor plugin, create a new **DITA** topic and paste the selected content in **Author** mode. The *Smart Paste* functionality will attempt to convert the HTML content to DITA.

Method 3

1. Open the document in the free *Libre Office* application and save it as **DocBook**.
2. Open the **DocBook** document in Oxygen XML Editor plugin.
3. Run the predefined transformation scenario called **DocBook to DITA**.
4. You may need to make some manual adjustments for elements that couldn't be mapped.

Method 4

1. If the document is in the MS Word DOCX format, you can open it in the **Archive Browser** view in Oxygen XML Editor plugin and then open the **document.xml** file contained in the archive.
2. Run the predefined transformation scenario called **DOCX DITA**. This scenario runs a build file over the DOCX archive and should produce a DITA project that contains a *DITA map* and multiple topics.
3. You may need to do some manual reconfiguration to map DOCX styles to DITA content.

DITA 1.3 Support

Starting with version 17.1, Oxygen XML Editor plugin includes support for some DITA 1.3 features.

To enable DITA 1.3 support in Oxygen XML Editor plugin and use the DITA Open Toolkit 2.5.4 for publishing, open the **Preferences** dialog box , go to **DITA**, and select the **Built-in DITA OT 2.x** radio button.

The Oxygen XML Editor plugin publication of the full DITA 1.3 specifications can be found at https://www.oxygenxml.com/dita/1.3/specs/index.html#introduction/dita-release-overview.html.

The following table is a list of DITA 1.3 features and their implementation status in Oxygen XML Editor plugin:

Table 74: DITA 1.3 Features Implementation Status

Feature	Editing	Publishing [DITA Open Toolkit 2.5.4 is used]
DITA 1.3 DTD, XML Schema, and Relax NG-based maps/topics/tasks/ references, etc.	New DITA 1.3 document templates. By default, DITA topics and maps that do not specify version in the DOCTYPE declaration are also considered to be DITA 1.3 Specific annotations presented in the content completion assistance window and documentation tooltips for all new DITA 1.3 elements	N/A
Learning Object and Group maps	New document templates	No specific support implemented
Troubleshooting specialization	Create and edit new troubleshooting topics	No specific support implemented
XML markup domain	Validation and Content Completion	Special rendering in PDF and XHTML-based outputs
Equation and MathML domain	Validation and content completion Display and Insert equations	Special rendering in PDF and XHTML-based outputs
SVG domain	Validation and content completion Display referenced SVG content	Special rendering in PDF and XHTML-based outputs
Other new DITA 1.3 elements (**div**, **strike-through**, **overline**, etc)	Validation and Content Completion	Special rendering in PDF and XHTML-based outputs
Release management domain	Validation and Content Completion	No specific support implemented
Scoped keys	Define key scopes Validate and check for completeness Resolve **keyrefs** and **conkeyrefs** taking key scopes into account Key scope information is displayed in a tooltip when hovering over an item in the **DITA Maps Manager**	Partially implemented (Various issues may still be encountered)

Feature	Editing	Publishing [DITA Open Toolkit 2.5.4 is used]
Branch filtering	Display, create, and edit **ditavalref** elements	Partially implemented (Various issues may still be encountered)
Key-based cross deliverable addressing	Special display for references to *DITA maps* with **scope="peer"** and a defined **keyscope** Gather and present keys from peer maps	Not implemented.
Shorthand to address syntax that identifies elements in the same topic	Properly resolved for validation, links, and conrefs	Implemented
Various table attributes (**orientation**, **rotation**, **scope**, and **headers** on cells)	Not implemented in the Table Properties action support. However, attributes can be changed from the Attributes view	Not implemented
New Map **topicref** attributes (**cascade**, **deliveryTarget**)	Allow setting new attributes, propose proper values for them	Implemented

Related Information:

Active Cell

Active cell refers to the selected cell where data is entered when you begin typing. Only one cell is active at a time. The *active cell* is bounded by a heavy border.

Alternate CSS Style

The ***Alternate CSS Style*** refers to the choices in the bottom half of **Styles** drop-down menu (on the toolbar) that makes it easy to apply style changes to your documents as they appear in **Author** mode and the output without having to edit the CSS stylesheets. By default, the *alternate styles* are applied like layers, they are merged sequentially with the *main CSS style*, and you can activate any number of them. However, if you deselect the **Enable multiple selection of alternate CSSs** option in the **CSS** subtab of the **Document Type** configuration dialog box, the *alternate styles* are treated like *main CSS styles* and you can only select one at a time.

For more information, see Configuring and Managing Multiple CSS Styles on page 1315.

Anchor

An ***Anchor*** is used in various types of links to take the user to a specific location within the target document. It is designated in a URL or in the value of the `href` attribute with a *#* symbol followed by the anchor that is defined in a target ID (for example `href="MyTopic.dita#anchor`).

Apache Ant

Apache Ant (Another Neat Tool) is a software tool for automating software build processes.

Block Element

A ***block element*** is intended to be visually separated from its siblings, usually vertically. For instance, paragraphs and list items are *block elements*. It is distinct from a *inline element*, which has no such separation.

Bookmap

A ***bookmap*** is a specialized *DITA map* used for creating books. A *bookmap* supports book divisions such as chapters and book lists such as indexes.

Callout

A ***callout*** is a string of text inside a graphic and is connected to a specific location in a document by a line. Oxygen XML Editor plugin uses callouts to present comments and other types of review modifications.

Canonicalize

To ***canonicalize*** something means to convert it to a standard format that everyone generally uses. When using the term with regards to XML, it refers to the process of converting data that has more than one possible representations into a standardization that conforms to the specification of an XML document or document subset. It is helpful for applications that require the ability to test whether or not the content of an XML document or subset has been changed.

Content Completion Assistant

The ***Content Completion Assistant*** refers to a very helpful mechanism in Oxygen XML Editor plugin that offers a list of proposed items that could be inserted at the current location, depending on the current context, editing mode, and type of document. It also tries to determine the most logical choice in the current editing context and displays that proposal at the beginning of the list.

For more information about this feature and how to invoke it, depending on your editing context, see the following:

- Content Completion Assistant in Author Mode on page 459
- Content Completion Assistant in Text Mode on page 412
- Content Completion Assistant in Grid Mode on page 441
- Content Completion in XSLT Stylesheets on page 625
- Content Completion in XML Schema on page 689
- Content Completion in XQuery on page 722
- Content Completion Assistance in WSDL Documents on page 736
- Content Completion in CSS Stylesheets on page 754
- Content Completion in Relax NG Schemas on page 761
- Content Completion in NVDL Schemas on page 774
- Content Completion in JavaScript Documents on page 785
- Content Completion in Schematron Documents on page 791
- Content Completion in SQF on page 807

Dockable

A ***Dockable*** window is one that can be moved and resized, and either floated or pinned to a location, allowing you to configure the workspace according to your preferences.

Document Fragment

A ***document fragment*** represents a portion of an XML document's tree of nodes or content.

Document Type Association

In general terms, a ***Document Type Association*** is a set of rules that associate a document type with a *framework*. In Oxygen XML Editor plugin, ***Document Type Association*** also specifically refers to a preferences page where you can create new custom *frameworks* or edit existing ones. Note that predefined *frameworks* (document types) are read-only, but you can **Extend** or **Duplicate** them to configure them as custom *frameworks*.

DITA Map

A ***DITA map*** is a component of the DITA *framework* that provides the means for a hierarchical collection of DITA topics that can be processed to form an output. Maps do not contain the content of topics, but only references to them. These are known as topic references. Usually the maps are saved on disk or in a CMS with the extension `.ditamap`.

Maps can also contain relationship tables that establish relationships between the topics contained within the map. Relationship tables are also used to generate links in your published document.

You can use your map or *bookmap* to generate a deliverable using an output type such as XHTML, PDF, HTML Help, or Eclipse Help.

DITA Open Toolkit

DITA Open Toolkit is an open-source publishing engine for content authored in the Darwin Information Typing Architecture. It is a vendor-independent, open-source implementation of the DITA standard, released under the Apache License, Version 2.0.

The toolkit supports all versions of the OASIS DITA specification, including 1.0, 1.1, 1.2, and 1.3.

DITA-OT
Related Information:

DITA-OT-DIR

DITA_OT_DIR refers to the default directory that is specified for your DITA Open Toolkit distribution in the **Window** > **Preferences** > **Oxygen XML Editor plugin** > **DITA** preferences page.

For example, if you are using DITA OT 2.5.4 with Oxygen XML Editor plugin, the default directory is: *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/DITA-OT2.x` (or if you are using DITA OT 1.8.5, the default directory is: *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/DITA-OT`). You can also specify a custom directory.

Foldable Element

A ***foldable element*** refers to elements that can be collapsed and expanded in Oxygen XML Editor plugin. *Foldable elements* are marked with a small triangle (/) on the left side of the editor panel and you can use that triangle to quickly collapse or expand them. This feature is helpful when you are working with large documents and you want to temporarily hide blocks of content. You can right-click the triangle to access additional collapse and expand actions (**Collapse Other Folds**, **Collapse Child Folds**, **Expand Child Folds**, **Expand All**).

Framework

A ***framework*** refers to a package that contains resources and configuration information to provide ready-to-use support for an XML vocabulary or document type. Oxygen XML Editor plugin includes a **Document Type Configuration Dialog Box** that allows you to define a set of rules and customize various authoring mechanisms for new or existing *frameworks*.

For advanced details about customizing your own *framework*, see the Advanced Framework Customization on page 1230 section.

IDML

IDML is an abbreviation for Adobe InDesign Markup files.

Inline Element

An ***inline element*** is intended to be displayed in the same line of text as its siblings or the surrounding text. For instance, strong and emphasis in HTML are *inline elements*. It is distinct from a *block element*, which is visually separated from its siblings.

Java Archive

Java Archive (JAR) is an archive file format. *JAR* files are built on the ZIP file format and have the `.jar` file extension. Computer users can create or extract *JAR* files using the `jar` command or an archive tool.

Key Space

The concept of a ***Key Space*** in DITA refers to a set of all possible keys that can be used in a *DITA map* structure. A ***Key Space*** is established when a *root map* defines a set of effective key bindings. When Oxygen XML Editor plugin processes key references, it determines the effective binding of a given key to a resource in the context of the specified *root map*.

Keystore

A ***Keystore*** is an encrypted file that contains private keys and certificates. There are two types of *keystores* that are supported in Oxygen XML Editor plugin:

- **Java Key Store (JKS)**
- **Public-Key Cryptography Standards version 12 (PKCS-12)**

Main CSS Style

The ***Main CSS Style*** refers to the selection in the top half of the **Styles** drop-down menu (on the toolbar) that makes it easy to quickly change the look of your documents as they appear in **Author** mode and the output without having to edit the CSS stylesheets. The *main CSS* applies to the whole document and you can also select one or more *alternate styles* (listed in the bottom half of the drop-down menu) that behave like layers and are merged sequentially with the *main CSS style*.

For more information, see Configuring and Managing Multiple CSS Styles on page 1315.

Master File

A ***Master File*** typically refers to the root of an imported or included tree of modules and this support helps you simplify the configuration and development of XML projects. For more information, see the Master Files Support on page 381 section.

Named User

Named User is defined as an individual full or part-time employee who is authorized by *You* (the individual or entity who owns the rights to Oxygen XML Editor plugin) to use the software regardless of whether or not the individual is actively using the software at any given time. To avoid any doubt, *Named User* licenses cannot be shared amongst multiple individuals and separate *Named User* licenses must be purchased for each individual user.

A *Named User* license may not be reassigned to another employee except in the following circumstances:

- (a) Upon termination of the *Named User's* employment with your company.
- (b) Permanent reassignment of a *Named User* to a position that does not involve the use of the Software.

For example, suppose Jane has been assigned an *Oxygen* license and she leaves your company. When she leaves, you can simply reassign her license to John, her replacement. In the event that you do reassign the *Named User* license in accordance with the restrictions above, you do not need to notify Syncro of such a reassignment.

Note: This definition is taken from the Oxygen XML Editor plugin End User License Agreement.

Perspective

In Oxygen XML Editor plugin, a ***perspective*** refers to an interface layout geared towards a specific editing environment. Each *perspective* includes a unique set of interface objects, toolbars, views, and features. You can change the *perspective* by selecting the *perspective* from the **Window** > **Open Perspective** menu.

The *perspectives* that are available in Oxygen XML Editor plugin are:

- **Editor** - The most commonly used *perspective* and it is used to edit XML documents.
- **XSLT Debugger** - Used to detect problems in an XSLT transformation by executing the process step by step in a controlled environment.
- **XQuery Debugger** - Used to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment
- **Database** - Used to browse and manage databases.

Plugin

A ***plugin*** (also referred to as *add-on* or *extension*) is a component that adds specific features to an existing application. Oxygen XML Editor plugin supports *plugins* to enable numerous customizations.

Pretty-Print

Pretty-print refers to formatting and indenting the source code in **Text** mode to make the content easier to view and analyze. The formatting actions that are available in Oxygen XML Editor plugin include:

- **Format and Indent Element** - Available in the **Source** submenu of the contextual menu for the current element.
- **Format and Indent** - Available on the toolbar for the entire currently opened document.
- **Format and Indent** - Available in the contextual menu of the **Text** view and applies to all the content in that view.
- **Format and Indent Files** - Available in the contextual menu of the **Navigator** view for one or more selected files.

QName

QName stands for "qualified name" and defines a valid identifier for elements and attributes. *QNames* are used as URI references to reference particular elements or attributes within XML documents.

Quick Assist

The ***Quick Assist*** feature gives you easy access to some of the most commonly used actions for the specific type of document you are editing. If one or more actions are available in the current context, they are accessible via a yellow bulb help ( ) placed at the current line in the stripe on the left side of the editor in **Text** mode. You can also invoke the quick assist menu by using the **Ctrl + 1** (**Meta 1** on Mac OS X) keyboard shortcuts.

Quick Fix

The ***Quick Fix*** support in Oxygen XML Editor plugin helps you resolve errors that appear in an XML document by offering proposals to fix problems such as missing required attributes or invalid elements. *Quick Fixes* are available in **Text** mode and **Author** mode and they can be presented and activated in several ways.

- When hovering over an area of text where a validation error or warning occurs, the *Quick Fix* proposals can be presented as links in a tooltip pop-up window.
- When hovering over an error or warning in **Author** mode, the *Quick Fix* proposals are presented in a small drop-down menu.

- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon ( ) is displayed in the stripe on the left side of the editor. Clicking that icon will allow you select from the available proposals.
- If you place the cursor in the highlighted area where a validation error or warning occurs, you can also access the *Quick Fix* menu by pressing **Ctrl + 1 (Command + 1 on OS X)** on your keyboard.

Oxygen XML Editor plugin also provides support for defining and customizing a library of *Quick Fixes* using the Schematron language.

Root Map

A ***Root Map*** (or master map) specifies a *DITA map* that defines a hierarchical structure of submaps that are contained within the *root map*. Essentially, the *root map* defines a scope and provides the mechanism to allow your defined keys to be propagated throughout the entire map structure (this mechanism is also known as a *key space*).

In Oxygen XML Editor plugin, the **DITA Maps Manager** includes an option on its toolbar where you can easily specify the *root map*, but there are also several other ways to select or change the *root map*.

Space-Preserved Element

A ***spaced-preserved element*** refers to elements that require white spaces and line endings to be preserved (for example, DITA `codeblock` and `pre` elements).

Subject Scheme Map

A ***Subject Scheme Map*** allows you to create custom controlled attribute values and to manage metadata. *Subject scheme maps* use a key definition to define a collection of controlled values rather than a collection of topics. The highest level of map that uses the set of controlled values must reference the *subject scheme map* in which those controlled values are defined.

A controlled value is a keyword that can be used as a value in a metadata attribute. For example, the `@audience` metadata attribute may take a value that identifies the user group associated with a particular content unit (for medical equipment, that might include *therapist*, *oncologist*, *surgeon*, *radiologist*, and so on). In a *subject scheme map*, you can define a list of these audience values and you can then use these values to profile your content. For more information, see Customizing Profiling Values with a Subject Scheme Map on page 1602.

.

Track Changes

The *Track Changes* feature allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the **Review** view.

For more information about this feature, see Managing Tracked Changes on page 473.

WebHelp Output Directory

WebHelp_OUTPUT_DIR refers to the output directory where WebHelp transformation files will be generated.

The output directory can be specified using the **Output Directory** text field in the **Output** tab of the transformation scenario dialog box.

When running the WebHelp transformation from a command line, the output directory can be specified using the `-o` or `--output` option.

Working Set

A ***Working Set*** refers to a set of files that will be used for the scope of search and refactoring operations. Many of the search and refactoring wizards include a step where you can specify the scope for the operation and you can choose one or more *working sets* to restrict the scope to that specified set of files.

XML Catalog

An ***XML Catalog*** maps a system ID or a URI reference for a resource (stored either remotely or locally) to a local copy of the same resource. Whenever XML processing relies on external resources (such as referenced schemas and stylesheets), the use of an *XML Catalog* becomes a necessity when Internet access is not available or the connection is slow.

Oxygen XML Editor plugin includes default global catalogs as well as default catalogs for each of the built-in *frameworks*, and you can also create your own. Oxygen XML Editor plugin uses these *XML Catalogs* to resolve references for document validation and transformations. For more information, see Working with XML Catalogs on page 591.
