- For attributes with detected issues, in the **Attributes** view *(page 349)*, with the attribute and its value colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

You can configure the color for each type in the **Document Checking** preferences page *(page 156)*.

Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

Upper Part of the Stripe

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

Middle Part of the Stripe

Errors are depicted with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights** option *(page 156)*.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the **Document Checking** preferences page *(page 156)*.

Bottom Part of the Stripe

Two navigation arrows () allow you to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next error** (**Ctrl + Period (Command + Period on OS X)**) and **Document > Automatic validation > Previous error** (**Ctrl + Comma (Command + Comma on OS X)**). Also, the **Remove All** button can be used to clear all the validation markers.

Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem and possible *quick fixes (page 1096)* (if available for that issue). Also, when hovering over an issue, pressing **F2** will change the focus to the tooltip where you can use **Tab** and **Shift + Tab** to navigate between quick fixes and **Space** to trigger them.

Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the **Document Checking**

preferences page *(page 156)* where you can configure some validation options (such as the colors used to present the validation issues).
- Status messages from every validation action are also logged in the **Information** view *(page 815)*.
- If you want to see all the validation messages grouped in the **Results** panel *(page 354)*, you should use the **Validate** action from the toolbar or **Document > Validate** menu..

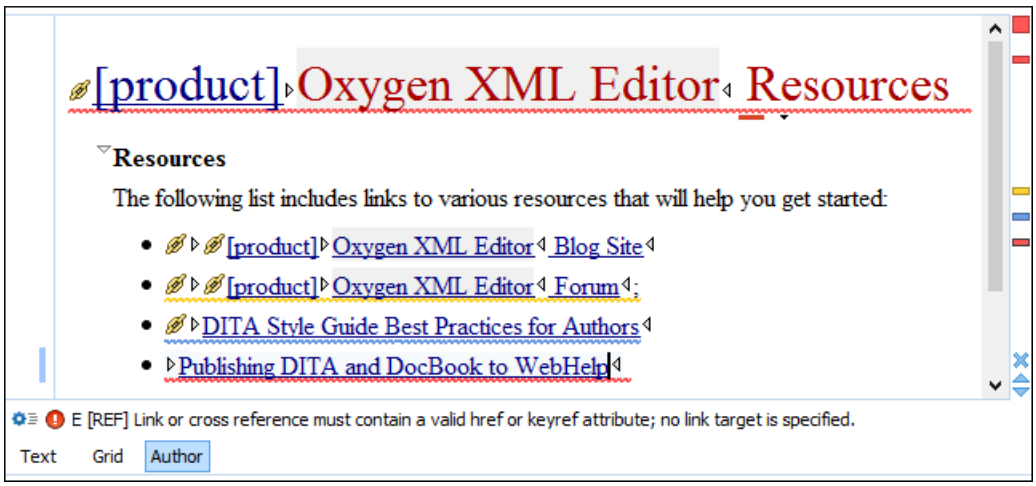
Presenting Validation Errors in Author Mode

By default, Oxygen XML Editor automatically validates documents *(page 1071)* while editing in the **Author** mode, and actions are also available to manually validate documents *(page 1072)* on-request.

Figure: Presenting Validation Errors in Author Mode



Validation Marker Locations

In **Author** mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the **Attributes** view *(page 424)*, with the attribute and its value colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

Upper Part of the Stripe

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

Middle Part of the Stripe

Errors are depicted with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights** option *(page 156)*.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the **Document Checking** preferences page *(page 156)*.

Bottom Part of the Stripe

Two navigation arrows () allow you to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next error** (**Ctrl + Period (Command + Period on OS X)**) and **Document > Automatic validation > Previous error** (**Ctrl + Comma (Command + Comma on OS X)**). Also, the **Remove All** button can be used to clear all the validation markers.

You can configure the color for each type in the **Document Checking** preferences page *(page 156)*.

Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem and possible *quick fixes (page 1096)* (if available for that issue). Also, when hovering over an issue, pressing **F2** will change the focus to the tooltip where you can use **Tab** and **Shift + Tab** to navigate between quick fixes and **Space** to trigger them.

Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the **Document Checking** preferences page *(page 156)* where you can configure some validation options (such as the colors used to present the validation issues).
- Status messages from every validation action are also logged in the **Information** view *(page 815)*.
- If you want to see all the validation messages grouped in the **Results** panel *(page 354)*, you should use the **Validate** action from the toolbar or **Document > Validate** menu..

Presenting Schematron Validation Issues *(page)*

Customizing Assert Error Messages

To customize the error messages that the Xerces or Saxon validation engines display for the `assert` and `assertion` elements, set the `message` attribute on these elements.

- For Xerces, the `message` attribute has to belong to the `http://xerces.apache.org` namespace.
- For Saxon, the `message` attribute has to belong to the `http://saxon.sourceforge.net/` namespace.

The value of the `message` attribute is the error message displayed if the assertion fails.

Custom Validators

If you need to validate the edited document with a validation engine that is different from the built-in engine, you can configure external validators in the Custom Validation Engines preferences page *(page 183)*. After a custom validation engine is properly configured *(page 183)*, it can be applied on the current document by selecting it from the list of custom validation engines in the **Validation** toolbar drop-down menu. The document is validated against the schema declared in the document.

Some validators are configured by default but there are third-party processors that do not support the output message format *(page 1080)* of Oxygen XML Editor for linked messages:

- **Saxon-EE** - Included in Oxygen XML Editor. It is associated to XML Editor and XSD Editor. It is able to validate XML Schema schemas and XML documents against XML Schema schemas. The validation is done according to the W3C XML Schema 1.0 or 1.1. This can be configured in Preferences *(page 190)*.
- **MSXML 4.0** - Included in Oxygen XML Editor (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **MSXML.NET** - Included in Oxygen XML Editor (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **LIBXML** - Not included in Oxygen XML Editor and, depending on your operating system, the libraries need to be downloaded and installed separately from http://xmlsoft.org/downloads.html. Afterwards, the `PATH` environment variable needs to be updated to contain the parent folder of the `xmllint` executable. Alternatively, you can go to **Options > Preferences > Editor > Custom Validation Engines**, edit the **LIBXML** validation engine and set a custom path to the `xmllint` executable.

  The LIBXML validator is associated with the XML Editor. It is able to validate the edited document against XML Schema, Relax NG schema full syntax, internal DTD (included in the XML document) or a custom schema type. Support for *XML Catalogs (page 3235)* (the `--catalogs` parameter) and XInclude processing (`--xinclude`) are enabled by default in the preconfigured LIBXML validator. The `--postvalid` parameter is also set by default and it allows LIBXML to validate correctly the main document even if the XInclude fragments contain IDREFS to ID's located in other fragments.

  For validation against an external DTD specified by URI in the XML document, add the `--dtdvalid ${ds}` parameter manually to the DTD validation command line. `${ds}` represents the detected DTD declaration in the XML document.

  CAUTION: File paths containing spaces are not handled correctly in the LIBXML processor. For example, the built-in *XML Catalog (page 3235)* files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled by LIBXML if Oxygen XML Editor is installed in the default location on Windows (`C:\Program Files`) because the built-in *XML catalog* files are stored in the `frameworks` subfolder of the installation folder and in this case, the file path contains at least one space character.

  Attention: On OS X, if the full path to the LIBXML executable file is not specified in the **Executable path** text field, some errors may occur during validation against a W3C XML Schema, such as:

```
Unimplemented block at ... xmlschema.c
```

To avoid these errors, specify the full path to the LIBXML executable file.

- **XSV** - Not included in Oxygen XML Editor. Windows and Linux distributions of XSV can be downloaded from http://www.cogsci.ed.ac.uk/~ht/xsv-status.html. The executable path is already configured in Oxygen XML Editor *(page 183)* for the *[OXYGEN_INSTALL_DIR]*`/xsv` installation folder. If it is installed in a different folder, the predefined executable path must be corrected in Preferences. *(page 183)* It is associated to XML Editor and XSD Editor. It is able to validate the edited document against XML Schema or a custom schema type.
- **SQC (Schema Quality Checker from IBM)** - Not included in Oxygen XML Editor. It can be downloaded from here (it comes as a .zip file, at the time of this writing SQC2.2.1.zip is about 3 megabytes). The executable path and working directory are already configured for the SQC installation directory *[OXYGEN_INSTALL_DIR]*`/sqc`. If it is installed in a different folder, the predefined executable path and working directory must be corrected in the Preferences page. *(page 183)* It is associated to XSD Editor.

A custom validator cannot be applied on files loaded through an Oxygen XML Editor custom protocol plugin *(page 2543)* developed independently and added to Oxygen XML Editor after installation.

Linked Output Messages of an External Engine

Validation engines display messages in an output view at the bottom of the Oxygen XML Editor window. If such an output message (**warning**, **error**, **fatal error**, etc) spans between three to six lines of text and has the format specified below, then the message is linked to a location in the validated document. Clicking the message in the output view highlights the location of the message in an editor panel containing the file referenced in the message. This behavior is similar to the linked messages generated by the default built-in validator.

Linked messages have the following format:

- **Type**: [F|E|W] (the string *Type:* followed by a letter for the type of the message: fatal error, error, warning). This property is optional in a linked message.
- **SystemID**: A system ID of a file (the string `SystemID:` followed by the system ID of the file that will be opened for highlighting when the message is clicked in the output message - usually the validated file, the schema file or an included file).
- **Line**: A line number (the string *Line:* followed by the number of the line that will be highlighted).
- **Column**: A column number (the string *Column:* followed by the number of the column where the highlight will start on the highlighted line). This property is optional in a linked message.
- **EndLine**: A line number (the string **EndLine**: followed by the number of the line where the highlight ends). This property is optional in a linked message.

- **EndColumn**: A column number (the string **EndColumn**: followed by the number of the column where the highlight ends on the end line). This property is optional in a linked message.

  Note: The **Line**/**Column** pair works in conjunction with the **EndLine**/**EndColumn** pair. Thus, if both pairs are specified, then the highlight starts at **Line**/**Column** and ends at **EndLine**/**EndColumn**. If the **EndLine**/**EndColumn** pair is missing, the highlight starts from the beginning of the line identified by the **Line** parameter and ends at the column identified by the **Column** parameter.

- **AdditionalInfoURL**: The URL string pointing to a remote location where additional information about the error can be found - this line is optional in a linked message.
- **Description**: Message content (the string *Description:* followed by the content of the message that will be displayed in the output view).

Example:

Example of how a custom validation engine can report an error using the format specified above:

```
Type: E
SystemID: file:///c:/path/to/validatedFile.xml
Line: 10
Column: 20
EndLine: 10
EndColumn: 35
AdditionalInfoURL: http://www.host.com/path/to/errors.html#errorID
Description: custom validator message
```

Validation Scenarios

A complex XML document is split in smaller interrelated modules. These modules do not make much sense individually and cannot be validated in isolation due to interdependencies with other modules. Oxygen XML Editor validates the main module of the document when an imported module is checked for errors.

A typical example is the chunking of a DocBook XSL stylesheet that has `chunk.xsl` as the main module and `param.xsl`, `chunk-common.xsl`, and `chunk-code.xsl` as imported modules. `param.xsl` only defines XSLT parameters. The module `chunk-common.xsl` defines an XSLT template with the name `chunk`. `Chunk-code.xsl` calls this template. The parameters defined in `param.xsl` are used in the other modules without being redefined.

Validating `chunk-code.xsl` as an individual XSLT stylesheet generates misleading errors in regards to parameters and templates that are used but undefined. These errors are only caused by ignoring the context in which this module is used in real XSLT transformations and in which it is validated. To validate such a module, define a validation scenario to set the main module of the stylesheet and the

validation engine used to find the errors. Usually this engine applies the transformation during the validation process to detect the errors that the transformation generates.

You can validate a stylesheet with several engines to make sure that you can use it in various environments and have the same results. For example, an XSLT stylesheet may be applied with Saxon 6.5, Xalan, and MSXML 4.0 engines in different production systems.

Other examples of documents that can benefit from a validation scenario include:

- A complex XQuery file with a main module that imports modules developed independently but validated in the context of the main module of the query. In an XQuery validation scenario, the default validator of Oxygen XML Editor (Saxon 9) or any connection to a database that supports validation (Berkeley DB XML Database, eXist XML Database, Documentum xDB (X-Hive/DB) 10 XML Database, MarkLogic version 5 or newer) can be set as a validation engine.
- An XML document in which the *master file (page 3231)* includes smaller fragment files using XML entity references.

Note: If a *master file* is associated with the current file, the validation scenarios defined in the *master file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *master files*, see Master Files Support *(page 719)* or Working with Modular XML Files in the Master Files Context *(page 1114)*.

For more information about how to use a validation scenario in Oxygen XML Editor, watch our video demonstration:

Creating a New Validation Scenario

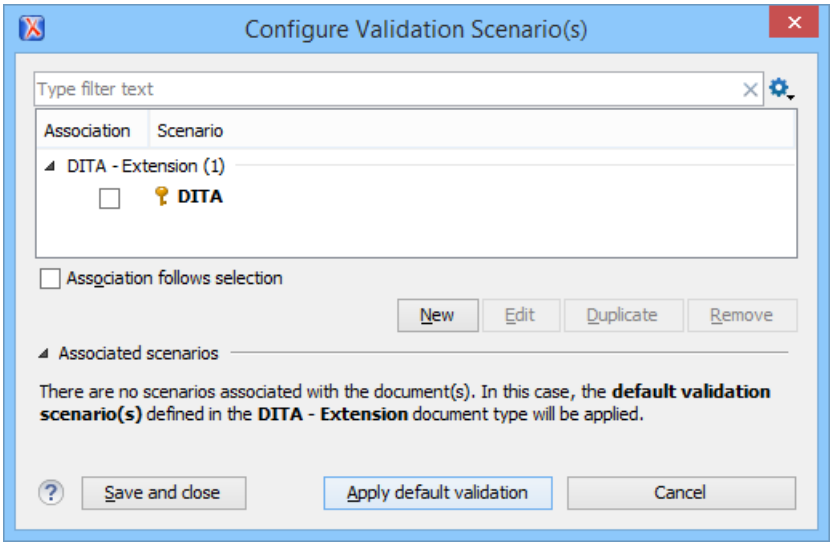
To create a validation scenario, follow these steps:

1. Select the **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project** view *(page 332)*).

The **Configure Validation Scenario(s)** dialog box is displayed. It contains built-in and user-defined scenarios. The built-in scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular *framework (page 3229)* are rendered in bold.

Note: If a *master file* is associated with the current file, the validation scenarios defined in the *master file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *master files*, see Master Files Support *(page 719)* or Working with Modular XML Files in the Master Files Context *(page 1114)*.

Figure: Configure Validation Scenario Dialog Box



The top section of the dialog box contains a filter that allows you to search through the scenarios list and the **Settings** button allows you to configure the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

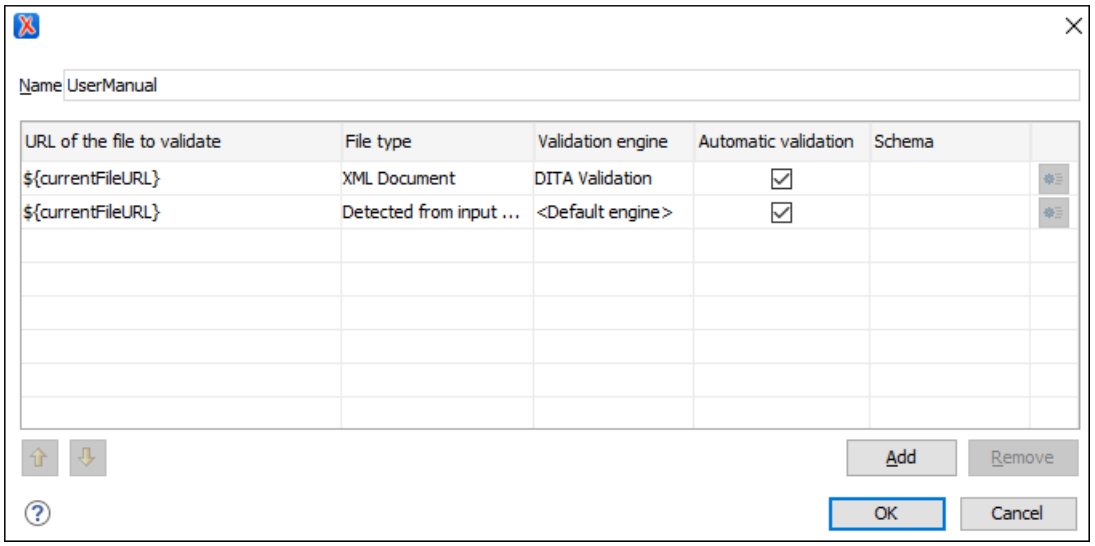
Note: When you keep both scenarios, Oxygen XML Editor adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor creates a `scenarios` file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

2. To add a scenario, click the **New** button.
   A validation scenario configuration dialog box is displayed and it lists all the validation units for the scenario.

Figure: Validation Scenario Configuration Dialog Box



This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

Storage

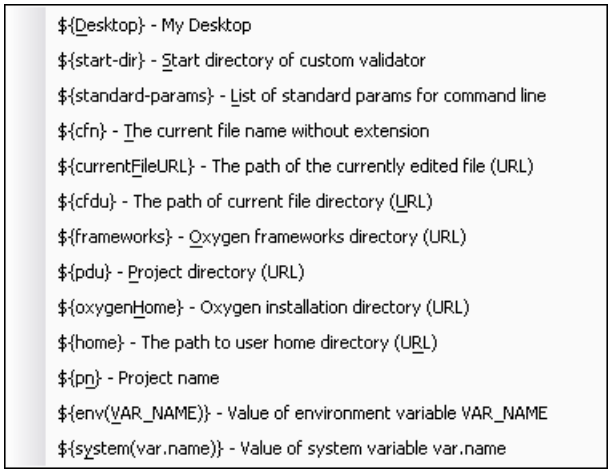
You can choose between storing the scenario in the **Project Options** *(page 3233)* or **Global Options** *(page 3230)*.

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an editor variable *(page 275)* or a custom editor variable *(page 283)*.

Figure: Insert an Editor Variable



File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can select one of the engines available in Oxygen XML Editor for validation of the particular document type.

Default engine means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page *(page 197)*, XQuery preferences page *(page 206)*, XML Schema preferences page *(page 190)*).

The **DITA Validation** engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the **DITA Maps Manager** **Validate and Check for Completeness** action *(page 2988)*, but for a local file rather than an entire *DITA map (page 3228)*).

The **Table Layout Validation** engine looks for table layout problems (for more information, see Report table layout problems *(page 2993)*).

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature *(page 1071)*. If the **Automatic validation** feature is disabled in the Document Checking preferences page *(page 156)*, then this option is ignored, as the preference setting has a higher priority.

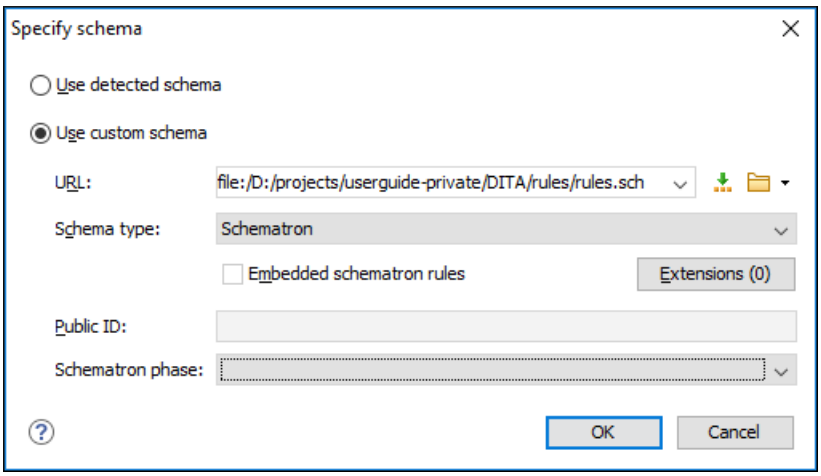
Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

Specify Schema

Opens the **Specify Schema** dialog box that allows you to set a schema to be used for validating XML documents.

Figure: Specify Schema Dialog Box



The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the schema detected for the particular document *(page 1099)*.

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(page 2564)*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (page 3230)* to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

Move Up

Moves the selected scenario up one spot in the list.

Move Down

Moves the selected scenario down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the **validation phase**.
4. Press **OK**.

The newly created validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current document and press the **Apply associated** button to run the validation scenario.

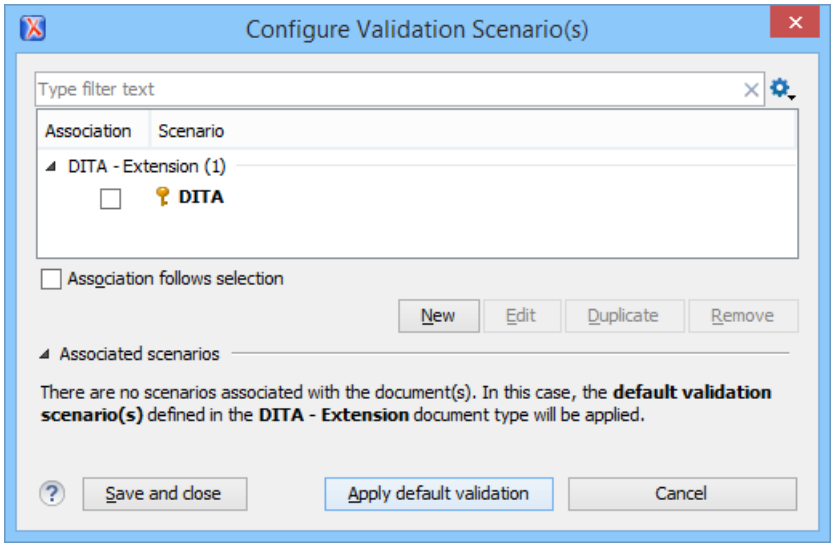
Editing a Validation Scenario

To edit an existing validation scenario, follow these steps:

1. Select the **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project** view *(page 332)*).
   The **Configure Validation Scenario(s)** dialog box is displayed. It contains built-in and user-defined scenarios. The built-in scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular *framework (page 3229)* are rendered in bold.

   Note: If a *master file* is associated with the current file, the validation scenarios defined in the *master file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *master files*, see Master Files Support *(page 719)* or Working with Modular XML Files in the Master Files Context *(page 1114)*.

   Figure: Configure Validation Scenario Dialog Box



The top section of the dialog box contains a filter that allows you to search through the scenarios list and the **Settings** button allows you to configure the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

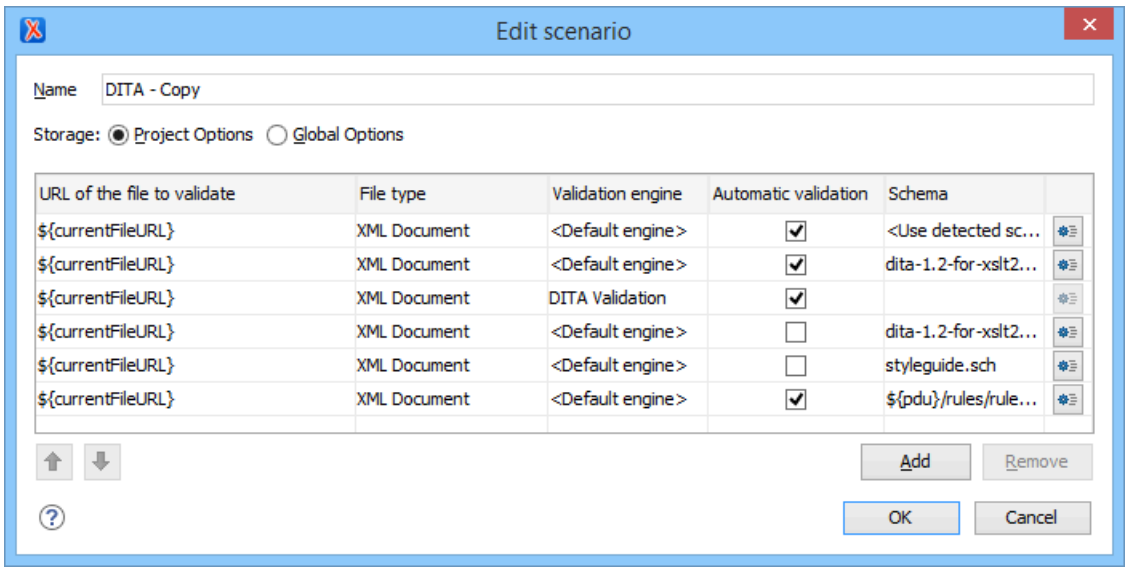
Note: When you keep both scenarios, Oxygen XML Editor adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor creates a `scenarios` file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

2. Select the scenario and press the **Edit** button. If you try to edit one of the *read-only* built-in scenarios, you will receive a warning message that Oxygen XML Editor needs to creates customizable duplicate (you can also use the **Duplicate** button).
   The **Edit scenario** dialog box is displayed and it lists all the validation units for the scenario.

Figure: Edit Validation Scenario



This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

Storage

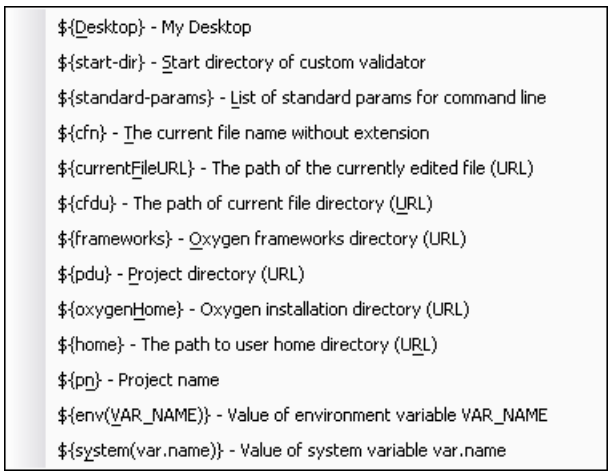
You can choose between storing the scenario in the **Project Options** *(page 3233)* or **Global Options** *(page 3230)*.

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an editor variable *(page 275)* or a custom editor variable *(page 283)*.

Figure: Insert an Editor Variable



File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can select one of the engines available in Oxygen XML Editor for validation of the particular document type.

Default engine means that the default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, XSLT preferences page *(page 197)*, XQuery preferences page *(page 206)*, XML Schema preferences page *(page 190)*).

The **DITA Validation** engine performs DITA-specific checks in the context of the specifications (it is similar to the checks done with the **DITA Maps Manager** **Validate and Check for Completeness** action *(page 2988)*, but for a local file rather than an entire *DITA map (page 3228)*).

The **Table Layout Validation** engine looks for table layout problems (for more information, see Report table layout problems *(page 2993)*).

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature *(page 1071)*. If the **Automatic validation** feature is disabled in the Document Checking preferences page *(page 156)*, then this option is ignored, as the preference setting has a higher priority.

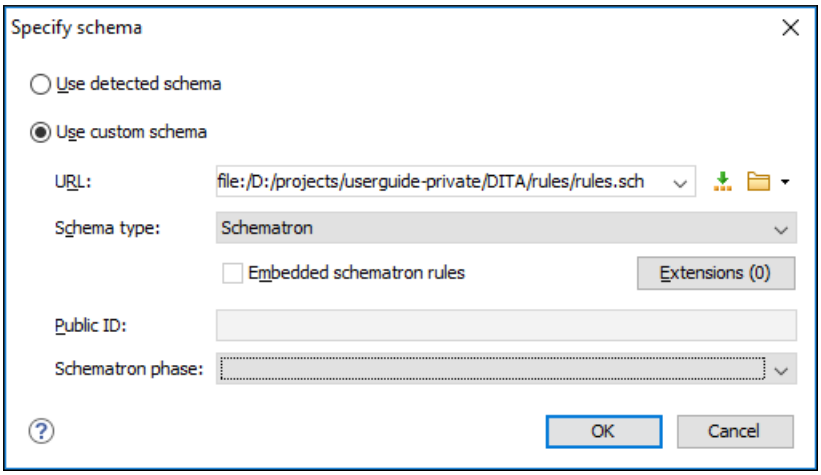
Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

Specify Schema

Opens the **Specify Schema** dialog box that allows you to set a schema to be used for validating XML documents.

Figure: Specify Schema Dialog Box



The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the schema detected for the particular document *(page 1099)*.

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(page 2564)*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.

- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (page 3230)* to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

Move Up

Moves the selected scenario up one spot in the list.

Move Down

Moves the selected scenario down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the **validation phase**.
4. When you are done configuring the scenario, press **OK**.
   The modified validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. If you chose to duplicate an existing one, the modified scenario will be listed with the word *copy* at the end of its name.

Sharing Validation Scenarios

The validation scenarios and their settings can be shared with other users by saving them at project level *(page 3233)* or by exporting them to a specialized scenarios file *(page 275)* that can then be imported. When you create a new validation scenario or edit an existing one, there is a **Storage** option to control whether the scenarios are stored in **Project Options** *(page 3233)* or **Global Options** *(page 3230)*.

Selecting **Project Options** *(page 3233)* stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define.

When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Selecting **Global Options** *(page 3230)* stores the scenario in the global options that are stored in the user home directory.

You can also change the storage options on existing validation scenarios by using the **Change storage** action from the contextual menu of the list of scenarios.

Sharing Application Settings *(page 265)*

Resolving References to Remote Schemas with an XML Catalog

When a reference to a remote schema must be used in the validated XML document for interoperability purposes, but a local copy of the schema should actually be used for performance reasons, the reference can be resolved to the local copy of the schema with an *XML Catalog (page 3235)*.

For example, if the XML document contains a reference to a remote schema `docbook.rng` like this:

```
<?xml-model href="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
    type="application/xml" schematypens="http://relaxng.org/ns/structure/1.0"?>
```

it can be resolved to a local copy with a catalog entry like this:

```
<uri name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
    uri="rng/docbook.rng"/>
```

An *XML Catalog* can also be used to map an XML Schema specified with a URN in the `xsi:schemaLocation` attribute of an XML document to a local copy of the schema. For example, if the XML document specifies the schema with:

```
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1">
```

the URN can be resolved to a local schema file with a catalog entry like this:

```
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
    uri="topic.xsd"/>
```

Related Information:

Working with XML Catalogs *(page 1110)*

Validation Example - A DocBook Validation Error

In the following DocBook 4 document, the content of the `listitem` element does not match the rules of the DocBook 4 schema (`docbookx.dtd`).

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.4//EN"
     "http://www.docbook.org/xml/4.4/docbookx.dtd">
<article>
    <title>Article Title</title>
    <sect1>
      <title>Section1 Title</title>
      <itemizedlist>
        <listitem>
          <link>a link here</link>
        </listitem>
      </itemizedlist>
    </sect1>
</article>
```

The **Validate Document** action will return the following error:

```
Unexpected element "link". The content of the parent element type must match
"(calloutlist|glosslist|bibliolist|itemizedlist|orderedlist|segmentedlist|simplelist
|variablelist|caution|important|note|tip|warning|literallayout|programlisting
|programlistingco|screen|screenco|screenshot|synopsis|cmdsynopsis|funcsynopsis
|classsynopsis|fieldsynopsis|constructorsynopsis|destructorsynopsis|methodsynopsis
|formalpara|para|simpara|address|blockquote|graphic|graphicco|mediaobject|mediaobjectco
|informalequation|informalexample|informalfigure|informaltable|equation|example|figure
|table|msgset|procedure|sidebar|qandaset|task|anchor|bridgehead|remark|highlights
|abstract|authorblurb|epigraph|indexterm|beginpage)+".
```

This error message is a little more difficult to understand, so understanding of the syntax or processing rules for the DocBook XML DTD `listitem` element is recommended. However, the error message does offer a clue as to the source of the problem, indicating that “The content of element type must match”.

Fortunately, most standards-based DTDs, XML Schemas, and Relax NG schemas are supplied with reference documentation. This enables you to lookup the element and read about it. In this case, you should learn about the child elements of `listitem` and their nesting rules. Once you have correctly inserted the required child element and nested it in accordance with the XML rules, the document will become valid.

XML Quick Fixes

The Oxygen XML Editor *Quick Fix* support *(page 3233)* helps you resolve errors that appear in an XML document by offering *Quick Fixes* to problems such as missing required attributes or invalid elements. *Quick Fixes* are available in **Text** mode and **Author** mode

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a *Quick Fix* is available for that particular error or warning, you can access the *Quick Fix* proposals with any of the following methods:

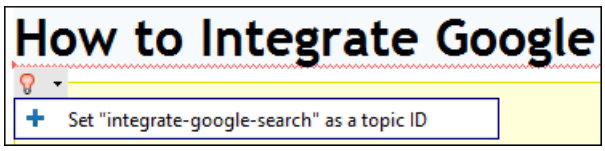
- When hovering over the error or warning, the proposals may be presented in a tooltip pop-up window and the available quick *Quick Fixes* include a link that can be used to perform the fix.

  Figure: Quick Fix Presented in a Tooltip in Text Mode

  Figure: Quick Fix Presented in a Tooltip in Author Mode

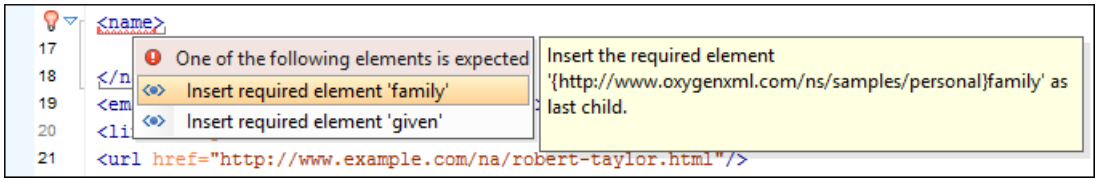
- When hovering over the error or warning in **Author** mode, a small *Quick Fix* drop-down menu is presented. You can use the drop-down menu to display a list of available *Quick Fixes* to select from for the particular error or warning.

  Figure: Quick Fix Drop-Down Menu in Author Mode

- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon (💡) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor displays the list of available fixes.

  Figure: Quick Fix Menu Invoked by Clicking on the 💡 Icon

- With the cursor placed in the highlighted area of the error or warning, you can also invoke the *Quick Fix* menu by pressing **Alt + 1 (Command + Alt + 1 on OS X)** on your keyboard.

Whenever you make a modification in the XML document or you apply a fix, the list of *Quick Fixes* is recomputed to ensure that you always have valid proposals.

Note: A *Quick Fix* that adds an element inserts it along with required and optional elements, and required and fixed attributes, depending on how the **Content Completion** preferences *(page 165)* are configured.

Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor offers *Quick Fixes (page 3233)* for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

Note: For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

Quick Fixes are available in **Text** mode and **Author** mode.

Oxygen XML Editor provides *Quick Fixes* for numerous types of problems, including the following:

Problem Type	Available Quick Fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute

Problem Type	Available Quick Fixes
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

Related Information:

Schematron Quick Fixes (SQF) *(page 1098)*

Schematron Quick Fixes (SQF)

Oxygen XML Editor provides support for Schematron *Quick Fixes (page 3233)* (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron *Quick Fixes* are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with *assert* or *report* messages.

A typical use case is using Schematron *Quick Fixes* to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, please see the following blog post: http://blog.oxygenxml.com/2015/05/schematron-checks-to-help-technical.html.

Displaying the Schematron Quick Fix Proposals

The defined Schematron *Quick Fixes* are displayed on validation errors in **Text** mode and **Author** mode.

Figure: Example of a Schematron Quick Fix

Editing Schematron Quick Fixes *(page 1460)*

Schematron Quick Fix Specifications

Presenting Schematron Validation Issues *(page)*

Associating a Schema to XML Documents

Oxygen XML Editor relies on schemas to validate XML documents and to compute valid proposals for the *Content Completion Assistant (page 3227)*.

Supported Types of Schema

The following schema types are supported:

- W3C XML Schema 1.0 and 1.1 (with and without embedded Schematron rules)
- DTD
- Relax NG - XML syntax (with and without embedded Schematron rules)
- Relax NG - compact syntax
- NVDL
- Schematron (both ISO Schematron and Schematron 1.5)

Detecting a Schema

For the purposes of using validation and content completion mechanisms, Oxygen XML Editor tries to detect a schema by searching multiple locations, in the following order:

- The schema defined in a validation scenario *(page 1100)*.
- The schema defined in the validation scenarios associated with the particular document type *(page 1103)* (if defined).
- The schema that is associated directly in the XML document *(page 1105)*.

  Note: If a DTD schema is specified in the document, the content completion for **Author** mode is based on this schema (even if there is already one detected from the validation scenario).

- The schema defined in the *framework* (document type) configuration *(page 1108)*.

In addition, the locations of the schema can be mapped through the use of an *XML Catalog (page 3235)*. For more information, see Resolving Schema Locations Through XML Catalogs *(page 1109)*.

Tip: To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

Related Information:

Working with Modular XML Files in the Master Files Context *(page 1114)*

Associating a Schema Through a Validation Scenario

Oxygen XML Editor uses the rules defined in the detected schema to report errors and warnings during automatic and manual validations that help maintain the structural integrity of your XML documents. You can specify the schema to be used for validation directly in validation scenarios *(page 1081)* and there are several methods that can be used to do so.

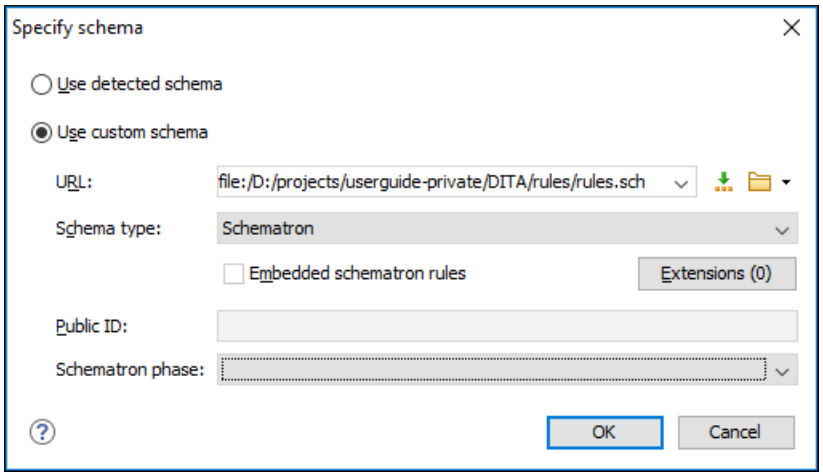
Configure a Validation Scenario and Specify the Schema

To associate a schema to a validation scenario to be used whenever the scenario is invoked, follow these steps:

1. Select the **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu, or from the **Document > Validate** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project** view *(page 332)*).
2. Press the **New** button to create a new validation scenario or the **Edit** button to modify an existing one.
3. Add or configure validation units *(page 1089)* according to your needs and click the **Specify Schema** button.

   Step Result: The **Specify Schema** dialog box is displayed:

   Figure: Specify Schema Dialog Box

The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the schema detected for the particular document *(page 1099)*.

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(page 2564)*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (page 3230)* to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

4. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.
5. Click **OK** on both dialog boxes.

Result: The schema is now associated with that validation scenario whenever it is invoked.

Use the Validate with Action to Specify a Schema for Validating the Current Document

To validate the current document using a specified schema, follow these steps:

1. Select the **Validation with** action from the **Validation** drop-down menu on the toolbar (or **Document > Validate** menu).

   Step Result: The **Validate with** dialog box is displayed:

Figure: Validate with Dialog Box

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(page 2564)*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (page 3230)* to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

2. Select the schema to be associated with the manual validation and configure the rest of the options according to your preferences.
3. Click **OK**.

Result: The current document is validated using the schema you specified.

Tip: To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

Use the Validate with Schema Action to Specify a Schema for Validating all Selected Documents

To validate multiple documents using a specified schema, follow these steps:

1. Select all the documents you want to validate in the **Project** view .

2. Invoke the contextual menu (right-click) and select the **Validate with Schema** action from the **Validate** submenu.

   Step Result: The **Validate with** dialog box is displayed:

   Figure: Validate with Dialog Box

   This dialog box contains the following options:

   - **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(page 2564)*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list.
   - **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
   - **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
   - **Public ID** - Allows you to specify a public ID if you have selected a DTD.
   - **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (page 3230)* to be used during the validation.
   - **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.
3. Select the schema that you want to use to validate all selected documents and configure the rest of the options according to your preferences.
4. Click **OK**.

Result: The selected documents are validated using the schema you specified.

Associating a Schema in Validation Scenarios Defined in the Document Type

To report errors and warnings during automatic and manual validations that help maintain the structural integrity of particular XML document types, Oxygen XML Editor uses rules defined in the

schema that is detected in the validation scenarios that are associated to each particular document type.

To associate a schema in validation scenarios defined in the *framework (page 3229)* (document type) configuration, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Document Type Association**.
2. Select your particular document type and click the **Edit** or **Duplicate** button to modify an existing *framework* (or use the **New** button to create a new one).

   Step Result: This opens a **Document type** configuration dialog box *(page 95)*.
3. Go to the **Validation** tab *(page 119)*.
4. Create or edit a validation scenario:
   a. To create a new validation scenario *(page 1082)*, click the **New** button.
   b. To edit the properties of an existing validation scenario *(page 1088)*, select it and click the **Edit** button (you can also use the **Duplicate** button to copy an existing scenario and edit its properties).
5. Add or configure validation units *(page 1089)* according to your needs and click the **Specify Schema** button.

   Step Result: The **Specify Schema** dialog box is displayed:

   Figure: Specify Schema Dialog Box

   
   The **Specify Schema** dialog box contains the following options:

   Use detected schema

   Uses the schema detected for the particular document *(page 1099)*.

   Use custom schema

   Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(page 2564)*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (page 3230)* to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

6. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.
7. Click **OK** on both dialog boxes.

Result: The schema is now associated with the validation scenario you just configured for that particular document type.

Associating a Schema Directly in XML Documents

Associate Schema Action

The schema used by the *Content Completion Assistant (page 3227)* and document validation engine can be associated with the current document by using the **Associate Schema** action. For most of the schema types, it uses the *xml-model* processing instruction *(page 1107)*, with the exceptions of:

- **W3C XML Schema** - The `xsi:schemaLocation` attribute is used.
- **DTD** - The `DOCTYPE` declaration is used.

The association can specify a relative file path or a URL of the schema. The advantage of relative file path is that you can configure the schema at file level instead of *framework (page 3229)* level.

To associate a schema to the current document, follow these steps:

1. Select the **Associate Schema** action from the toolbar (or **Document > Schema** menu).

   Step Result: The **Associate Schema** dialog box is displayed:

   Figure: Associate Schema Dialog Box

   
   This dialog box contains the following options:

   - **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(page 2564)*.
   - **Use path relative to file location** - Select this option if the XML instance document and the associated schema contain relative paths. The location of the schema file is inserted in the XML instance document as a relative file path. This practice allows you, for example, to share these documents with other users without running into problems caused by multiple project locations on physical disk.
   - **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
   - **Add additional association for embedded schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
   - **Public ID** - Allows you to specify a public ID if you have selected a DTD.
   - **Keep existing schema associations** - Select this option to use the existing schema associations of the currently edited document.
2. Select the schema that will be associated with the XML document and configure the rest of the options according to your preferences.

3. Click **OK**.

Result: The schema association is created based upon the specified type.

- **XML Schema** - The association with an XML Schema is added as an attribute of the root element with one of the following:
  # `xsi:schemaLocation` attribute, if the root element of the document sets a default namespace with an `xmlns` attribute.
  # `xsi:noNamespaceSchemaLocation` attribute, if the root element does not set a default namespace.
- **DTD** - The association with a DTD is added as a `DOCTYPE` declaration.
- **Other** - The association with a Relax NG, Schematron, or NVDL schema is added as *xml-model* processing instruction *(page 1107)*.

Tip: To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **Document > Schema** menu).

Associate Schema with the `xml-model` Processing Instruction

The `xml-model` processing instruction associates a schema with the XML document that contains the processing instruction. It must be added at the beginning of the document, just after the XML prolog. The following code snippet contains an `xml-model` processing instruction declaration:

```
<?xml-model href="../schema.sch" type="application/xml"
 schematypens="http://purl.oclc.org/dsdl/schematron" phase="ALL"
 title="Main schema"?>
```

It is available in the *Content Completion Assistant (page 3227)*, before XML document root element, and includes the following attributes:

- `href` (required) - The schema file location.
- `type` - The content type of the schema. This is an optional attribute with the following possible values for each specified type:
  # DTD - The recommended value is `application/xml-dtd`.
  # W3C XML Schema - The recommended value is `application/xml`, or can be left unspecified.
  # RELAX NG XML Syntax - The recommended value is `application/xml`, or can be left unspecified.
  # RELAX NG Compact Syntax - The recommended value is `application/relax-ng-compact-syntax`.
  # Schematron - The recommended value is `application/xml`, or can be left unspecified.
  # NVDL - The recommended value is `application/xml`, or can be left unspecified.

- `schematypens` - The namespace for the schema language of the referenced schema with the following possible values:
  # DTD - Not specified.
  # W3C XML Schema - The recommended value is `http://www.w3.org/2001/XMLSchema`.
  # RELAX NG XML Syntax - The recommended value is `http://relaxng.org/ns/structure/1.0`.
  # RELAX NG Compact Syntax - Not specified.
  # Schematron - The recommended value is `http://purl.oclc.org/dsdl/schematron`.
  # NVDL - The recommended value is `http://purl.oclc.org/dsdl/nvdl/ns/structure/1.0`.
- `phase` - The phase name for the validation function in Schematron schema. This is an optional attribute. To run all phases from the Schematron, use the special **#ALL** value. If the phase is not specified, the default phase that is configured in the Schematron will be applied.
- `title` - The title for the associated schema. This is an optional attribute.

Older versions of Oxygen XML Editor used the `oxygen` processing instruction with the following attributes:

- `RNGSchema` - Specifies the path to the Relax NG schema that is associated with the current document.
- `type` - Specifies the type of Relax NG schema. It is used along with the `RNGSchema` attribute and can have the value **xml** or **compact**.
- `NVDLSchema` - Specifies the path to the NVDL schema that is associated with the current document.
- `SCHSchema` - Specifies the path to the SCH schema that is associated with the current document.

Note: Documents that use the `oxygen` processing instruction are compatible with newer versions of Oxygen XML Editor.

Related Information:

Validating XML Documents *(page 1068)*

Content Completion Assistant in Text Mode *(page 836)*

Content Completion Assistant in Author Mode *(page 914)*

Associating a Schema in a Framework (Document Type) Configuration

The schema used to compute valid proposals in the *Content Completion Assistant (page 3227)* and by the document validation engine to report errors and warnings can be defined in each particular

framework (page 3229) (document type). This schema will be used only if one is not detected in the current XML file *(page 1105)*.

To associate a schema in a particular *framework* (document type), follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Document Type Association**.
2. Select your particular document type and click the **Edit** *(page 93)*, **Extend** *(page 93)*, or **Duplicate** *(page 93)* button to modify an existing *framework* (or use the **New** button to create a new one).

   Step Result: This opens a **Document type** configuration dialog box *(page 95)*.
3. Go to the **Schema** tab *(page 97)*.
4. Select the schema type and its URI.
5. Click **OK**.

Result: The schema is now associated with the particular document type and will be used by the *Content Completion Assistant* and validation engine if a schema is not detected in the current XML document.

Resolving Schema Locations Through XML Catalogs

Schema locations can be mapped using an *XML Catalog (page 3235)*. Oxygen XML Editor resolves the location of a schema in the following order:

- First, it attempts to resolve the schema location as a URI (`uri` , `uriSuffix` , `rewriteUri` , `delegateUri` mappings from the *XML Catalog*). If this succeeds, the process end here.
- If the **Resolve schema locations also through system mappings** option *(page 187)* is selected, it attempts to resolve the schema location as a system ID (`system` , `systemSuffix` , `rewriteSuffix` , `rerwriteSystem` from the *XML Catalog*). If this succeeds, the process ends here.
- If the **Process "schemaLocation" namespaces through URI mappings for XML Schema** option *(page 187)* is selected, the target namespace of the imported XML Schema is resolved through URI mappings. If the schema specified in the *schemaLocation* attribute is not resolved successfully, the namespace of the root element is taken into account. If this succeeds, the process ends here.
- If none of these succeeds, the actual schema location *(page 1099)* is used.

Related Information:

Working with XML Catalogs *(page 1110)*

Learn Document Structure when Schema is not Detected

When working with documents that do not specify a schema, or for which the schema is not known or does not exist, Oxygen XML Editor is able to learn and translate the document structure to a DTD. You can choose to save the learned structure to a file to provide a DTD as an initialization source for content completion *(page 836)* and document validation *(page 1068)*. This feature is also useful for producing DTDs for documents that contain personal or custom element types.

When you open a document that is not associated with a schema, Oxygen XML Editor automatically learns the document structure and uses it for content completion *(page 836)*. To disable this feature, deselect the **Learn on open document** option in the user preferences *(page 165)*.

Related Information:

Detecting a Schema *(page 1099)*

Create a DTD from Learn Document Structure Option

When there is no schema associated with an XML document, Oxygen XML Editor can learn the document structure by parsing the document internally. This feature is enabled by the **Learn on open document** option *(page 165)* that is available in the user preferences.

To create a DTD from the learned structure, follow these steps:

1. Open the XML document for which a DTD will be created.
2. Go to **Document > XML Document > Learn Structure** (**Ctrl + Shift + L (Command + Shift + L on OS X)**).
   The **Learn Structure** action reads the mark-up structure of the current document. The **Learn completed** message is displayed in the application status bar when the action is finished.
3. Go to **Document > XML Document > Save Structure** (**Ctrl + Shift + S (Command + Shift + S on OS X)**) and enter the DTD file path.
4. Press the **Save** button.

Working with XML Catalogs

Oxygen XML Editor uses *XML Catalogs (page 3235)* to resolve references for validations and transformations and they are especially helpful for resolving external resources when internet access is not available or your connection is slow.

Oxygen XML Editor supports any *XML Catalog* file that conforms to one of the following:

1. OASIS XML Catalogs Committee Specification v1.1.
2. OASIS Technical Resolution 9401:1997, including the plain-text flavor described in that resolution.

The version 1.1 of the OASIS *XML Catalog* specification introduces the possibility to map a system ID, public ID, or a URI to a local copy using only a suffix of the ID or URI used in the actual document. This is done using the catalog elements *systemSuffix* and *uriSuffix*.

Depending on the resource type, Oxygen XML Editor uses different catalog mappings.

Table 42. Catalog Mappings

Doc Type	Referenced Resource	Mappings
XML	DTD	*system* or *public* The **Prefer** option *(page 187)* controls which one of the mappings should be used.
	XML Schema Relax NG Schematron NVDL	The following strategy is used (if one step fails to provide a resource, the next is applied): 1. resolve the schema using *URI* catalog mappings. 2. resolve the schema using *system* catalog mappings. This happens only if the **Resolve schema locations also through system mappings** option *(page 187)* is selected (it is by default). 3. resolve the root *namespace* using *URI* catalog mappings.
XSL	XSL/ANY	*URI*
CSS	CSS	*URI*
XML Schema	XML Schema	The following strategy is used (if one step fails to provide a resource, the next is applied): 1. resolve schema reference using *URI* catalog mappings. 2. resolve schema reference using *system* catalog mappings. This happens only if the **Resolve schema locations also through system mappings** option *(page 187)* is selected (it is by default). 3. resolve schema *namespace* using *URI* catalog mappings. This happens only if the **Process namespaces through URI mappings for XML Schema** option *(page 187)* is selected (it is not by default).
Relax NG	Relax NG	

Creating an XML Catalog with a Template

An *XML Catalog (page 3235)* file can be created quickly in Oxygen XML Editor starting from the two document templates called *OASIS XML Catalog 1.0* and *OASIS XML Catalog 1.1*. They are available when creating new document templates *(page 673)*.

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE catalog
      PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN"
      "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">

<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">

    <!-- Use "system" and "public" mappings when resolving DTDs -->
    <system
          systemId="http://www.docbook.org/xml/4.4/docbookx.dtd"
          uri="frameworks/docbook/4.4/dtd/docbookx.dtd"/>

    <!-- "systemSuffix" matches any system ID ending in a specified string -->
    <systemSuffix
          systemIdSuffix="docbookx.dtd"
          uri="frameworks/docbook/dtd/docbookx.dtd"/>

    <!-- Use "uri" for resolving XML Schema and XSLT stylesheets -->
    <uri
          name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
          uri="frameworks/docbook/5.0/rng/docbookxi.rng"/>

    <!-- The "uriSuffix" matches any URI ending in a specified string -->
    <uriSuffix
          uriSuffix="docbook.xsl"
          uri="frameworks/docbook/xsl/fo/docbook.xsl"/>

</catalog>
```

How Oxygen XML Editor Determines which Catalog to Use

Oxygen XML Editor uses *XML Catalogs (page 3235)* to resolve references for validations and transformations and it maps such references to the built-in local copies of the schemas associated with the various *frameworks (page 3229)* (DocBook, DITA, TEI, XHTML, SVG, etc.)

Oxygen XML Editor includes default global catalogs as well as default catalogs for each of the built-in *frameworks*, and you can also create your own.

Oxygen XML Editor looks for catalogs in the following order:

- Global user-defined catalogs that are set in the **XML Catalog** preferences page *(page 186)*.
- User-defined catalogs that are set for each *frameworks (page 3229)* in the **Catalog** tab *(page 117)* of the **Document Type** configuration dialog box *(page 95)*.
- Default built-in catalogs.

Example:

An *XML Catalog* can be used to map an XML Schema specified with an URN in the `xsi:noNamespaceSchemaLocation` attribute of an XML document to a local copy of the schema.

Considering the following XML document code snippet:

```
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
     xsi:noNamespaceSchemaLocation="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1">
```

The URN can be resolved to a local schema file with a catalog entry like this:

```
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
    uri="topic.xsd"/>
```

Related Information:

XML Catalog Preferences *(page 186)*

Resolving Schema Locations Through XML Catalogs

Schema locations can be mapped using an *XML Catalog (page 3235)*. Oxygen XML Editor resolves the location of a schema in the following order:

- First, it attempts to resolve the schema location as a URI (`uri` , `uriSuffix` , `rewriteUri` , `delegateUri` mappings from the *XML Catalog*). If this succeeds, the process end here.
- If the **Resolve schema locations also through system mappings** option *(page 187)* is selected, it attempts to resolve the schema location as a system ID (`system` , `systemSuffix` , `rewriteSuffix` , `rerwriteSystem` from the *XML Catalog*). If this succeeds, the process ends here.
- If the **Process "schemaLocation" namespaces through URI mappings for XML Schema** option *(page 187)* is selected, the target namespace of the imported XML Schema is resolved through URI mappings. If the schema specified in the *schemaLocation* attribute is not resolved

successfully, the namespace of the root element is taken into account. If this succeeds, the process ends here.
- If none of these succeeds, the actual schema location *(page 1099)* is used.

Working with Modular XML Files in the Master Files Context

Smaller interrelated modules that define a complex XML modular structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Editor provides the support for defining the main module (or modules), allowing you to edit any file from the hierarchy in the context of the *master files (page 3231)*.

You cat set a main XML document either using the *master files* support from the **Project** view *(page 719)*, or using a validation scenario.

To set a *master file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main XML document. In this case, it considers the current module as the main XML document.

The advantages of working with modular XML files in the context of a *master file (page 3231)* include:

- Correct validation of a module in the context of a larger XML structure.
- *Content Completion Assistant (page 3227)* displays all collected entities and IDs starting from the *master files*.
- Oxygen XML Editor uses the schema defined in the *master file* when you edit a module that is included in the hierarchy through the *External Entity* mechanism.
- The *master files* defined for the current module determines the scope of the search and refactoring actions *(page 1116)* for ID/IDREFS values and for updating references when renaming/moving a resource. Oxygen XML Editor performs the search and refactoring actions in the context that the *master files* determine, improving the speed of execution.

For more information about editing modular XML files in the *master files* context, watch our video demonstration:

Search and Refactoring Actions for IDs and IDREFS

Oxygen XML Editor allows you to search for ID declarations and references (IDREFS) and to define the scope of the search and refactor operations *(page 1116)*. These operations are available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. These operations are available through the search and refactor actions in the contextual menu. In **Text** mode, these actions are also available in the **Quick Assist** *(page 863)* menu.

The search and refactor actions from the contextual menu are grouped in the **Manage IDs** section:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation *(page 1116)*. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

Note: Available in the **Text** mode only.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** *(page 1116)* dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the **Select the scope for the Search and Refactor operations** *(page 1116)*.

Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** *(page 1116)* dialog box, this scope will be used instead.

Note: Available in the **Text** mode only.

Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the **Select the scope for the Search and Refactor operations** *(page 1116)*.

Note: Available in the **Text** mode only.

Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

Tip: A quick way to go to the declaration of an ID in **Text** mode is to move the cursor over an ID reference and use the **Ctrl + Single-Click (Command + Single-Click on OS X)** navigation.

Selecting an ID that you use for search or refactor operations differs between the **Text** and **Author** modes. In the **Text** mode, you position the cursor inside the declaration or reference of an ID. In the **Author** mode, Oxygen XML Editor collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

Figure: Selecting an ID in the Author Mode

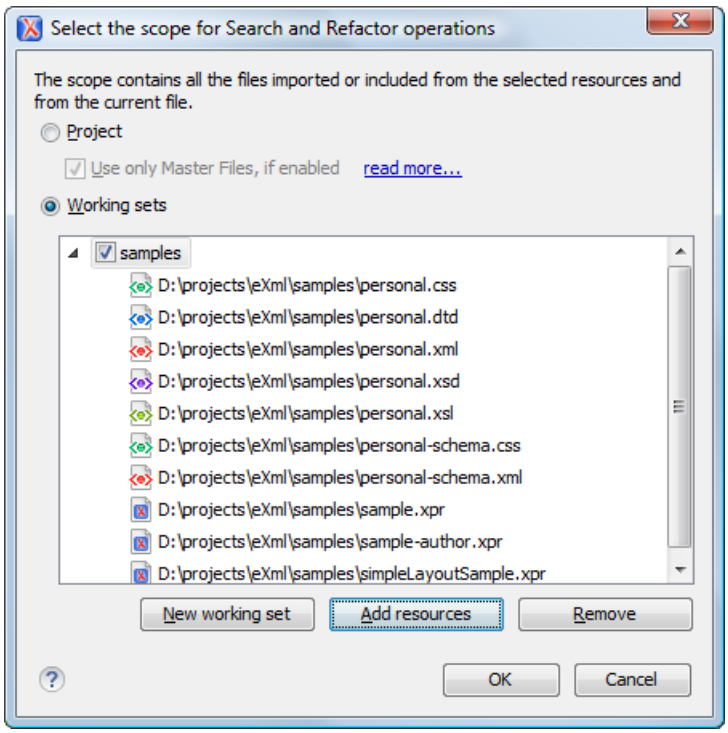
Working with Modular XML Files in the Master Files Context *(page 1114)*

Search and Refactor Operations Scope

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the **Change scope** operation, available in the *Quick Assist* action set or on the **Resource Hierarchy/Dependency View** toolbar. You can restrict the scope to the current project or to one or multiple *working sets (page 3235)*. The **Use only Master Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Master Files** directory. Click **read more** for details about the *Master Files* support *(page 719)*.

Figure: Change Scope Dialog Box



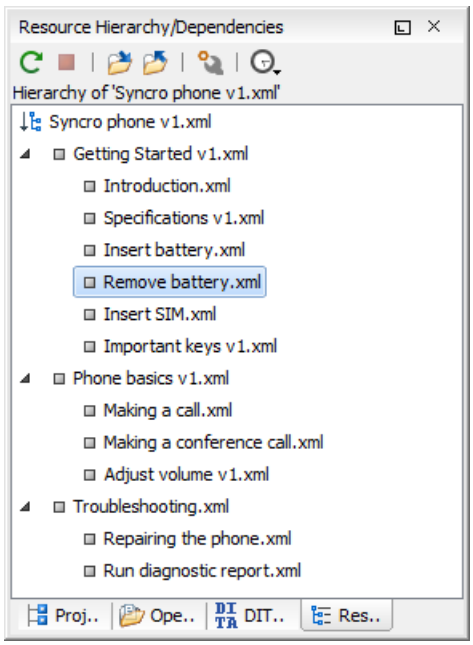
The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the *working set (page 3235)* structure.

XML Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view allows you to easily see the hierarchy / dependencies for an XML document. The tree structure presented in this view is built based on the *XIinclude* and *External Entity* mechanisms. To define the scope for calculating the dependencies of a resource, click **Configure dependencies search scope** *(page 1116)* on the **Resource Hierarchy/Dependencies** toolbar.

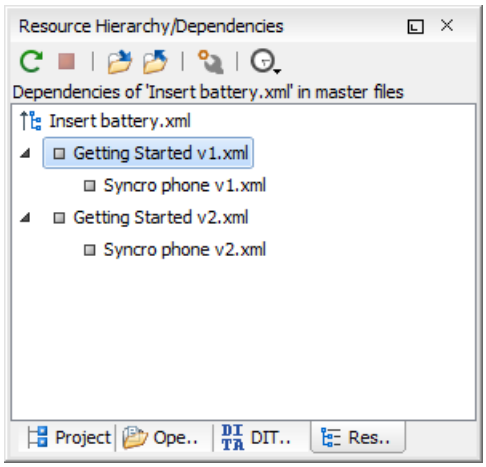
To open this view, go to **Window > Show View > Resource Hierarchy/Dependencies** . As an alternative, right-click the current document and either select **Resource Hierarchy** or **Resource Dependencies**.

Figure: Resource Hierarchy/Dependencies View - Hierarchy for `Syncro phone v1.xml`



The build process for the dependencies view is started with the **Resource Dependencies** action available on the contextual menu.

Figure: Resource Hierarchy/Dependencies View - Dependencies for `Insert battery.xml`



The following actions are available in the **Resource Hierarchy/Dependencies** view:

Refresh

Refreshes the Hierarchy/Dependencies structure.

Stop

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the **Master Files** directory *(page 719)*.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

Note: The **Move resource** or **Rename resource** actions give you the option to update the references to the resource *(page 1120)*. Only the references made through the *XInclude* and *External Entity* mechanisms are handled.

Search and Refactor Operations Scope *(page 1116)*

Moving/Renaming XML Resources

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Select this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is selected, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

Combining XML Content Using DTD Entities and XInclude

When documenting large projects, it is likely that there are multiple people involved. In this case, it is usually more efficient to using a modular approach so that everyone involved in the project can

work in parallel. Other advantages of modular documentation include: reusable content possibilities, smaller file units are easier to edit, and better version control.

Two possible solutions for this are to use **DTD Entities** or **XInclude** to combine XML content in a *master file (page 3231)*. A master document can be created with references to various document parts, users can edit those documents individually, and then apply an XSLT stylesheet over the master document to obtain the output files in various formats (for example, PDF or HTML).

Combining XML Document Content Using DTD Entities

There are two conditions for including a document fragment using DTD entities:

- The master document should declare the DTD to be used, while the external entities should declare the XML fragments to be referenced.
- The referenced documents that contain the fragments cannot also define the DTD because the main document will not be valid. If you want to validate the parts separately you have to use XInclude *(page 1122)* for assembling the parts together with the *master file*.

The master document looks like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE book SYSTEM "../xml/docbookx.dtd" [
<!ENTITY testing SYSTEM "testing.xml" > ]
>
<book>
<chapter> ...
```

The referenced document (*testing.xml*) looks like this:

```
<section> ... here is the section content ... </section>
```

Note:

The indicated DTD and the element names (*section*, *chapter*) are used here only for illustrating the inclusion mechanism. You can use any DTD and element names you need.

The content from the referenced file (in the example above, it's a `section` in the *test.xml* file) can be inserted somewhere in the master document:

```
... &testing; ...
```

To obtain output in various formats (for example, PDF or HTML), you simply need to apply an XSLT stylesheet over the master document using a transformation scenario.

Viewing the Expanded Content in Oxygen XML Editor

When a transformation scenario is applied on the *master file*, an intermediary file combines all the referenced content and it will be expanded in the final output. If you want to see how the referenced content will be expanded before applying the transformation, you can do one of the following:

- Simply switch to **Author** mode.
- Create a minimal XSLT stylesheet that simply copies the XML content, then create a new XSLT transformation scenario that applies the stylesheet over the XML. The XSLT stylesheet would look like this:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="3.0">
    <xsl:template match="node() | @*">
        <xsl:copy>
            <xsl:apply-templates select="node() | @*"/>
        </xsl:copy>
    </xsl:template>

</xsl:stylesheet>
```

Combining XML Documents and Fragments Using XInclude

XInclude is a standard for assembling XML instances into another XML document through inclusion. A *master file (page 3231)* can be dynamically created from smaller XML documents without having to physically duplicate the content of the smaller files. The advantage of using XInclude instead of the DTD Entities method *(page 1121)* is that each of the assembled documents is permitted to contain a Document Type Declaration (DOCTYPE). This means that each file is a valid XML instance and can be independently validated. It also means that the main document, which includes smaller instances, can be validated without having to remove or comment out the DOCTYPE (as is the case with External Entities).

Enabling XInclude Support in Oxygen XML Editor

The XInclude support in Oxygen XML Editor is enabled by default. It is controlled by the **Enable XInclude processing** option *(page 189)* in the **XML > XML Parser** preferences page *(page 189)*. When

enabled, Oxygen XML Editor will be able to validate and transform documents comprised of parts added using XInclude.

Example: Using XInclude to Combine Files

A chapter file (`introduction.xml`) looks like this:

```
<?xml version="1.0"?>
<!DOCTYPE chapter PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN"
"http://www.oasis-open.org/docbook/xml/4.3/docbookx.dtd">
<chapter>
    <title>Getting started</title>
    <section>
        <title>Section title</title>
        <para>Para text</para>
    </section>
</chapter>
```

The main article (*master file*) looks like this:

```
<?xml version="1.0"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN"
"http://www.docbook.org/xml/4.3/docbookx.dtd"
[ <!ENTITY % xinclude SYSTEM "../frameworks/docbook/dtd/xinclude.mod">
%xinclude;
]>
<article>
    <title>Install guide</title>
    <para>This is the install guide.</para>
    <xi:include xmlns:xi="http://www.w3.org/2001/XInclude"
                    href="introduction.xml">
      <xi:fallback>
        <para>
          <emphasis>FIXME: MISSING XINCLUDE CONTENT</emphasis>
        </para>
      </xi:fallback>
    </xi:include>
</article>
```

In this example, note the following:

- The DOCTYPE declaration defines an entity that references a file containing the information to add the *xi* namespace to certain elements defined by the DocBook DTD.

- The href attribute of the xi:include element specifies that the `introduction.xml` file will replace the *xi:include* element when the document is parsed.
- If the `introduction.xml` file cannot be found, the parser will use the value of the *xi:fallback* element - a *FIXME* message.

Example: Using XInclude to Combine Fragments of Files

If you want to include only a fragment of a file in the *master file (page 3231)*, the fragment must be contained in a tag having an `xml:id` attribute and you must use an XPointer expression pointing to the `xml:id` value.

Note: Oxygen XML Editor supports the XPointer *Framework* and the XPointer element() Scheme, but it does NOT support the XPointer xpointer() Scheme.

For example, if the *master file* is:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml"
        schematypens="http://relaxng.org/ns/structure/1.0"?>
<test>
    <xi:include href="a.xml" xpointer="a1"
        xmlns:xi="http://www.w3.org/2001/XInclude"/>
</test>
```

and the file (`a.xml`) is:

```
<?xml version="1.0" encoding="UTF-8"?>
<test>
    <a xml:id="a1">test</a>
</test>
```

after resolving the XPointer reference, the document is:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml"
          schematypens="http://relaxng.org/ns/structure/1.0"?>
<test>
    <a xml:id="a1" xml:base="a.xml">test</a>
</test>
```

Viewing the Expanded Content in Oxygen XML Editor

When a transformation scenario is applied on the *master file*, an intermediary file combines all the referenced content and it will be expanded in the final output. If you want to see how the referenced content will be expanded before applying the transformation, you can do one of the following:

- Simply switch to **Author** mode.
- Create a minimal XSLT stylesheet that simply copies the XML content, then create a new XSLT transformation scenario that applies the stylesheet over the XML. The XSLT stylesheet would look like this:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="3.0">
    <xsl:template match="node() | @*">
        <xsl:copy>
            <xsl:apply-templates select="node() | @*"/>
        </xsl:copy>
    </xsl:template>

</xsl:stylesheet>
```

XInclude 1.1 Features

Oxygen XML Editor offers partial support for XInclude 1.1 features. This includes support for fragment identifiers and attribute copying.

- **Fragment Identifiers**

  You can `xi:include` a text file and specify the `@fragid` value so that you only get part of that text file in the main document. For some examples and to see how `xi:include` gets expanded when the `@fragid` specifies a line range or character range, see **Textual Inclusion Examples with RFC5147 Fragment Identifiers**.

- **Attribute Copying**

  Any *namespaced* attribute defined on the `xi:include` element wll be passed to the root element of the included content.

  For example, if you have this:

```
<xi:include href="section2.xml" xmlns:xi="http://www.w3.org/2001/XInclude"
```

```
  xml:id="sectInner1"/>
```

and `section2.xml` looks like this:

```
<sect2 xmlns="http://docbook.org/ns/docbook" version="5.0"
    xmlns:xlink="http://www.w3.org/1999/xlink" xml:id="section2">
    <title>FS2</title>
    <para>P2</para>
</sect2>
```

then the final processed result will have the original `xml:id="section2"` replaced with the value specified in the *xi:included* section.

For more information, see **Attribute Copying when Processing XML**. Also, to see more examples, see **Attribute Copying Examples**.

W3C Specifications: XML Inclusions (XInclude) Version 1.1

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor includes a specialized **XML Refactoring** tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The **XML Refactoring** tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the **XML Refactoring** action from one of the following locations:

- The **Tools** menu.
- The **Refactoring** submenu from the contextual menu in the **Project** view *(page 332)*.
- The **Refactoring** submenu from the contextual menu in the **DITA Maps Manager** view *(page 2943)*.

Note: The built-in refactoring operations are also available from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were finished *(page 1130)* or previewed *(page 1130)* also appear in the **Refactoring** submenu of the contextual menu in the **Project** view and the **DITA Maps Manager**.

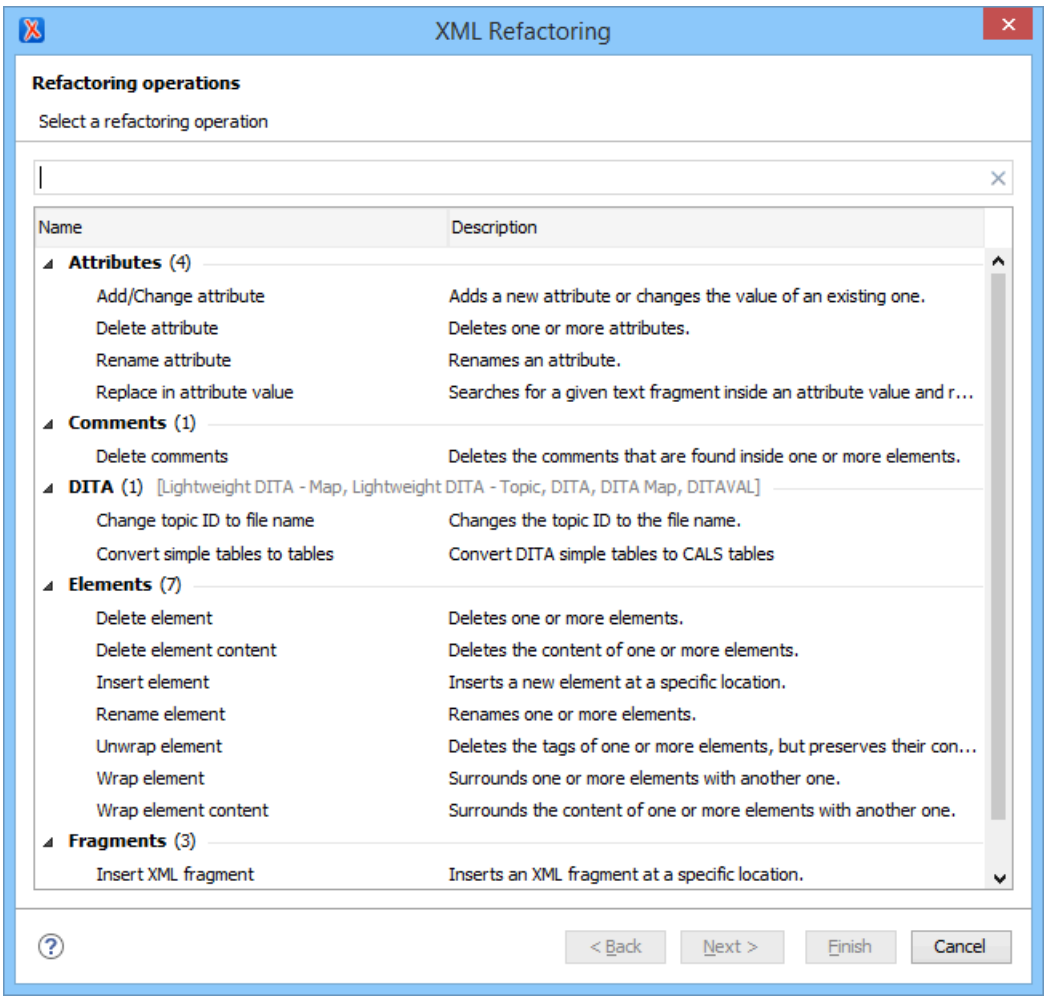
XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

Refactoring operations

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

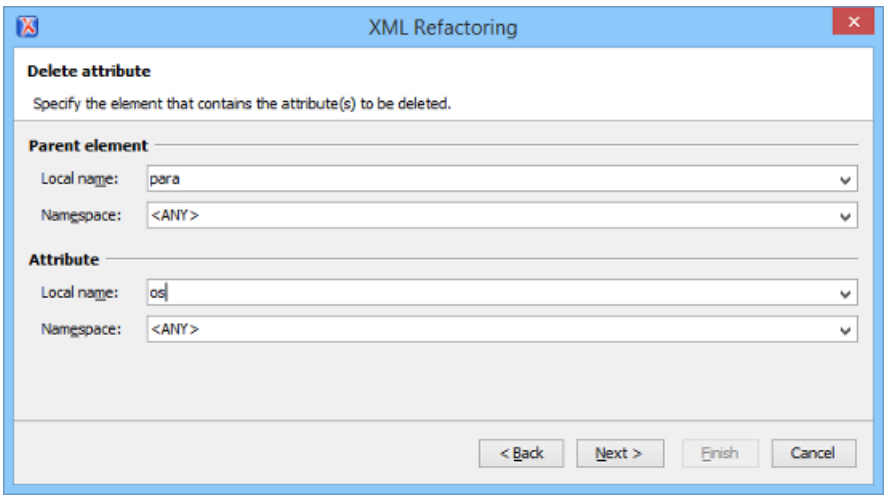
Figure: XML Refactoring Wizard



Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

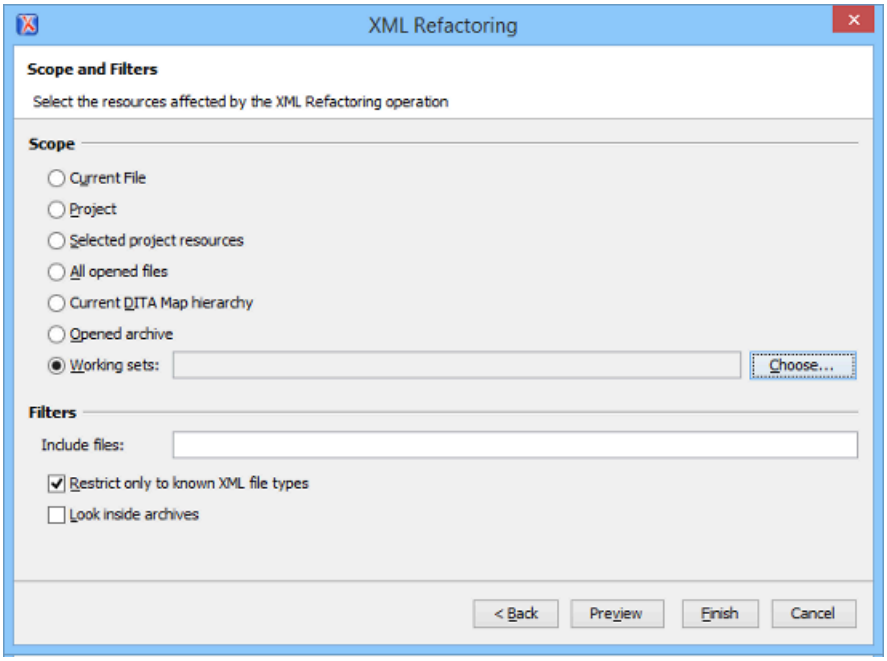
Figure: XML Refactoring 2nd Wizard Page (Delete Attribute Operation)



Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

Figure: XML Refactoring - Scope and Filters Wizard Page



Scope section

In the **Scope** section, you can select from predefined resource sets (such as the current file, your whole project, the current *DITA map (page 3228)* hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a *working set (page 3235)*.

Filters

The **Filters** section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.
- **Look inside archives** - When selected, the resources inside archives will also be affected.

Preview

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

Finish

After clicking the **Finish** button, the operation will be processed and Oxygen XML Editor provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

Troubleshooting: If an operation fails, a notification will be displayed in the **Results** panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

Tip: If an operation takes longer than expected you can use the **Stop** button in the progress bar to cancel the operation.

Restriction: XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

Built-in Refactoring Operations

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Tip: Each operation includes a link in the lower part of the wizard that opens the **XML / XSLT-FO-XQuery / XPath** preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

Refactoring Operations for *Attributes*

Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

- **Parent element** section
  - **Element** - The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** section
  - **Local name** - The local name of the affected attribute.
  - **Namespace** - The namespace of the affected attribute.
  - **Value** - The value for the affected attribute.
- **Options** section
  - You can choose between one of the following options for the **Operation mode**:
    - **Add the attribute in the parent elements where it is missing**
    - **Change the value in the parent elements where the atrribute already exists**
    - **Both**

Convert attribute to element

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

- **Parent element** section
  - **Element** - The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** section
  - **Local name** - The local name of the affected attribute.
  - **Namespace** - The namespace of the affected attribute.
- **New element** section
  - **Local name** - The local name of the new element.

    # **Namespace** - The namespace of the new element.

Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be deleted.

Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

- **Element** - The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
- **Attribute** - The name of the attribute to be renamed.
- **New local name** - The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

- **Target attribute** section
    # **Element** - The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.
    # **Attribute** - The name of the attribute to be modified.
- **Find / Replace** section
    # **Find** - The text fragments to find. You can use Perl-like regular expressions.
    # **Replace with** - The text fragment to replace the target with. This parameter can bind regular expression capturing groups (`$1`, `$2`, etc.) from the find pattern.

Refactoring Operations for *Comments*

Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

- **Element** - The target element (or elements) for which comments will be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Note: Comments that are outside the root element will not be deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *DITA*

Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS tables to simple tables

Use this operation to convert DITA CALS tables to simple tables.

Convert conrefs to conkeyrefs

Use this operation to convert `conref` attributes to `conkeyref` attributes. For more information and instructions for using this operation, see Converting Conrefs to Conkeyrefs *(page 3083)*.

Convert simple tables to CALS tables

Use this operation to convert DITA simple tables to CALS tables.

Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager *(page 2943)*)

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager *(page 2943)*)

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see Converting DITA Topics to Another Type *(page 3011)*.

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see Converting DITA Topics to Another Type *(page 3011)*.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see Converting DITA Topics to Another Type *(page 3011)*.

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see Converting DITA Topics to Another Type *(page 3011)*.

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see Converting DITA Topics to Another Type *(page 3011)*.

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see Converting DITA Topics to Another Type *(page 3011)*.

Rename Key

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

All of these DITA refactoring actions allow you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.
- **Filters** section
  # **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as ***** or **?**).
  # **Restrict to known XML file types only** - Excludes non-XML file types from the operation.
  # **Look inside archives** - If this option is selected, the scope of the operation will include files inside archives.

Refactoring Operations for *Elements*

Delete element

Use this operation to delete elements. This operation requires you to specify the following parameter:

- **Element** - The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Delete element content

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

- **Element** - The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Insert element

Use this operation to insert new elements. This operation allows you to specify the following parameters:

- **Element** section
  # **Local name** - The local name of the element to be inserted.
  # **Namespace** - The namespace of the element to be inserted.
- **Location** section
  # **XPath**- An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
  # **Position** - The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Rename element

Use this operation to rename elements. This operation requires you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **New local name** - The new local name of the element.

Unwrap element

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

- **Target elements (XPath)** - The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrap element

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **Wrapper element** section
  # **Local name** - The local name of the *Wrapper element*.
  # **Namespace** - The namespace of the *Wrapper element*.

Wrap element content

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **Wrapper element** section
  # **Local name** - The local name of the *Wrapper element* that will surround the content of the target.
  # **Namespace** - The namespace of the *Wrapper element* that will surround the content of the target.

Refactoring Operations for *Fragments*

Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

- **XML Fragment** - The XML fragment to be inserted.
- **Location** section
  # **XPath** - An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position - The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

- **Target elements (XPath)** - The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.
- **XML Fragment** - The XML fragment with which to replace the target element.

Refactoring Operations for *JATSKit*

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these JATSKit refactoring actions allow you to choose a scope for the operation and some filters:

- **Scope** - Select from a variety of options to define the scope for which resources will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.
- **Filters** section

Include files - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as ***** or **?**).
Restrict to known XML file types only - Excludes non-XML file types from the operation.
Look inside archives - If this option is selected, the scope of the operation will include files inside archives.

Additional Notes

Note: There are some operations that allow `<ANY>` for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<NO_NAMESPACE>` value can be used to select nodes that do not belong to a namespace.

Note: Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the **Options > Preferences > XML > XSLT-FO-XQUERY > XPath** *(page 216)* page. This preferences page can be easily opened by clicking the link in the note (**Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section**) at the bottom of the **Configure Operation Parameters** wizard page.

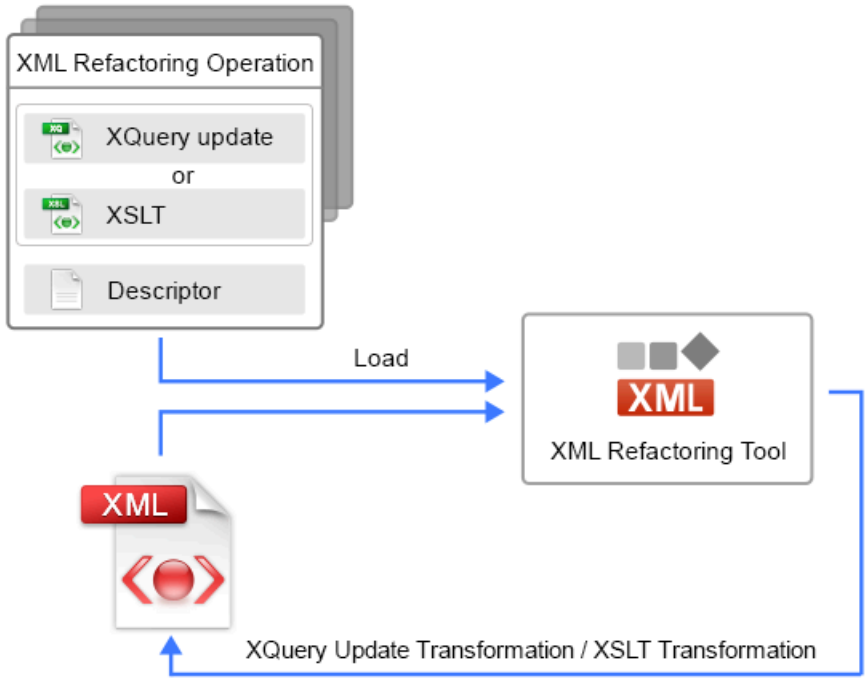
Custom Refactoring Operations

While Oxygen XML Editor includes a variety of built-in XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An *XQuery Update script* or *XSLT stylesheet* that Oxygen XML Editor will run to refactor the XML files.
- An *XML Operation Descriptor* file that contains information about the operation (such as the name, description, and parameters).

Figure: Diagram of an XML Refactoring Operation



All the defined custom operations are loaded by the **XML Refactoring Tool** and presented in the **Refactoring Operations** wizard page *(page 1127)*, along with the built-in operations.

After the user chooses an operation and specifies its parameters, Oxygen XML Editor processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a **safe mode**, which implies the following:

- When loading the document:
  # The **XInclude** mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
  # The DTD entities will be processed without being expanded.
  # The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.

- When saving the updated XML document:
  # The `DOCTYPE` will be preserved.

    Note: This can be changed using Saxon extension functions in XSLT *(page 1155)*.

  # The DTD entities will be preserved as they are in the original document when the document is saved.
  # The attribute values will be kept in their original form without being normalized.

The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

Note: To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the `http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes` namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.

Restriction: *Comments* or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be applied on the root element and the nodes inside it. However, as a work around to this limitation, you can use Saxon extension functions and the XSLT stylesheet method *(page 1155)* to implement the new custom XML refactoring operation.

Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:

1. Create an XQuery Update script *(page 1146)* or XSLT stylesheet file *(page 1150)*.
2. Create an **XML Refactoring Operation Descriptor** file contains the path to the XQuery Update script *(page 1148)* or XSLT stylesheet *(page 1153)*.
3. Store both files in one of the locations that Oxygen XML Editor *(page 1157)* scans when loading the custom operations.

   Result: Once you run the **XML Refactoring** tool again, the custom operation appears in the **Refactoring Operations** wizard page *(page 1127)*.

Related Information:

Storing and Sharing Refactoring Operations *(page 1157)*

Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an XQuery Update script *(page 1146)* or XSLT stylesheet *(page 1150)* that is needed to process the refactoring operations. The easiest way to create this script file is to use the **New** document wizard to create a new **XQuery** or **XSLT** file and you can use our XQuery method example *(page 1146)* or XSLT method example *(page 1150)* to help you with the content.

There are cases when it is necessary to add parameters in the XQuery script *(page 1146)* or XSLT stylesheet *(page 1150)*. For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the *refactoring operation descriptor file* that is associated with this operation.

Note: The XQuery Update processing is disabled by default in Oxygen XML Editor. Thus, if you want to create or edit an XQuery Update script you have to enable this mechanism by creating an XQuery transformation scenario *(page 1709)* and choose **Saxon EE** as the transformation engine. Also, you need to make sure the **Enable XQuery update** option is selected in the Saxon processor advanced options *(page 1665)*.

Note: If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the **XML /XSLT-FO-XQuery / XPath** preferences page *(page 216)*.

The next step in creating a custom refactoring operation is to create an **XML Refactoring Operation Descriptor** file contains the path to the XQuery Update script *(page 1148)* or XSLT stylesheet *(page 1153)*.

Related Information:

XQuery Update Script for Creating a Custom Operation *(page 1146)*

XSLT Stylesheet for Creating a Custom Operation *(page 1150)*

Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the **New** document wizard and choose the **XML Refactoring Operation Descriptor** template.

Introduction to the Descriptor File

This file contains information (such as `name`, `description`, and `id`) that is necessarily when loading an XML Refactoring operation . It also contains the path to the XQuery Update script *(page 1146)* or XSLT stylesheet *(page 1150)* that is associated with the particular operation through the `script` element.

You can specify a `category` for your custom operations to logically group certain operations. The `category` element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is *Other operations*.

The descriptor file is edited and validated against the following schema: `frameworks/xml_refactoring/operation_descriptor.xsd`.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the **parameters** section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the **XML Refactoring** tool within the **Configure Operation Parameters** wizard page *(page 1128)* for that particular operation.

The value of the first `description` element in the **parameters** section will be displayed at the top of the **Configure Operation Parameters** wizard page *(page 1128)*.

To declare a parameter, specify the following information:

- `label` - This value is displayed in the user interface for the parameter.
- `name` - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- `type` - Defines the type of the parameter and how it will be rendered. There are several types available:
  # `TEXT` - Generic type used to specify a simple text fragment.
  # `XPATH` - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor will use a text input with corresponding content completion and syntax highlighting.

    Note: The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.

    Note: A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.

    Note: When writing XPath expressions, you can only use prefixes declared in the **Options > Preferences > XML > XSLT-FO-XQUERY > XPath** *(page 216)* options page.

  # `NAMESPACE` - Used for editing namespace values.
  # `REG_EXP_FIND` - Used when you want to match a certain text by using Perl-like regular expressions.
  # `REG_EXP_REPLACE` - Used along with `REG_EXP_FIND` to specify the replacement string.
  # `XML_FRAGMENT` - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor will display a text area specialized for inserting XML documents.

    # `NC_NAME` - The parameter for `NC_NAME` values. It is useful when you want to specify the local part of a *QName (page 3233)* for an element or attribute.
    # `BOOLEAN` - Used to edit boolean parameters.
    # `TEXT_CHOICE` - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor renders each possible value as a radio button option.
- **`description`** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.
- **`possibleValues`** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```
<possibleValues onlyPossibleValuesAllowed="true">
    <value name="before">Before</value>
    <value name="after"default="true">After</value>
    <value name="firstChild">First child</value>
    <value name="lastChild">Last child</value>
</possibleValues>
```

Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

`elementLocation`

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the `label` attribute is displayed in the application as the label of the text field. The `name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the `useCurrentContext` attribute is set to **true**, the element name from the cursor position is used as proposed values for this parameter.

Example of an `elementLocation`:

```
<elementLocation name="elem_loc" useCurrentContext="false">
                <element label="Element location">
                    <description>Element location description.</
description>
                </element>
</ ElementLocation>
```

`attributeLocation`

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the `label` attributes is displayed in the application as the label of the associated text fields. The `name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the `element` and `attribute` text fields. For example, if `section` is entered for the element and a `title` is entered for the attribute, the XPath expression would be computed as `//section/@title`. If the value of the `useCurrentContext` attribute is set to `true`, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an `attributeLocation`:

```
<attributeLocation name="attr_xpath" useCurrentContext="true">
                <element label="Element path">
                    <description>Element path description.</description>
                </element>
                <attribute label="Attribute" >
                    <description>Attribute path description.</description>
                </attribute>
</ AttributeLocation>
```

`elementParameter`

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the `label` attribute is displayed in the application as label of the associated combo. The `name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the `allowsAny` attribute, the application will propose *<ANY>* as a possible value for the **Name** and **Namespace** combo boxes. You can also use the `useCurrentContext` attribute and if its value is set to `true`, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an `elementParameter`:

```
<elementParameter id="elemID" useCurrentContext="true">
    <localName label="Name" name="element_localName" allowsAny="true">
        <description>Local name of the parent element.</description>
```

```
    </localName>
    <namespace label="Namespace" name="element_namespace" allowsAny="true">
        <description>Local name of the parent element</description>

    </namespace>
</elementParameter>
```

`attributeParameter`

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the `label` attribute is displayed in the application as the label of the associated combo box. You can also use the `useCurrentContext` attribute and if its value is set to `true`, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

Note: An `attributeParameter` is dependant upon an `elementParameter`. The list of attributes and namespaces are computed based on the selection in the `elementParameter` combo boxes.

Example of an `attributeParameter`:

```
<attributeParameter dependsOn="elemID" useCurrentContext="true">
    <localName label="Name" name="attribute_localName">
        <description>The name of the attribute to be converted.</
description>
    </localName>

  <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
        <description>Namespace of the attribute to be converted.</
description>
    </namespace>
</attributeParameter>
```

Note: All built-in operations are loaded from the *[OXYGEN_INSTALL_DIR]*`/refactoring` folder.

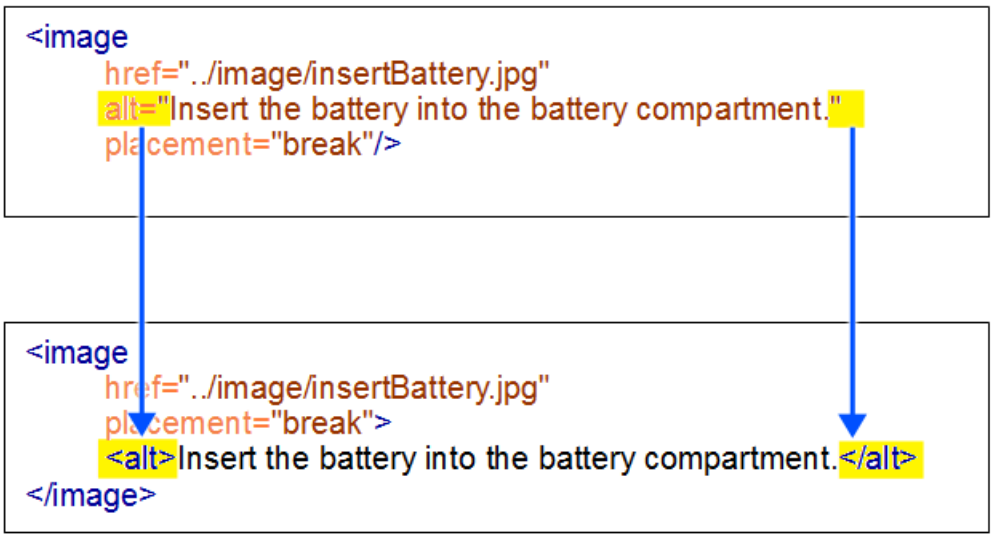
Example of an Operation Descriptor File with an XQuery Update script *(page 1148)*

XQuery Update Script for Creating a Custom Operation

To demonstrate creating a custom operation, consider that we have a task where we need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `image` elements where a deprecated `alt` attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `image` element.

Thus, our task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure: Example: Custom XML Refactoring Operation



We can use an XQuery Update script to implement the new custom XML refactoring operation. The second requirement is an XML Refactoring operation descriptor file *(page 1148)* that contains the path to the XQuery Update script.

Restriction: There is a limitation to using an XQuery script in that *comments* or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be performed on *comments* or *processing instructions* that are inside the root element. However, as a work around to

this limitation, you can use Saxon extension functions and the XSLT stylesheet method *(page 1155)* to implement the new custom XML refactoring operation.

Example of an XQuery Update Script for Creating a Custom Operation to *Convert an Attribute to an Element*

The XQuery Update script does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Computes the *QName (page 3233)* of the new element to be inserted and inserts it as the first child of the parent element.

```
(:
    XQuery document used to implement 'Convert attribute to element'
      operation from XML Refactoring tool.
:)

declare namespace output = "http://www.w3.org/2010/xslt-xquery-serialization";
declare option output:method   "xml";
declare option output:indent   "no";

(: Local name of the attribute's parent element. :)
declare variable $element_localName as xs:string external;

(: Namespace of the attribute's parent element. :)
declare variable $element_namespace as xs:string external;

(: The local name of the attribute to be converted :)
declare variable $attribute_localName as xs:string external;

(: The namespace of the attribute to be converted :)
declare variable $attribute_namespace as xs:string external;

(: Local name of the new element. :)
declare variable $new_element_localName as xs:string external;

(: Namespace of the new element. :)
declare variable $new_element_namespace as xs:string external;

(: Convert attribute to element:)
```

```
for $node in //*
(: Find the attribute to convert :)
let $attribute :=
    $node/@*[local-name() = $attribute_localName and
    ($attribute_namespace = '<ANY>' or $attribute_namespace = namespace-uri())]

(: Compute the prefix for the new element to insert :)
let $prefix :=
    for $p in in-scope-prefixes($node)
      where $new_element_namespace = namespace-uri-for-prefix($p, $node)
return $p

(: Compute the qname for the new element to insert :)
let $new_element_qName :=
    if (empty($prefix) or $prefix[1] = '') then $new_element_localName
    else $prefix[1] || ':' || $new_element_localName

 where ('<ANY>' = $element_localName or local-name($node) = $element_localName)
   and
 ($element_namespace = '<ANY>' or $element_namespace = namespace-uri($node))

  return
    if (exists($attribute)) then
      (insert node element {QName($new_element_namespace, $new_element_qName)}
      {string($attribute)} as first into $node,
      delete node $attribute)
      else ()
```

Example of an Operation Descriptor File That References the XQuery Script for Creating a Custom Operation to *Convert an Attribute to an Element*

After you have developed the XQuery script, you have to create an XML Refactoring operation descriptor. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
 id="convert-attribute-to-element"
```

```
name="Convert attribute to element">
<description>Converts the specified attribute to an element.
          The new element will be inserted as first child of the attribute's
          parent element.</description>
<!-- For the XSLT stylesheet option uncomment the following line and comment
          the line referring the XQuery Update script -->
<!-- <script type="XSLT" href="convert-attribute-to-element.xsl"/> -->
<script type="XQUERY_UPDATE" href="convert-attribute-to-element.xq"/>
 <parameters>
  <description>Specify the attribute to be converted to element.</description>
   <section label="Parent element">
    <elementParameter id="elemID">
     <localName label="Name" name="element_localName" allowsAny="true">
      <description>Local name of the parent element.</description>
       </localName>
      <namespace label="Namespace" name="element_namespace" allowsAny="true">
        <description>Local name of the parent element</description>
      </namespace>
    </elementParameter>
   </section>
   <section label="Attribute">
    <attributeParameter dependsOn="elemID">
     <localName label="Name" name="attribute_localName">
      <description>Name of the attribute to be converted.</description>
     </localName>
    <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
      <description>Namespace of the attribute to be converted.</description>
    </namespace>
    </attributeParameter>
   </section>
   <section label="New element">
       <elementParameter>
          <localName label="Name" name="new_element_localName">
              <description>The name of the new element.</description>
          </localName>
          <namespace label="Namespace" name="new_element_namespace">
              <description>The namespace of the new element.</description>
          </namespace>
       </elementParameter>
   </section>
```

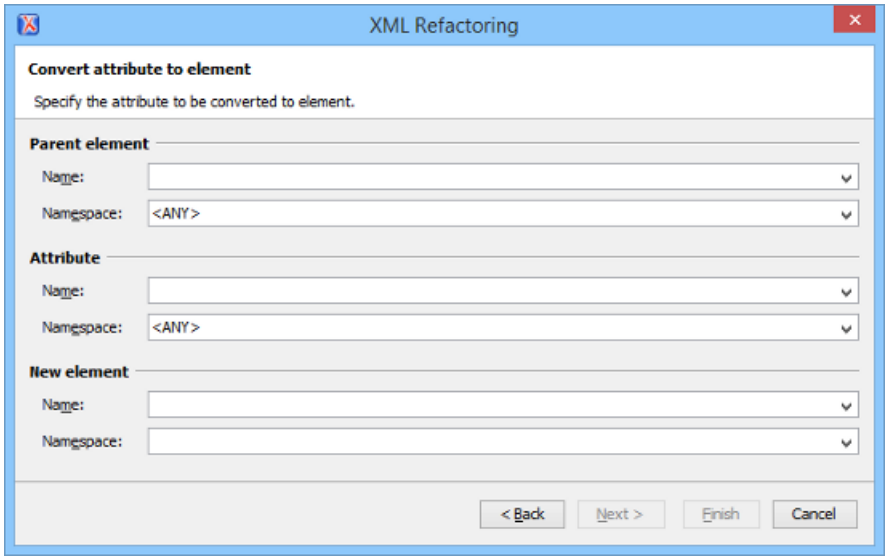
```
  </parameters>
</refactoringOperationDescriptor>
```

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor when it loads the custom operation *(page 1157)*. When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in our example of the custom operation to convert an attribute to an element:

Figure: Example: XML Refactoring Wizard for a Custom Operation

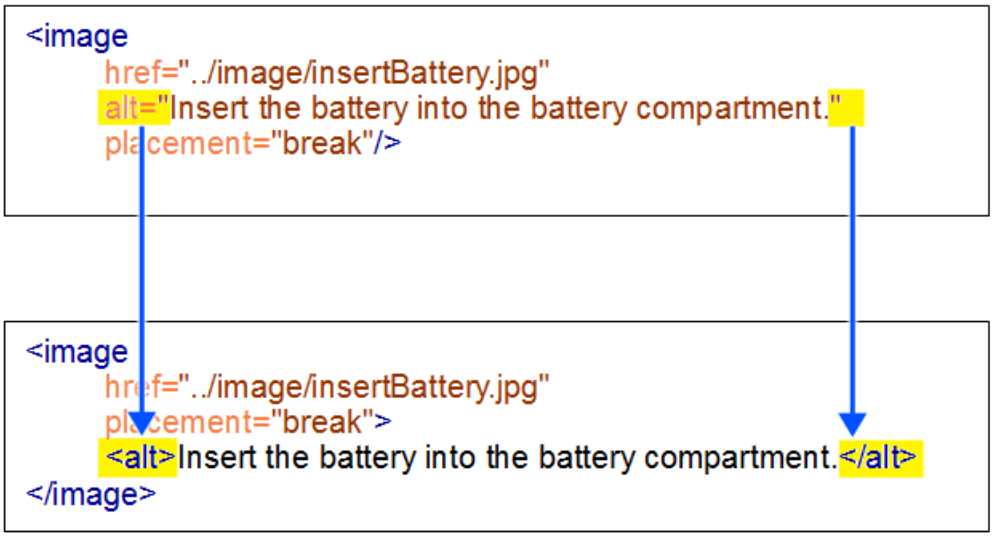


XSLT Stylesheet for Creating a Custom Operation

To demonstrate creating a custom operation, consider that we have a task where we need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `image` elements where a deprecated `alt` attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `image` element.

Thus, our task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure: Example: Custom XML Refactoring Operation



We can use an XSLT stylesheet to implement the new custom XML refactoring operation. The second requirement is an XML Refactoring operation descriptor file *(page 1153)* that contains the path to the XSLT stylesheet.

Example of an XSLT Script for Creating a Custom Operation to *Convert an Attribute to an Element*

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
  version="2.0">

  <xsl:import
href="http://www.oxygenxml.com/ns/xmlRefactoring/resources/commons.xsl"/>

  <xsl:param name="element_localName" as="xs:string" required="yes"/>
  <xsl:param name="element_namespace" as="xs:string" required="yes"/>
  <xsl:param name="attribute_localName" as="xs:string" required="yes"/>
```

```
<xsl:param name="attribute_namespace" as="xs:string" required="yes"/>
<xsl:param name="new_element_localName" as="xs:string" required="yes"/>
<xsl:param name="new_element_namespace" as="xs:string" required="yes"/>

<xsl:template match="node() | @*">
    <xsl:copy>
        <xsl:apply-templates select="node() | @*"/>
    </xsl:copy>
</xsl:template>
<xsl:template match="//*[xr:check-local-name($element_localName, ., true())
   and
      xr:check-namespace-uri($element_namespace, .)]">

    <xsl:variable name="attributeToConvert"
       select="@*[xr:check-local-name($attribute_localName, ., true())
   and
      xr:check-namespace-uri($attribute_namespace, .)]"/>

    <xsl:choose>
        <xsl:when test="empty($attributeToConvert)">
            <xsl:copy>
                <xsl:apply-templates select="node() | @*"/>
            </xsl:copy>
        </xsl:when>
    <xsl:otherwise>
        <xsl:copy>
            <xsl:for-each select="@*[empty(. intersect $attributeToConvert)]">
                 <xsl:copy-of select="."/>
            </xsl:for-each>
              <!-- The new element namespace -->
              <xsl:variable name="nsURI" as="xs:string">
                  <xsl:choose>
         <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">
                        <xsl:value-of select="''"/>
                    </xsl:when>
                    <xsl:otherwise>
                        <xsl:value-of select="$new_element_namespace"/>
                    </xsl:otherwise>
                </xsl:choose>
            </xsl:variable>
```

```
            <xsl:element name="{$new_element_localName}" namespace="{$nsURI}">
                        <xsl:value-of select="$attributeToConvert"/>
                    </xsl:element>
                <xsl:apply-templates select="node()"/>
            </xsl:copy>
        </xsl:otherwise>
    </xsl:choose>
  </xsl:template>
</xsl:stylesheet>
```

Note: The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an *XML Catalog (page 3235)* set in the XML Refactoring *framework (page 3229)*.

Example of an Operation Descriptor File That References the XSLT Stylesheet for Creating a Custom Operation to *Convert an Attribute to an Element*

After you have developed the XSLT stylesheet, you have to create an XML Refactoring operation descriptor. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
 id="convert-attribute-to-element"
 name="Convert attribute to element">
 <description>Converts the specified attribute to an element.
          The new element will be inserted as first child of the attribute's
          parent element.</description>
 <!-- For the XSLT stylesheet option uncomment the following line and comment
          the line referring the XQuery Update script -->
 <!-- <script type="XSLT" href="convert-attribute-to-element.xsl"/> -->
 <script type="XQUERY_UPDATE" href="convert-attribute-to-element.xq"/>
  <parameters>
   <description>Specify the attribute to be converted to element.</description>
    <section label="Parent element">
     <elementParameter id="elemID">
      <localName label="Name" name="element_localName" allowsAny="true">
       <description>Local name of the parent element.</description>
```

```
        </localName>
       <namespace label="Namespace" name="element_namespace" allowsAny="true">
         <description>Local name of the parent element</description>
       </namespace>
     </elementParameter>
    </section>
    <section label="Attribute">
     <attributeParameter dependsOn="elemID">
      <localName label="Name" name="attribute_localName">
       <description>Name of the attribute to be converted.</description>
      </localName>
     <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
       <description>Namespace of the attribute to be converted.</description>
     </namespace>
     </attributeParameter>
    </section>
    <section label="New element">
        <elementParameter>
           <localName label="Name" name="new_element_localName">
               <description>The name of the new element.</description>
           </localName>
           <namespace label="Namespace" name="new_element_namespace">
               <description>The namespace of the new element.</description>
           </namespace>
        </elementParameter>
    </section>
  </parameters>
</refactoringOperationDescriptor>
```

Note: If you are using an XSLT file, the line with the `script` element would look like this:

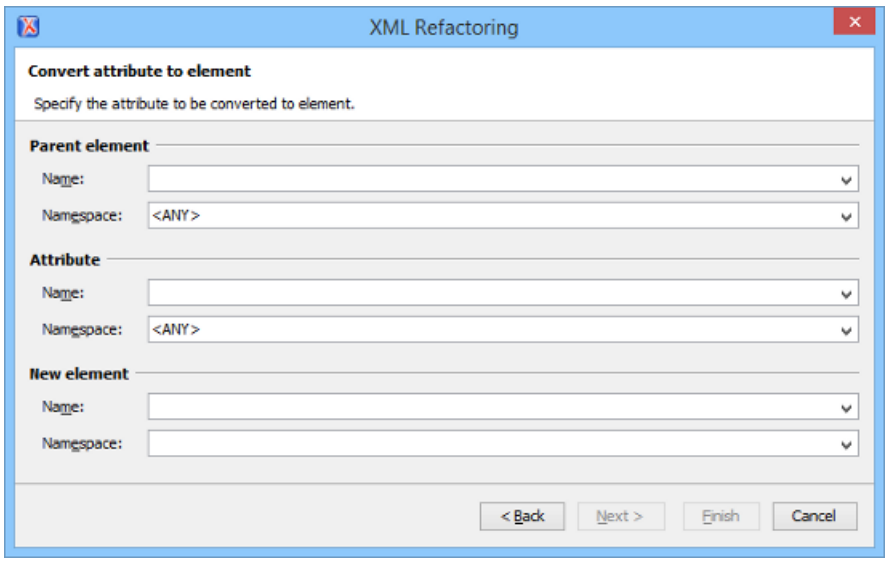
```
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor when it loads the custom operation *(page 1157)*. When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in our example of the custom operation to convert an attribute to an element:

Figure: Example: XML Refactoring Wizard for a Custom Operation



Using Saxon Extension Functions to Allow Custom Refactoring Operations to Read and Modify Content Outside the Root Node

One advantage to using an XSLT stylesheet is that there is limitation when using an XQuery Update script *(page 1146)* in that refactoring operations can only be performed on *comments* or *processing instructions* that are inside the root element. Thus, using the XQuery method, *comments* or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation.

The XSLT stylesheet method offers a work around to this limitation through the use of some Saxon extension functions.

To illustrate the use of these functions, consider the following sample XML file:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
    <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

The following Saxon extension functions can be used to read and modify content outside the root node:

Note: They belong to the `http://www.oxygenxml.com/ns/xmlRefactoring/functions` namespace.

- **get-content-after-root()** - Returns the content after root as `xs:string`.

  For the XML above, the call of this function will return the following string value:

  ```
  <!-- comment after root -->
  <?pi after root ?>
  ```

- **set-content-after-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

  The function call `set-content-after-root('<!-- Inserted comment -->')` will result in replacing the nodes after the root element with the comment passed as string argument. The XML document will be modified as follows:

  ```
  <?xml version="1.0" encoding="UTF-8"?>
  <!-- comment before root -->
  <?pi before root ?>
  <root>
      <child></child>
  </root><!-- Inserted comment -->
  ```

- **get-content-before-root()** - Returns the content before root as `xs:string`.

  For the XML above, the call of this function will return the following string value:

  ```
  <?xml version="1.0" encoding="UTF-8"?>
  <!-- comment before root -->
  <?pi before root ?>
  ```

- **set-content-before-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

  The function call `set-content-before-root('<!-- Inserted comment -->')` will result in replacing the nodes before the root element with the comment passed as string argument. The XML document will be modified as follows:

  ```
  <!-- Inserted comment --><root>
      <child></child>
  </root>
  <!-- comment after root -->
  ```

```
<?pi after root ?>
```

XSLT Example:

To process content after the root node, the XSLT would look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="xs"
    xmlns:xrf="http://www.oxygenxml.com/ns/xmlRefactoring/functions" version="3.0">
    <xsl:template match="/">
        <!-- The comment content that will be inserted after the root element -->
        <xsl:variable name="commentAsText">&lt;!-- COMMENT ADDED FROM XR OPERATION-->
        </xsl:variable>
        <!-- Retrieve the content after the root element as is -->
        <xsl:variable name="after-root-content" as="xs:string"
                      select="xrf:get-content-after-root()"/>

        <xsl:variable name="processedContent"
                      select="concat($after-root-content, $commentAsText)"/>

        <!-- Update the content after the root element -->
        <xsl:value-of select="xrf:set-content-after-root($processedContent)"/>

        <xsl:apply-templates/>
    </xsl:template>

    <xsl:template match="node() | @*">
        <xsl:copy>
            <xsl:apply-templates select="node() | @*"/>
        </xsl:copy>
    </xsl:template>
</xsl:stylesheet>
```

Note: The above XSLT retrieves the nodes after the root element as string, appends a new comment, and then sets back the updated content into the XML document.

Storing and Sharing Refactoring Operations

Oxygen XML Editor scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A `refactoring` folder, created inside a directory that is associated to a *framework* you are customizing. To associate the parent directory to the *framework*, you need to add it in the **Classpath** tab of the **Document type** configuration dialog box *(page 97)*.
- A folder that you specify in the **Load additional refactoring operations from** text box *(page 223)* in the **XML Refactoring** preferences page *(page 222)*.

  Note: If you share a project with your team, you can also share the custom operation by doing the following:

  1. Save the custom operation in a folder that is part of your project.
  2. Switch the **XML Refactoring** option page to project level *(page 3233)*:
     a. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **XML > XML Refactoring** *(page 222)*.
     b. Select **Project Options** *(page 3233)* at the bottom of the dialog box.
  3. In the **Load additional refactoring operations from** text box *(page 223)*, use the *${pd}* editor variable *(page 281)* so that the folder path is declared relative to the project.

- A folder specified by the XML Refactoring Operations Plugin Extension *(page 2555)*.
- The `refactoring` folder from the Oxygen XML Editor installation directory (*`[OXYGEN_INSTALL_DIR]`*`/refactoring/`).

Sharing Custom Refactoring Operations

The purpose of Oxygen XML Editor scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as *framework (page 3229)* or projects.

After storing custom operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Editor includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in *`[OXYGEN_INSTALL_DIR]`*`/refactoring/i18n/translation.xml`.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation `name`, `description`, and `category`.
- The `description` of the `parameters` element.
- The `label`, `description`, and `possibleValues` for each `parameter`.

Translated refactoring information uses the following form:

```
${i18n(translation_key)}
```

Oxygen XML Editor scans the following locations to find the `translation.xml` files that are used to load the translation keys:

- A `refactoring/i18n` folder, created inside a directory that is associated to a customized *framework*.
- A `i18n` folder, created inside a directory that is associated to a customized *framework*.
- An `i18n` folder inside any specified folder. In this case, you need to open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **XML > XML Refactoring**, and specify the folder in the **Load additional refactoring operations from** text box.
- An `i18n` folder located in directories specified through the XML Refactoring Operations Plugin Extension *(page 2555)*.
- The `refactoring/i18n` folder from the Oxygen XML Editor installation directory (*`[OXYGEN_INSTALL_DIR]`*`/refactoring/i18n`).

Example: Refactoring Operation Descriptor File with *i18n* Support

```
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
    xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"
           name="${i18n(Remove_text_content)}">
    <description>${i18n(Remove_text_content_description)}</description>
    <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>
    <parameters>
        <description>${i18n(parameters_description)}</description>
        <parameter label="${i18n(Element_name)}" name="element_localName"
                      type="NC_NAME">
            <description>${i18n(Element_name_descriptor)}</description>
            <possibleValues>
                <value default="true" name="value1">${i18n(value_1)}</value>
                <value name="value2">${i18n(value_2)}</value>
            </possibleValues>
        </parameter>
    </parameters>
</refactoringOperationDescriptor>
```

XML Digital Signatures

This chapter explains how to apply and verify digital signatures on XML documents.

Digital Signatures Overview

Digital signatures are widely used as security tokens, not just in XML. A *digital signature* provides a mechanism for assuring integrity of data, the authentication of its signer, and the non-repudiation of the entire signature to an external party:

- A *digital signature* must provide a way to verify that the data has not been modified or replaced to ensure integrity.
- The *signature* must provide a way to establish the identity of the data's signer for authentication.
- The *signature* must provide the ability for the data's integrity and authentication to be provable to a third party for non-repudiation.

A *public key system* is used to create the digital signature and it's also used for verification. The signature binds the signer to the document because digitally signing a document requires the originator to create a hash of the message and then encrypt that hash value with their own private key. Only the originator has that private key and that person is the only one who can encrypt the hash so that it can be unencrypted using their public key. The recipient, upon receiving both the message and the encrypted hash value, can decrypt the hash value, knowing the originator's public key. The recipient must also try to generate the hash value of the message and compare the newly generated hash value with the unencrypted hash value received from the originator. If the hash values are identical, it proves that the originator created the message, because only the actual originator could encrypt the hash value correctly.

XML Signatures can be applied to any digital content (data object), including XML (see W3C Recommendation, XML-Signature Syntax and Processing). An XML Signature may be applied to the content of one or more resources:

- Enveloped or enveloping signatures are applied over data within the same XML document as the signature
- Detached signatures are applied over data external to the signature element; the signature is "detached" from the content it signs. This definition typically applies to separate data objects, but it also includes the instance where the signature and data object reside within the same XML document but are sibling elements.

The *XML Signature* is a method of associating a key with referenced data. It does not normatively specify how keys are associated with persons or institutions, nor the meaning of the data being referenced and signed.

The original data is not actually signed. Instead, the signature is applied to the output of a chain of *canonicalization (page 3227)* and transformation algorithms, which are applied to the data in a designated sequence. This system provides the flexibility to accommodate whatever "normalization" or desired preprocessing of the data that might be required or desired before subjecting it to being signed.

Since the signature is dependent on the content it is signing, a signature produced from a *non-canonicalized* document could possibly be different from one produced from a *canonicalized (page 3227)* document. The *canonical (page 3227)* form of an XML document is physical representation of the document produced by the method described in this specification. The *XML canonicalization (page 3227)* method is the algorithm defined by this specification that generates the canonical form of a given XML document or document subset. *XML canonicalization* is designed to be useful for applications that require the ability to test whether or not the information content of a document or document subset has been changed. This is done by comparing the *canonical* form of the original document before application processing with the *canonical* form of the document result of the application processing.

A digital signature over the *canonical (page 3227)* form of an XML document or document subset would allows the signature digest calculations to be oblivious to changes in the original document's physical representation. During signature generation, the digest is computed over the *canonical* form of the document. The document is then transferred to the relying party, which validates the signature by reading the document and computing a digest of the *canonical* form of the received document. The equivalence of the digests computed by the signing and relying parties (hence, the equivalence of the *canonical* forms for which they were computed) ensures that the information content of the document has not been altered since it was signed.

The following *canonicalization algorithms* are used in Oxygen XML Editor:

- **Canonical XML (or Inclusive XML Canonicalization)** (XMLC14N) - Used for XML where the context doesn't change.

  Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the *Inclusive Canonicalization* will copy them and the signature will be invalid.
- **Exclusive XML Canonicalization** (EXCC14N) - Designed for *canonicalization* where the context might change.

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

The *canonicalization (page 3227)* method can specify whether or not comments should be included in the *canonical* form output by the *XML canonicalization* method. If a *canonical* form contains comments corresponding to the comment nodes in the input node-set, the result is called *canonical* XML with comments. In an uncommented *canonical* form comments are removed, including delimiter for comments outside document element.

The three operations. **Canonicalize** *(page 1163)*, **Sign** *(page 1164)*, and **Verify Signature** *(page 1166)*, are available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

Certificates *(page 1162)*

Canonicalizing Files *(page 1163)*

Signing Files *(page 1164)*

Verifying Signature *(page 1166)*

Example of How to Digitally Sign XML Files or Content *(page 1167)*

Certificates

A certificate is a digitally signed statement from the issuer (an individual, an organization, a website or a firm), saying that the public key (and some other information) of some other entity has a particular value. When data is digitally signed, the signature can be verified to check the data integrity and authenticity. Integrity means that the data has not been modified. Authenticity means the data comes indeed from the entity that claims to have created and signed it. Certificates are kept in special repositories called *keystores (page 3230)*.

All *keystore* entries (key and trusted certificate entries) are accessed via unique aliases. An alias must be assigned for every new entry of either a key or certificate as a reference for that entity. No *keystore* can store an entity if its alias already exists in that *keystore* and cannot store trusted certificates generated with keys in its *keystore*.

Oxygen XML Editor provides two types of *keystores*: Java Key Store (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A *keystore* file is protected by a password. In a PKCS 12 *keystore* you should not store a certificate without alias together with other certificates, with or without alias, as in such a case the certificate without alias cannot be extracted from the *keystore*.

To configure the options for a certificate or to validate it, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **XML > XML Signing Certificates**. This opens the certificates preferences page *(page 222)*.

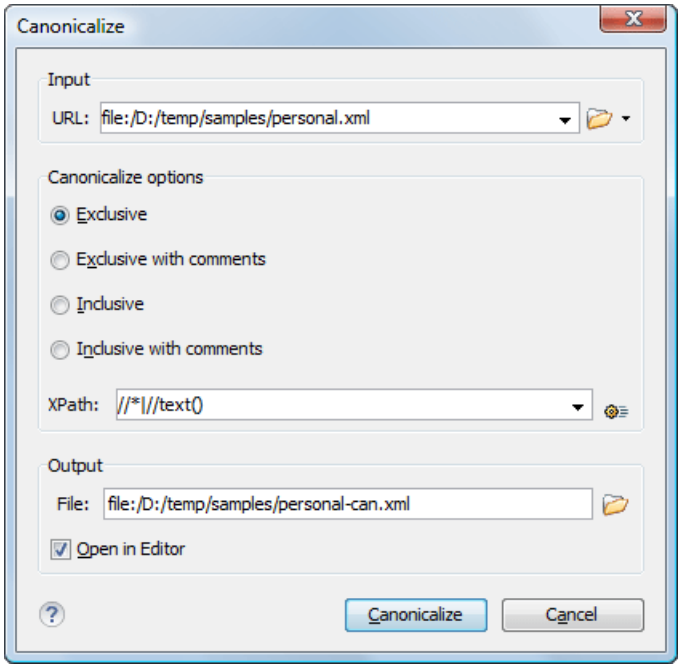
Digital Signatures Overview *(page 1160)*

Canonicalizing Files

You can select the *canonicalization (page 3227)* algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

Figure: Canonicalization Settings Dialog Box



The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the location of the input file.

- **Exclusive** - If selected, the exclusive (uncommented) *canonicalization (page 3227)* method is used.

  Note: *Exclusive Canonicalization* just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments *canonicalization (page 3227)* method is used.
- **Inclusive** - If selected, the inclusive (uncommented) *canonicalization (page 3227)* method is used.

  Note: *Inclusive Canonicalization* copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive *Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive *Canonicalization* will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments *canonicalization (page 3227)* method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the **Canonicalize** action was selected from the **Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in the editor.

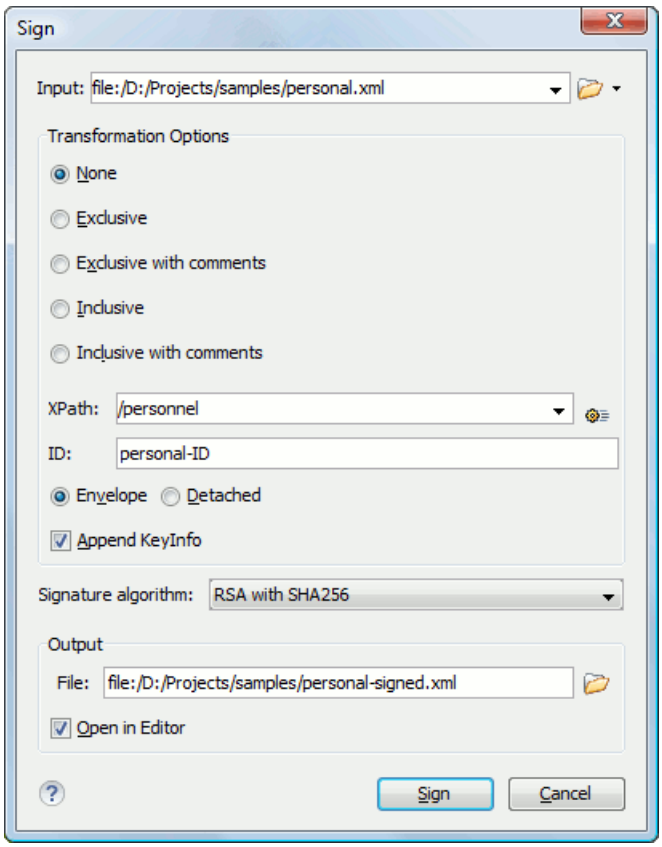
Digital Signatures Overview *(page 1160)*

Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu.

Figure: Signature Settings Dialog Box



The following options are available:

Note: If Oxygen XML Editor could not find a valid certificate, a link is provided at the top of the dialog box that opens the XML Signing Certificates preferences page *(page 222)* where you can configure a valid certificate.

- **Input** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the location of the input URL.
- **Transformation Options** - See the Digital Signature Overview *(page 1160)* section for more information about these options.
  # **None** - If selected, no *canonicalization (page 3227)* algorithm is used.
  # **Exclusive** - If selected, the exclusive (uncommented) *canonicalization (page 3227)* method is used.

    Note: *Exclusive Canonicalization* just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is

useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

Exclusive with comments - If selected, the exclusive with comments *canonicalization (page 3227)* method is used.
Inclusive - If selected, the inclusive (uncommented) *canonicalization (page 3227)* method is used.

Note: *Inclusive Canonicalization* copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. Inclusive *Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the Inclusive *Canonicalization* will copy them and the signature will be invalid.

Inclusive with comments - If selected, the inclusive with comments *canonicalization (page 3227)* method is used.

- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the *enveloped* signature is used. See the Digital Signature Overview *(page 1160)* for more information.
- **Detached** - If selected, the *detached* signature is used. See the Digital Signature Overview *(page 1160)* for more information.
- **Append KeyInfo** - If this option is selected, the `ds:KeyInfo` element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: **RSA with SHA1**, **RSA with SHA256**, **RSA with SHA384**, and **RSA with SHA512**.
- **Output** - Available if the **Sign** action was selected from the **Tools** menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in Oxygen XML Editor.

Digital Signatures Overview *(page 1160)*

Verifying Signature *(page 1166)*

Example of How to Digitally Sign XML Files or Content *(page 1167)*

Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

Related Information:

Digital Signatures Overview *(page 1160)*

Signing Files *(page 1164)*

Example of How to Digitally Sign XML Files or Content *(page 1167)*

Example of How to Digitally Sign XML Files or Content

Suppose you want to digitally sign an XML document, but more specifically, suppose you have multiple instances of the same element in the document and you just want to sign a specific ID. Oxygen XML Editor includes a signature tool that allows you to digitally sign XML documents or specific content.

The Oxygen XML Editor installation directory includes a `samples` folder that contains a file called `personal.xml`. For the purposes of this example, this file will be used to demonstrate how to digitally sign specific content. Notice that this file has multiple `person` elements inside the `personnel` element. Suppose you want to digitally sign the specific `person` element that contains the `id=robert.taylor`. To do this, follow this procedure:

1. Open the `personal.xml` file in Oxygen XML Editor in **Text** editing mode.
2. Right-click anywhere in the editor and select the **Sign** action from the **Source** submenu.
   The **Sign** dialog box is displayed.

   Tip: If you want to sign a file but create a new output file so that the original file remains unchanged, use the **Sign** action from the **Tools** menu. Selecting the action from this menu will allow you to choose an input file and output file in the **Sign** dialog box.

3. If Oxygen XML Editor cannot find a valid certificate, click the link at the top of the dialog box to **configure a valid certificate**. This opens the **XML Signing Certificates** preferences page *(page 222)* that allows you to configure and validate a certificate.

4. Once a valid certificate is recognized, continue to configure the **Sign** dialog box.
   a. Select one of the **Transformation Options** *(page 1165)*. For the purposes of this example, select the **Inclusive with comments** option.
   b. Specify the appropriate **XPath** expression for the specific element that needs to be signed. For this example, type `/personnel/person` in the **XPath** text box.
   c. Enter the specific **ID** that needs to be signed. For this example, type `robert.taylor` in the **ID** field.
   d. Select the **Envelope** option *(page 1166)* and leave the other options as their default values.

   The digital signature is added at the end of the XML document, just before the end tag. It is always added at the end of the document, even if you only sign specific content within the document.
5. You can verify the signature by choosing the **Verify Signature** action from the **Source** submenu of the contextual menu.

Verifying Signature *(page 1166)*

Editing XSLT Stylesheets

Oxygen XML Editor includes a built-in editor for XSLT stylesheets. This section presents the features of the XSLT editor and how these features can be used. The features of the XSLT editor include:

- **Create new XSLT files and templates** - You can use the built-in new file wizards to create new XSLT documents or templates *(page 673)*.
- **Open and Edit XSLT files** - XSLT files can be opened and edited in the source editor (**Text** mode *(page 819)*).
- **Visual Editing** - XSLT stylesheets are rendered, and can be edited, in the visual **Author** editing mode *(page 885)*.
- **Validation** - Presents validation errors in XSLT files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Syntax highlighting** - The syntax highlighting in Oxygen XML Editor makes XSLT files more readable.

Editing XSLT Stylesheets in the Master Files Context

Smaller interrelated modules that define a complex stylesheet cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a function defined in a main stylesheet is not visible when you edit an included or imported module. Oxygen XML Editor provides the support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger stylesheet structure.

You cat set a main XSLT stylesheet either using the *master files* support from the **Project** view *(page 719)*, or using a validation scenario.

To set a *master file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main stylesheet. In this case, it considers the current module as the main stylesheet.

The advantages of editing in the context of *master file (page 3231)* include:

- Correct validation of a module in the context of a larger stylesheet structure.
- *Content Completion Assistant (page 3227)* displays all components valid in the current context.
- The **Outline** view *(page 1182)* displays the components collected from the entire stylesheet structure.

For more information about editing XSLT stylesheets in the *master files* context, watch our video demonstration:

Related Information:

XSLT Resource Hierarchy/Dependencies View *(page 1191)*

XSLT Component Dependencies View *(page 1195)*

Validating XSLT Stylesheets

Numerous XSLT code quality assurance checks are done during automatic validation to help you keep your stylesheets valid and well formed. Oxygen XML Editor performs the validation of XSLT documents with the help of an XSLT processor that you can configure in the preferences pages *(page 197)* according to the XSLT version.

For XSLT 1.0, the options are: Xalan, Saxon 6.5.5, Saxon 9.8.0.12 and a JAXP transformer specified by the main Java class. *(page 197)* For XSLT 2.0, the options are: Saxon 9.8.0.12 and a JAXP transformer

specified by the main Java class. *(page 197)* For XSLT 3.0, the options are Saxon 9.8.0.12 and a JAXP transformer specified by the main Java class. *(page 197)*

To access the XSLT preferences *(page 197)* quickly, use the **Validation options** action from the **Document > Validate** menu.

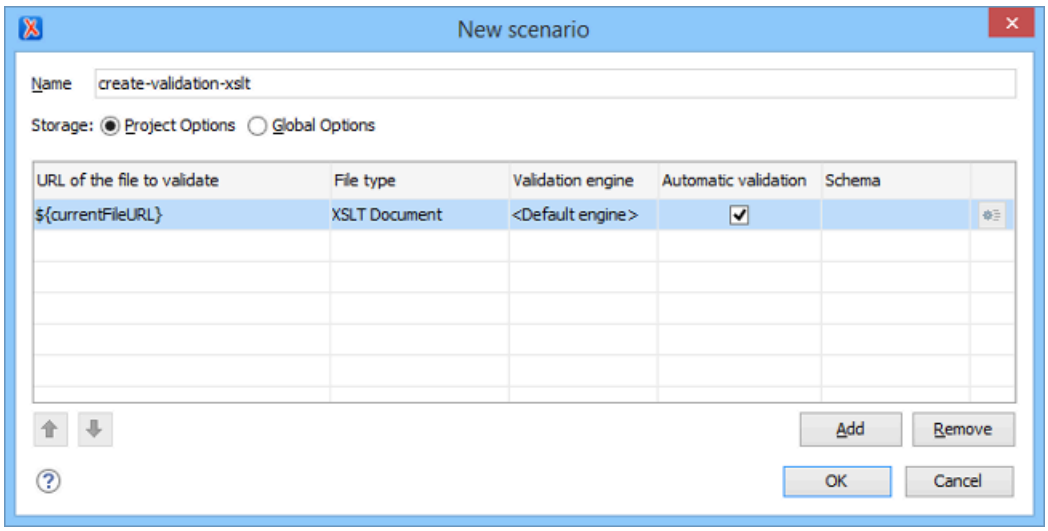
Creating a Validation Scenario for XSLT Stylesheets

You can validate an XSLT document using the engine defined in the transformation scenario, or a custom validation scenario. If you choose to validate using the engine from transformation scenario, and a transformation scenario is not associated with the current document or the engine has no validation support, the default engine is used. To set the default engine, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **XML > XSLT/FO/XQuery > XSLT**.

You can also create new validation scenarios or edit existing ones, and you can add *JARS (page 3230)* and classes that contain extension functions. To create or edit a validation scenario for an XSLT stylesheet, follow these steps:

1. With the XSLT file opened in Oxygen XML Editor, select the **Configure Validation Scenario(s)** from the **Document > Validate** menu, or the **Validation** toolbar drop-down menu, or from the **Validate** submenu when invoking the contextual menu on the XSLT file in the **Project** view *(page 332)*.
   The **Configure Validation Scenario(s)** dialog box is displayed. It contains the existing scenarios, organized in categories depending on the type of file they apply to. You can use the options in the **Settings** drop-down menu to filter which scenarios are shown.
2. To edit an existing scenario, select the scenario and press the **Edit** button. If you try to edit one of the *read-only* built-in scenarios, Oxygen XML Editor creates a customizable duplicate (you can also use the **Duplicate** button).
3. To add a new scenario, press the **New** button.
   The **New scenarios** dialog box is displayed. It lists all validation units of the scenario.

Figure: Add / Edit a Validation Unit



4. Configure the following information in this dialog box:
   a. **Name** - The name of the validation scenario.
   b. **Storage** - You can choose between storing the scenario in the **Project Options** *(page 3233)* or **Global Options** *(page 3230)*.
   c. **URL of the file to validate** - In most cases, leave this field as the default selection (the URL of the current file). If you want to specify a different URL, double-click its cell and enter the URL in the text field, select it from the drop-down list, or use the **Browse** drop-down menu or **Insert Editor Variable** *(page 275)* button.
   d. **File type** - The file type should be **XSLT Document**.
   e. **Validation engine** - Click the cell to select a validation engine. You must select an engine to be able to add or edit extensions.
   f. **Automatic validation** - If this option is selected, the validation operation defined by this row is also used by the automatic validation feature *(page 1071)*.

5. To add or edit extensions, click the **Edit extensions** button. This button is only available if the **File type** is set as **XSLT Document** and a **Validation engine** is chosen.
   The **Libraries** dialog box is opened. It is used to specify the *JARS* and classes that contain extension functions called from the XSLT file of the current validation scenario. They will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item and press the **Move up** or **Move down** buttons.

6. Press **OK** to close the **New scenario** dialog box.
   The newly created validation scenario is now included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate

it with the current XSLT document and press the **Apply associated** button to run the validation scenario.

Validating XSLT Stylesheets with Custom Engines

If you need to validate an XSLT stylesheet with a validation engine that is different from the built-in engine, you can configure external engines as custom XSLT validation engines in the Oxygen XML Editor preferences. After a custom validation engine is properly configured *(page 183)*, it can be applied on the current document by selecting it from the list of custom validation engines in the **Validation** toolbar drop-down menu. The document is validated against the schema declared in the document.

By default, there are two validators that are configured for XSLT stylesheets:

- **MSXML 4.0** - included in Oxygen XML Editor (Windows edition). It is associated to the XSL Editor type in Preferences page. *(page 183)*
- **MSXML.NET** - included in Oxygen XML Editor (Windows edition). It is associated to the XSL Editor type in Preferences page. *(page 183)*

Validating XSLT Stylesheets that Call Java Extensions

It is possible to validate XSLT that call Java extensions. This is achieved through a transformation scenario in which the Java extensions are specified, and the default validation will be processed using the parameters defined in the transformation scenario.

To validate XSLT with Java extensions, follow this procedure:

1. Create an XSLT transformation scenario *(page 1688)* for your XSLT document (select **Configure Transformation Scenario(s)** action from the toolbar, then click **New**, and select **XSLT transformation**).
2. In the **New scenario** dialog box, click the **Extensions** button (in the **XSLT** tab), specify the Java extensions (JAR libraries) that are needed, and click **OK**.
3. Once you are finished configuring the transformation scenario, click **OK**, then select **Save and close**.
4. Use the **Validate** button on the toolbar **(or Ctrl + Shift + V (Command + Shift + V on OS X))** and the default validation will detect and use the transformation scenario profile you just configured and saved.

Debugging XSLT that Call Java Extensions *(page 2228)*

XSLT Quick Fix Support

The Oxygen XML Editor *Quick Fix* support *(page 3233)* helps you resolve various errors that appear in a stylesheet by proposing *Quick Fixes* to problems such as missing templates, misspelled template names, missing functions, or references to an undeclared variable or parameter.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a *Quick Fix* is available for that particular error or warning, you can access the *Quick Fix* proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip pop-up window.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon () is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor displays the list of available fixes.
- With the cursor placed in the highlighted area of the error or warning, you can also invoke the *Quick Fix* menu by pressing **Alt + 1 (Command + Alt + 1 on OS X)** on your keyboard.

Note: The *Quick Fixes* are available only when validating an XSLT file with Saxon HE/PE/EE.

Figure: Example of an Undefined XSLT Functions Quick Fix

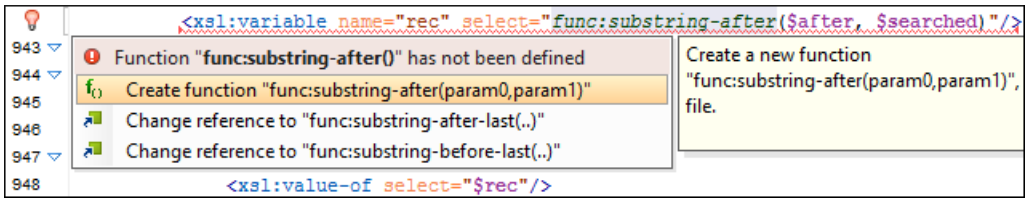

Figure: Example of an Undeclared XSLT Variables/Parameters Quick Fix

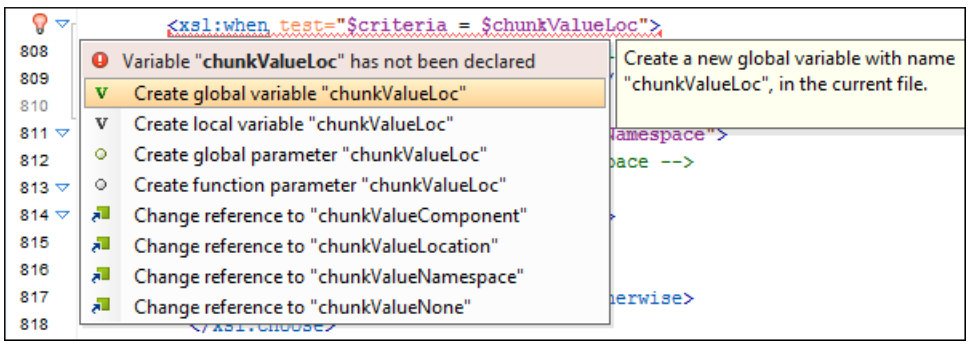


Oxygen XML Editor provides XSLT *Quick Fixes* for the following types of instances:

- **Template does not exist**, when the template name referenced in a `call-template` element does not exist. The following fixes are available:
  # **Create template "templateName"** - creates a template and generates its corresponding parameters. The template name and parameter names and types are collected from the `call-template` element.
  # **Change reference to "newTemplateName"** - changes the name of the missing template referenced in the `call-template` element. The proposed new names are the existing templates with names similar with the missing one.
- **Variable/Parameter not declared**, when a parameter or variable reference cannot be found. The following fixes are available:
  # **Create global variable "varName"** - creates a global variable with the specified name in the current stylesheet. The new variable is added at the beginning of the stylesheet after the last global variable or parameter declaration.
  # **Create global parameter "paramName"** - creates a global parameter with the specified name in the current stylesheet. The new parameter is added at the beginning of the stylesheet after the last global parameter or variable declaration.
  # **Create local variable "varName"** - creates a local variable with the specified name before the current element.
  # **Create template parameter "paramName"** - creates a new parameter with the specified name in the current template. This fix is available if the error is located inside a template.
  # **Create function parameter "paramName"** - creates a new parameter with the specified name in the current function. This fix is available if the error is located inside a function.
  # **Change reference to "varName"** - changes the name of the referenced variable/parameter to an existing local or global variable/parameter, that has a similar name with the current one.
- **Parameter from a called template is not declared**, when a parameter referenced from a `call-template` element is not declared. The following fixes are available:
  # **Create parameter "paramName" in the template "templateName"** - creates a new parameter with the specified name in the referenced template.
  # **Change "paramName" parameter reference to "newParamName"** - changes the parameter reference from the `call-template` element to a parameter that is declared in the called template.
  # **Remove parameter "paramName" from call-template** - removes the parameter with the specified name from the `call-template` element.
- **No value supplied for required parameter**, when a required parameter from a template is not referenced in a `call-template` element. The following quick-fix is available::
  # **Add parameter "paramName" in call-template** - creates a new parameter with the specified name in call-template element.
- **Function "prefix:functionName()" has not been defined**, when a function declaration is not found. The following *Quick Fixes* are available:

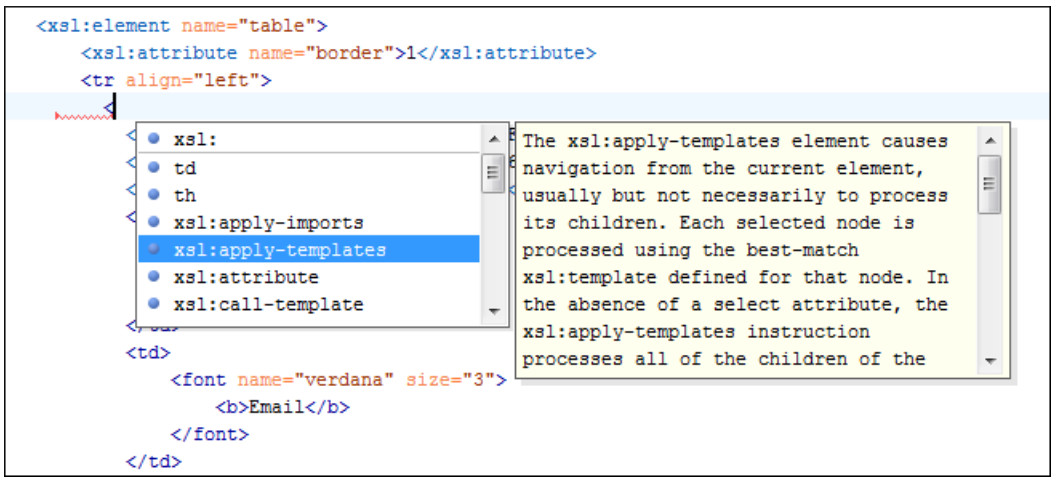
    # **Create function "prefix:functionName(param1, param2)"** - creates a new function with the specified signature, after the current top level element from stylesheet.
    # **Change function to "newFunctionName(..)"** - changes the referenced function name to an already defined function. The proposed names are collected from functions with similar names and the same number of parameters.
- **Attribute-set "attrSetName" does not exist**, when the referenced attribute set does not exist. The following *Quick Fixes* are available:
    # **Create attribute-set "attrSetName"** - creates a new attribute set with the specified name, after the current top level element from stylesheet.
    # **Change reference to "attrSetName"** - changes the referenced attribute set to an already defined one.
- **Character-map "chacterMap" has not been defined**, when the referenced character map declaration is not found. The following *Quick Fixes* are available:
    # **Create character-map "characterMapName"** - creates a new character map with the specified name, after the current top level element from stylesheet.
    # **Change reference to "characterMapName"** - changes the referenced character map to an already defined one.

Content Completion in XSLT Stylesheets

The list of proposals offered by the *Content Completion Assistant (page 3227)* in XSLT are context-sensitive and includes proposals that are valid at the current cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut.

You can enhance the list of proposals by specifying an additional schema. This schema is defined in the **Content Completion / XSLT** preferences *(page 169)* page and can be any of the following: XML Schema, DTD, RELAX NG schema, or NVDL schema.

Figure: XSLT Content Completion Assistant



The feature is activated in **Text** mode in the following situations:

- After you press the **<** character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the **Activation delay of the proposals window (ms)** option *(page 167)* from the **Content Completion** preferences page.
- After typing a partial element or attribute name, you can manually activate it by pressing **Ctrl + Space (Command + Space on OS X)** or **Alt + ForwardSlash (Command + Alt + ForwardSlash on OS X)**. If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

The *Content Completion Assistant* proposes numerous item types (such as templates, variables, parameters, keys, etc.) that are defined in the current stylesheet, and in the imported and included XSLT stylesheets. The *Content Completion Assistant* also includes code templates that can be used to quickly insert code fragments *(page 848)* into stylesheets.

Note: For XSL and XSD resources, the *Content Completion Assistant* collects its components starting from the *master files (page 3231)*. The *master files* can be defined in the project or in the associated validation scenario. For further details about the *Master Files* support go to Defining Master Files at Project Level *(page 719)*.

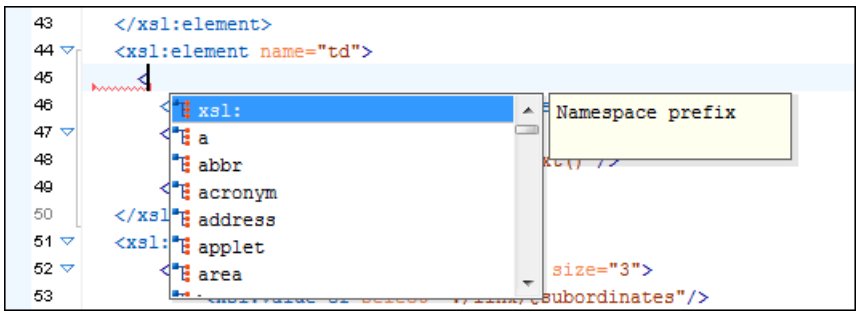
The extension functions included in the Saxon 6.5.5 and 9.8.0.12 transformation engines are presented in the content completion list only if the Saxon namespace (*http://saxon.sf.net* for XSLT version 2.0 / 3.0 or *http://icl.com/saxon* for XSLT version 1.0) is declared and one of the following conditions is true:

- The edited file has a transformation scenario that uses as transformation engine Saxon 6.5.5 (for XSLT version 1.0), Saxon 9.8.0.12 PE or Saxon 9.8.0.12 EE (for XSLT version 2.0 / 3.0).
- The edited file has a validation scenario that uses as validation engine Saxon 6.5.5 (for version 1.0), Saxon 9.8.0.12 PE or Saxon 9.8.0.12 EE (for version 2.0 / 3.0).
- The validation engine specified in Options *(page 197)* page is Saxon 6.5.5 (for version 1.0), Saxon 9.8.0.12 PE or Saxon 9.8.0.12 EE (for version 2.0 / 3.0).

Additionally. the Saxon-CE-specific extension functions and instructions are presented in the list of content completion assistance proposals only if the `http://saxonica.com/ns/interactiveXSLT` namespace is declared.

Namespace prefixes in the scope of the current context are presented at the top of the content completion assistance window to speed up the insertion into the document of prefixed elements.

Figure: Namespace Prefixes in the Content Completion Assistant



For the common namespaces such as XSL namespace (`http://www.w3.org/1999/XSL/Transform`), XML Schema namespace (`http://www.w3.org/2001/XMLSchema`), or Saxon namespace (`http://icl.com/saxon` for version 1.0, `http://saxon.sf.net/` for version 2.0 / 3.0), Oxygen XML Editor provides an easy mode to declare them by proposing a prefix for these namespaces.

Content Completion in XPath Expressions

In XSLT stylesheets, the *Content Completion Assistant (page 3227)* provides all the features available in the XML editor *(page 836)* and also adds some enhancements. In XPath expressions used in attributes of XSLT stylesheets (elements such as `match` , `select` , and `test`), the *Content Completion Assistant* offers the names of XPath and XSLT functions, XSLT axes, and user-defined functions (the name of the function and its parameters). If a transformation scenario was defined and associated to the edited stylesheet, the *Content Completion Assistant* computes and presents elements and attributes based on:

- The input XML document selected in the scenario.
- The current context in the stylesheet.

The associated document is displayed in the **XSLT/XQuery Input** view *(page 1187)*.

Content completion for XPath expressions is started:

- On XPath operators detected in one of the `match` , `select` and `test` attributes of XSLT elements: `"` , `'` , `/` , `//` , `(` , `[` , `|` , `:` , `::` , `$`
- For attribute value templates of non-XSLT elements, that is the `{` character when detected as the first character of the attribute value.
- On request, if the combination **Ctrl + Space (Command + Space on OS X)** is pressed inside an edited XPath expression.

The proposals presented in the *Content Completion Assistant* are dependent on:

- The context of the current XSLT element.

- The XML document associated with the edited stylesheet in the stylesheet transformation scenario.
- The XSLT version of the stylesheet (1.0, 2.0, or 3.0).

Note: The XSLT 3.0 content completion list of proposals includes specific elements and attributes for the 3.0 version.

For example, if the document associated with the edited stylesheet is:

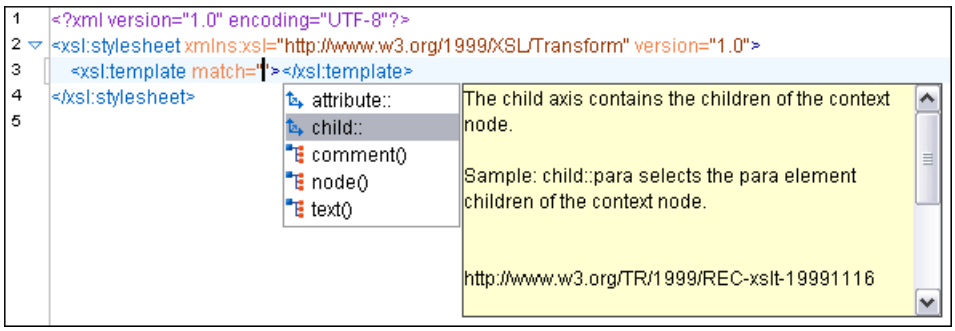
```
<personnel>
    <person id="Big.Boss">
        <name>
            <family>Boss</family>
            <given>Big</given>
        </name>
        <email>chief@oxygenxml.com</email>
        <link subordinates="one.worker"/>
    </person>
    <person id="one.worker">
        <name>
            <family>Worker</family>
            <given>One</given>
        </name>
        <email>one@oxygenxml.com</email>
        <link manager="Big.Boss"/>
    </person>
</personnel>
```

If you enter an `xsl:template` element using the *Content Completion Assistant*, the following actions are triggered:

- The `match` attribute is inserted automatically.
- The cursor is placed between the quotes.
- The XPath *Content Completion Assistant* automatically displays a pop-up window with all the XSLT axes, XPath functions and elements and attributes from the XML input document that can be inserted in the current context.

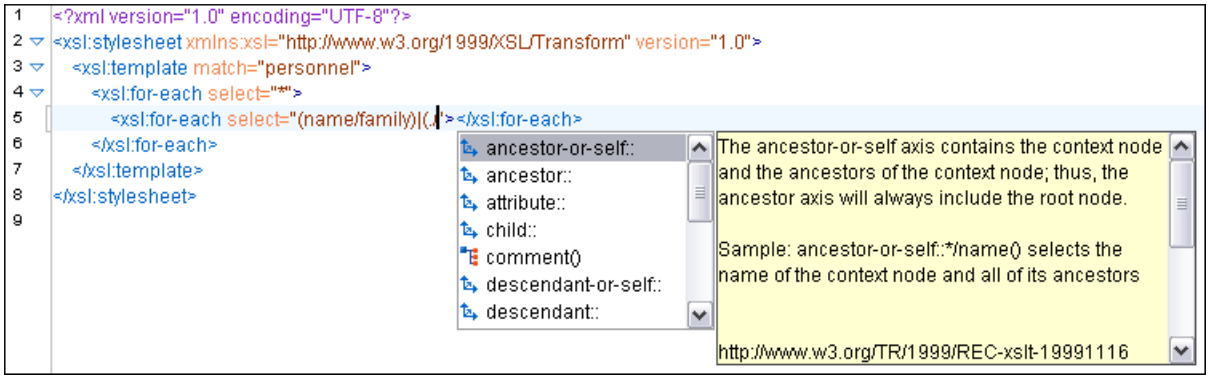
The set of XPath functions depends on the XSLT version declared in the root element `xsl:stylesheet`: 1.0, 2.0, or 3.0.

Figure: Content Completion in the `match` Attribute



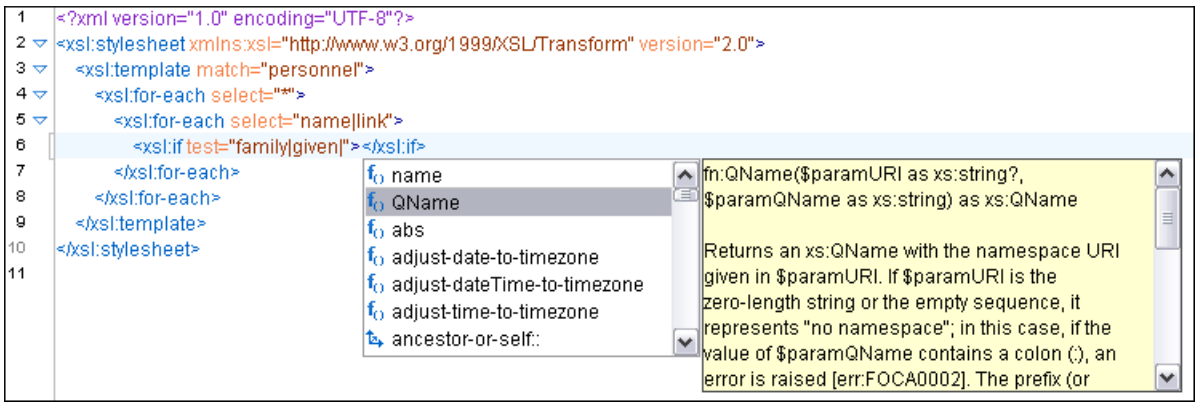
If the cursor is inside the `select` attribute of an `xsl:for-each`, `xsl:apply-templates`, `xsl:value-of` or `xsl:copy-of` element the content completion proposals depend on the path obtained by concatenating the XPath expressions of the parent XSLT elements `xsl:template` and `xsl:for-each` as shown in the following figure:

Figure: Content Completion in the `select` Attribute



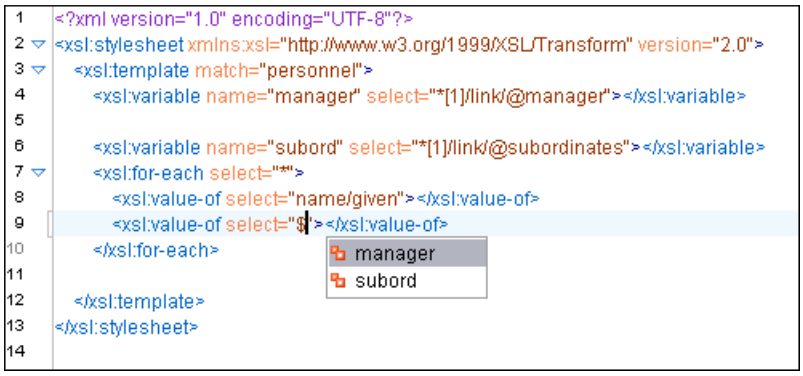
Also XPath expressions typed in the `test` attribute of an `xsl:if` or `xsl:when` element benefit of the assistance of the content completion.

Figure: Content Completion in the `test` Attribute



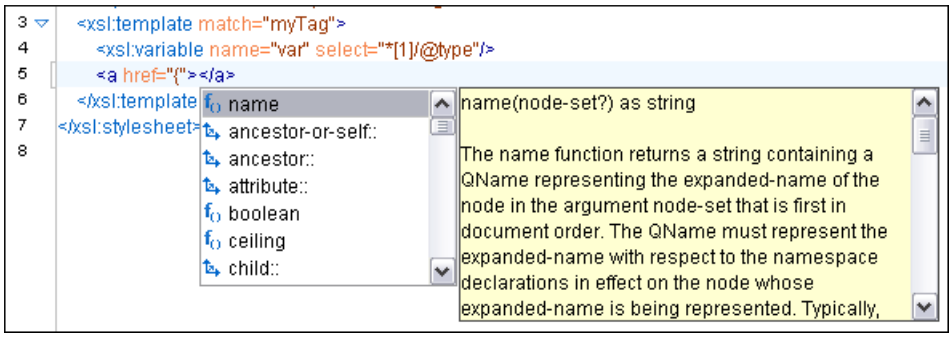
XSLT variable references are easier to insert in XPath expressions with the help of the content completion pop-up triggered by the `$` character, which signals the start of such a reference in an XPath expression.

Figure: Content Completion in the `test` Attribute



If the `{` character is the first one in the value of the attribute, the same *Content Completion Assistant* is available also in attribute value templates of non-XSLT elements.

Figure: Content Completion in Attribute Value Templates



The time delay (configured in the **Content Completion** preferences page *(page 167)*) for all content completion assistance windows is also applied for the content completion in XPath expressions.

Related Information:

Working with XPath Expressions *(page 2082)*

Tooltip Helper for the XPath Functions Arguments

When editing the arguments of an XPath/XSLT function, Oxygen XML Editor tracks the current entered argument by displaying a tooltip containing the function signature. The currently edited argument is highlighted with a bolder font.

When moving the cursor through the expression, the tooltip is updated to reflect the argument found at the cursor position.

Examples:

If you want to concatenate the absolute values of two variables, named *v1* and *v2*:

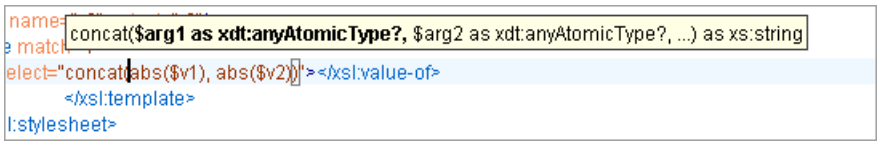
```
<xsl:template match="/">
    <xsl:value-of select="concat(abs($v1), abs($v2))"></xsl:value-of>
</xsl:template>
```

When moving the cursor before the first `abs` function, Oxygen XML Editor identifies it as the first argument of the `concat` function. The tooltip shows in bold font the following information about the first argument:

- Its name is `$arg1`.
- Its type is `xdt:anyAtomicType`.
- It is optional (note the `?` sign after the argument type).

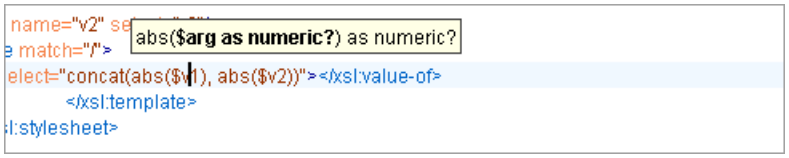
The function also takes other arguments that have the same type and returns a `xs:string`.

Figure: XPath Tooltip Helper - Identify the `concat` Function's First Argument



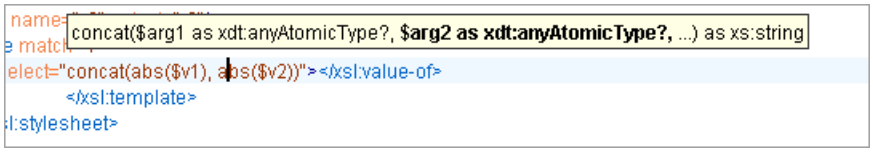
Moving the cursor on the first variable `$v1`, the editor identifies the `abs` as context function and shows its signature:

Figure: XPath Tooltip Helper - Identify the `abs` Function's Argument



Further, clicking the second `abs` function name, the editor detects that it represents the second argument of the `concat` function. The tooltip is repainted to display the second argument in bold font.

Figure: XPath Tooltip Helper - Identify the `concat` Function's Second Argument



Note: The tooltip helper is also available in the **XPath Builder** view *(page 2085)* and XPath toolbar *(page 2082)*.

Working with XPath Expressions *(page 2082)*

Syntax Highlighting in XSLT

Oxygen XML Editor supports syntax highlighting in XSLT documents to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for XSLT files, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*.
2. Go to **Editor > Syntax Highlight** *(page 171)*.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XSL** tab in the **Preview** pane to see the effects of your changes.

Tip: Oxygen XML Editor also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page *(page 172)*.

Related Information:

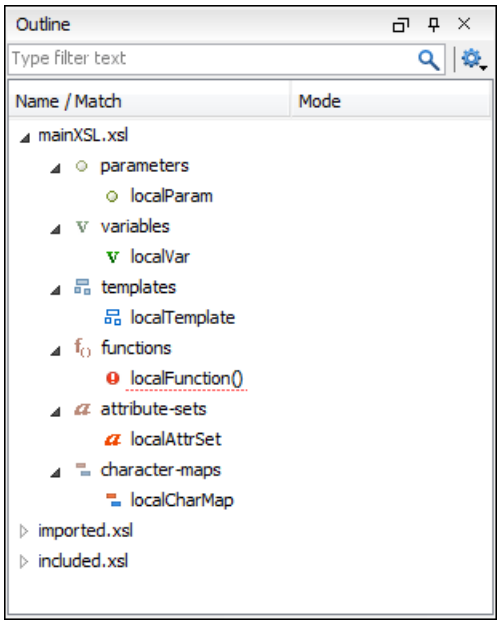
Customize Syntax Highlight colors *(page 171)*

XSLT Outline View

The **Outline** view for XSLT stylesheets displays the list of all the components (templates, attribute-sets, character-maps, variables, functions, keys, outputs) from both the edited stylesheet and its imports or includes. For XSL and XSD resources, the **Outline** view collects its components starting from the *master files (page 3231)*. The master files can be defined in the project or in the associated validation scenario. For further details about the *Master Files* support go to Defining Master Files at Project Level *(page 719)*.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: XSLT Outline View



The following actions are available in the **Settings** menu on the **Outline** view toolbar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches;

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the XSLT editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

When the **Show components** option is selected, the following actions are available:

Show XML structure

Displays the XML document structure in a tree-like structure.

Show all components

Displays all components that were collected starting from the *master file (page 3231)*. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/type

The stylesheet components can be grouped by location and type.

When the **Show XML structure** option is selected, the following actions are available:

Show components

Switches the **Outline** view to the components display mode.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel *(page 257)*.

Configure displayed attributes

Displays the **XML Structured Outline** preferences page *(page 257)*.

The following contextual menu actions are also available when the **Show components** option is selected in the **Settings** menu:

Edit Attributes

Opens a small in-place editor that allow you to edit the attributes of the selected node.

Cut

Cuts the currently selected node.

Copy

Copies the currently selected node.

Delete

Deletes the currently selected node.

Search References **Ctrl + Shift + R (Command + Shift + R on OS X)**

Searches all references of the item found at current cursor position in the defined scope, if any. See Finding XSLT References and Declarations *(page 1197)* for more details.

Search References in

Searches all references of the item found at current cursor position in the specified scope. See Finding XSLT References and Declarations *(page 1197)* for more details.

Component Dependencies

Opens the **Component Dependencies** view *(page 1195)* that allows you to see the dependencies for the current selected component.

Resource Hierarchy

Opens the **Resource Hierarchy/Dependencies** view *(page 1191)* that displays the hierarchy for the currently selected resource.

Resource Dependencies

Opens the **Resource Hierarchy/Dependencies** view *(page 1191)* that displays the dependencies of the currently selected resource.

Rename Component in

Renames the selected component. See XSLT Refactoring Actions *(page 1201)* for more details.

The following contextual menu actions are available in the **Outline** view when the **Show XML structure** option is selected in the **Settings** menu:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a small in-place editor that allow you to edit the attributes of the selected node.

Toggle Comment

Comments/uncomments the currently selected element.

Search references

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Opens the **Component Dependencies** view *(page 1195)* that displays the dependencies of the currently selected component.

Rename Component in

Renames the currently selected component in the context of a scope that you define.

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Delete

Deletes the currently selected component.

Expand More

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

The stylesheet components information is presented on two columns: the first column presents the `name` and `match` attributes, the second column the `mode` attribute. If you know the component name, match or mode, you can search it in the **Outline** view by typing one of these pieces of information in the filter text field from the top of the view or directly on the tree structure. When you type de component name, match or mode in the text field, you can switch to the tree structure using:

- Keyboard arrow keys
- **Enter** key
- **Tab** key
- **Shift-Tab** key combination

To switch from tree structure to the filter text field, you can use **Tab** and **Shift-Tab**.

Tip: The search filter is case insensitive. The following wildcards are accepted:

- ***** - any string

- **?** - any character
- **,** - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

Oxygen XML Editor allows you to sort the components of the tree in the **Outline** view.

Note: Sorting groups in the **Outline** view is not supported.

Oxygen XML Editor has a predefined order of the groups in the **Outline** view:

- For location, the names of the files are sorted alphabetically. The file you are editing is located at the top of the list.
- For type, the order is: parameters, variables, templates, functions, set attributes, character-map.

Note: When no grouping is available and the table is not sorted, Oxygen XML Editor sorts the components depending on their order in the document. Oxygen XML Editor also takes into account the name of the file that the components are part of.

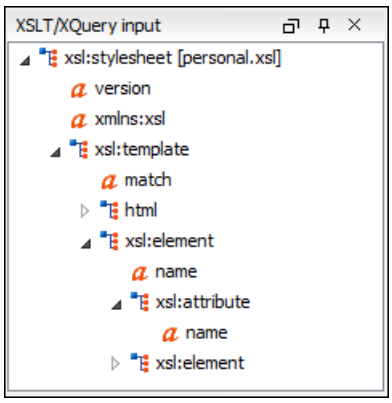
XSLT/XQuery Input View

The structure of the XML document associated to the edited XSLT stylesheet, or the structure of the source documents of the edited XQuery is displayed in a tree form in a view called the **XSLT/XQuery Input** view. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. The tree nodes represent the elements of the documents.

XSLT

If you click a node in the **XSLT/XQuery Input** view, the corresponding template from the stylesheet is highlighted. A node can be dragged from this view and dropped in the editor area for quickly inserting `xsl:template`, `xsl:for-each`, or other XSLT elements that have the `match` / `select` / `test` attribute already completed. The value of the attribute is the correct XPath expression that refers to the dragged tree node. This value is based on the current editing context of the drop spot.

Figure: XSLT Input View



XSLT Example:

For the following XML document:

```
<personnel>
    <person id="Big.Boss">
        <name>
            <family>Boss</family>
            <given>Big</given>
        </name>
        <email>chief@oxygenxml.com</email>
        <link subordinates="one.worker"/>
    </person>
    <person id="one.worker">
        <name>
            <family>Worker</family>
            <given>One</given>
        </name>
        <email>one@oxygenxml.com</email>
        <link manager="Big.Boss"/>
    </person>
</personnel>
```

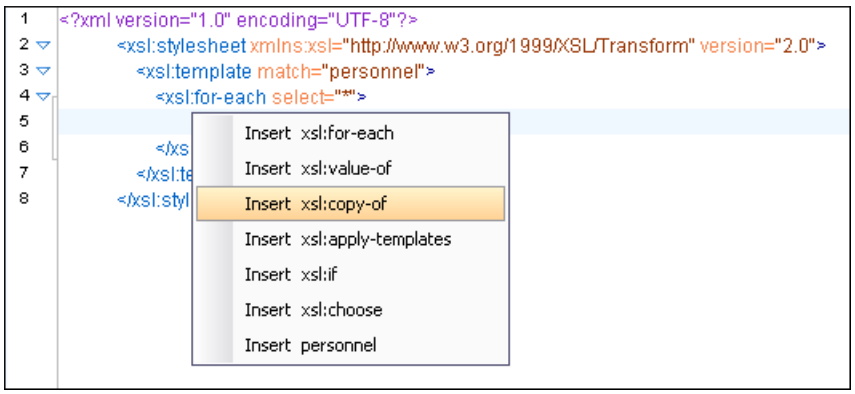
and the following XSLT stylesheet:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
        version="2.0">
    <xsl:template match="personnel">
        <xsl:for-each select="*">
```

```
        </xsl:for-each>
    </xsl:template>
</xsl:stylesheet>
```

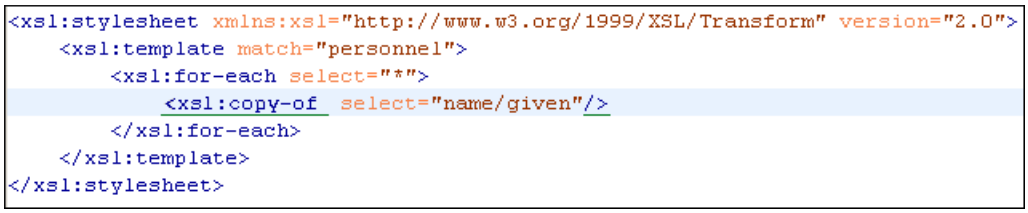
if you drag the `given` element and drop it inside the `xsl:for-each` element, the following pop-up menu is displayed:

Figure: XSLT Input Drag and Drop Pop-up Menu



If you select **Insert xsl:copy-of** (for example), the resulting document will look like this:

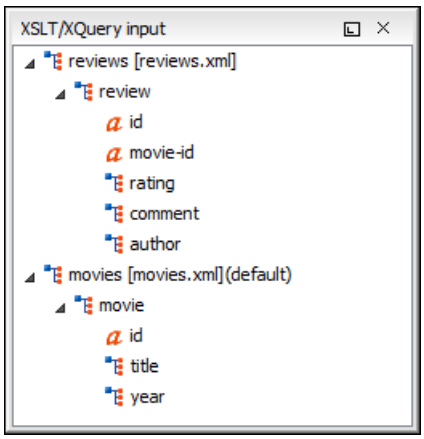
Figure: XSLT Input Drag and Drop Result



XQuery

You can also use the **XSLT/XQuery Input** view to drag and drop a node into the editing area to quickly insert XQuery expressions.

Figure: XQuery Input View



XQuery Example:

For the following XML documents:

```
<movies>
<movie id="1">
<title>The Green Mile</title>
<year>1999</year>
</movie>
<movie id="2">
<title>Taxi Driver</title>
<year>1976</year>
</movie>
</movies>
```

```
<reviews>
<review id="100" movie-id="1">
<rating>5</rating>
<comment>It is made after a great Stephen King book.
</comment>
<author>Paul</author>
</review>
<review id="101" movie-id="1">
<rating>3</rating>
<comment>Tom Hanks does a really nice acting.</comment>
<author>Beatrice</author>
</review>
```

```
<review id="104" movie-id="2">
<rating>4</rating>
<comment>Robert De Niro is my favorite actor.</comment>
<author>Maria</author>
</review>
</reviews>
```

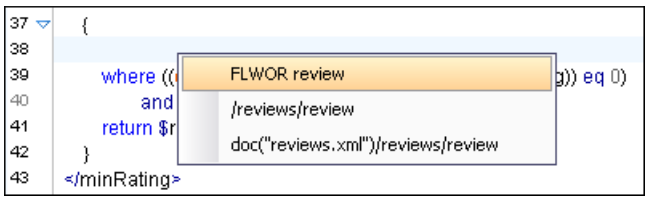
and the following XQuery:

```
let $review := doc("reviews.xml")
for $movie in doc("movies.xml")/movies/movie
let $movie-id := $movie/@id
return
<movie id="{$movie/@id}">
{$movie/title}
{$movie/year}
<maxRating>
{

}
</maxRating>
</movie>
```

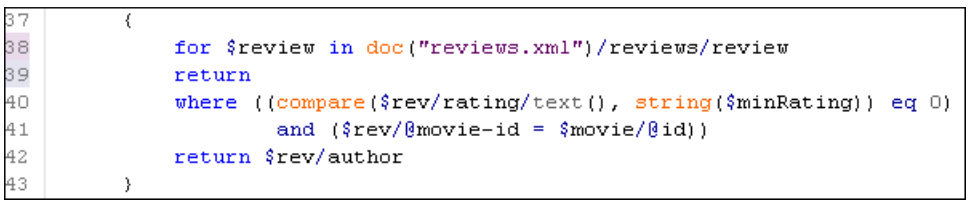
If you drag the **review** element and drop it between the braces, the following pop-up menu is displayed:

Figure: XQuery Input Drag and Drop Pop-up Menu



Select **FLWOR review**, the resulting document will look like this:

Figure: XQuery Input Drag and Drop Result

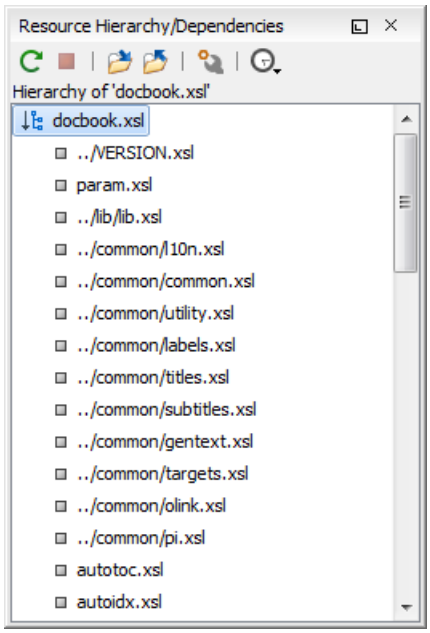


XSLT Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a stylesheet. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

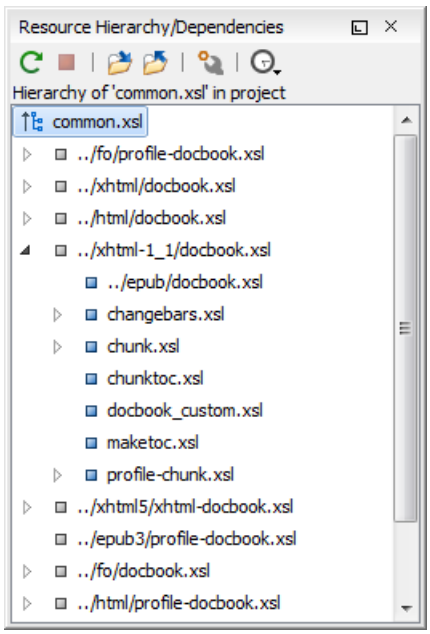
If you want to see the hierarchy of a stylesheet, select the desired stylesheet in the **Project** view *(page 332)* and choose **Resource Hierarchy** from the contextual menu.

Figure: Resource Hierarchy/Dependencies View - Hierarchy for `docbook.xsl`



If you want to see the dependencies of a stylesheet, select the desired stylesheet in the **Project** view *(page 332)* and choose **Resource Dependencies** from the contextual menu.

Figure: Resource Hierarchy/Dependencies View - Dependencies for `common.xsl`



The following actions are available in the **Resource Hierarchy/Dependencies** view:

Refresh

Refreshes the Hierarchy/Dependencies structure.

Stop

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the **Master Files** directory *(page 719)*.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

Related Information:

Working with Modular XML Files in the Master Files Context *(page 1114)*

Search and Refactor Operations Scope *(page 1116)*

Moving/Renaming XSLT Resources

You can move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Select this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is selected, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

XSLT Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

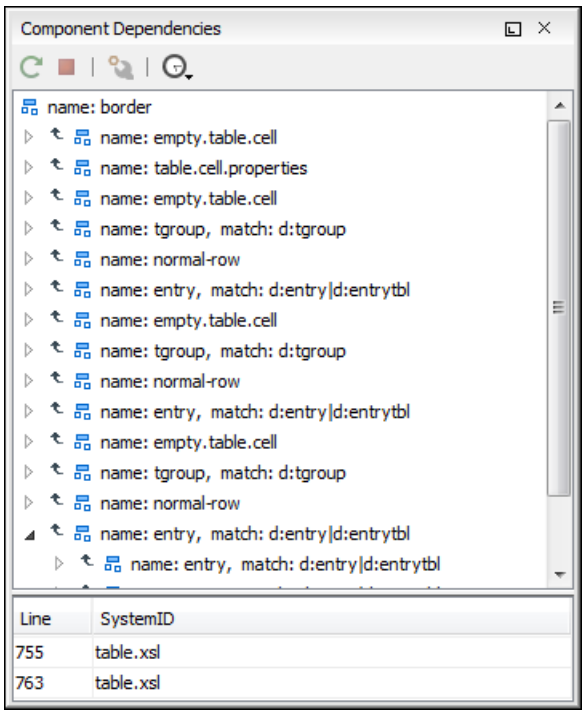
To see the dependencies of an XSLT component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named components (templates, variables, parameters, attribute sets, keys, functions, outputs).

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

Figure: Component Dependencies View - Hierarchy for table.xsl



The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:

Search and Refactor Operations Scope *(page 1116)*

Highlight Component Occurrences

When a component (for example variable or named template) is found at current cursor position, Oxygen XML Editor performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document.

Note: Oxygen XML Editor also supports occurrences highlight for template modes.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is enabled by default. To configure it, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Editor > Mark Occurrences**. A search can also be triggered with the **Search > Search Occurrences in File (Ctrl + Shift + U (Command + Shift + U on OS X))** contextual menu action. Matches are displayed in separate tabs of the **Results** view *(page 354)*.

Finding XSLT References and Declarations

The following search actions related with XSLT references and declarations are available from the **Search** submenu of the contextual menu and from the **Document > References** menu:

- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined but the currently edited resource is not part of the range of determined resources, a warning dialog box is displayed that allows you to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when a scope is defined.
- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope, if any. If a scope is defined but the current edited resource is not part of the range of resources determined by this scope, a warning dialog box is displayed that allows you to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when a scope is defined.

- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

- **Go to Definition** - Moves the cursor to the location of the definition of the current item.

  Note: You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

Related Information:

Search and Refactor Operations Scope *(page 1116)*

XSLT Stylesheet Component Documentation Support

Oxygen XML Editor offers built-in support for documenting XSLT stylesheets. If the expanded *QName (page 3233)* of the element has a non-null namespace URI, the `xsl:stylesheet` element may contain any element not from the XSLT namespace. Such elements are referenced as user-defined data elements. Such elements can contain the documentation for the stylesheet and its elements (top-level elements whose names are in the XSLT namespace). Oxygen XML Editor offers its own XML schema that defines such documentation elements. The schema is named `stylesheet_documentation.xsd` and can be found in *`[OXYGEN_INSTALL_DIR]/frameworks/stylesheet_documentation`*. The user can also specify a custom schema in XSL Content Completion options *(page 169)*.

Content Completion

When content completion is invoked inside an XSLT editor by pressing **Ctrl + Space (Command + Space on OS X)**, it offers elements from the XSLT documentation schema (either the built-in one or one specified by user).

Adding Documentation Blocks

In **Text** mode, to add documentation blocks, press **Ctrl + Alt + D (Command + Alt + D on OS X)** or select **Add component documentation** from the contextual menu.

In **Author** mode, the following stylesheet documentation actions are available in the contextual menu, **Component Documentation** submenu:

- **Add component documentation** - Adds documentation blocks for the component at cursor position.

- **Paragraph** - Inserts a new documentation paragraph.
- **Bold** - Makes the selected documentation text bold.
- **Italic** - Makes the selected documentation text italic.
- **List** - Inserts a new list.
- **List Item** - Inserts a list item.
- **Reference** - Inserts a documentation reference.

If the cursor is positioned inside the `xsl:stylesheet` element context, documentation blocks are generated for all XSLT elements. If the cursor is positioned inside a specific XSLT element (such as a template or function), a documentation block is generated for that element only.

Example: Documentation Block Using Oxygen XML Editor Built-in Schema

```
<xd:doc>
  <xd:desc>
    <xd:p>Search inside parameter <xd:i>string</xd:i>
        for the last occurrence of parameter
    <xd:i>searched</xd:i>. The substring starting from the 0 position
        to the identified last occurrence will be returned.
    <xd:ref name="f:substring-after-last" type="function"
        xmlns:f="http://www.oxygenxml.com/doc/xsl/functions">See also
    </xd:ref>
    </xd:p>
  </xd:desc>
  <xd:param name="string">
    <xd:p>String to be analyzed</xd:p>
    </xd:param>
  <xd:param name="searched">
    <xd:p>Marker string. Its last occurrence will be identified</xd:p>
    </xd:param>
  <xd:return>
    <xd:p>A substring starting from the beginning of <xd:i>string</xd:i>
        to the last occurrence of <xd:i>searched</xd:i>.
        If no occurrence is found an empty string will be returned.
    </xd:p>
  </xd:return>
</xd:doc>
```

XSLT Documentation Links

Oxygen XML Editor includes support for links inside XSLT documentation blocks. Using a construct like `<xd:a docid="user-defined-id">TEXT</xd:a>` will cause the browser to scroll to the particular

anchor (the defined ID) in the current document. Using a construct like `<xd:a href="http://www.my-web-site">TEXT</xd:a>` or `<xd:a href="local-file-path/filename">TEXT</xd:a>` will open the referenced link in a new tab.

Example: Documentation Links

```
<xd:doc xmlns:xd="http://www.oxygenxml.com/ns/doc/xsl" id="thisDoc">
   <xd:desc>
      <xd:p>
         <xd:ref name="test" type="variable">My test variable</xd:ref>
            <xd:a docid="thisDoc">Link to this documentation, see
the the id="thisDoc" above</xd:a>
            <xd:a docid="otherDocID" href="included.xsl">Link to
otherDocID defined in included.xsl</xd:a>
      </xd:p>
   </xd:desc>
</xd:doc>
```

Related Information:

Generating Documentation for an XSLT Stylesheet *(page 1210)*

XSLT 3.0 Text Value Templates

Oxygen XML Editor offers built-in support for XSLT 3.0 *Text Value Templates*, including content completion to present the variables and parameters from the current context and syntax highlighting.

A text node in the stylesheet is treated as a *text value template* if the following things are true:

- It is part of a sequence constructor or a child of an `xsl:text` instruction.
- There is an ancestor element with an `[xsl:]expand-text` attribute and on the innermost ancestor element that has such an attribute, the value of the attribute is `yes`.

Example:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
xmlns:xs="http://www.w3.org/2001/XMLSchema"
expand-text="yes"
version="3.0">

  <xsl:param name="seq" as="xs:string*" select="'c', 'a', 'b', 'z'"/>
```

```
  <xsl:template name="main">
    {sort($seq)}
  </xsl:template>
</xsl:stylesheet>
```

For more information, see: W3C XSLT Specifications: Text Value Templates.

XSLT Refactoring Actions

Oxygen XML Editor offers a set of actions that allow you to change the structure of an XSLT stylesheet without changing the results of running it in an XSLT transformation. Depending on the selected text, the following XSLT refactoring actions are available from the **Refactoring** submenu of the contextual menu (or from the **Document > Refactoring** menu):

- **Extract template** (Active only when the selection contains well-formed elements) - Extracts the selected XSLT instructions sequence into a new template. It opens a dialog box that allows you to specify the name of the new template to be created. The possible changes to perform on the document can be previewed before altering the document. After pressing OK, the template is created and the selection is replaced with a `<xsl:call-template>` instruction referencing the newly created template.

  Note: The newly created template is indented and its name is highlighted in the `<xsl:call-template>` element.

- **Extract function** - Extracts the selected XSLT instructions sequence into a new function. It opens a dialog box that allows you to specify the name of the new function. It then moves the selected lines to a newly created XSLT function and inserts a function call in the place of the selected lines. You can also use parts of an XPath expression to create the new functions.
- **Create local variable** - Creates an XSLT variable, wrapped around the selection. It opens a dialog box that allows you to specify the name of the new variable. It then wraps the selection in the variable and you can reference it at anytime in the code.
- **Move to another stylesheet** (Active only when entire components are selected) - Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet. It opens a dialog box that allows you to specify where the selected components will be moved to. Follow these steps when using the dialog box:
  1. Choose whether you want to move the selected components to a new stylesheet or an existing one.
  2. If you choose to move the components to an existing one, select the destination stylesheet. Press the **Choose** button to select the destination stylesheet file. Oxygen XML Editor will automatically check if the destination stylesheet is already contained by the hierarchy of the current stylesheet. If it is not contained, choose whether or not the destination stylesheet will

be referenced (imported or included) from the current stylesheet. The following options are available:

Include - The current stylesheet will use an `xsl:include` instruction to reference the destination stylesheet.
Import - The current stylesheet will use an `xsl:import` instruction to reference the destination stylesheet.
None - There will be created no relation between the current and destination stylesheets.

3. Press the **Move** button to move the components to the destination. The moved components are highlighted in the destination stylesheet.

- **Convert attributes to xsl:attributes** - Converts the attributes from the selected element and represents each of them with an `<xsl:attribute>` instruction. For example, the following element:

```
<person id="Big{test}Boss"/>
```

is converted to:

```
<person>
    <xsl:attribute name="id">
        <xsl:text>Big</xsl:text>
        <xsl:value-of select="test"/>
        <xsl:text>Boss</xsl:text>
    </xsl:attribute>
</person>
```

- **Convert xsl:attributes to attributes** - Converts `<xsl:attribute>` elements to inline attributes for elements outside the XSL namespace. For example, the following element: It is the reverse of the **Convert attributes to xsl:attributes** action with the following limitations:

The `<xsl:attribute>` element is "text only".
The `<xsl:attribute>` element has a single `xsl:text` child element.
The `<xsl:attribute>` element has a single `xsl:value-of` child element. In this case, the value of the attribute will be the XPath expression from the `select` attribute surrounded by curly brackets (*text value template*).

```
<person>
  <xsl:attribute name="id">john.doe</xsl:attribute>
  <xsl:attribute name="email"><xsl:text>john.doe@example.com</xsl:text>
  </xsl:attribute>
  <xsl:attribute name="manager"><xsl:value-of select="person[@id='boss']/name"/>
  </xsl:attribute>
</person>
```

is converted to:

```
<person id="john.doe" email="john.doe@example.com" manager="{person[@id='boss']/
name}"/>
```

- **Convert xsl:if into xsl:choose/xsl:when** - Converts one or more `xsl:if` element blocks into one or more `xsl:when` blocks surrounded by an `xsl:choose` element. If it is invoked on a selection, the selection must contain a well-formed fragment. If there is no selection, the `xsl:if` element that surrounds the content at the current cursor position is converted.

  For example, the following block:

  ```
  <xsl:if test="a">
    <!-- XSLT code -->
  </xsl:if>
  ```

  is converted to:

  ```
  <xsl:choose>
      <xsl:when test="a">
          <!-- XSLT code -->
      </xsl:when>
      <xsl:otherwise>
          |
      </xsl:otherwise>
  </xsl:choose>
  ```

  (where the `|` character is the current cursor position)

- **Convert xsl:choose/xsl:when into xsl:if** - Converts each `xsl:when` block into an `xsl:if` block. For the *otherwise* branch, it also adds an *and* statement to each negated form of the conditions. For example, the following block:

  ```
  <xsl:choose>
      <xsl:when test="c1">
          <!-- XSLT statement 1 -->
      </xsl:when>
      <xsl:when test="c2">
          <!-- XSLT statement 2 -->
      </xsl:when>
      <xsl:when test="c3">
          <!-- XSLT statement 3 -->
      </xsl:when>
      <xsl:otherwise>
  ```

```
        <!-- XSLT "otherwise" statement-->
    </xsl:otherwise>
</xsl:choose>
```

is converted to:

```
<xsl:if test="c1">
    <!-- XSLT statement 1 -->
</xsl:if>
<xsl:if test="c2">
    <!-- XSLT statement 2 -->
</xsl:if>
<xsl:if test="c3">
    <!-- XSLT statement 3 -->
</xsl:if>
<xsl:if test="not(c1) and not(c2) and not(c3)">
    <!-- XSLT "otherwise" statement-->
</xsl:if>
```

- **Extract local variable** (Active on a selection made inside an attribute that contains an XPath expression) - Allows you to create a new local variable by extracting the selected XPath expression. After creating the new local variable before the current element, Oxygen XML Editor allows you to edit the name of the variable.
- **Extract global variable** (Active on a selection made inside an attribute that contains an XPath expression) - Allows you to create a new global variable by extracting the selected XPath expression. After creating the new global variable, Oxygen XML Editor allows you to edit the name of the variable.

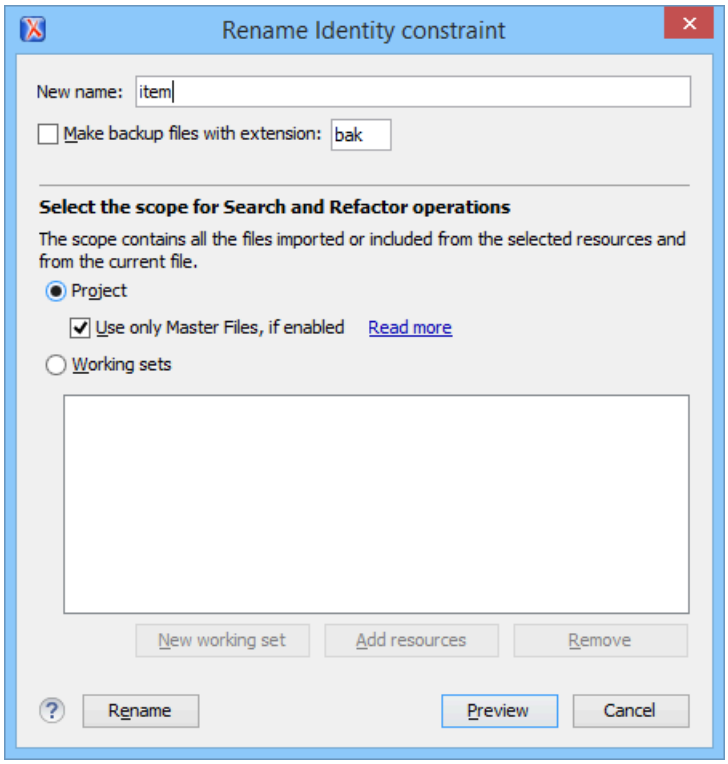
  Note: Oxygen XML Editor checks if the selected expression depends on local variables or parameters that are not available in the global context where the new variable is created.

- **Extract template parameter** (Active on a selection made inside an attribute that contains an XPath expression) - Allows you to create a new template parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Editor allows you to edit the name of the parameter.
- **Extract global parameter** (Active on a selection made inside an attribute that contains an XPath expression) - Allows you to create a new global parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Editor allows you to edit the name of the parameter.

  Note: Oxygen XML Editor checks if the selected expression depends on local variables or parameters that are not available in the global context where the new parameter is created.

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure: Rename Identity Constraint Dialog Box



Note: Many of these refactoring actions are also proposed by the *Quick Assist* support *(page 1205)*.

For more information about XSLT refactoring, watch our video demonstration:

XSLT Quick Assist Support

The *Quick Assist* support *(page 3233)* helps you to rapidly access search and refactoring actions. If one or more actions are available in the current context, they are accessible via a yellow bulb help () placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *Quick Assist* menu by using the **Alt + 1** (**Meta + Alt + 1** on Mac OS X) keyboard shortcuts.

Two categories of actions are available in the *Quick Assist* menu:

- Actions available on a selection made inside an attribute that contains an XPath expression:

  Extract template

  Extracts the selected XSLT instructions sequence into a new template.

  Move to another stylesheet

  Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet.

  Extract local variable

  Allows you to create a new local variable by extracting the selected XPath expression.

  Extract global variable

  Allows you to create a new global variable by extracting the selected XPath expression.

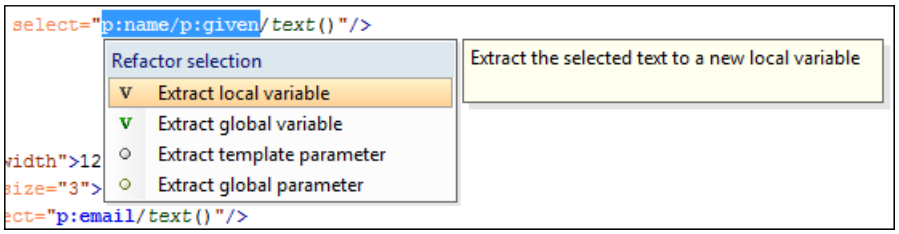
  Extract template parameter

  Allows you to create a new template parameter by extracting the selected XPath expression.

  Extract global parameter

  Allows you to create a new global parameter by extracting the selected XPath expression.

Figure: XSLT Quick Assist Support - Refactoring Actions



- Actions available when the cursor is positioned over the name of a component:

  Rename Component in

  Renames the component and all its dependencies.

  Search Declarations

  Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

  Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Figure: XSLT Quick Assist Support - Component Actions

Search and Refactor Operations Scope *(page 1116)*

XSLT Unit Test (XSpec)

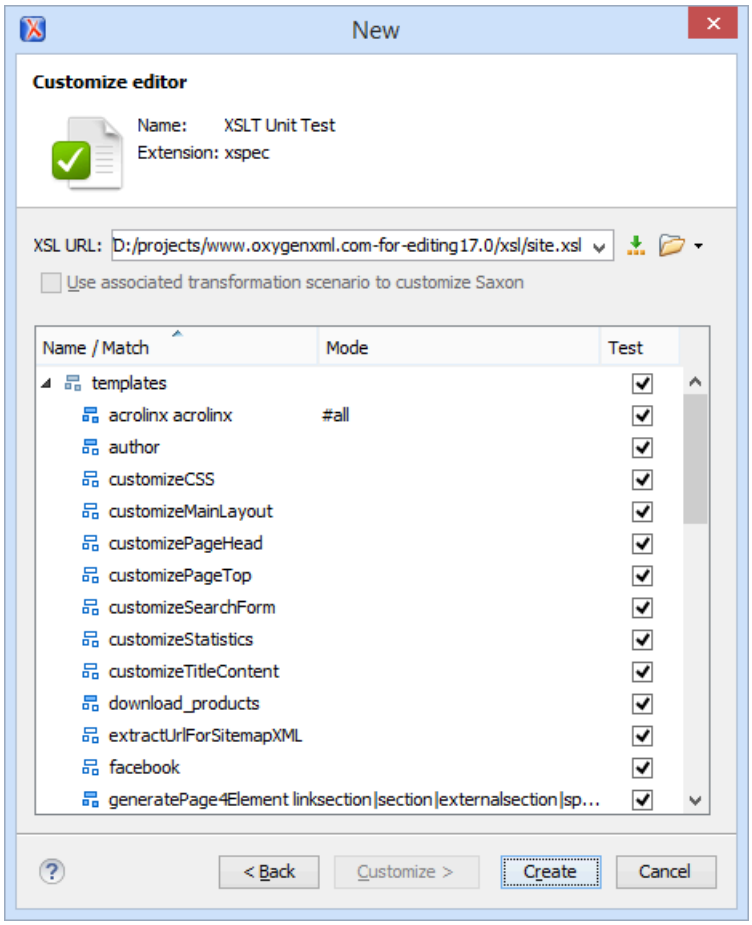
XSpec is a behavior driven development (BDD) *framework* for XSLT, XQuery, and Schematron. XSpec consists of a syntax for describing the behavior of your XSLT, XQuery, or Schematron code, and some code that enables you to test your code against those descriptions.

Creating an XSLT Unit Test

To create an XSLT Unit Test, go to **File > New > XSLT Unit Test**. You can also create an XSLT Unit Test from the contextual menu of an XSL file in the **Project** view *(page 332)*. Oxygen XML Editor allows you to customize the XSpec document when you create it. In the customization dialog box, you can enter the path to an XSL document or to a master XSL document.

When you create an XSpec document based on an XSL document, Oxygen XML Editor uses information from the validation and transformation scenarios associated with the XSL file. From the transformation scenario Oxygen XML Editor uses extensions and properties of Saxon 9.8.0.12, improving the Ant scenario associated with the XSpec document.

Figure: New XSLT Unit Test Wizard



Running an XSLT Unit Test

To run an XSLT Unit Test, open the XSpec file in an editor and click **Apply Transformation Scenario(s)** on the main toolbar. This will run the built-in **Run XSpec Test** transformation scenario that is defined in the XSpec *framework (page 3229)*.

Testing a Stylesheet

An XSpec file contains one or more test scenarios. You can test a stylesheet in one of the following ways:

- Test an entire stylesheet.

  Testing is performed in a certain context. You can define a context as follows:

  # Inline context, building the test based on a string.

  ```
  <x:scenario label="when processing a para element">
      <x:context>
          <para>...</para>
      </x:context>
      ...
  </x:scenario>
  ```

  # Based on an external file, or on a part of an external file extracted with an XPath expression.

  ```
  <x:scenario label="when processing a para element">
      <x:context href="source/test.xml" select="/doc/body/p[1]" />
      ...
  </x:scenario>
  ```

- Test a function.

  ```
  <x:scenario label="when capitalising a string">
    <x:call function="eg:capital-case">
      <x:param select="'an example string'" />
      <x:param select="true()" />
    </x:call>
    ...
  </x:scenario>
  ```

- Test a template with a name.

  ```
  <x:scenario label="when creating a table">
    <x:call template="createTable">
      <x:param name="nodes">
        <value>A</value>
        <value>B</value>
      </x:param>
      <x:param name="cols" select="2" />
  ```

```
  </x:call>
</x:scenario>
```

You can reference test files between each other, which allows you to define a suite of tests. For further details about test scenarios, go to https://github.com/expath/xspec/wiki/Writing-Scenarios.

Adding a Catalog to an XSpec Transformation

If your XSLT needs a catalog, you can add one to the XSpec transformation by doing one of the following:

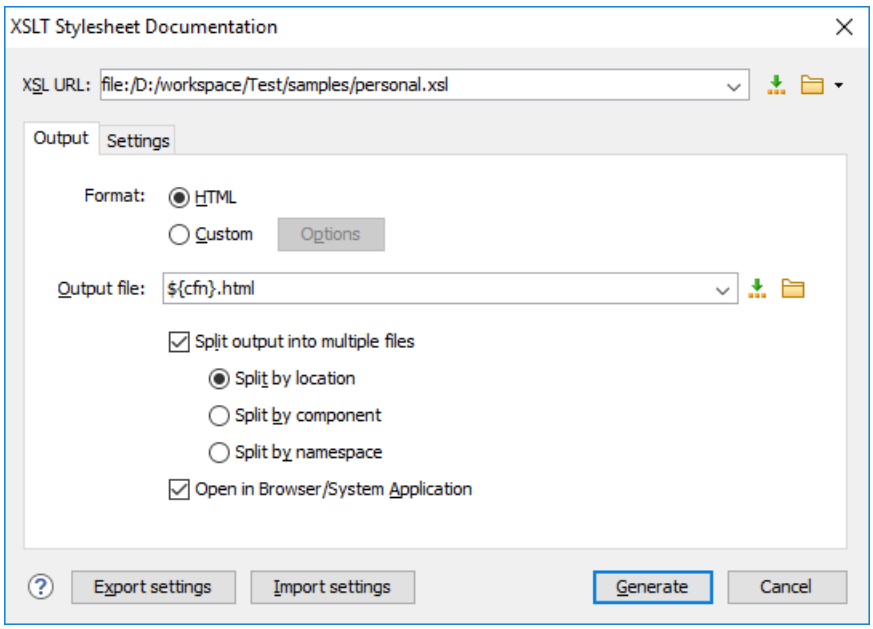
- If you are using a project *(page 702)* in Oxygen XML Editor, create a `catalog.xml` file in the project directory. This catalog will then be loaded automatically.
- Edit *(page 1718)* the **Run XSpec Test** transformation scenario, go to the **Parameters** tab *(page 1686)*, and set the value of the `catalog` parameter to the location of your catalog file.

Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Editor to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for each of them. The elements are hyperlinked. To generate documentation in a custom output format *(page 1216)*, you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the **XSLT Stylesheet Documentation** dialog box, select **XSLT Stylesheet Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view *(page 332)*.

Figure: XSLT Stylesheet Documentation Dialog Box



The **XSL URL** field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  # **HTML** - The documentation is generated in HTML output format *(page 1214)*.
  # **Custom** - The documentation is generated in a custom output format *(page 1216)*, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box *(page 1217)* where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.

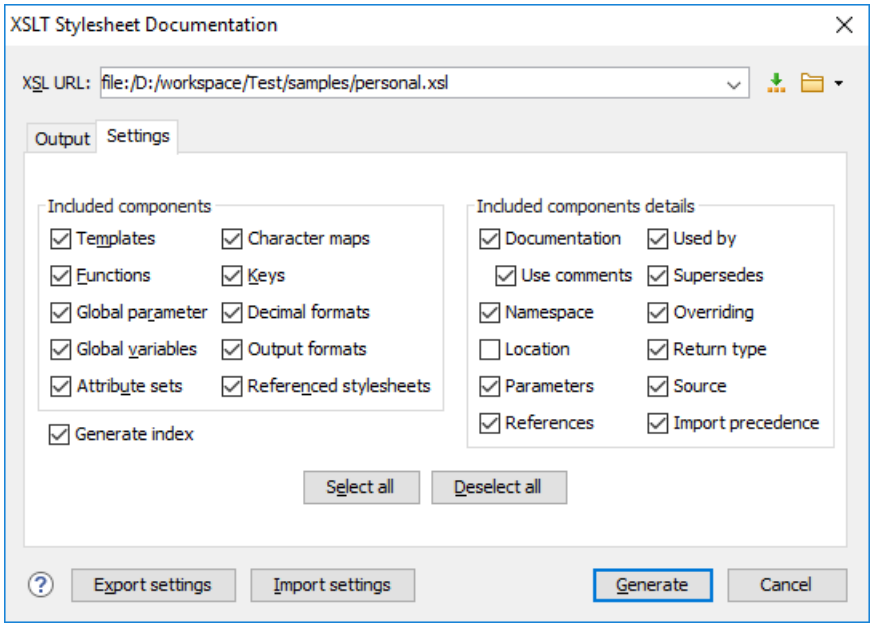
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

  Note: To set the browser or system application that will be used, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

Settings Tab

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

Figure: Settings Tab of the XSLT Stylesheet Documentation Dialog Box



The **Settings** tab allows you to choose whether or not to include the following components: **Templates**, **Functions**, **Global parameters**, **Global variables**, **Attribute sets**, **Character maps**, **Keys**, **Decimal formats**, **Output formats**, **Referenced stylesheets**.

You can choose whether or not to include the following other details:

- **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:

  # Oxygen XML Editor built-in XSLT documentation schema.

A subset of DocBook 5 elements. The recognized elements are: *section*, *sect1* to *sect5*, *emphasis*, *title*, *ulink*, *programlisting*, *para*, *orderedlist*, *itemizedlist*.
A subset of DITA elements. The recognized elements are: *concept*, *topic*, *task*, *codeblock*, *p*, *b*, *i*, *ul*, *ol*, *pre*, *sl*, *sli*, *step*, *steps*, *li*, *title*, *xref*.
Full XHTML 1.0 support.
XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
DOXSL documentation *framework (page 3229)*. Supported elements are : *codefrag*, *description*, *para*, *docContent*, *documentation*, *parameter*, *function*, *docSchema*, *link*, *list*, *listitem*, *module*, *parameter*, *template*, *attribute-set*;

Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML *pre* element. You can change this behavior by using a custom format *(page 1216)* instead of the built-in HTML format *(page 1214)* and providing your own XSLT stylesheets.

- **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the *xsl:stylesheet* element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.
- **Namespace** - Shows the namespace for named XSLT elements.
- **Location** - Shows the stylesheet location for each XSLT element.
- **Parameters** - Shows parameters of templates and functions.
- **References** - Shows the named XSLT elements that are referenced from within an element.
- **Used by** - Shows the list of all the XSLT elements that reference the current named element.
- **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.
- **Overriding** - Shows the list of all the XSLT elements that override the current element.
- **Return type** - Shows the return type of the function.
- **Source** - Shows the text stylesheet source for each XSLT element.
- **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.
- **Generate index** - Creates an index with all the XSLT elements included in the documentation.

Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command-line interface *(page 1217)*.)

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XSLT documentation.

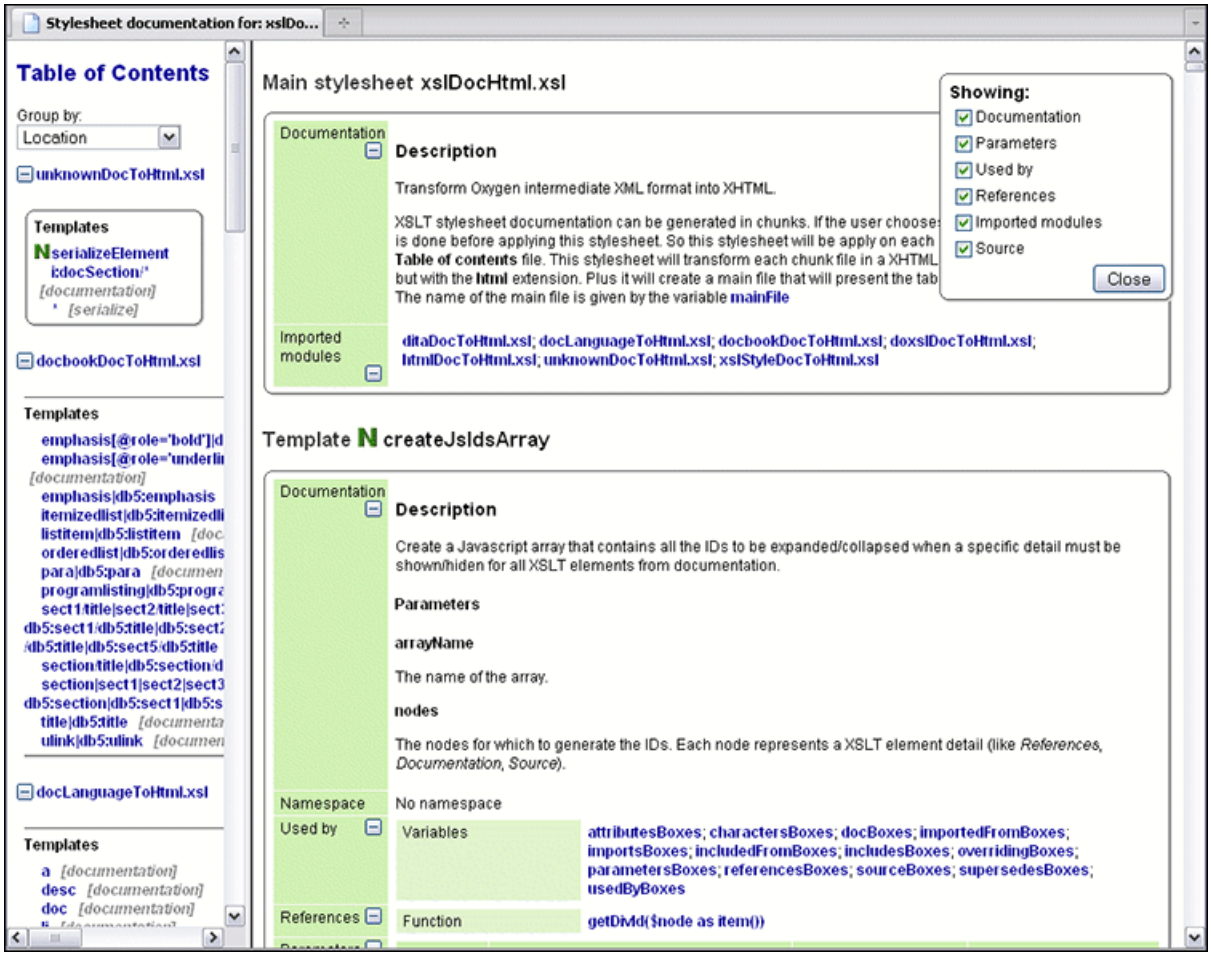
Related Information:

XSLT Stylesheet Component Documentation Support *(page 1198)*

Generate XSLT Documentation in HTML Format

When using the XSLT Stylesheet Documentation dialog box *(page 1210)* to generate XSLT documentation in HTML format, it is presented in a visual diagram style with various sections, hyperlinks, and options.

Figure: XSLT Stylesheet Documentation Example

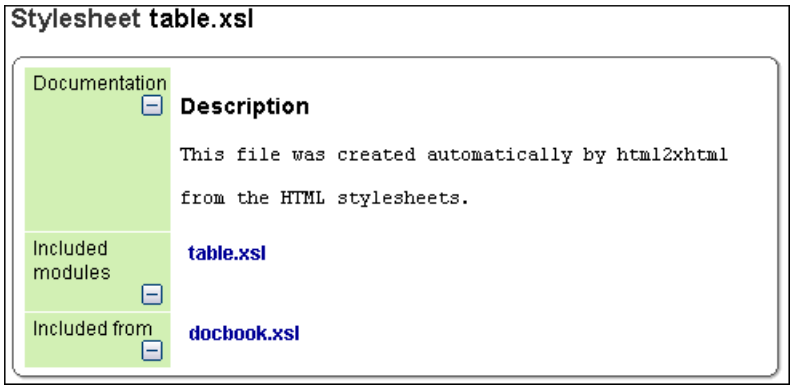


The generated documentation includes the following:

- Table of Contents - You can group the contents by namespace, location, or component type. The XSLT elements from each group are sorted alphabetically (named templates are presented first and the `match` ones second).
- Information about main, imported, and included stylesheets. This information consists of:
  # XSLT modules included or imported by the current stylesheet.

The XSLT stylesheets where the current stylesheet is imported or included.
The stylesheet location.

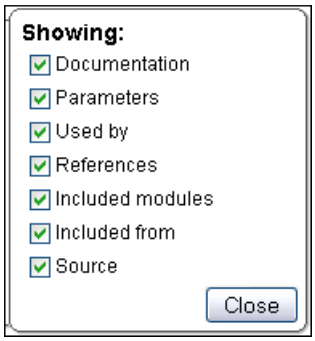
Figure: Information About an XSLT Stylesheet



If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped using the same criteria as the split.

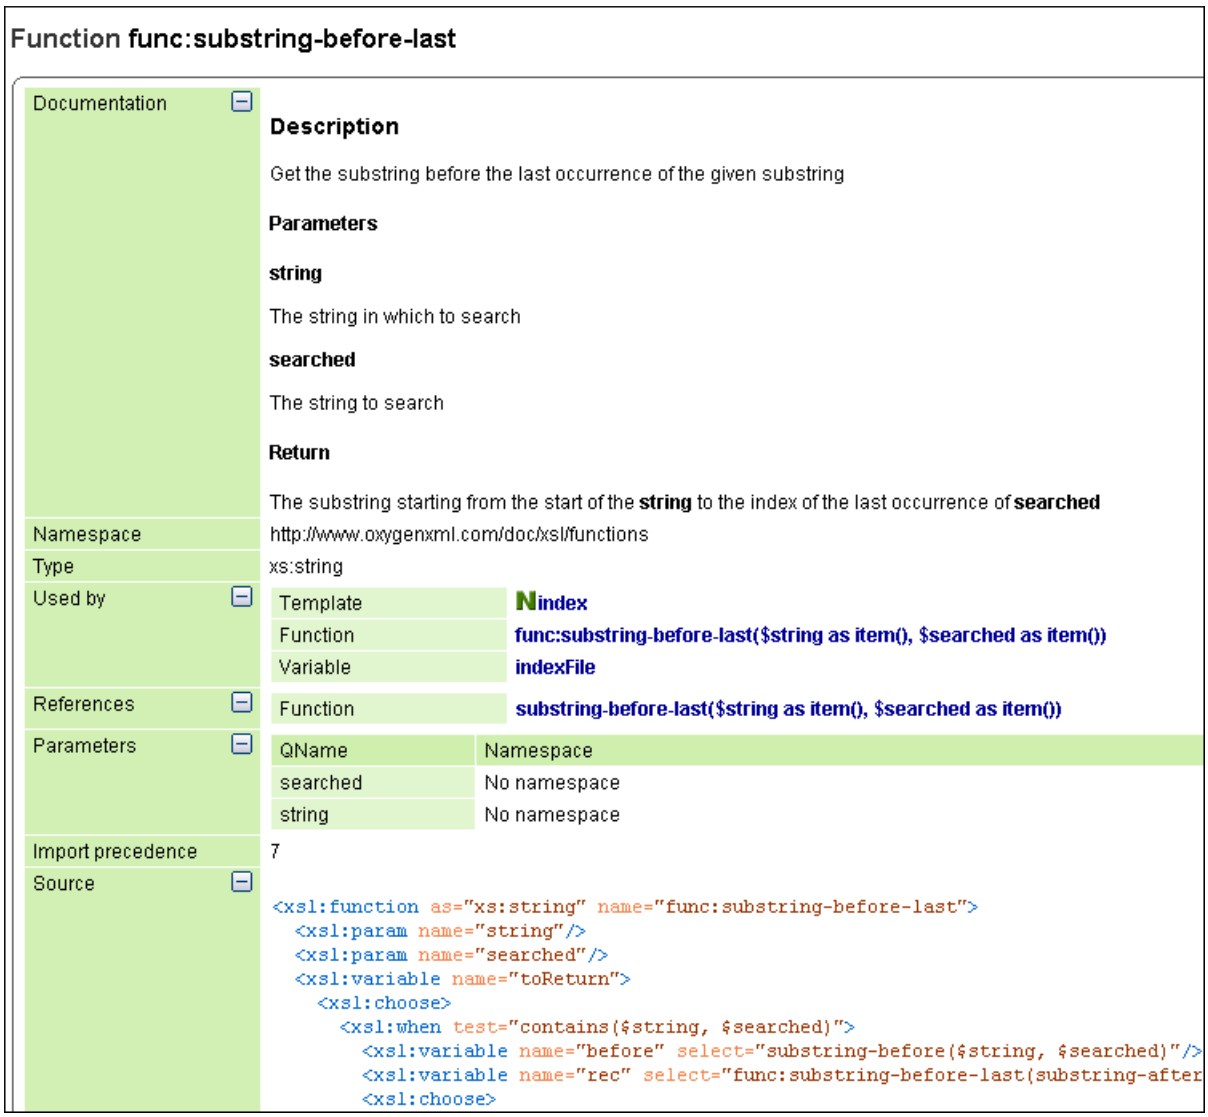
After the documentation is generated, you can collapse or expand details for some stylesheet XSLT elements by using the **Showing** options or the **Collapse** or **Expand** buttons.

Figure: Showing Options



For each element included in the documentation, the section presents the element type followed by the element name (value of the `name` or `match` attribute for match templates).

Figure: Documentation for an XSLT Element



Generate XSLT Documentation in a Custom Format

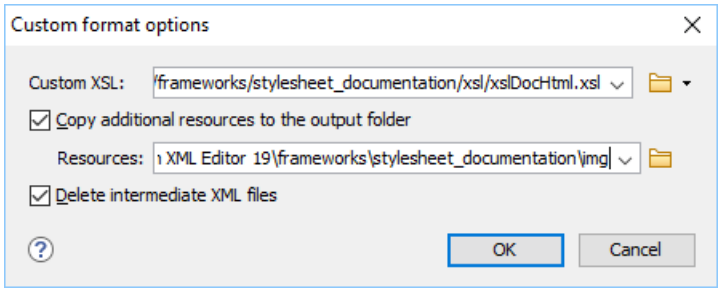
XSLT stylesheet documentation can be also generated in a custom format. You must write your custom stylesheet based on the schema `xslDocSchema.xsd` from *`[OXYGEN_INSTALL_DIR]/frameworks/stylesheet_documentation`*. You can create a custom format starting from one of the stylesheets used in the built-in HTML, PDF, and DocBook formats. These stylesheets are available in *`[OXYGEN_INSTALL_DIR]`*`/frameworks/stylesheet_documentation/xsl`.

To generate XSLT documentation in a custom format:

1. Select **Tools > Generate Documentation > XSLT Stylesheet Documentation** to open the XSLT Stylesheet Documentation dialog box *(page 1210)*.
2. Select **Custom** for the **Format** and click the **Options** button.

3. In this next dialog box, specify your own stylesheet to transform the intermediary XML generated in the documentation process.
4. You can also choose to copy additional resources into the output folder or choose whether or not to keep the intermediate XML files created during the documentation process.
5. Click **OK** to close this dialog box and then click **Generate**.

Figure: Custom Format Options Dialog Box



Generating XSLT Documentation From the Command-Line Interface

You can export the settings of the **XSLT Stylesheet Documentation** dialog box to an XML file by pressing the **Export settings** button. With the exported settings file, you can generate the same documentation from the command line by running the script `stylesheetDocumentation.bat` (on Windows) / `stylesheetDocumentation.sh` (on OS X / Linux) located in the Oxygen XML Editor installation folder. The script can be integrated in an external batch process launched from the command-line interface.

The command-line parameter of the script is the relative path to the exported XML settings file. The files that are specified with relative paths in the exported XML settings are resolved relative to the script directory.

Example:

```
<serialized>
    <map>
        <entry>
            <String xml:space="preserve">xsd.documentation.options</String>
            <xsdDocumentationOptions>
                <field name="outputFile">
                    <String xml:space="preserve">${cfn}.html</String>
                </field>
                <field name="splitMethod">
                    <Integer xml:space="preserve">1</Integer>
                </field>
                <field name="openOutputInBrowser">
                    <Boolean xml:space="preserve">true</Boolean>
```

```
            </field>
            <field name="format">
                <Integer xml:space="preserve">1</Integer>
            </field>
            <field name="customXSL">
                <null/>
            </field>
            <field name="deleteXMLFiles">
                <Boolean xml:space="preserve">true</Boolean>
            </field>
            <field name="includeIndex">
                <Boolean xml:space="preserve">true</Boolean>
            </field>
            <field name="includeGlobalElements">
                <Boolean xml:space="preserve">true</Boolean>
            </field>
            <field name="includeGlobalAttributes">
                <Boolean xml:space="preserve">true</Boolean>
            </field>
            <field name="includeLocalElements">
                <Boolean xml:space="preserve">true</Boolean>
            </field>
            <field name="includeLocalAttributes">
                <Boolean xml:space="preserve">true</Boolean>
            </field>
            <field name="includeSimpleTypes">
                <Boolean xml:space="preserve">true</Boolean>
            </field>
            <field name="includeComplexTypes">
                <Boolean xml:space="preserve">true</Boolean>
            </field>
            <field name="includeGroups">
                <Boolean xml:space="preserve">true</Boolean>
            </field>
            <field name="includeAttributesGroups">
                <Boolean xml:space="preserve">true</Boolean>
            </field>
            <field name="includeRedefines">
                <Boolean xml:space="preserve">true</Boolean>
            </field>
```

```
<field name="includeReferencedSchemas">
    <Boolean xml:space="preserve">true</Boolean>
</field>
<field name="detailsDiagram">
    <Boolean xml:space="preserve">true</Boolean>
</field>
<field name="detailsNamespace">
    <Boolean xml:space="preserve">true</Boolean>
</field>
<field name="detailsLocation">
    <Boolean xml:space="preserve">true</Boolean>
</field>
<field name="detailsType">
    <Boolean xml:space="preserve">true</Boolean>
</field>
<field name="detailsTypeHierarchy">
    <Boolean xml:space="preserve">true</Boolean>
</field>
<field name="detailsModel">
    <Boolean xml:space="preserve">true</Boolean>
</field>
<field name="detailsChildren">
    <Boolean xml:space="preserve">true</Boolean>
</field>
<field name="detailsInstance">
    <Boolean xml:space="preserve">true</Boolean>
</field>

                <field name="detailsAnnotations">
                    <Boolean xml:space="preserve">true</Boolean>
                </field>
            </xsdDocumentationOptions>
        </entry>
    </map>
</serialized>
```

Compiling an XSL Stylesheet for Saxon

As of Saxon 9.7, it is possible to export a compiled form of a stylesheet as an XML file (called a *stylesheet export file* or SEF). Oxygen XML Editor includes a simple tool called **Compile XSL Stylesheet for Saxon** (found in the **Tools** menu) that does this for you.

Use-Cases for a Stylesheet Export File (SEF)

- **Use Saxon-JS to run transformations in a browser** - A *stylesheet export file* (SEF) is needed if you want to use the Saxon-JS product to run transformations in a browser, as in the following example:

```
<script type="text/javascript" src="SaxonJS/SaxonJS.min.js"></script>
<script>
    window.onload = function() {
      SaxonJS.transform({
         stylesheetLocation: "books.sef",
         sourceLocation: "books.xml"
         });
    }
</script>
```

- **Use SEF to run transformations in Oxygen XML Editor** - You can also use a *stylesheet export file* (SEF) in Oxygen XML Editor to apply an XSLT transformation over an XML file. This requires **Saxon-EE** or **Saxon-PE** versions of the Saxon product and you must select one of those two

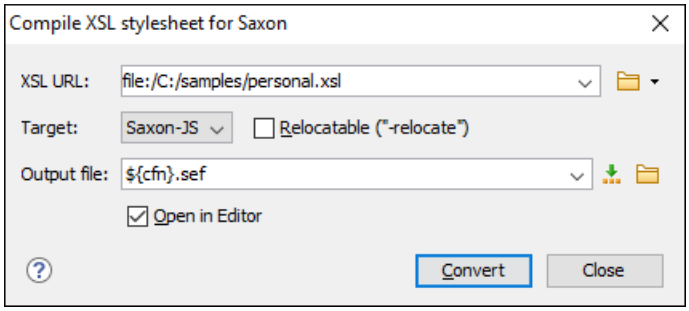
versions for the **Target** when you configure the SEF file *(page 1221)*. When configuring the XSLT transformation, you will specify the SEF file in the **XSL URL** field *(page 1646)*.

Compiling an SEF File

The **Compile XSL Stylesheet for Saxon** tool can be found in the **Tools** menu and it compiles a specified stylesheet as an XML file (*stylesheet export file* with a file extension of `.sef`).

Selecting this tool opens the **Compile XSL Stylesheet for Saxon** dialog box that allows you to configure some options for conversion.

Figure: Compile XSL Stylesheet for Saxon Dialog Box



This dialog box includes the following options:

XSL URL

Allows you to select URL of the source XSL stylesheet. You can specify the URL by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down list.

Target

Allows you to select the type of Saxon product that the export file will be used with. You can choose **Saxon-JS**, **Saxon-EE**, **Saxon-PE**, or **Saxon-HE**.

Relocatable

Can be used to control the Saxon `-relocate` parameter. You can select this option to produce a *relocatable* export package (SEF) that can be deployed to a different location, with a different base URI.

Output file

You can specify the path where the output file will be saved by entering it in the text field, using the **Insert Editor Variables** button, or using the browsing tool button ().

Open in Editor

Select this option to open the resulting *stylesheet export file* in the main Oxygen XML Editor editing pane.

Convert

Use this button to generate the *stylesheet export file* according the options selected in this dialog box.

Editing Ant Build Files

Oxygen XML Editor includes an Ant editor that provides a variety of specialized features to assist you with creating and editing Ant build files. The editor includes some specialized views, content completion assistance, automatic validation, syntax highlighting, *Quick Assist (page 3233)* and *Quick Fix (page 3233)* support, as well as numerous common editing and search features.

Related Information:

Editing XML Documents in Text Mode *(page 819)*

Editing Ant Build Files in the Context of Master Files

Smaller interrelated modules that define a complex Ant build file cannot be correctly edited or validated individually due to their interdependency with other modules. For example, a *target* defined in a main build file is not visible when you edit an included or imported module. Oxygen XML Editor provides support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger Ant build structure.

You cat set a main Ant build file either by using the *master files* support from the **Project** view *(page 719)*, or a validation scenario *(page 1223)*.

To set a *master file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main build file. In this case, it considers the current module as the main build file.

The advantages of editing in the context of *master file (page 3231)* include:

- Correct validation of a module in the context of a larger build structure.
- *Content Completion Assistant (page 3227)* displays all components valid in the current context.
- The **Outline** view *(page 1226)* displays the components collected from the entire build file structure.

Validating Ant Build Files

Oxygen XML Editor performs the validation of Ant build files with the help of a built-in processor, which is largely based on the *Apache Ant (page 3226)* libraries. The path to these libraries can be configured in the **Ant** preferences page *(page 219)*. The validation processor accesses the parameters set in the associated Ant transformation scenario *(page 1686)* and uses them as Ant properties when validating the current build script.

Oxygen XML Editor automatically validates Ant build files as you type. You can also validate the currently edited file by selecting the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu.

Tip: To make a custom task available in the Ant validation engine, add a *JAR (page 3230)* file that contains the task implementation to the library directory of the built-in Ant distribution that comes bundled with Oxygen XML Editor (for example, `[OXYGEN_INSTALL_DIR]/tools/ant/lib` folder).

Create a Validation Scenario for Ant Build Files

If you want to customize the validation process for Ant build files, you can create a new validation scenario (or configure an existing one). For example, if you want to validate interrelated modules that define a complex Ant build file, you can specify the main Ant file by configuring a validation scenario. To create or configure a validation scenario, select **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu or the **Document > Validate** menu.

Passing parameters to the Ant validation engine

Ant validation scenarios cannot be configured to accept custom Ant parameters. However, you can specify values for the parameters in your Ant document using an Ant transformation scenario:

1. Create a new Ant transformation scenario *(page 1684)*.
2. Edit the transformation scenario and set all parameters *(page 1686)* you need to pass to your Ant document.
3. Associate the new scenario with your Ant document (in the **Configure Transformation Scenarios(s)** dialog box *(page 1722)*). You do not need to run the transformation scenario. Every time a validation operation is triggered, the built-in validation engine uses the parameters set in the transformation scenario.

   Note: This behavior is available only for the validation scenarios that use the built-in validation engine. The custom defined validation engines do not benefit from this functionality.

Transforming Ant Build Files

Oxygen XML Editor includes a few built-in transformation scenarios that allow you to transform Ant build files. They are listed in the **Ant** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*:

- **ANT** - This transformation scenario runs as an external process that executes the Ant build script with the built-in Ant distribution (*Apache Ant (page 3226)* version 1.9.8) that is included with Oxygen XML Editor, or optionally with a custom Ant distribution configured in the scenario.
- **ANT (with Saxon 9 EE XSLT support)** - This transformation scenario allows Ant XSLT tasks to be performed using Saxon 9 *JAR (page 3230)* libraries that come bundled with Oxygen XML Editor and all defined XML catalogs are also taken into account during the transformation.

Related Information:

Editing a Transformation Scenario *(page 1718)*

Configure Transformation Scenario(s) Dialog Box *(page 1722)*

Applying Associated Transformation Scenarios *(page 1721)*

Ant Transformation *(page 1684)*

Ant Quick Fix Support

The Oxygen XML Editor *Quick Fix* support *(page 3233)* helps you resolve missing target reference errors that may occur when developing Ant build documents.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a *Quick Fix* is available for that particular error or warning, you can access the *Quick Fix* proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip pop-up window.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon ( ) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor displays the list of available fixes.
- With the cursor placed in the highlighted area of the error or warning, you can also invoke the *Quick Fix* menu by pressing **Alt + 1 (Command + Alt + 1 on OS X)** on your keyboard.

Oxygen XML Editor provides the following types of *Quick Fixes* for Ant build files:

- **Create new target** - Creates a new target with the specified name.
- **Change reference to "targetName"** - Corrects the reference to point to an already defined target.
- **Remove target reference** - Removes the erroneous reference.

Content Completion in Ant Build Files

The list of proposals offered by the *Content Completion Assistant (page 3227)* in Ant build files are context-sensitive and includes proposals that are valid at the current cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut.

The *Content Completion Assistant* proposes various item types that are defined in the current Ant build and in the imported and included builds. The proposals include:

- Element names
- Attribute names
- Property names

  Note: In addition to the user-defined properties, the *Content Completion Assistant* offers the following values:

  # The system properties set in the Java Virtual Machine.
  # The built-in properties that Ant provides.

- Target names
- Task and type reference IDs

  Tip: To make a custom task available in the *Content Completion Assistant*, add a *JAR (page 3230)* file that contains the task implementation to the library directory of the built-in Ant distribution that comes bundled with Oxygen XML Editor (for example, `[OXYGEN_INSTALL_DIR]/tools/ant/lib` folder).

Note: For Ant resources, the proposals are collected starting from the *master files (page 3231)*. The *master files* can be defined in the project or in the associated validation scenario. For further details about the *Master Files* support go to Defining Master Files at Project Level *(page 719)*.

Related Information:

http://ant.apache.org/manual/properties.html

Syntax Highlighting in Ant Files

Oxygen XML Editor supports syntax highlighting in Ant files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for Ant build files, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*.
2. Go to **Editor > Syntax Highlight** *(page 171)*.
3. Select and expand the **Ant Property** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

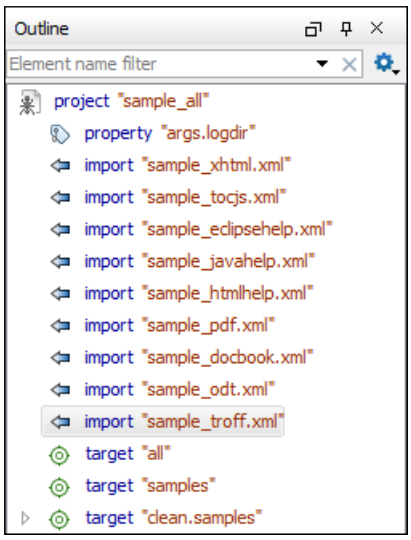
Syntax Highlight Preferences *(page 171)*

Ant Outline View

The **Outline** view for Ant files displays the list of all the components (properties, targets, extension points, task/type definitions and references) from both the edited Ant build file and its imported and included modules. For Ant resources, the **Outline** view collects its components starting from the *master files (page 3231)*. The *master files* can be defined in the project and the main build file can be specified in a validation scenario. For more details, see Defining Master Files at Project Level *(page 719)*.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: Ant Outline View



The following actions are available in the **Settings** menu on the Outline view toolbar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches. By default, this filter is not selected.

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the Ant editor. Selecting one of the components from the outline view also selects the corresponding item in the source document.

When the **Show components** option is selected, the following actions are available:

Show XML structure

Displays the XML document structure in a tree-like manner.

Sort

Sorts the components in the **Outline** view alphabetically.

Show all components

Displays all components that were collected starting from the *master file (page 3231)*. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/type

The build file components can be grouped by location and type.

When the **Show XML structure** option is selected, the following actions are available:

Show components

Switches the **Outline** view to the components display mode.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel *(page 257)*.

Configure displayed attributes

Displays the **XML Structured Outline** preferences page *(page 257)*.

The following actions are available in the contextual menu of the **Outline** view (when the **Show XML structure** option is selected in the **Settings** menu:

Append Child

Displays a list of elements that can be inserted as children of the current element.

Insert Before

Displays a list of elements that can be inserted as siblings of the current element, before the current element.

Insert After

Displays a list of elements that can be inserted as siblings of the current element, after the current element.

Edit Attributes

Displays an in-place attribute editing window.

Toggle Comment

Comments/uncomments the currently selected element.

Search References Ctrl + Shift + R (Command + Shift + R on OS X)

Searches all references of the item found at current cursor position in the defined scope. See Find References and Declarations of Ant Components *(page 1233)* for more details.

Search References in

Searches all references of the item found at current cursor position in the specified scope. See Find References and Declarations of Ant Components *(page 1233)* for more details.

Component Dependencies

Opens the Ant **Component Dependencies** view *(page 1231)* that allows you to see the dependencies for the current selected component.

Rename Component in

Renames the selected component. See Ant Refactoring Actions *(page 1234)* for more details.

Cut, Copy, Delete

Executes the typical editing actions on the currently selected component.

Expand More

Expands recursively all sub-components of the selected component.

Collapse All

Collapses recursively all sub-components of the selected component.

You can search a component in the **Outline** view by typing its name in the filter text field at the top of the view or directly on the tree structure. When you type the component name in the text field, you can switch to the tree structure using the following:

- **Down** arrow key
- **Tab** key
- **Shift-Tab** key combination

To switch from tree structure to the filter text field, you can use **Tab** and **Shift-Tab**.

Tip: The search filter is case insensitive. The following wildcards are accepted:

- ***** - any string
- **?** - any character
- **,** - patterns separator

If no wildcards are specified, the string to search is used as a partial match (such as ***textToFind***).

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

Oxygen XML Editor has a predefined order for the groups in the **Outline** view:

- For location, the names of the files are sorted alphabetically. The file you are editing is located at the top of the list.
- For type, the order is: properties, targets, references.

Note: When no grouping is available Oxygen XML Editor sorts the components depending on their order in the document. Oxygen XML Editor also takes into account the name of the file that the components are part of.

Ant Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for an Ant build file by analyzing imported or included build files. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If you want to see the hierarchy of a build file, select it in the **Project** view *(page 332)* and choose **Resource Hierarchy** from the contextual menu.

If you want to see the dependencies of a build file, select it in the **Project** view *(page 332)* and choose **Resource Dependencies** from the contextual menu.

The following actions are available in the **Resource Hierarchy/Dependencies** view:

Refresh

Refreshes the Hierarchy/Dependencies structure.

Stop

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the **Master Files** directory *(page 719)*.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

Ant Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To see the dependencies of an Ant component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for the following components: *properties*, *targets*, *extension-points*, and *references* (those that have an ID set).

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:

Search and Refactor Operations Scope *(page 1116)*

Highlight Component Occurrences

When a component (for example *property* or *target*) is found at the current cursor position, they are highlighted in both the document and in the stripe bar at the right side of the document. Oxygen XML Editor also supports occurrences highlight for type and task references.

Customizable colors are used (one for the component definition and another one for component references). Occurrences are displayed until another component is selected and a new search is performed. All highlights are removed when you start to edit the document.

This feature is enabled by default. To configured it, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Editor > Mark Occurrences**. If your particular type of file is not selected, you can perform this search by going to **Search > Search Occurrences in File Ctrl + Shift + U (Command + Shift + U on OS X)** in the contextual menu. Matches are displayed in separate tabs of the **Results** view *(page 354)*.

Related Information:

Mark Occurrences Preferences *(page 183)*

Find References and Declarations of Ant Components

The following search actions related to references and declarations of Ant components are available from the **Search** submenu of the contextual menu and from the **Document > References** menu::

- **Search References** - Searches all references of the item found at current cursor position in the defined scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify after selecting a scope for the search operation.
- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when defining a new scope.
- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

- **Go to Definition** - Moves the cursor to the location of the definition of the current item.

  Note: You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

Related Information:

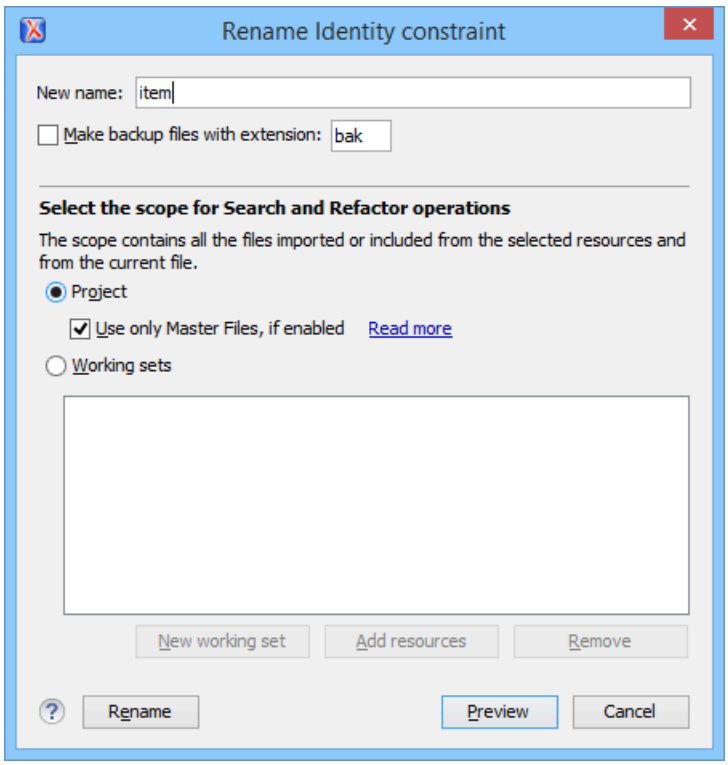
Search and Refactor Operations Scope *(page 1116)*

Ant Refactoring Actions

The following refactoring actions can be applied on *targets*, *extension-points*, *properties*, and *references* and allow you to consistently rename a component in the entire Ant build file structure. They are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure: Rename Identity Constraint Dialog Box



Ant Quick Assist Support

The *Quick Assist* support *(page 3233)* helps you to rapidly access search and refactoring actions. If one or more actions are available in the current context, they are accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *Quick Assist* menu by using the **Alt + 1** (**Meta + Alt + 1** on Mac OS X) keyboard shortcuts.

The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Related Information:

Ant Component Dependencies View *(page 1231)*

Ant resource Hierarchy/Dependencies View *(page 1230)*

Ant Refactoring Actions *(page 1234)*

Search and Refactor Operations Scope *(page 1116)*

Editing XML Schemas

An XML Schema describes the structure of an XML document and is used to validate XML document instances against it, to check that the XML instances conform to the specified requirements. If an XML instance conforms to the schema then it is said to be valid. Otherwise, it is invalid.

Oxygen XML Editor offers support for both XML Schema 1.0 and 1.1 and you can edit XML Schema files in the following editing modes:

- **Text editing mode *(page 1274)*** - Allows you to edit XML Schema files in a source editing mode.
- **Grid editing mode *(page 390)*** - Displays XML Schema files in a structured spreadsheet-like grid.
- **Design editing mode *(page 617)*** - Visual schema designer that helps you understand the structure and develop complex schemas.
- **Author editing mode *(page 885)*** - The visual **Author** mode is also available for XML Schema, allowing you to visually edit the schema annotations. It presents a polished and compact view of the XML Schema, with support for links on imported/included schemas.

For information about applying and detecting schemas, see Associating a Schema to XML Documents *(page 1099)*.

For more information about editing XML Schemas, see our video demonstration:

Related Information:

Associating a Schema to XML Documents *(page 1099)*

Design Editing Mode (XML Schema Diagram Editor)

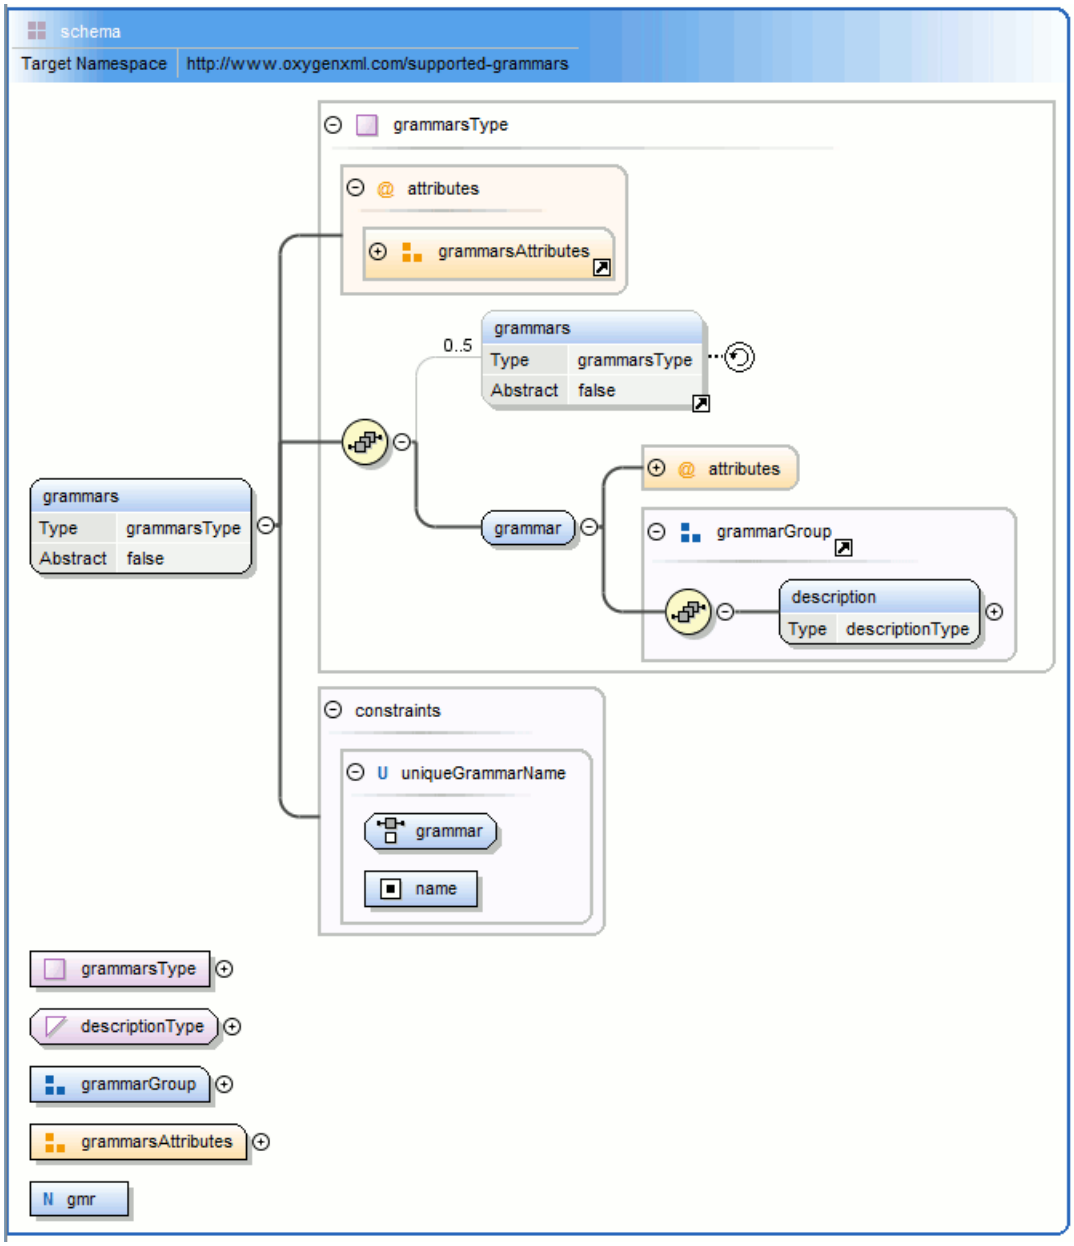
XML Schemas allow document designers to specify the allowed structure and content of an XML document and to check if an XML document is valid.

Oxygen XML Editor provides a simple and expressive XML Schema diagram editor (**Design** mode) for editing XML Schemas. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

The diagram font can be increased using the usual Oxygen XML Editor shortcuts: **(Ctrl (Meta on Mac OS) + "+")** , **(Ctrl (Meta on Mac OS)+"-")** , **(Ctrl (Meta on Mac OS) + 0)** or **(Ctrl (Meta on Mac OS) - mouse wheel)**. The whole diagram can also be zoomed with one of the predefined factors available in the Schema preferences panel *(page 151)*. The same zoom factor is applied for the print and save actions.

To switch to this mode, select **Design** at the bottom of the editing area.

Figure: XML Schema Diagram



For more information about designing XML Schemas, watch our video demonstration:

Navigation in the XML Schema Design Mode

The following editing and navigation features work for all types of schema components in the XML Schema **Design** mode:

- Move/reference components in the diagram using drag-and-drop actions.
- Select consecutive components on the diagram (components from the same level) using the *Shift* key. You can also make discontinuous selections in the schema diagram using the **Ctrl (Meta on**

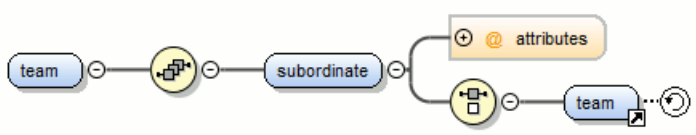
Mac OS) key. To deselect one of the components, use **Ctrl + Single-Click (Command + Single-Click on OS X)**.

- Use the arrow keys to navigate the diagram vertically and horizontally.
- Use *Home*/*End* keys to jump to the first/last component from the same level. Use **Ctrl + Home (Command + Home on OS X)** key combination to go to the diagram root and **Ctrl + End (Command + End on OS X)** to go to the last child of the selected component.
- You can easily go back to a previously visited component while moving from left to right. The path will be preserved only if you use the left arrow key or right arrow key. For example, if the current selection is on the second attribute from an attribute group and you press the left arrow key to jump to the attribute group, when you press the right arrow key, then the selection will be moved to the second attribute.
- Go back and forward between components viewed or edited in the diagram by selecting them in the **Outline** view *(page 620)*:
  - **Back** (go to previous schema component).
  - **Forward** (go to next schema component).
  - **Go to Last Modification** (go to last modified schema component).
- Copy, reference, or move global components, attributes, and identity constraints to another position and from one schema to another using the **Cut/Copy** and **Paste/Paste as Reference** actions.
- Go to the definition of an element or attribute with the **Go to Definition** action.
- Search in the diagram using the Find/Replace dialog box *(page 736)* or the Quick find toolbar *(page 747)*. You can find/replace components only in the current file scope.
- You can expand and see the contents of the imports/includes/redefines in the diagram. In order to edit components from other schemas the schema for each component will be opened as a separate file in Oxygen XML Editor.

Tip: If an XML Schema referenced by the current opened schema was modified on disk, the change will be detected and you will be asked to refresh the current schema contents.

- Recursive references are marked with a *recurse symbol* (). Click this symbol to navigate between the element declaration and its reference.

Figure: Recursive Reference



Schema Editing Actions

You can edit an XML schema using drag and drop operations or contextual menu actions.

Drag and drop is the easiest way to move the existing components to other locations in an XML schema. For example, you can quickly insert an element reference in the diagram with a drag and drop from the **Outline** view *(page 620)* to a compositor in the diagram. Also, the components order in an `xs:sequence` can be easily changed using drag and drop.

If this property has not been set, you can easily set the attribute/element type by dragging over it a simple type or complex type from the diagram. If the type property for a simple type or complex type is not already set, you can set it by dragging over it a simple or complex type.

Depending on the drop area, various actions are available:

- **move** - Context dependent, the selected component is moved to the destination.
- **reference** - Context dependent, the selected component is referenced from the parent.
- **copy** - If **(Ctrl (Meta on Mac OS))** key is pressed, a copy of the selected component is inserted to the destination.

Visual clues about the operation type are indicated by the mouse pointer shape:

- - When moving a component.
- - When referencing a component.
- - When copying a component.

You can edit some schema components directly in the diagram. For these components, you can edit the name and the additional properties presented in the diagram by double clicking the value you want to edit. If you want to edit the name of a selected component, you can also press **(Enter)**. The list of properties that can be displayed for each component can be customized in the Preferences *(page 152)*.

When editing references, you can choose from a list of available components. Components from an imported schema for which the target namespace does not have an associated prefix is displayed in the list as `componentName#targetNamespace`. If the reference is from a target namespace that was not yet mapped, you are prompted to add prefix mappings for the inserted component namespace in the current edited schema.

You can also change the compositor by double-clicking it and choose the compositor you want from the proposals list.

There are some components that cannot be edited directly in the diagram: imports, includes, redefines. The editing action can be performed if you double-click or press **(Enter)** on an import/include/redefine component. An edit dialog box is displayed, allowing you to customize the directives.

Generating Sample XML Files *(page 1295)*

Schema Design Preferences *(page 151)*

Contextual Menu Actions in the Design Mode

The contextual menu of the **Design** mode includes the following actions:

Go to Definition (Ctrl + Shift + Enter)

Shows the definition for the current selected component. For references, this action is available by clicking the arrow displayed in its bottom right corner.

Open Schema (Ctrl + Shift + Enter)

Opens the selected schema. This action is available for `xsd:import`, `xsd:include` and `xsd:redefine` elements. If the file you try to open does not exist, a warning message is displayed and you have the possibility to create the file.

Edit Attributes ()

Allows you to edit the attributes of the selected component in a small in-place editor that presents the same attributes as in the **Attributes** view *(page 622)* and the **Facets** view *(page 624)*. The actions that can be performed on attributes in this dialog box are the same actions presented in the two views.

Append child

Offers a list of valid components, depending on the context, and appends your selection as a child of the currently selected component. You can set a name for a named component after it has been added in the diagram.

Insert before

Offers a list of valid components, depending on the context, and inserts your selection before the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

Insert after

Offers a list of valid components, depending on the context, and inserts your selection after the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

New global

Inserts a global component in the schema diagram. This action does not depend on the current context. If you choose to insert an import you have to specify the URL of the imported file, the target namespace and the import ID. The same information, excluding the target namespace, is requested for an `xsd:include` or `xsd:redefine` element.

Note: If the imported file has declared a target namespace, the field **Namespace** is completed automatically.

Edit Schema Namespaces

When performed on the schema root, it allows you to edit the schema target namespace and namespace mappings. You can also invoke the action by double-clicking the target namespace property from **Attributes** view *(page 622)* for the schema or by double-clicking the schema component.

Edit Annotations

Allows you to edit the annotation for the selected schema component in the **Edit Annotations** dialog box. You can perform the following operations in the dialog box:

- **Edit all `appinfo/documentation` items for a specific annotation** - All `appinfo/documentation` items for a specific annotation are presented in a table and can be easily edited. Information about an annotation item includes: type (documentation/appinfo), content, source (optional, specify the source of the `documentation/appinfo` element) and `xml:lang`. The content of a `documentation/appinfo` item can be edited in the **Content** area below the table.
- **Insert/Insert before/Remove documentation/appinfo.** The **Add** button allows you to insert a new annotation item (`documentation/appinfo`). You can add a new item before the item selected in table by pressing the **Insert Before** button. Also, you can delete the selected item using the **Remove** button.
- **Move items up/down** - to do this use the **Move up** and **Move down** buttons.
- **Insert/Insert before/Remove annotation** - Available for components that allow multiple annotations such as schemas or redefines.

- **Specify an ID for the component annotation**. An optional identifier for the annotation.

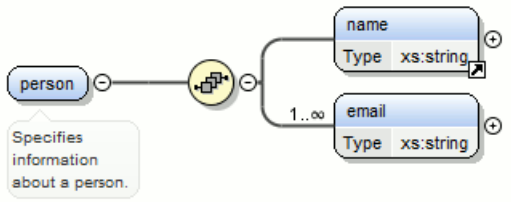
Annotations are rendered by default under the graphical representation of the component. When you have a reference to a component with annotations, these annotations are presented in the diagram also below the reference component. The **Edit Annotations** action invoked from the contextual menu edit the annotations for the reference. If the reference component does not have annotations, you can edit the annotations of the referenced component by double-clicking the annotations area. Otherwise, you can edit the referenced component annotations only if you go to the definition of the component.

Note: For imported/included components that do not belong to the currently edited schema, the **Edit Annotations** dialog box presents the annotation as read-only. To edit its annotation, open the schema where the component is defined.

Extract Global Element

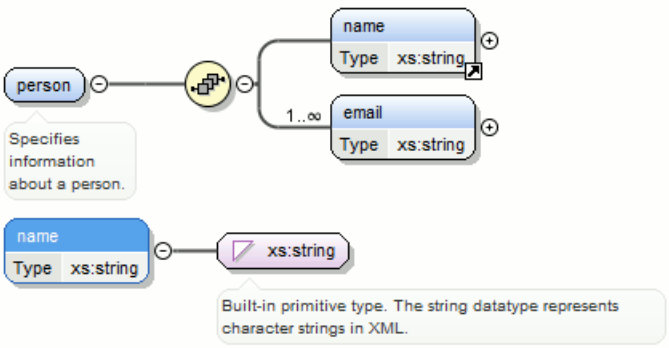
Action that is available for local elements. A local element is made global and is replaced with a reference to the global element. The local element properties that are also valid for the global element declaration are kept.

Figure: Extracting a Global Element



If you use the **Extract Global Element** action on a `name` element , the result is:

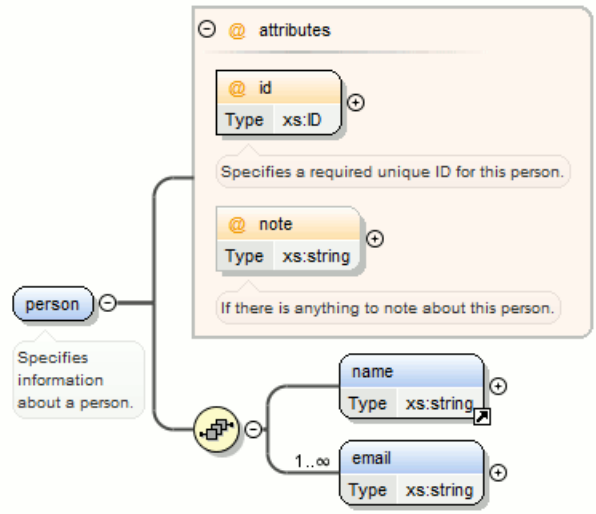
Figure: Extracting a Global Element on a `name` Element



Extract Global Attribute

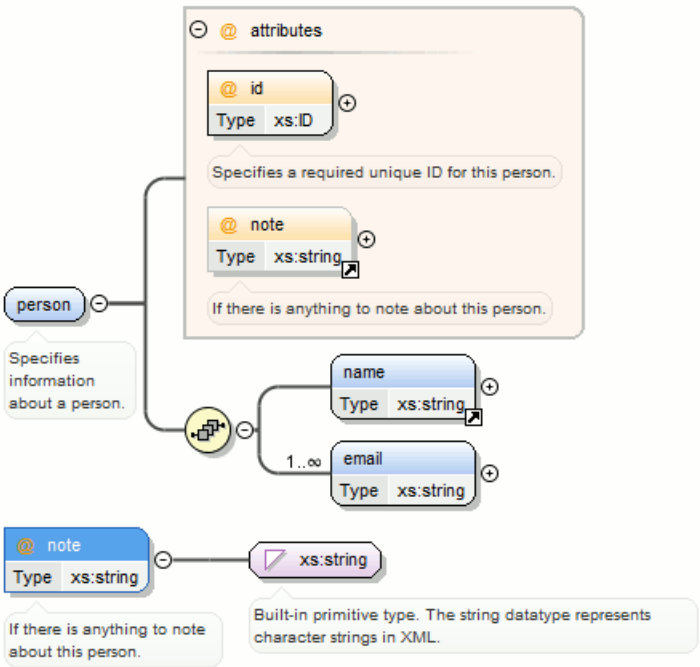
Action available for local attributes. A local attribute is made global and replaced with a reference to the global attribute. The properties of local attribute that are also valid in the global attribute declaration are kept.

Figure: Extracting a Global Attribute



If you use the **Extract Global Attribute** action on a `note` attribute, the result is:

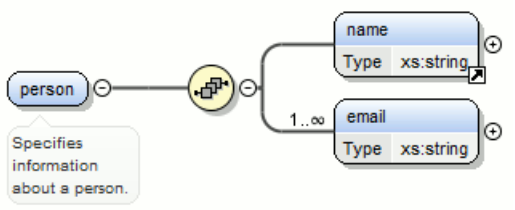
Figure: Extracting a Global Attribute on a `note` Attribute



Extract Global Group

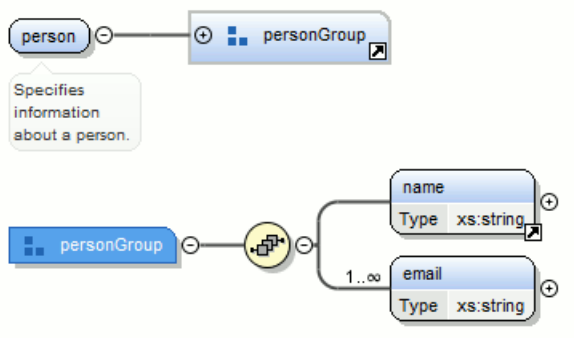
Action available for compositors (sequence, choice, all). This action extracts a global group and makes a reference to it. The action is available only if the parent of the compositor is not a group.

Figure: Extracting a Global Group



If you use the **Extract Global Group** action on the `sequence` element, the **Extract Global Component** dialog box is displayed and you can choose a name for the group. If you type `personGroup`, the result is:

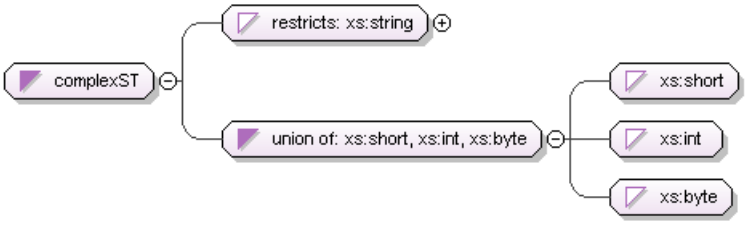
Figure: Extracting a Global Gropu on a `sequence` Element



Extract Global Type

Action used to extract an anonymous simple type or an anonymous complex type as global. For anonymous complex types, the action is available on the parent element.

Figure: Extracting a Global Simple Type



If you use the action on the `union` component and choose `numericST` for the new global simple type name, the result is:

Figure: Extracting a Global Simple Type on a `union` Component

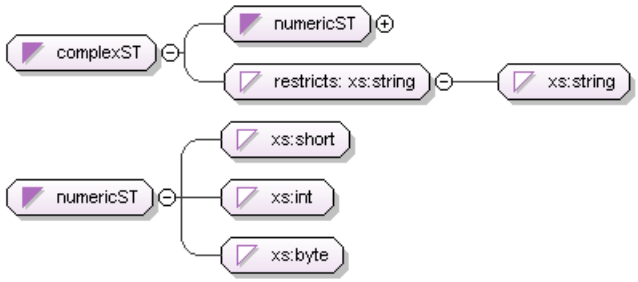


Figure: Extracting a Global Complex Type

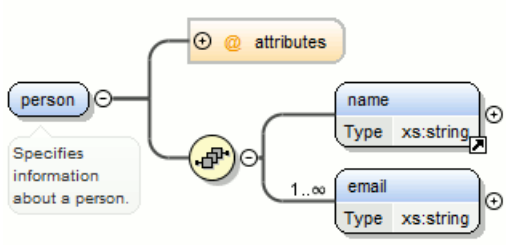
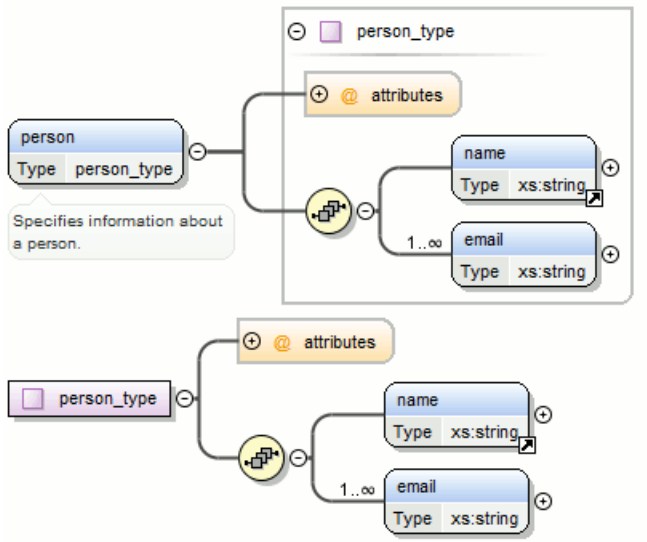


If you use the action on a `person` element and choose `person_type` for the new complex type name, the result is:

Figure: Extracting a Global Complex Type on a `person` Element



Rename Component in

Rename the selected component.

Cut Ctrl + X (Command + X on OS X)

Cut the selected component(s).

Copy Ctrl + C (Command + C on OS X)

Copy the selected component(s).

Copy XPath

This action copies an XPath expression that identifies the selected element or attribute in an instance XML document of the edited schema and places it in the clipboard.

Paste Ctrl + V (Command + V on OS X)

Paste the component(s) from the clipboard as children of the selected component.

Paste as Reference

Create references to the copied component(s). If not possible a warning message is displayed.

Remove (Delete)

Remove the selected component(s).

Override component

Copies the overridden component in the current XML Schema. This option is available for `xs:override` components.

Redefine component

The referenced component is added in the current XML Schema. This option is available for `xs:redefine` components.

Optional

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The `minOccurs` property is set to 0 and the `use` property for attributes is set to `optional`.

Unbounded

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The `maxOccurs` property is set to `unbounded` and the `use` property for attributes is set to `required`.

Search

Can be performed on local elements or attributes. This action makes a reference to a global element or attribute.

Search References

Searches all references of the item found at current cursor position in the defined scope if any.

Search References in

Searches all references of the item found at current cursor position in the specified scope.

Search Occurrences in File

Searches all occurrences of the item found at current cursor position in the current file.

Component Dependencies

Opens the **Component Dependencies** view *(page 1289)* that allows you to see the dependencies for the current selected component.

Resource Hierarchy

Opens the **Resource Hierarchy / Dependencies** view *(page 1286)* that allows you to see the hierarchy for the current selected resource.

Flatten Schema

Recursively adds the components of included Schema files to the main one. It also flattens every imported XML Schema from the hierarchy.

Resource Dependencies

Allows you to see the dependencies for the current selected resource.

Expand All

Recursively expands all sub-components of the selected component.

Collapse All

Recursively collapses all sub-components of the selected component.

Save as Image

Save the diagram as image, in JPEG, BMP, SVG or PNG format.

Generate Sample XML Files

Generate XML files using the current opened schema. The selected component is the XML document root. See more in the Generate Sample XML Files *(page 1295)* section.

Options

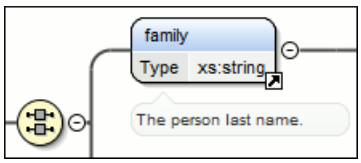
Show the Schema preferences panel *(page 151)*.

XML Schema Components

A schema diagram contains a series of interconnected components. To quickly identify the relation between two connected components, the connection is represented as:

- A thick line to identify a connection with a required component (in the following image, `family` is a required element).

Figure: Example: Required Component



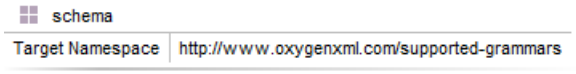
- A thin line to identify a connection with an optional component (in the following image, `email` is an optional element).

Figure: Example: Optional Component

The following topics explain in detail all available components and their symbols as they appear in an XML schema diagram.

xs:schema

Figure: The xs:schema Component



Defines the root element of a schema. A schema document contains representations for a collection of schema components, such as type definitions and element declarations, that have a common target namespace. See more info at http://www.w3.org/TR/xmlschema11-1/#element-schema.

By default, it displays the *targetNamespace* property when rendered.

Table 43. *xs:schema* Properties

Property Name	Description	Possible Values
Target Namespace	The schema target namespace.	Any URI
Element Form Default	Determining whether or not local element declarations will be namespace-qualified by default.	qualified, unqualified, [Empty]. Default value is unqualified.
Attribute Form Default	Determining whether or not local attribute declarations will be namespace-qualified by default.	qualified, unqualified, [Empty]. Default value is unqualified.

Property Name	Description	Possible Values
Block Default	Default value of the *block* attribute of *xs:element* and *xs:complexType*.	#all, extension, restriction, substitution, restriction extension, restriction substitution, extension substitution, restriction extension substitution, [Empty].
Final Default	Default value of the *final* attribute of *xs:element* and *xs:complexType*.	#all, restriction, extension, restriction extension, [Empty].
Default Attributes	Specifies a set of attributes that apply to every complex Type in a schema document.	Any.
Xpath Default Namespace	The default namespace used when the XPath expression is evaluated.	##defaultNamespace, ##targetNamespace, ##local.
Version	Schema version	Any token.
ID	The schema ID	Any ID.
Component	The edited component name.	Not editable property.
SystemID	The schema system ID	Not editable property.

xs:element

Figure: The xs:element Component

Defines an element. An element declaration is an association of a name with a type definition, either simple or complex, an (optional) default value and a (possibly empty) set of identity-constraint definitions. See more info at http://www.w3.org/TR/xmlschema11-1/#element-element.

An element by default displays the following properties when rendered in the diagram: *default*, *fixed*, *abstract* and *type*. When referenced or declared locally, the element graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the element are drawn using dotted lines if the element is optional.

Table 44. *xs:element* Properties

Property Name	Description	Possible Values	Mentions
Name	The element name. Always required.	Any NCName for global or local elements, any *QName (page 3233)* for element references.	If missing, will be displayed as '[element]' in diagram.
Is Reference	When set, the local element is a reference to a global element.	true/false	Appears only for local elements.
Type	The element type.	All declared or built-in types. In addition, the following anonymous types are available: [ST-restriction], [ST-union], [ST-list], [CT-anonymous], [CT-extension SC], [CT-restriction SC], [CT-restriction CC], [CT-extension CC].	For all elements. For references, the value is set in the referenced element.
Base Type	The extended/restricted base type.	All declared or built-in types	For elements with complex type, with simple or complex content.
Mixed	Defines if the complex type content model will be mixed.	true/false	For elements with complex type.
Content	The content of the complex type.	simple/complex	For elements with complex type that extends/ restricts a base type. It is automatically detected.

Property Name	Description	Possible Values	Mentions
Content Mixed	Defines if the complex content model will be mixed.	true/false	For elements with complex type that has a complex content.
Default	Default value of the element. A default value is automatically assigned to the element when no other value is specified.	Any string	The fixed and default attributes are mutually exclusive.
Fixed	A simple content element may be fixed to a specific value using this attribute. A fixed value is also automatically assigned to the element and you cannot specify another value.	Any string	The fixed and default attributes are mutually exclusive.
Min Occurs	Minimum number of occurrences of the element.	A numeric positive value. Default value is 1	Only for references/ local elements
Max Occurs	Maximum number of occurrences of the element.	A numeric positive value. Default value is 1	Only for references/ local elements
Substitution Group	Qualified name of the head of the substitution group that this element belongs to.	All declared elements. For XML Schema 1.1 this property supports multiple values.	For global and reference elements
Abstract	Controls whether or not the element may be used directly in instance XML documents. When set to true, the element may still be used to define content models, but it must be substituted through a substitution group in the instance document.	true/false	For global elements and element references
Form	Defines if the element is "qualified" (belongs to the target namespace) or "unqualified" (doesn't belong to any namespace).	unqualified/qualified	Only for local elements

Property Name	Description	Possible Values	Mentions
Nillable	When this attribute is set to true, the element can be declared as nil using an *xsi:nil* attribute in the instance documents.	true/false	For global elements and element references
Target Namespace	Specifies the target namespace for local element and attribute declarations. The namespace URI may be different from the schema target namespace. This property is available for local elements only.	Not editable property.	For all elements.
Block	Controls if the element can be subject to a type or substitution group substitution. '#all' blocks any substitution, 'substitution' blocks any substitution through substitution groups and 'extension'/'restriction' block any substitution (both through *xsi:type* and substitution groups) by elements or types, derived respectively by extension or restriction from the type of the element. Its default value is defined by the *blockDefault* attribute of the parent *xs:schema*.	#all, restriction, extension,substitution, extension restriction, extension substitution, restriction substitution, restriction extension substitution	For global elements and element references
Final	Controls whether the element can be used as the head of a substitution group for elements whose types are derived by extension or restriction from the type of the element. Its default value is defined by the *finalDefault* attribute of the parent *xs:schema*.	#all, restriction, extension, restriction extension, [Empty]	For global elements and element references
ID	The component ID.	Any ID	For all elements.
Component	The edited component name.	Not editable property.	For all elements.
Namespace	The component namespace.	Not editable property.	For all elements.
System ID	The component system ID.	Not editable property.	For all elements.

xs:attribute

Figure: The xs:attribute Component

Defines an attribute. See more info at http://www.w3.org/TR/xmlschema11-1/#element-attribute.

An attribute by default displays the following properties when rendered in the diagram: *default, fixed, use* and *type*. Connectors to the attribute are drawn using dotted lines if the attribute use is optional. The attribute name is stroked out if prohibited.

Table 45. *xs:attribute* Properties

Property Name	Description	Possible Value	Mentions
Name	Attribute name. Always required.	Any NCName for global/local attributes, all declared attributes' *QName (page 3233)* for references.	For all local or global attributes. If missing, will be displayed as '[attribute]' in the diagram.
Is Reference	When set, the local attribute is a reference.	true/false	For local attributes.
Type	Qualified name of a simple type.	All global simple types and built-in simple types. In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for creating anonymous simple types more easily.	For all attributes. For references, the type is set to the referenced attribute.
Default	Default value. When specified, an attribute is added by the schema processor (if it is missing from the instance XML document) and it is given this value. The default and fixed attributes are mutually exclusive.	Any string	For all local or global attributes. For references the value is from the referenced attribute.
Fixed	When specified, the value of the attribute is fixed and must be equal to this value. The default and fixed attributes are mutually exclusive.	Any string	For all local or global attributes. For references the value is from the referenced attribute.

Property Name	Description	Possible Value	Mentions
Use	Possible usage of the attribute. Marking an attribute "prohibited" is useful to exclude attributes during derivations by restriction.	optional, required, prohibited	For local attributes
Form	Specifies whether or not the attribute is qualified (must have a namespace prefix in the instance XML document). The default value for this attribute is specified by the *attributeFormDefault* attribute of the *xs:schema* document element.	unqualified/qualified	For local attributes.
Inheritable	Specifies if the attribute is inheritable. Inheritable attributes can be used by <alternative> element on descendant elements.	true/false	For all local or global attributes. The default value is false. This property is available for XML Schema 1.1.
Target Namespace	Specifies the target namespace for local attribute declarations. The namespace URI may be different from the schema target namespace.	Any URI	Setting a target namespace for local attribute is useful only when restricts attributes of a complex type that is declared in other schema with a different target namespace. This property is available for XML Schema 1.1.
ID	The component ID.	Any ID	For all attributes.
Component	The edited component name.	Not editable property.	For all attributes.
Namespace	The component namespace.	Not editable property.	For all attributes.
System ID	The component system ID.	Not editable property.	For all attributes.

xs:attributeGroup

Figure: The xs:attributeGroup Component

Defines an attribute group to be used in complex type definitions. See more info at http://www.w3.org/TR/xmlschema11-1/#element-attributeGroup.

Table 46. *xs:attributeGroup* Properties

Property Name	Description	Possible Values	Mentions
Name	Attribute group name. Always required.	Any NCName for global attribute groups, all declared attribute groups for reference.	For all global or referenced attribute groups. If missing, will be displayed as '[attributeGroup]' in diagram.
ID	The component ID.	Any ID	For all attribute groups.
Component	The edited component name.	Not editable property.	For all attribute groups.
Namespace	The component namespace.	Not editable property.	For all attribute groups.
System ID	The component system ID.	Not editable property.	For all attribute groups.

xs:complexType

Figure: The xs:complexType Component

Defines a top level complex type. Complex Type Definitions provide for: See more data at http://www.w3.org/TR/xmlschema11-1/#element-complexType.

- Constraining element information items by providing Attribute Declarations governing the appearance and content of attributes.
- Constraining element information item children to be empty, or to conform to a specified element-only or mixed content model, or else constraining the character information item children to conform to a specified simple type definition.
- Using the mechanisms of Type Definition Hierarchy to derive a complex type from another simple or complex type.
- Specifying post-schema-validation infoset contributions for elements.
- Limiting the ability to derive additional types from a given complex type.
- Controlling the permission to substitute, in an instance, elements of a derived type for elements declared in a content model to be of a given complex type.

Tip: A complex type that is a base type to another type will be rendered with yellow background.

Table 47. *xs:complexType* Properties

Property Name	Description	Possible Values	Mentions
Name	The name of the complex type. Always required.	Any NCName	Only for global complex types. If missing, will be displayed as '[complexType]' in diagram.
Base Type Definition	The name of the extended/restricted types.	Any from the declared simple or complex types.	For complex types with simple or complex content.
Derivation Method	The derivation method.	restriction/ extension	Only when base type is set. If the base type is a simple type, the derivation method is always extension.
Content	The content of the complex type.	simple/ complex	For complex types that extend/restrict a base type. It is automatically detected.
Content Mixed	Specifies if the complex content model will be mixed.	true/false	For complex contents.
Mixed	Specifies if the complex type content model will be mixed.	true/false	For global and anonymous complex types.
Abstract	When set to *true*, this complex type cannot be used directly in the instance documents and needs to be substituted using an *xsi:type* attribute.	true/false	For global and anonymous complex types.

Property Name	Description	Possible Values	Mentions
Block	Controls if a substitution (either through a *xsi:type* or substitution groups) can be performed for a complex type, which is an extension or a restriction of the current complex type. This attribute can only block such substitutions (it cannot "unblock" them), which can also be blocked in the element definition. The default value is defined by the *blockDefault* attribute of *xs:schema*.	all, extension, restriction, extension restriction, [Empty]	For global complex types.
Final	Controls whether the complex type can be further derived by extension or restriction to create new complex types.	all, extension, restriction, extension restriction, [Empty]	For global complex types.
Default Attributes Apply	The *schema* element can carry a *defaultAttributes* attribute, which identifies an attribute group. Each *complexType* defined in the schema document then automatically includes that attribute group, unless this is overridden by the *defaultAttributesApply* attribute on the *complexType* element.	true/false	This property is available only for XML Schema 1.1.
ID	The component ID.	Any ID	For all complex types.
Component	The edited component name.	Not editable property.	For all complex types.
Namespace	The component namespace.	Not editable property.	For all complex types.
System ID	The component system ID.	Not editable property.	For all complex types.

xs:simpleType

Figure: The xs:simpleType Component

Defines a simple type. A simple type definition is a set of constraints on strings and information about the values they encode, applicable to the normalized value of an attribute information item or of an element information item with no element children. Informally, it applies to the values of attributes and

the text-only content of elements. See more info at http://www.w3.org/TR/xmlschema11-1/#element-simpleType.

Tip: A simple type that is a base type to another type will be rendered with yellow background.

Table 48. *xs:simpleType* Properties

Name	Description	Possible Values	Scope
Name	Simple type name. Always required.	Any NCName.	Only for global simple types. If missing, will be displayed as '[simpleType]' in diagram.
Derivation	The simple type category: restriction, list or union.	restriction,list or union	For all simple types.
Base Type	A simple type definition component. Required if derivation method is set to restriction.	All global simple types and built-in simple types. In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for easily create anonymous simple types.	For global and anonymous simple types with the derivation method set to restriction.
Item Type	A simple type definition component. Required if derivation method is set to list.	All global simple types and built-in simple types(from schema for schema). In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for easily create anonymous simple types.	For global and anonymous simple types with the derivation method set to list. Derivation by list is the process of transforming a simple datatype (named the item type) into a whitespace-separated list of values from this datatype. The item type can be defined inline by adding a simpleType definition as a child element of the list element, or by reference, using the itemType attribute (it is an error to use both).
Member Types	Category for grouping union members.	Not editable property.	For global and anonymous simple types with the derivation method set to union.

Name	Description	Possible Values	Scope
Member	A simple type definition component. Required if derivation method is set to union.	All global simple types and built-in simple types(from schema for schema). In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for easily create anonymous simple types.	For global and anonymous simple types with the derivation method set to union. Deriving a simple datatype by union merges the lexical spaces of several simple datatypes (called member types) to create a new simple datatype. The member types can be defined either by reference (through the memberTypes attribute) or embedded as simple datatype local definitions in the xs:union element. Both styles can be mixed.
Final	Blocks any further derivations of this datatype (by list, union, derivation or all).	#all, list, restriction, union, list restriction, list union, restriction union. In addition, [Empty] proposal is present for set empty string as value.	Only for global simple types.
ID	The component ID.	Any ID.	For all simple types
Component	The name of the edited component.	Not editable property.	Only for global and local simple types
Namespace	The component namespace.	Not editable property.	For global simple types.
System ID	The component system ID.	Not editable property.	Not present for built-in simple types..

xs:alternative

The *type alternatives* mechanism allows you to specify type substitutions on an element declaration.

Note: *xs:alternative* is available for XML Schema 1.1.

Figure: The xs:alternative Component

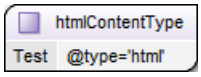


Table 49. *xs:alternative* Properties

Name	Description	Possible Values
Type	Specifies type substitutions for an element, depending on the value of the attributes.	All declared or built-in types. In addition, the following anonymous types are available: [ST-restriction], [ST-union], [ST-list], [CT-anonymous], [CT-extension SC], [CT-restriction SC], [CT-restriction CC], [CT-extension CC].
Test	Specifies an XPath expression. If the XPath condition is valid, the specified type is selected as the element type. The expressions allowed are limited to a subset of XPath 2.0. Only the attributes of the current element and inheritable attributes from ancestor elements are accessible in the XPath expression. When you edit this property, the content completion list of proposals offers XPath expressions.	An XPath expression.
XPath Default Namespace	The default namespace used when the XPath expression is evaluated.	##defaultNamespace, ##targetNamespace, ##local.
ID	Specifies the component ID.	Any ID.
Component	Specifies the type of XML schema component.	Not editable property.
System ID	Points to the document location of the schema.	Not editable property.

xs:group

Figure: The xs:group Component

Defines a group of elements to be used in complex type definitions. See more info at http://www.w3.org/TR/xmlschema11-1/#element-group.

When referenced, the graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the group are drawn using dotted lines if the group is optional.

Table 50. *xs:group* Properties

Property Name	Description	Possible Values	Mentions
Name	The group name. Always required.	Any NCName for global groups, all declared groups for reference.	If missing, will be displayed as '[group]' in diagram.

Property Name	Description	Possible Values	Mentions
Min Occurs	Minimum number of occurrences of the group.	A numeric positive value. Default value is 1.	Appears only for reference groups.
Max Occurs	Maximum number of occurrences of the group.	A numeric positive value. Default value is 1.	Appears only for reference groups.
ID	The component ID.	Any ID	For all groups.
Component	The edited component name.	Not editable property.	For all groups.
Namespace	The component namespace.	Not editable property	For all groups.
System ID	The component system ID.	Not editable property.	For all groups.

xs:include

Figure: The xs:include Component

Adds multiple schemas with the same target namespace to a document. See more info at http://www.w3.org/TR/xmlschema11-1/#element-include.

Table 51. *xs:include* properties

Property Name	Description	Possible Values
Schema Location	Included schema location.	Any URI
ID	Include ID.	Any ID
Component	The component name.	Not editable property.

xs:import

Figure: The xs:import Component

Adds multiple schemas with a different target namespace to a document. See more info at http://www.w3.org/TR/xmlschema11-1/#element-import.

Table 52. *xs:import* Properties

Property Name	Description	Possible Values
Schema Location	Imported schema location	Any URI

Property Name	Description	Possible Values
Namespace	Imported schema namespace	Any URI
ID	Import ID	Any ID
Component	The component name	Not editable property.

xs:redefine

Figure: The xs:redefine Component

Redefines simple and complex types, groups, and attribute groups from an external schema. See more info at http://www.w3.org/TR/xmlschema11-1/#element-redefine.

Table 53. *xs:redefine* Properties

Property Name	Description	Possible Values
Schema Location	Redefine schema location.	Any URI
ID	Redefine ID	Any ID
Component	The component name.	Not editable property.

xs:override

Figure: The xs:override Component

The override construct allows replacements of old components with new ones without any constraint. See more info at http://www.w3.org/TR/xmlschema11-1/#element-override.

Table 54. *xs:override* Properties

Property Name	Description	Possible Values
Schema Location	Redefine schema location.	Any URI
ID	Redefine ID	Any ID

xs:notation

Figure: The xs:notation Component

Describes the format of non-XML data within an XML document. See more info at http://www.w3.org/TR/xmlschema11-1/#element-notation.

Table 55. *xs:notation* Properties

Property Name	Description	Possible values	Mentions
Name	The notation name. Always required.	Any NCName.	If missing, will be displayed as '[notation]' in diagram.
System Identifier	The notation system identifier.	Any URI	Required if public identifier is absent (otherwise, optional).
Public Identifier	The notation public identifier.	A Public ID value	Required if system identifier is absent (otherwise, optional).
ID	The component ID.	Any ID	For all notations.
Component	The edited component name.	Not editable property.	For all notations.
Namespace	The component namespace.	Not editable property.	For all notations.
System ID	The component system ID.	Not editable property.	For all notations.

xs:sequence / xs:choice / xs:all

Figure: xs:sequence

xs:sequence specifies that the child elements must appear in a sequence. Each child element can occur from 0 to any number of times. See more info at http://www.w3.org/TR/xmlschema11-1/#element-sequence.

Figure: xs:choice

xs:choice allows only one of the elements contained in the declaration to be present within the containing element. See more info at http://www.w3.org/TR/xmlschema11-1/#element-choice.

Figure: xs:all

xs:all specifies that the child elements can appear in any order. See more info at http://www.w3.org/TR/xmlschema11-1/#element-all.

The compositor graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the compositor are drawn using dotted lines if the compositor is optional.

Table 56. *xs:sequence*, *xs:choice*, *xs:all* Properties

Property Name	Description	Possible Values	Mentions
Compositor	Compositor type.	sequence, choice, all.	'all' is only available as a child of a group or complex type.
Min Occurs	Minimum occurrences of compositor.	A numeric positive value. Default is 1.	The property is not present if compositor is 'all' and is child of a group.
Max Occurs	Maximum occurrences of compositor.	A numeric positive value. Default is 1.	The property is not present if compositor is 'all' and is child of a group.
ID	The component ID.	Any ID	For all compositors.
Component	The edited component name.	Not editable property.	For all compositors.
System ID	The component system ID.	Not editable property.	For all compositors.

xs:any

Figure: The xs:any Component

Enables the author to extend the XML document with elements not specified by the schema. See more info at http://www.w3.org/TR/xmlschema11-1/#element-any.

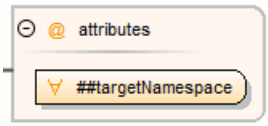
The graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the wildcard are drawn using dotted lines if the wildcard is optional.

Table 57. *xs:any* Properties

Property Name	Description	Possible Values
Namespace	The list of allowed namespaces. The namespace attribute expects a list of namespace URIs. In this list, two values have a specific meaning: '##targetNamespace' stands for the target namespace, and '##local' stands for local attributes (without namespaces).	##any, ##other, ##targetNamespace, ##local or anyURI
notNamespace	Specifies the namespace that extension elements or attributes cannot come from.	##local, ##targetNamespace
notQName	Specifies an element or attribute that is not allowed.	##defined
Process Contents	Type of validation required on the elements allowed for this wildcard.	skip, lax, strict
Min Occurs	Minimum occurrences of any	A numeric positive value. Default is 1.
Max Occurs	Maximum occurrences of any	A numeric positive value. Default is 1.
ID	The component ID.	Any ID.
Component	The name of the edited component.	Not editable property.
System ID	The component system ID.	Not editable property.

xs:anyAttribute

Figure: The xs:anyAttribute Component



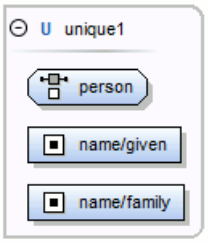
Enables the author to extend the XML document with attributes not specified by the schema. See more info at http://www.w3.org/TR/xmlschema11-1/#element-anyAttribute.

Table 58. *xs:anyAttribute* Properties

Property Name	Description	Possible Value
Namespace	The list of allowed namespaces. The namespace attribute expects a list of namespace URIs. In this list, two values have a specific meaning: '##targetNamespace' stands for the target namespace, and '##local' stands for local attributes (without namespaces).	##any, ##other, ##targetNamespace, ##local or anyURI
Process Contents	Type of validation required on the elements allowed for this wildcard.	skip, lax, strict
ID	The component ID.	Any ID.
Component	The name of the edited component.	Not editable property.
System ID	The component system ID.	Not editable property.

xs:unique

Figure: The xs:unique Component



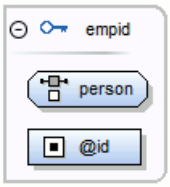
Defines that an element or an attribute value must be unique within the scope. See more info at http://www.w3.org/TR/xmlschema11-1/#element-unique.

Table 59. *xs:unique* Properties

Property Name	Description	Possible Values
Name	The unique name. Always required.	Any NCName.
ID	The component ID.	Any ID.
Component	The edited component name.	Not editable property.
Namespace	The component namespace.	Not editable property.
System ID	The component system ID.	Not editable property.

xs:key

Figure: The xs:key Component



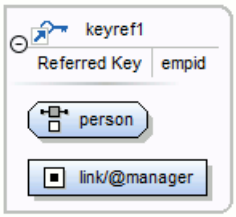
Specifies an attribute or element value as a key (unique, non-nullable and always present) within the containing element in an instance document. See more info at http://www.w3.org/TR/xmlschema11-1/#element-key.

Table 60. *xs:key* Properties

Property Name	Description	Possible Value
Name	The key name. Always required.	Any NCName.
ID	The component ID.	Any ID.
Component	The edited component name.	Not editable property.
Namespace	The component namespace.	Not editable property.
System ID	The component system ID.	Not editable property.

xs:keyRef

Figure: The xs:keyRef Component



Specifies that an attribute or element value corresponds to that of the specified key or unique element. See more info at http://www.w3.org/TR/xmlschema11-1/#element-keyref.

A keyref by default displays the *Referenced Key* property when rendered.

Table 61. *xs:keyRef* Properties

Property Name	Description	Possible Values
Name	The keyref name. Always required.	Any NCName.
Referenced Key	The name of referenced key.	any declared element constraints.

Property Name	Description	Possible Values
ID	The component ID.	Any ID.
Component	The edited component name.	Not editable property.
Namespace	The component namespace.	Not editable property.
System ID	The component system ID.	Not editable property.

xs:selector

Figure: The xs:selector Component

Specifies an XPath expression that selects a set of elements for an identity constraint. See more info at http://www.w3.org/TR/xmlschema11-1/#element-selector.

Table 62. *xs:selector* Properties

Property Name	Description	Possible Values
XPath	Relative XPath expression identifying the element that the constraint applies to.	An XPath expression.
ID	The component ID.	Any ID.
Component	The edited component name.	Not editable property.
System ID	The component system ID.	Not editable property.

xs:field

Figure: The xs:field Component

Specifies an XPath expression that specifies the value used to define an identity constraint. See more info at http://www.w3.org/TR/xmlschema11-1/#element-field.

Table 63. *xs:field* Properties

Property Name	Description	Possible Values
XPath	Relative XPath expression identifying the field(s) composing the key, key reference, or unique constraint.	An XPath expression.
ID	The component ID.	Any ID.

Property Name	Description	Possible Values
Component	The edited component name.	Not editable property.
System ID	The component system ID.	Not editable property.

xs:assert

Assertions provide a flexible way to control the occurrence and values of elements and attributes available in an XML Schema.

Note: *xs:assert* is available for XML Schema 1.1.

Figure: The xs:assert Component

Table 64. *xs:assert* Properties

Property Name	Description	Possible Values
Test	Specifies an XPath expression. If the XPath condition is valid, the specified type is selected as the element type. The expressions allowed are limited to a subset of XPath 2.0. Only the attributes of the current element and inheritable attributes from ancestor elements are accessible in the XPath expression. When you edit this property, the content completion list of proposals offers XPath expressions.	An XPath expression.
XPath Default Namespace	The default namespace used when the XPath expression is evaluated.	##defaultNamespace, ##targetNamespace, ##local.
ID	Specifies the component ID.	Any ID.
Component	The edited component name.	Not editable property.
System ID	The component system ID.	Not editable property.

xs:openContent

Figure: The xs:openContent Component

The *openContent* element enables instance documents to contain extension elements to be inserted amongst the elements declared by the schema. You can declare open content for your elements at one place (within the *complexType* definition) or at the schema level.

For further details about the *openContent* component, go to http://www.w3.org/TR/xmlschema11-1/#element-openContent.

Table 65. *xs:openContent* Properties

Property Name	Description	Possible Value
Mode	Specifies where the extension elements can be inserted.	The value can be: "interleave", "suffix" or "none". The default value is "interleave".
ID	The component ID.	Any ID.
Component	The edited component name.	Not editable property.
System ID	The component system ID.	Not editable property.

Note: This component is available for XML Schema 1.1 only. To change the version of the XML Schema, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **XML > XML Parser > XML Schema**.

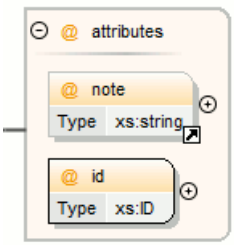
Constructs Used to Group Schema Components

This section explains the components that can be used for grouping other schema components:

- Attributes *(page 1271)*
- Constraints *(page 1272)*
- Substitutions *(page 1272)*

Attributes

Figure: Attributes Construct



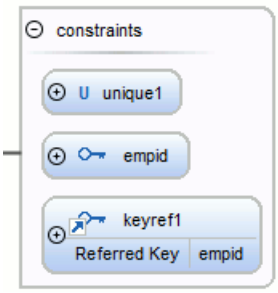
Groups all attributes and attribute groups belonging to a complex type.

Table 66. *attributes* Properties

Property Name	Description	Possible Values
Component	The element for which the attributes are displayed.	Not editable property.
System ID	The component system ID.	Not editable property.

Constraints

Figure: Constraints Construct



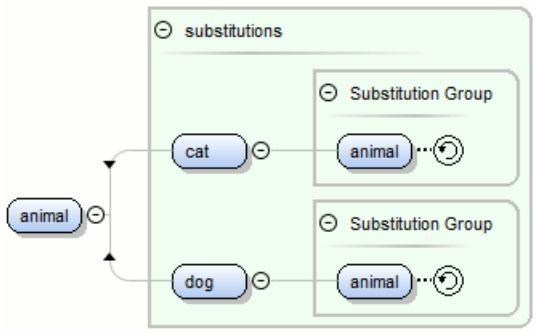
Groups all constraints (*xs:key (page 1267)*, *xs:keyRef (page 1268)* or *xs:unique (page 1267)*) belonging to an element.

Table 67. *constraints* Properties

Property Name	Description	Possible Values
Component	The element for which the constraints are displayed.	Not editable property.
System ID	The component system ID.	Not editable property.

Substitutions

Figure: Substitutions Construct



Groups all elements that can substitute the current element.

Table 68. *substitutions* Properties

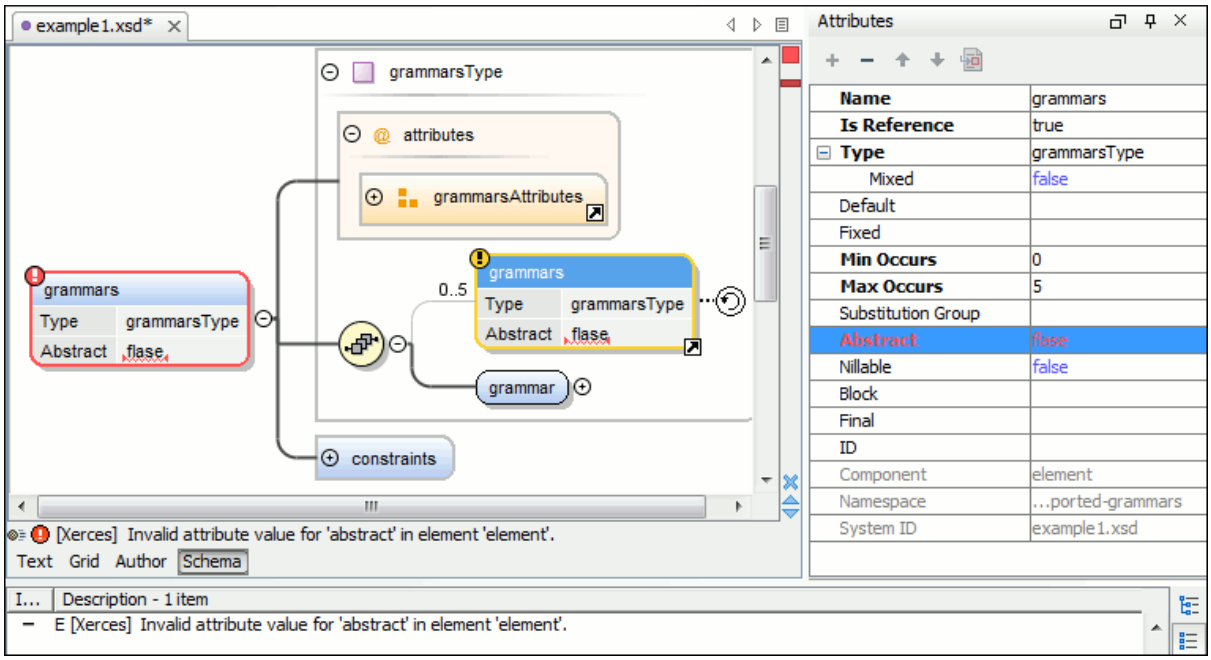
Property Name	Description	Possible Values
Component	The element for which the substitutions are displayed.	Not editable property.

Property Name	Description	Possible Values
System ID	The component system ID.	Not editable property.

Schema Validation

Validation for the **Design** mode is seamlessly integrated in the Oxygen XML Editor XML documents validation *(page 1068)* capability.

Figure: XML Schema Validation



A schema validation error is presented by highlighting the invalid component:

- In the Attributes View *(page 622)*.
- In the diagram by surrounding the component that has the error with a red border.
- A marker on the errors stripe at the right of the diagram view.
- A status label with a red icon (●) below the diagram view.

Invalid facets for a component are highlighted in the Facets View *(page 624)*.

Components with invalid properties are rendered with a red border. This is a default color, but you can customize it in the Document checking user preferences *(page 156)*. When hovering an invalid component, the tooltip will present the validation errors associated with that component.

When editing a value that is supposed to be a qualified or unqualified XML name, the application provides automatic validation of the entered value. This proves to be very useful in avoiding setting invalid XML names for the given property.

If you validate the entire schema using the **Validate** action from the **Document > Validate** menu or from the **Validation** toolbar drop-down menu, all validation errors will be presented in the **Errors** tab. To resolve an error, just click it (or double-click for errors located in other schemas) and the corresponding schema component will be displayed as the diagram root so that you can easily correct the error.

Important: If the schema imports only the namespace of other schema without specifying the schema location and a catalog is set-up *(page 1110)* that maps the namespace to a certain location both the validation and the diagram will correctly identify the imported schema.

Tip: If the validation action finds that the schema contains unresolved references, the application will suggest the use of validation scenarios, but only if the current edited schema is an XML Schema module.

Edit Schema Namespaces

You can use the **XML Schema Namespaces** dialog box to easily set a target namespace and define namespace mappings for a newly created XML Schema. In the **Design** mode these namespaces can be modified anytime by choosing **Edit Schema Namespaces** from the contextual menu. You can also do this by double-clicking the schema root in the diagram.

The **XML Schema Namespaces** dialog box allows you to edit the following information:

- **Target namespace** - The target namespace of the schema.
- **Prefixes** - The dialog box displays a table with namespaces and the mapped prefixes. You can add a new prefix mapping or remove an already existing one.

Editing XML Schema in Text Editing Mode

The Oxygen XML Editor **Text** editing mode can be used for editing XML Schema in a source editing mode. It offers powerful content completion support, a synchronized Outline view, and multiple refactoring actions *(page 1291)*. The Outline view has two display modes: the standard outline *(page 345)* mode and the components *(page 620)* mode.

A diagram of the XML Schema can be presented side by side with the text. To activate the diagram presentation, select the *Show Full Model XML Schema diagram* option *(page 127)* in the **Diagram** preferences page *(page 126)*.

Editing XML Schema in the Master Files Context

Smaller interrelated modules that define a complex XML Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main XML document either using the *master files* support from the **Project** view *(page 719)*, or using a validation scenario.

To set a *master file* using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of a *master file (page 3231)* include:

- Correct validation of a module in the context of a larger schema structure.
- *Content Completion Assistant (page 3227)* displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.
- The **Outline** view *(page 620)* displays the components collected from the entire schema structure.

Validating XML Schema Documents

By default, XML Schema files are validated as you type. To change this, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option *(page 156)*.

To validate an XML Schema document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu. When Oxygen XML Editor validates an XML Schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Validation of an XML Schema containing a type definition with a `minOccurs` or `maxOccurs` attribute having a value larger than 256 limits the value to 256 and issues a warning about this restriction in the Message panel at the bottom of the Oxygen XML Editor window. Otherwise, for large values of the `minOccurs` and `maxOccurs` attributes, the validator fails with an **OutOfMemory** error that might make Oxygen XML Editor unusable without restarting the entire application.

Important: If the schema imports only a namespace without specifying the schema location and a catalog is set up *(page 1110)* to map the namespace to a certain location, both validation and the schema components will correctly identify the imported schema.

Related Information:

Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor offers *Quick Fixes (page 3233)* for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

Note: For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

Quick Fixes are available in **Text** mode and **Author** mode.

Oxygen XML Editor provides *Quick Fixes* for numerous types of problems, including the following:

Problem Type	Available Quick Fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value

Problem Type	Available Quick Fixes
References to an invalid ID	Change the reference to an already defined ID

Related Information:

Schematron Quick Fixes (SQF) *(page 1098)*

Content Completion in XML Schema

The intelligent *Content Completion Assistant (page 3227)* allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Editor > Content Completion**, and deselect the **Enable content completion** option *(page 166)*.

When active, the *Content Completion Assistant* displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on OS X)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

Depending on the selected schema version *(page 1324)*, Oxygen XML Editor populates the proposals list with information taken either from XML Schema 1.0 or 1.1.

Oxygen XML Editor helps you to easily reference a component by providing the list of proposals (complex types, simple types, elements, attributes, groups, attribute groups, or notations) valid in the current context. The components are collected from the current file or from the imported/included schemas.

When editing `xs:annotation/xs:appinfo` elements of an XML Schema, the *Content Completion Assistant* proposes elements and attributes from a custom schema (by default ISO Schematron). This feature can be configured from the XSD Content Completion *(page 170)* preferences page.

Syntax Highlighting in XML Schema

Oxygen XML Editor supports syntax highlighting when editing XML Schema in **Text** mode to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for XML Schema files, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*.
2. Go to **Editor > Syntax Highlight** *(page 171)*.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XSD** tab in the **Preview** pane to see the effects of your changes.

Tip: Oxygen XML Editor also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page *(page 172)*.

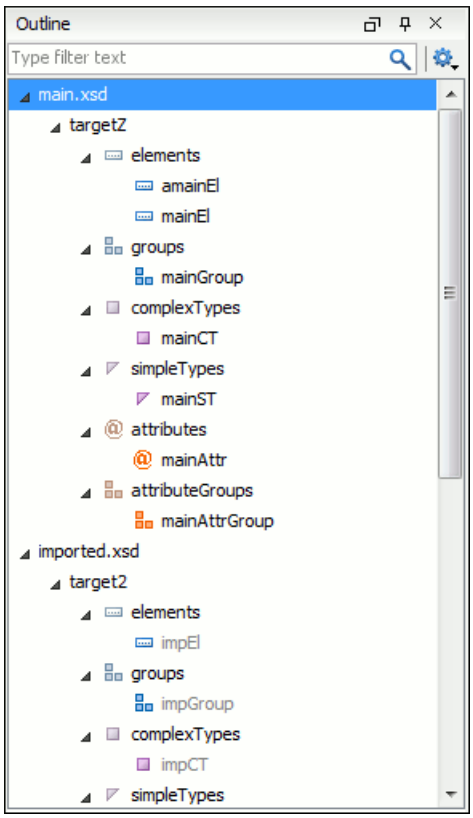
Related Information:

Customize Syntax Highlight colors *(page 171)*

XML Schema Outline View

The **Outline** view for XML Schemas presents all the global components grouped by their location, namespace, or type. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: Outline View for XML Schema



The **Outline** view provides the following options in the **Settings** menu on the **Outline** view toolbar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches;

Selection update on cursor move

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram is also selected in the **Outline** view.

Sort

Allows you to sort alphabetically the schema components.

Show all components

Displays all components that were collected starting from the *master files (page 3231)*. Components that are not referable from the current file are marked with an orange underline. To reference them, add an import directive with the `componentNS` namespace.

Show referable components

Displays all components (collected starting from the *master files (page 3231)*) that can be referenced from the current file. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/namespace/type

These three operations allow you to group the components by location, namespace, or type. When grouping by namespace, the main schema target namespace is the first presented in the **Outline** view.

The following contextual menu actions are available in the **Outline** view:

Remove (Delete)

Removes the selected item from the diagram.

Search References (Ctrl (Meta on Mac OS)+Shift+R)

Searches all references of the item found at current cursor position in the defined scope, if any.

Search References in

Searches all references of the item found at current cursor position in the specified scope.

Component Dependencies (Ctrl (Meta on Mac OS)+Shift+F4)

Opens the **Component Dependencies** view *(page 1289)* that allows you to see the dependencies for the current selected component.

Resource Hierarchy (F4)

Opens the **Resource Hierarchy / Dependencies** view *(page 1117)* that allows you to see the hierarchy for the current selected resource.

Resource Dependencies (Shift + F4)

Opens the **Resource Hierarchy / Dependencies** view *(page 1117)* that allows you to see the dependencies for the current selected resource.

Rename Component in

Renames the selected component.

Generate Sample XML Files

Generate XML files using the current opened schema. The selected component is the XML document root.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are

presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

Tip: The search filter is case insensitive. The following wildcards are accepted:

- ***** - any string
- **?** - any character
- **,** - patterns separator

If no wildcards are specified, the string to search will be searched as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

XML Schema Component Dependencies View *(page 1289)*

XML Schema Resource Hierarchy / Dependencies View *(page 1286)*

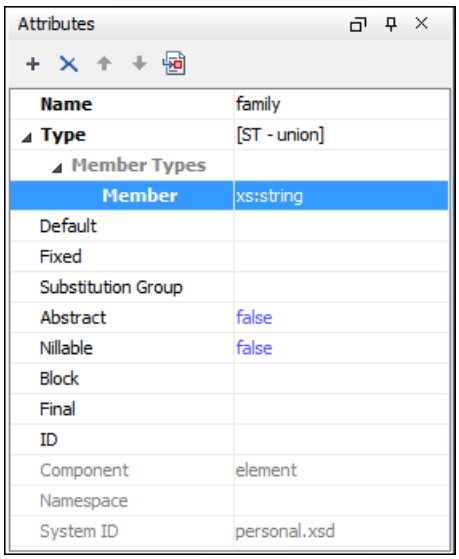
Generating Sample XML Files *(page 1295)*

Editing Relax NG Schema in the Master Files Context *(page 1380)*

XML Schema Attributes View

The **Attributes** view for XML Schemas presents the properties for the selected component in the schema diagram. By default, it is displayed on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: Attributes View



The default value of a property is presented in the **Attributes** view with blue foreground. The properties that can not be edited are rendered with gray foreground. A non-editable category that contains at least one child is rendered with bold. Bold properties are properties with values set explicitly to them.

Properties for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a property by double-clicking by pressing Enter. For most properties you can choose valid values from a list or you can specify another value. If a property has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, properties with errors are highlighted with red and the properties with warnings are highlighted with yellow. You can customize these colors from the Document checking user preferences *(page 156)*.

For imports, includes and redefines, the properties are not edited directly in the **Attributes** view. A dialog box will open that allows you to specify properties for them.

The schema namespace mappings are not presented in **Attributes** view. You can view/edit these by choosing **Edit Schema Namespaces** from the contextual menu on the schema root. See more in the Edit Schema Namespaces *(page 1274)* section.

The **Attributes** view has five actions available on the toolbar and also on the contextual menu:

- **Add**

  Allows you to add a new member type to an union's member types category.

- **Remove**

Allows you to remove the value of a property.

Move Up

Allows you to move up the current member to an union's member types category.

Move Down

Allows you to move down the current member to an union's member types category.

Copy

Copy the attribute value.

Go to Definition

Shows the definition for the selected type.

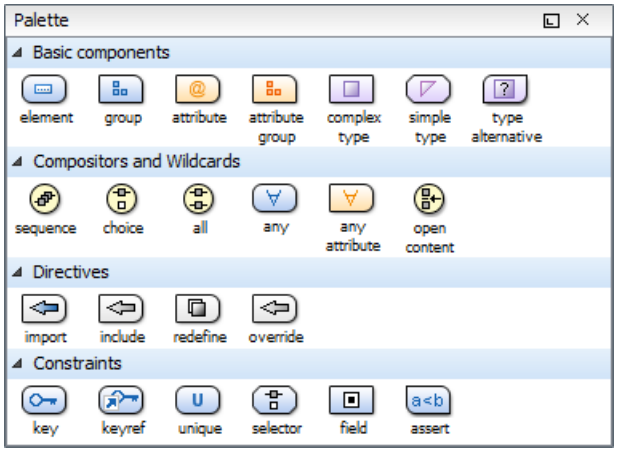
Show Facets

Allows you to edit the facets for a simple type.

XML Schema Palette View

The **Palette** view is designed to offer quick access to XML Schema components and to improve the usability of the XML Schema diagram builder. You can use the **Palette** to drag and drop components in the **Design** mode. The components offered in the **Palette** view depend on the XML schema version set in the **XML Schema** preferences page *(page 190)*. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: Palette View



Components are organized functionally into 4 collapsible categories:

- Basic components: *elements*, *group*, *attribute*, *attribute group*, *complex type*, *simple type*, *type alternative*.
- Compositors and Wildcards: *sequence*, *choice*, *all*, *any*, *any attribute*, *open content*.

- Directives: *import*, *include*, *redefine*, *override*.
- Identity constraints: *key*, *keyref*, *unique*, *selector*, *field*, *assert*.

Note: The *type alternative*, *open content*, *override*, and *assert* components are available for XML Schema 1.1.

To add a component to the edited schema:

- Click and hold a graphic symbol from the **Palette** view, then drag the component into the **Design** view.
- A line dynamically connects the component with the XML schema structure.
- Release the component into a valid position.

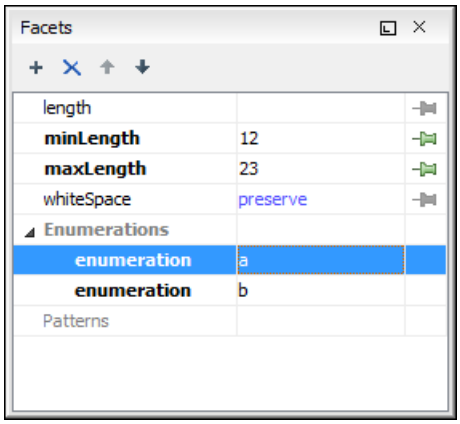
Note: You cannot drop a component into an invalid position. When you hover the component into an invalid position, the mouse cursor changes its shape into . Also, the connector line changes its color from the usual dark gray to the color defined in the **Validation error highlight color** option *(page 156)* (default color is red).

For more information about the Schema palette, watch our video demonstration:

XML Schema Facets View

The **Facets** view for XML Schemas presents the facets for the selected component, if available. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: Facets View



The default value of a facet is rendered in the **Facets** view with a blue color. The facets that can not be edited are rendered with a gray color. The grouping categories (for example: **Enumerations** and

Patterns) are not editable. If these categories contain at least one child they are rendered with bold. Bold facets are facets with values set explicitly to them.

Important: Usually inherited facets are presented as default in the **Facets** view but if patterns are inherited from a base type and also specified in the current simple type only the current specified patterns will be presented. You can see the effective pattern value obtained by combining the inherited and the specified patterns as a tooltip on the **Patterns** category.

Facets for components that do not belong to the current edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a facet by double-clicking it or by pressing Enter, when that facet is selected. For some facets you can choose valid values from a list or you can specify another value. If a facet has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, facets with errors are presented with red and the facets with warnings with yellow. You can customize the error colors from the Document Checking user preferences *(page 156)*.

The **Facets** view provides the following actions in its toolbar and contextual menu:

Add

Allows you to add a new enumeration or a new pattern.

Remove

Allows you to remove the value of a facet.

Edit Annotations

Allows you to edit an annotation for the selected facet.

Move Up

Allows you to move up the current enumeration/pattern in **Enumerations/Patterns** category.

Move Down

Allows you to move down the current enumeration/pattern in **Enumerations/Patterns** category.

Copy

Copy the attribute value.

Open in Regular Expressions Builder

Rather than editing regular expressions manually, this action allows you to open the pattern in the XML Schema Regular Expressions Builder *(page 1321)* that guides you through the process of testing and constructing the pattern..

Facets can be fixed to prevent a derivation from modifying its value. To fix a facet value just press the **Pin** button.

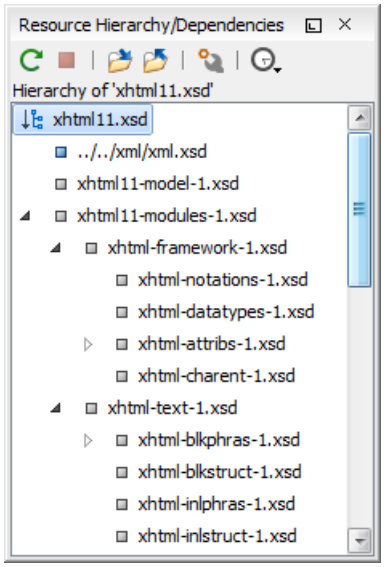
XML Schema Resource Hierarchy / Dependencies View

The **Resource Hierarchy / Dependencies** view allows you to easily see the hierarchy / dependencies for an XML Schema, a Relax NG schema *(page 1391)* or an XSLT stylesheet *(page 1191)*. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The **Resource Hierarchy / Dependencies** is useful when you want to start from an XML Schema (XSD) file and build and review the hierarchy of all the other XSD files that are imported, included or redefined in the given XSD file. The view is also able to build the tree structure, that is the structure of all other XSD files that import, include or redefine the given XSD file. The scope of the search is configurable (the current project, a set of local folders, etc.)

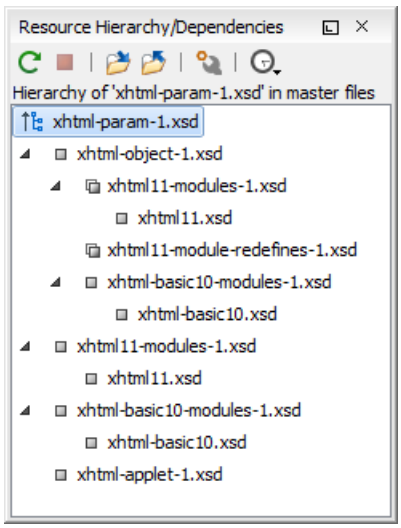
The build process for the hierarchy view is started with the **Resource Hierarchy** action available on the contextual menu of the editor panel.

Figure: Resource Hierarchy/Dependencies View - Hierarchy for `xhtml11.xsd`



The build process for the dependencies view is started with the **Resource Dependencies** action available on the contextual menu.

Figure: Resource Hierarchy/Dependencies View - Dependencies for `xhtml-param-1.xsd`



The following actions are available in the **Resource Hierarchy/Dependencies** view:

Refresh

Refreshes the Hierarchy/Dependencies structure.

Stop

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the **Master Files** directory *(page 719)*.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

Note: The **Move resource** or **Rename resource** actions give you the option to update the references to the resource *(page 1288)*.

Related Information:

Working with Modular XML Files in the Master Files Context *(page 1114)*

Search and Refactor Operations Scope *(page 1116)*

Moving/Renaming XML Schema Resources

You can move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Select this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is selected, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

XML Schema Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

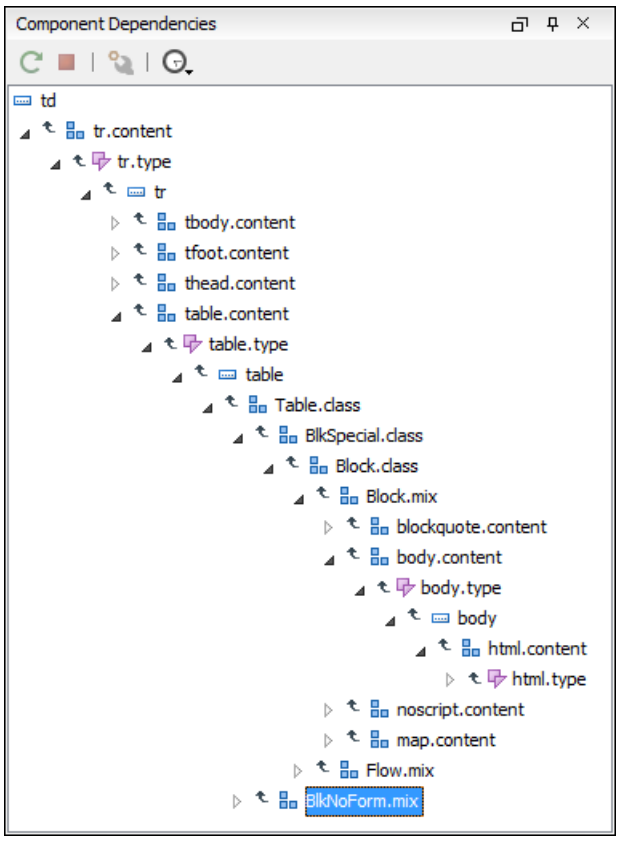
To see the dependencies of an XML Schema component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named components (for example, elements or attributes).

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

Figure: Component Dependencies View - Hierarchy for `xhtml11.xsd`



The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

For more information, see the **Maintain Complex XML Schemas** section of our **Developing XML Schemas** video demonstration:

Related Information:

Search and Refactor Operations Scope *(page 1116)*

Highlight Component Occurrences

When a component (for example types, elements, attributes) is found at current cursor position, Oxygen XML Editor performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document. Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is on by default. To configured it, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Editor > Mark Occurrences**. A search can also be triggered with the **Search > Search Occurrences in File ()** contextual menu action. All matches are displayed in a separate tab of the **Results** view *(page 354)*.

Searching and Refactoring Actions in XML Schemas

Search Actions

The following search actions can be applied on `attribute`, `attributeGroup`, `element`, `group`, `key`, `unique`, `keyref`, `notation`, `simple`, or `complex` types and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the

range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

- **Go to Definition** - Moves the cursor to the definition of the referenced XML Schema item.

  Note: You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on `attribute`, `attributeGroup`, `element`, `group`, `key`, `unique`, `keyref`, `notation`, `simple`, or `complex` types and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure: Rename Identity Constraint Dialog Box

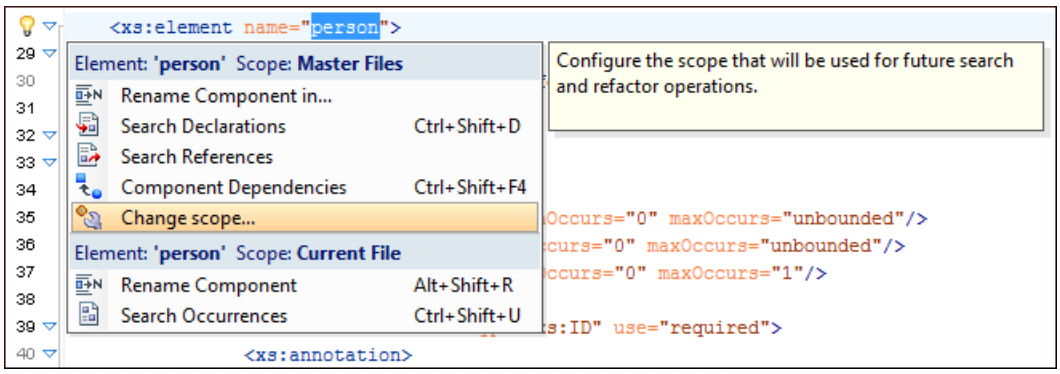
Search and Refactor Operations Scope *(page 1116)*

XML Schema Quick Assist Support

The *Quick Assist* support *(page 3233)* improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist* feature *(page 3233)* is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon ( ) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Alt + 1** (**Meta + Alt + 1** on Mac OS X) keyboard shortcuts.

Figure: Quick Assist Support



The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

For more information about improving schema development using the **Quick Assist** action set, watch our video demonstration:

Searching and Refactoring Actions *(page 1291)*

Generating Sample XML Files

Oxygen XML Editor offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in **XML Schema** preferences page *(page 190)*.

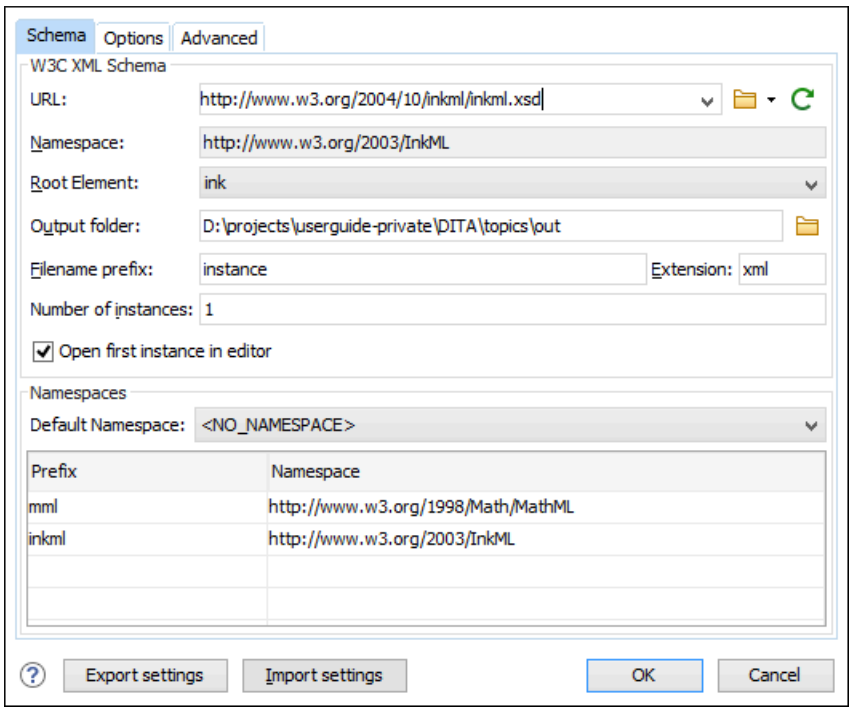
To generate sample XML files from an XML Schema, use the **Generate Sample XML Files** action from the **Tools** menu. This action is also available in the contextual menu of the schema Design mode *(page 1239)*. The action opens the **Generate Sample XML Files** dialog box that allows you to configure a variety of options for generating the files.

The **Generate Sample XML Files** dialog box contains three tabs with various configurable options. Default values for these options can be set in the **Sample XML Files Generator** preferences page *(page 193)*. You can also run the tool from the command line using exported options.

Schema Tab (Generate Sample XML Files Tool)

The **Generate Sample XML Files** tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The first set of options are found in the **Schema** tab.

Figure: Generate Sample XML Files Dialog Box (Schema Tab)



This tab includes the following options:

URL

Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the **Browse** drop-down list.

Namespace

Displays the namespace of the selected schema.

Root Element

After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

Output folder

Path to the folder where the generated XML instances will be saved.

Filename prefix and Extension

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: `prefixN.extension`, where `N` represents an incremental number from 0 up to the specified **Number of instances** *(page 1296)*.

Number of instances

The number of XML files to be generated.

Open first instance in editor

When selected, the first generated XML file is opened in the editor.

Namespaces section

You can specify the **Default Namespace**, as well as the prefixes for the namespaces.

Export settings

Use this button to save the current settings for future use.

Import settings

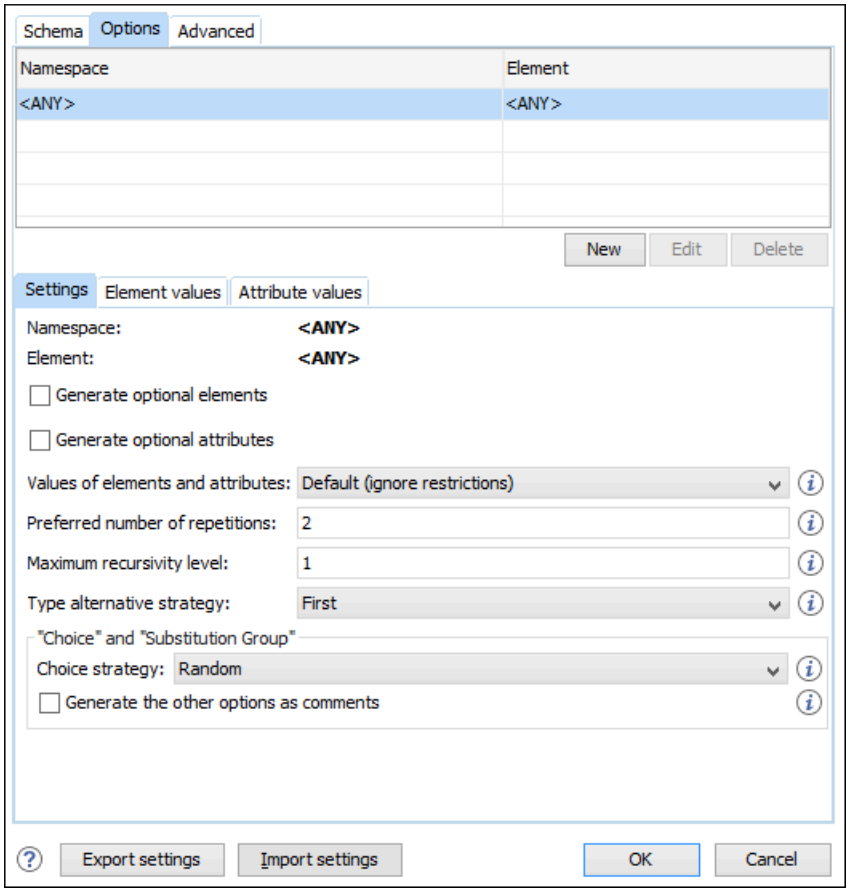
Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Options Tab (Generate Sample XML Files Tool)

The **Generate Sample XML Files** tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The **Options** tab allows you to set specific options for namespaces and elements.

Figure: Generate Sample XML Files Dialog Box (Options Tab)



This tab includes the following options:

Namespace / Element table

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces (`<ANY>` - `<ANY>`). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

Settings subtab

Namespace

Displays the namespace specified in the table at the top of the dialog box.

Element

Displays the element specified in the table at the top of the dialog box.

Generate optional elements

When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

Generate optional attributes

When selected, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending of data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the **Sample XML Files Generator** preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an **xs:string** with the **xs:maxLength** facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending of data type descriptor of the particular element or attribute.

Important: If all of the following are true, the **Generate Sample XML Files** tool outputs invalid values:

At least one of the restrictions is a `regexp`.
The value generated after applying the regexp does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the `xs:alternative` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

Choice strategy

Used for `xs:choice` or `substitutionGroup` elements. The possible strategies are:

- **First** - The first branch of `xs:choice` or the head element of `substitutionGroup` is always used.
- **Random** - A random branch of `xs:choice` or a substitute element or the head element of a `substitutionGroup` is used.

Generate the other options as comments

If selected, generates the other possible choices or substitutions (for `xs:choice` and `substitutionGroup`). These alternatives are generated

inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Element values subtab

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

Attribute values subtab

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

Export settings

Use this button to save the current settings for future use.

Import settings

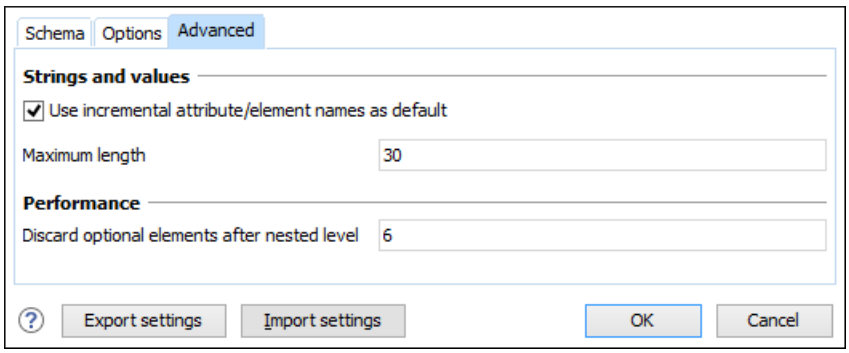
Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Advanced Tab (Generate Sample XML Files Tool)

The **Generate Sample XML Files** tool includes a dialog box that allows you to configure a variety of options for generating the XML files. The **Advanced** tab allows you to set some options in regards to output values and performance.

Figure: Generate Sample XML Files Dialog Box (Advanced Tab)



This tab includes the following options:

Use incremental attribute / element names as default

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `a` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

Running the Generate Sample XML Files Tool from the Command Line

The **Generate Sample XML Files** tool can be also used from command line by running the script called `xmlGenerator.bat` (on Windows) / `xmlGenerator.sh` (on Mac OS X / Unix / Linux) located in the Oxygen XML Editor installation folder. The parameters can be set in the dialog box, exported to an XML file on disk with the **Export settings** button, and then reused from command line. With the exported settings file, you can generate the same XML instances from the command line as from the dialog box. For example:

```
xmlGenerator.bat path_of_CFG_file
```

The script can be integrated in an external batch process launched from the command line. The command line parameter of the script is the relative path to the exported XML settings file. The files specified with relative paths in the exported XML settings will be made absolute relative to the folder where the script is run.

The following example shows such an XML configuration file:

```
<settings>
    <schemaSystemId>http://www.w3.org/2001/XMLSchema.xsd</schemaSystemId>
    <documentRoot>schema</documentRoot>
    <outputFolder>D:\projects\output</outputFolder>
    <filenamePrefix>instance</filenamePrefix>
    <filenameExtension>xml</filenameExtension>
    <noOfInstances>1</noOfInstances>
    <openFirstInstance>true</openFirstInstance>
    <defaultNamespace>&lt;NO_NAMESPACE></defaultNamespace>
    <element namespace="&lt;ANY>" name="&lt;ANY>">
        <generateOptionalElements>false</generateOptionalElements>
```

```
        <generateOptionalAttributes>false</generateOptionalAttributes>
        <valuesForContentType>DEFAULT</valuesForContentType>
        <preferredNumberOfRepetitions>2</preferredNumberOfRepetitions>
        <maximumRecursivityLevel>1</maximumRecursivityLevel>
        <choicesAndSubstitutions strategy="RANDOM"
                generateOthersAsComments="false"/>
        <attribute namespace="&lt;ANY>"
                name="&lt;ANY>">
            <attributeValue>attrValue1</attributeValue>
            <attributeValue>attrValue2</attributeValue>
        </attribute>
    </element>
    <element namespace="&lt;NO_NAMESPACE>"
            name="&lt;ANY>">
        <generateOptionalElements>true</generateOptionalElements>
        <generateOptionalAttributes>true</generateOptionalAttributes>
        <valuesForContentType>DEFAULT</valuesForContentType>
        <preferredNumberOfRepetitions>2</preferredNumberOfRepetitions>
        <maximumRecursivityLevel>1</maximumRecursivityLevel>
        <choicesAndSubstitutions strategy="RANDOM"
                generateOthersAsComments="true"/>
        <elementValue>value1</elementValue>
        <elementValue>value2</elementValue>
        <attribute namespace="&lt;ANY>"
                name="&lt;ANY>">
            <attributeValue>attrValue1</attributeValue>
            <attributeValue>attrValue2</attributeValue>
        </attribute>
    </element>
</settings>
```

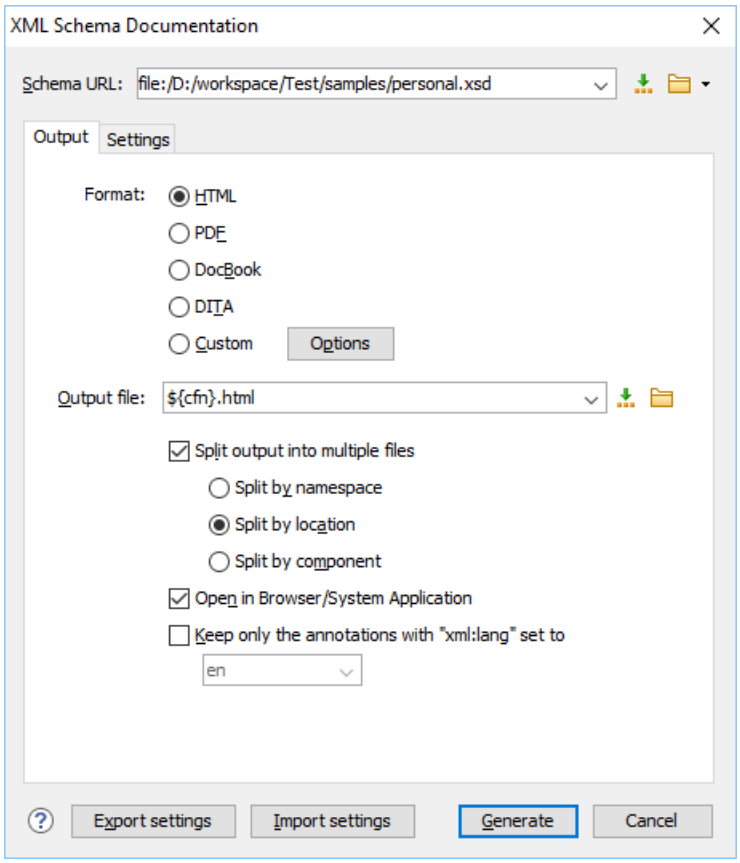
Generating Documentation for an XML Schema

Oxygen XML Editor can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

Note: You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select **XML Schema Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view *(page 332)*.

Figure: XML Schema Documentation Dialog Box



The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file for which you want to generate documentation. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  # **HTML** - The documentation is generated in HTML output format *(page 1307)*.
  # **PDF** - The documentation is generated in PDF output format *(page 1310)*.
  # **DocBook** - The documentation is generated in DocBook output format *(page 1310)*.
  # **DITA** - The documentation is generated in DITA output format *(page 1310)*.

    # **Custom** - The documentation is generated in a custom output format *(page 1310)*, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type. For DITA and DocBook documents, this option appears as **Open in Editor** and the result will be opened in Oxygen XML Editor (in the current editor).

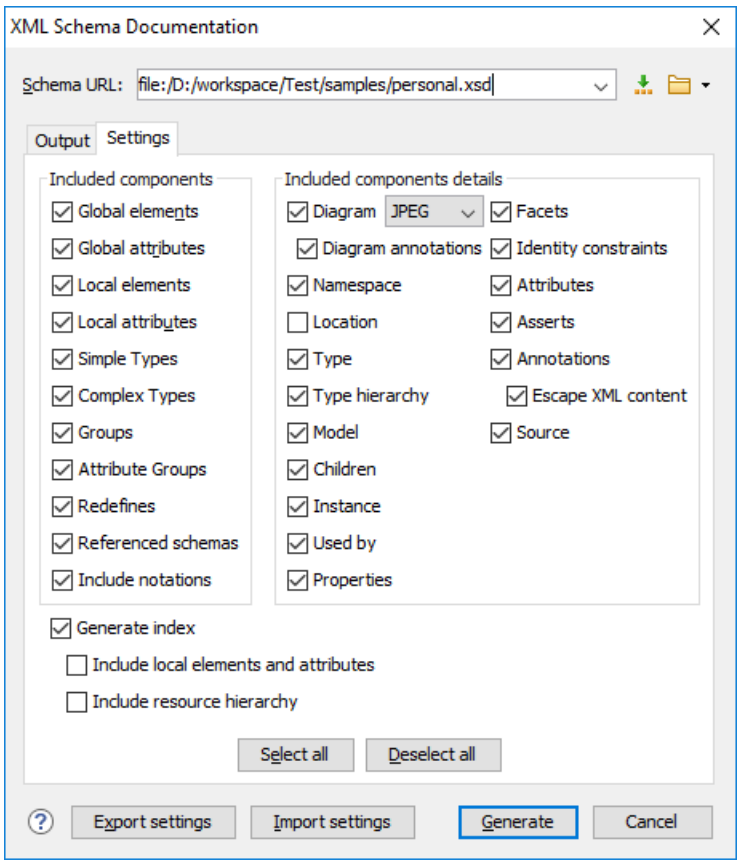
  Note: To set the browser or system application that will be used, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `xml:lang` attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

Settings Tab

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

Figure: Settings Tab of the XML Schema Documentation Dialog Box



The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the Schema Design Properties *(page 152)* page.
  - **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.
- **Namespace** - Displays the namespace for each component.
- **Location** - Displays the schema location for each component.
- **Type** - Displays the component type if it is not an anonymous one.
- **Type hierarchy** - Displays the types hierarchy.
- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:
  - `xs:all` - Its children will be separated by space characters.
  - `xs:sequence` - Its children will be separated by comma characters.

    # `xs:choice` - Its children will be separated by | characters.
- **Children** - Displays the list of component's children.
- **Instance** - Displays an XML instance generated based on each schema element.
- **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
- **Properties** - Displays some of the component's properties.
- **Facets** - Displays the facets for each simple type
- **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
- **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
- **Asserts** - Displays the **assert** elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
- **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.
- **Source** - Displays the text schema source for each component.
- **Generate index** - Displays an index with the components included in the documentation.
    # **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
    # **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command line interface *(page 1312)*.)

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XML Schema documentation.

Related Information:

Customizing PDF or DocBook Output of Generated XML Schema Documentation *(page 1310)*

Output Formats for Generating XML Schema Documentation

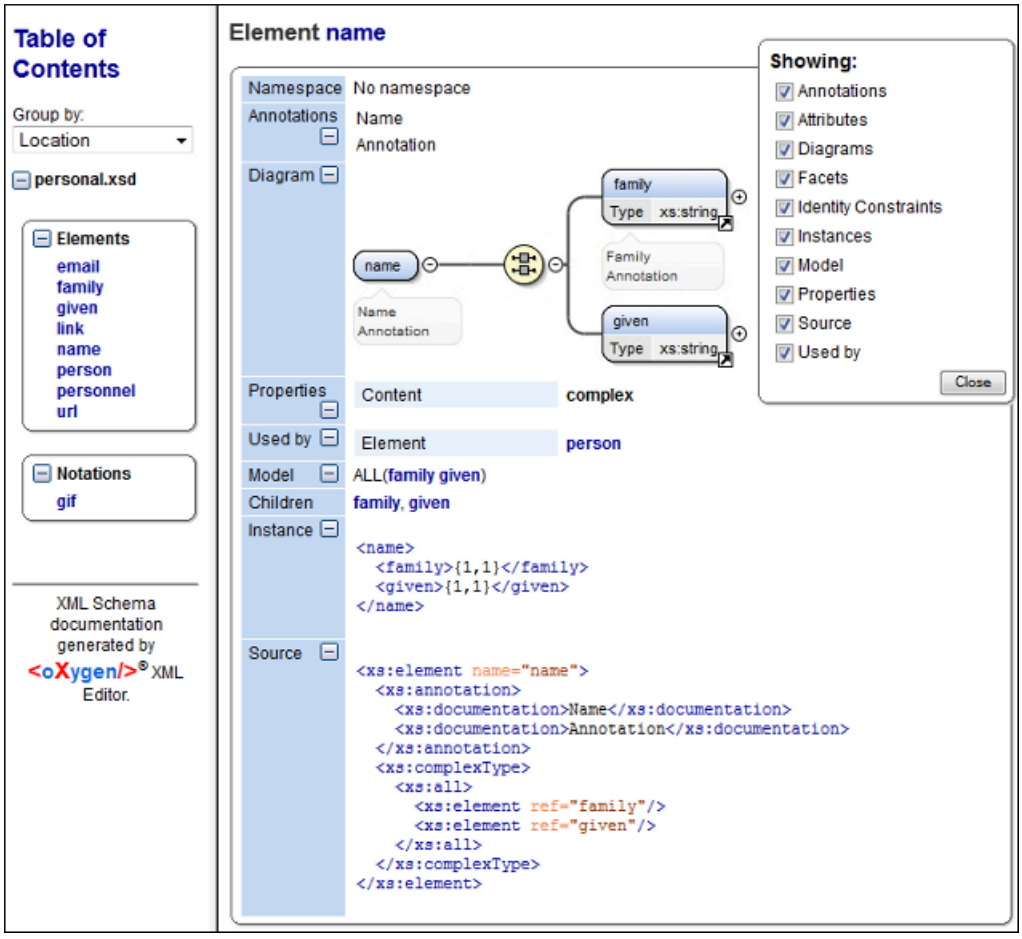
XML Schema documentation can be generated in HTML, PDF, DocBook, or a custom format. You can choose the format from the Schema Documentation *(page 1302)* dialog box. For the PDF and DocBook formats, the option to split the output in multiple files is not available.

HTML Output Format

The XML Schema documentation generated in HTML format contains images corresponding to the same schema definitions as the ones displayed by the schema diagram editor. *(page 617)* These images are divided in clickable areas that are linked to the definitions of the names of types or elements. The documentation of a definition includes a **Used By** section with links to the other definitions that reference it. If the **Escape XML Content** option is unchecked, the HTML or XHTML tags used inside the `xs:documentation` elements of the input XML Schema for formatting the documentation text (for example, `<b>`, `<i>`, `<u>`, `<ul>`, `<li>`, etc.) are rendered in the generated HTML documentation.

The generated images format is **PNG**. The image of an XML Schema component contains the graphical representation of that component as it is rendered in the schema diagram panel of the Oxygen XML Editor XSD editor panel. *(page 618)*

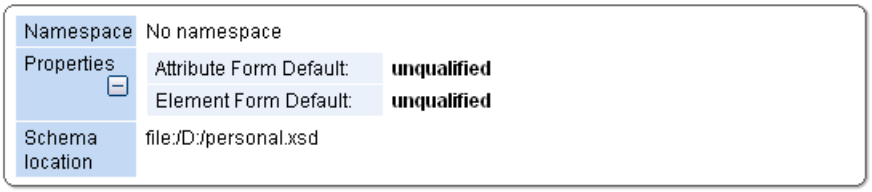
Figure: XML Schema Documentation Example



The generated documentation includes a table of contents. You can group the contents by namespace, location, or component type. After the table of contents there is some information about the main, imported, included, and redefined schemas. This information contains the schema target

namespace, schema properties (attribute form default, element form default, version), and schema location.

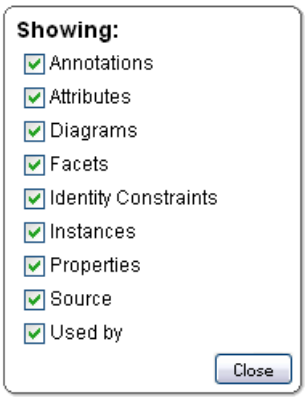
Figure: Information About a Schema



If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped in the same mode. If you split the output by location, each file contains a schema description and the components that you have chosen to include. If you split the output by namespace, each file contains information about schemas from that namespace and the list with all included components. If you choose to split the output by component, each file contains information about a schema component.

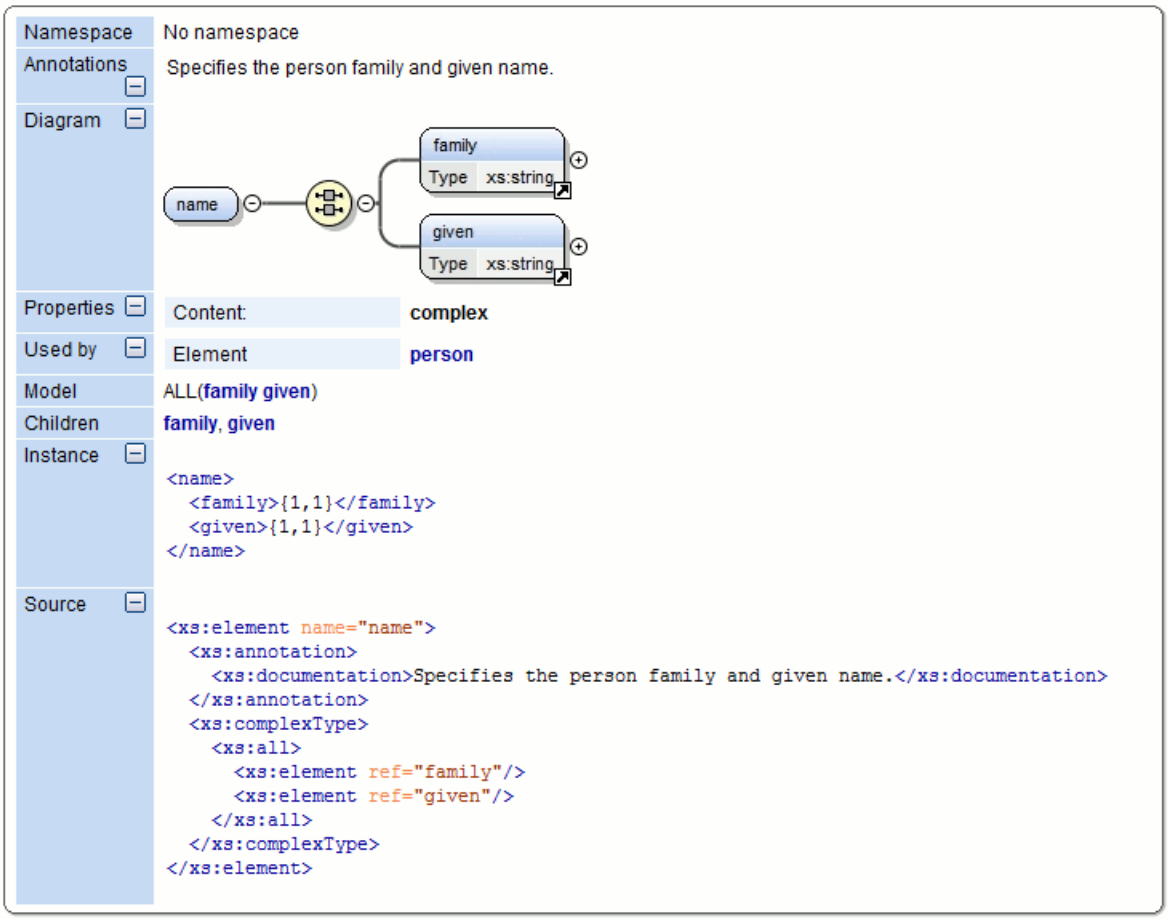
After the documentation is generated, you can collapse or expand details for some schema components by using the **Showing** options or the **Collapse** or **Expand** buttons.

Figure: Showing Options



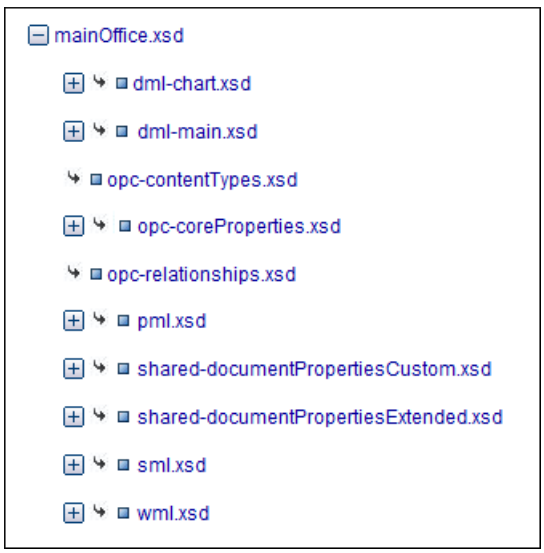
For each component included in the documentation, the section presents the component type follow by the component name. For local elements and attributes, the name of the component is specified as *parent name/component name*. You can easily go to the parent documentation by clicking the parent name.

Figure: Documentation for a Schema Component



If the schema contains imported or included modules, their dependencies tree is generated in the documentation.

Figure: Example: Generated Documentation



PDF Output Format

For the PDF output format, the documentation is generated in DocBook format and a transformation using the FOP processor is applied to obtain the PDF file. To configure the FOP processor, see the FO Processors *(page 212)* preferences page.

For information about customizing the PDF output, see Customizing PDF or DocBook Output of Generated XML Schema Documentation *(page 1310)*.

DocBook Output Format

If you generate the documentation in DocBook output format, the documentation is generated as a DocBook XML file. You can then apply a built-in DocBook transformation scenario *(page 1638)* (such as, *DocBook PDF* or *DocBook HTML*) on the output file, or configure your own transformation scenario *(page 1644)* to convert it into whatever format you desire.

For information about customizing the DocBook output, see Customizing PDF or DocBook Output of Generated XML Schema Documentation *(page 1310)*.

DITA Output Format

If you generate the documentation in DITA output format, each element of the schema is converted to a DITA *Topic* and all the generated topics are referenced in a *DITA map (page 3228)* file. You can then apply a built-in DITA transformation scenario *(page 1614)* (such as, *DITA Map PDF* or *DITA Map XHTML*), or configure your own DITA OT transformation scenario *(page 1667)* to convert it into whatever format you desire.

For information about customizing the DITA output, see Customizing DITA Output of Generated XML Schema *(page 1312)*.

Custom Output Format

For the custom format, you can specify a stylesheet to transform the intermediary XML file generated in the documentation process. You have to edit your stylesheet based on the schema `xsdDocSchema.xsd` from *`[OXYGEN_INSTALL_DIR]`*`/frameworks/schema_documentation`. You can create a custom format starting from one of the stylesheets used in the built-in HTML, PDF, DocBook, and DITA formats. These stylesheets are available in *`[OXYGEN_INSTALL_DIR]`*`/frameworks/schema_documentation/xsl`.

When using a custom format you can also copy additional resources into the output folder and choose to keep the intermediate XML files created during the documentation process.

Important: If you create a custom format for DITA, you must select the **Split output into multiple files** option in the **Output** tab *(page 1304)* and choose **Split by component**.

Customizing PDF or DocBook Output of Generated XML Schema Documentation

To customize the PDF or DocBook output of the generated XML Schema documentation, use the following procedure:

1. Customize the *[OXYGEN_INSTALL_DIR]*`/frameworks/schema_documentation/xsl/xsdDocDocbook.xsl` stylesheet to include the content that you want to add in the PDF or DocBook output. Add the content in the XSLT template with the `match="schemaDoc"` attribute between the `info` and `xsl:apply-templates` elements, as commented in the following example:

```
<info>
    <pubdate><xsl:value-of select="format-date(current-date(),
         '[Mn] [D], [Y]', 'en', (), ())"/></pubdate>
</info>
   <!-- Add the XSLT template content with match="schemaDoc" attribute here -->

<xsl:apply-templates select="schemaHierarchy"/>
```

2. Create an intermediary file that holds the content of your XML Schema documentation by following these steps:
   a. Go to **Tools > Generate Documentation > XML Schema Documentation**.
   b. Select **Custom** for the output format and click the **Options** button.
   c. In the **Custom format options** dialog box, do the following:
      i. Enter the customized stylesheet in the **Custom XSL** field (*[OXYGEN_INSTALL_DIR]*`/frameworks/schema_documentation/xsl/xsdDocDocbook.xsl`).
      ii. Select the **Copy additional resources to the output folder** option and leave the default selection in the **Resources** field.
      iii. Click **OK**.
   d. When you return to the **XML Schema Documentation** dialog box, just press the **Generate** button to generate a DocBook XML file with an intermediary form of the Schema documentation.
3. If you want the DocBook file to be transformed into a PDF document, follow these steps:
   a. Use the **Configure Transformation Scenario(s)** action from the toolbar or the **Document > Transformation** menu, click **New**, and select **XML transformation with XSLT**.
   b. In the **New Scenario** dialog box, go to the **XSL URL** field and choose the *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/oxygen/xsdDocDocbookCustomizationFO.xsl` file.
   c. Go to the **FO Processor** tab and select the **Perform FO Processing** and **XSLT result as input** options.

d. Go to the **Output** tab and select the directory where you want to store the XML Schema documentation output and click **OK**.
e. Click **Apply Associated**.

Tip: If you want your modifications to be permanent so that you can simply select the PDF output format in the **XML Schema Documentation** dialog box, rather than configuring a custom format each time you generate this documentation, follow this procedure:

1. Create a *JAR (page 3230)* or ZIP file that includes the modified stylesheet (customized in step 1 above), placed in the following directory structure: `builtin/documentation/schema_documentation/xsdDocDocbook.xsl`.
2. Create a new directory named `endorsed` inside the *`[OXYGEN_INSTALL_DIR]`*`/lib` directory and place the created *JAR* or ZIP file inside it.
3. Restart Oxygen XML Editor and the PDF output format will now use your customized stylesheet.

Customizing DITA Output of Generated XML Schema

To customize the DITA output of the generated XML Schema documentation, use the following procedure:

1. Customize the *`[OXYGEN_INSTALL_DIR]`*`/frameworks/schema_documentation/xsl/xsdDocDita.xsl` stylesheet to incorporate your desired changes.
2. Create an intermediary file that holds the content of your XML Schema documentation by following these steps:
   a. Go to **Tools > Generate Documentation > XML Schema Documentation**.
   b. Select **Custom** for the output format and click the **Options** button.
   c. In the **Custom format options** dialog box, do the following:
      i. Enter the customized stylesheet in the **Custom XSL** field (*`[OXYGEN_INSTALL_DIR]`*`/frameworks/schema_documentation/xsl/xsdDocDita.xsl`).
      ii. Select the **Copy additional resources to the output folder** option and leave the default selection in the **Resources** field.
      iii. Click **OK**.
   d. Make sure the **Split output into multiple files** option *(page 1304)* is selected and choose **Split by component**.
   e. When you return to the **XML Schema Documentation** dialog box, just press the **Generate** button to generate a DITA map file that contains the XML Schema documentation.

Generating XML Schema Documentation From the Command-Line Interface

You can export the settings of the **XML Schema Documentation** dialog box *(page 1302)* to an XML file by pressing the **Export settings** button. With the exported configuration file, you can generate the same documentation from the command-line interface by running the following script:

- `schemaDocumentation.bat` on Windows.
- `schemaDocumentation.sh` on OS X / Linux.

The script is located in the Oxygen XML Editor installation folder. The script can be integrated in an external batch process launched from the command-line interface. The script accepts a variety command line arguments that allow you to configure the documentation.

The accepted syntax and arguments are as follows:

schemaDocumentation schemaFile [**[-cfg:configFile]** | [**[-out:outputFile] [-format:<value>] [-xsl:<xslFile>] [-split:<value>] [-openInBrowser:<value>]**] | **--help** | **-help** | **--h** | **-h**]

schemaFile

The XML Schema file.

-cfg:configfile

The exported configuration file. It contains the output file, output format options, split method, and some advanced options regarding the included components and components details. If an external configuration file is specified, all other supplied arguments except for the XML Schema file will be ignored.

-out:outputFile

The file where the generated documentation will be saved. By default, it is the name of the schema file with an *html* extension.

-format:<value>

The output format type used when generating the documentation. Possible values are as follows:

- `html` - To generate documentation in HTML format.
- `pdf` - To generate documentation in PDF format.
- `docbook` - To generate documentation in DocBook format.
- `custom` - To generate documentation in a custom format.

-xsl:<xslFile>

The XSL file to be applied on the intermediate XML format. If there is no XSL file provided, the result will be in the HTML format.

-split:<value>

The split method used when generating the documentation. Splitting is recommended for large schemas. Possible values are as follows:

- `none` (default value) - To generate one single output file.
- `namespace` - To generate an output file for every namespace in the schema.
- `component` - To generate an output file for every component in the schema.
- `location` - To generate an output file for every schema location.

-openInBrowser:<value>

Opens the result of the transformation in a browser or system application. Possible values are `true` or `false` (default value).

--help | -help | --h | -h

Displays the available options.

Example:

Example of the script in a Windows command line:

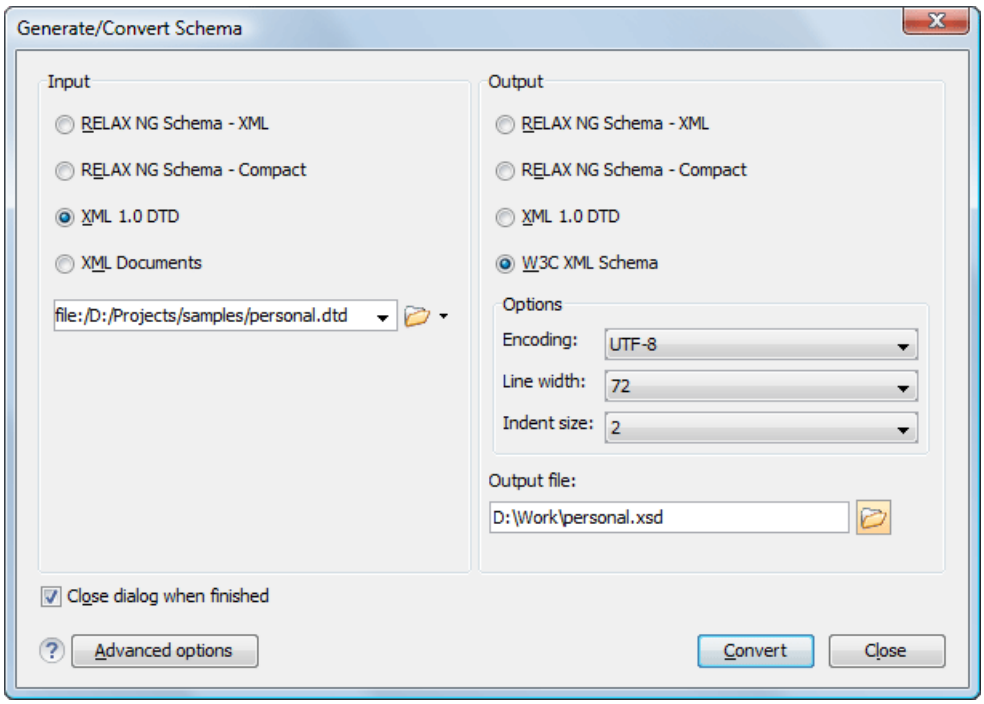
```
schemaDocumentation example.xsd -out:schemaDocumentation.html
    -format:custom -xsl:example.xsl -split:namespace
```

Converting Schema to Another Schema Language

The **Generate/Convert Schema** tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor generates an approximation of the source schema. Oxygen XML Editor uses *Trang multiple format converter* to perform the actual schema conversions.

To use this tool, select the **Generate/Convert Schema (Alt + Shift + C (Command + Alt + C on OS X))** action from the **Tools** menu or from the **Open with** submenu when invoking the contextual menu in the **Project** view *(page 332)*. This action opens the **Generate/Convert Schema** dialog box that allows you to configure various options for conversion.

Figure: Generate/Convert Schema Dialog Box



The **Generate/Convert Schema** dialog box includes the following options:

Input section

Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the **XML Documents** option and use the file selector to add the XML files involved in the conversion.

Output section

Allows you to select the language of the target schema.

Options

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

Output file

Specifies the path for the output file that will be generated.

Close dialog when finished

If you deselect this option, the dialog box will remain opened after the conversion so that you can easily continue to convert more files.

Advanced options

If you select **XML 1.0 DTD** for the input, you can click this button to access more advance options to further fine-tune the conversion. The following advanced options are available:

XML 1.0 DTD Input section

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.
- **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **annotation-prefix** - Default values are represented using an annotation attribute `prefix:defaultValue` where prefix is the specified value and is bound to `http://relaxng.org/ns/compatibility/annotations/1.0` as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.
- **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.
- **strict-any** - Preserves the exact semantics of *ANY* content models by using an explicit choice of references to all declared elements.

By default, the conversion engine uses a wildcard that allows any element

- **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.
- **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

W3C XML Schema Output section

This section is available if you select **W3C XML Schema** for the output.

- **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.
- **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the `processContents` attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).
- **any-attribute-process-contents** - Specifies the value for the `processContents` attribute of `anyAttribute` elements. The default is skip (corresponding to RELAX NG semantics).

Converting Database to XML Schema

Oxygen XML Editor includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.

   Result: The **Convert DB Structure to XML Schema** dialog box is opened and your current database connections are displayed in the **Connections** section.
2. If the database source is not listed, click the **Configure Database Sources** button to open the **Data Sources** preferences page *(page 227)* where you can configure data sources and connections.
3. In the **Format for generated schema** section, select one of the following formats:
   - **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.

- **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click **Connect**.

   Result: The database structure is listed in the **Select database tables** section according to the format you chose.

5. Select the database tables that you want to be included in the XML Schema.
6. If you selected **Hierarchical schema** for the format, you can configure the database columns.
   a. Select the database column you want to configure.
   b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
   c. You can also change the name of the selected database column by changing it in the **Name** text field.
7. Click **Generate XML Schema**.

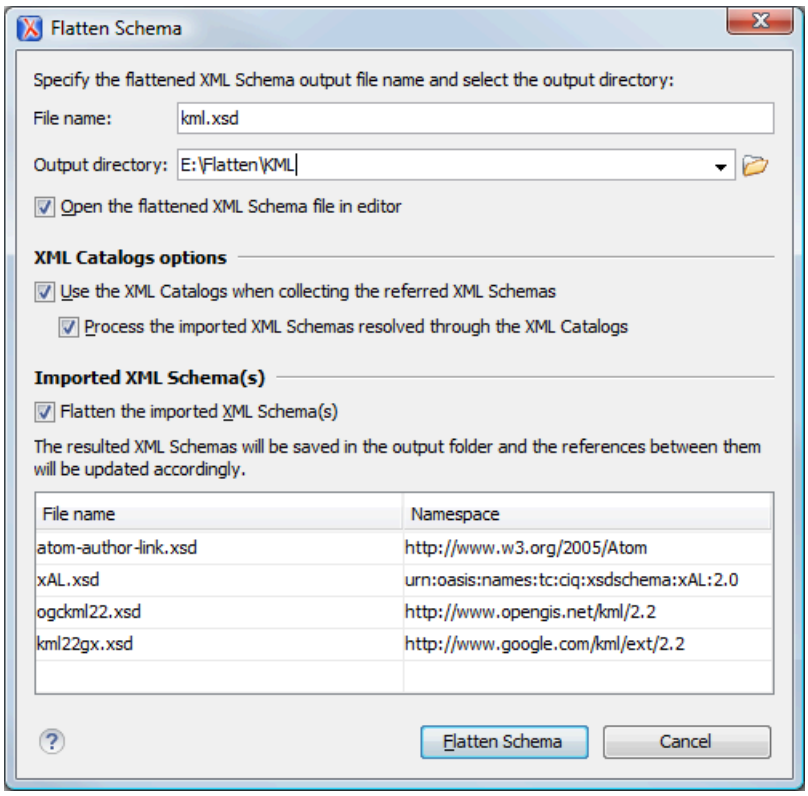
Result: The database structure is converted to an XML Schema and it is opened for viewing and editing.

Flatten an XML Schema

You can organize an XML schema linked by `xs:include` and `xs:import` statements on several levels. In some cases, working on such a schema as if it were a single file is more convenient than working on multiple files separately. The **Flatten Schema** operation allows you to flatten an entire hierarchy of XML schemas. Starting with the main XML schema, Oxygen XML Editor calculates its hierarchy by processing the `xs:include` and `xs:import` statements.

The **Flatten Schema** action is available from the **Tools** menu or the contextual menu in **Text** mode. The action opens the **Flatten Schema** dialog box that allows you to configure the operation.

Figure: Flatten Schema Dialog Box



For the main schema file and for each imported schema, a new flattened schema is generated in the specified output folder. These schemas have the same name as the original ones.

Note: If necessary, the operation renames the resulted schemas to avoid duplicated file names.

A flattened XML schema is obtained by recursively adding the components of the included schemas into the main one. This means Oxygen XML Editor replaces the `xs:include`, `xs:redefine`, and `xs:override` elements with the ones coming from the included files.

Options in the Flatten Schema Dialog Box

The following options are available in the **Flatten Schema** dialog box:

File name

The name of the output file.

Output directory

The path of the output directory where the flattened schema file will be saved.

Open the flattened XML Schema file in editor

Opens the main flattened schema in the editing area after the operation completes.

Use the XML Catalogs when collecting the referenced XML Schemas

Enables the imported and included schemas to be resolved through the available *XML Catalogs (page 3235)*.

Note: Changing this option triggers the recalculation of the dependencies graph for the main schema.

Process the imported XML Schemas resolved through the XML Catalogs

Specifies whether or not the imported schemas that were resolved through an *XML Catalog (page 3235)* are also processed.

Flatten the imported XML Schema(s)

Specifies whether or not the imported schemas are flattened.

Note: For the schemas skipped by the flatten operation, no files are created in the output folder and the corresponding import statements remain unchanged.

Flatten Schema from the Command Line

The **Flatten Schema** tool can be also ran from command line by using the following command:

- `flattenSchema.bat` on Windows
- `sh flattenSchema.sh` on OS X and Linux

The command line accepts the following parameters:

- `-in:inputSchemaURL` - The input schema URL.
- `-outDir:outputDirectory` - The directory where the flattened schemas should be saved.
- `-flattenImports:<boolean_value>` - Controls whether or not the imported XML Schemas should be flattened. The default value `true`.
- `-useCatalogs:<boolean_value>` - Controls if the references to other XML Schemas should be resolved through the available *XML Catalogs (page 3235)*. The default value `false`.
- `-flattenCatalogResolvedImports:<boolean_value>` - Controls whether or not the imported schemas that were resolved through the *XML Catalogs (page 3235)* should be flattened. The default value is `true`.

  Note: This option is used only when `-useCatalogs` is set to `true`.

- `-verbose` - Provides information about the current flatten XML Schema operation.
- `--help | -help | --h | -h` - Prints the available parameters for the operation.

Example: Command Line Example for Windows

```
flattenSchema.bat -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
   -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
```

```
      -flattenCatalogResolvedImports:true -verbose
```

Example: Command Line Example for OS X

```
sh flattenSchema.sh -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
    -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
       -flattenCatalogResolvedImports:true -verbose
```

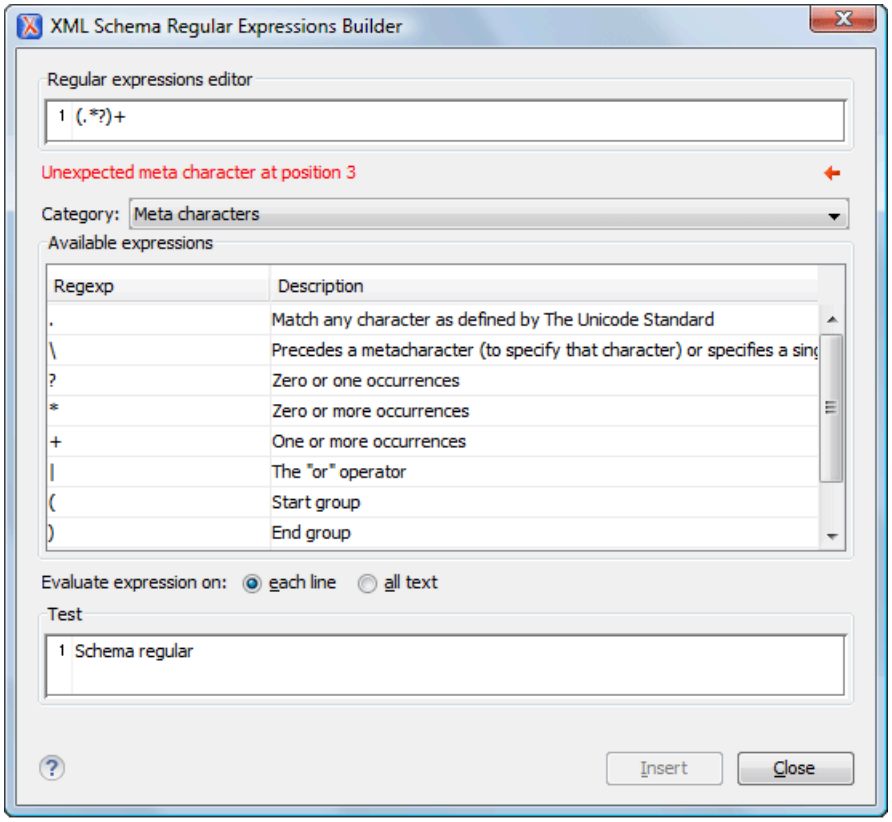
Example: Command Line Example for Unix/Linux

```
sh flattenSchema.sh -in:http://www.w3.org/MarkUp/SCHEMA/xhtml11.xsd
     -outDir:mySchemas/flattened/xhtml -flattenImports:true -useCatalogs:true
        -flattenCatalogResolvedImports:true -verbose
```

XML Schema Regular Expressions Builder

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting **XML Schema Regular Expressions Builder** from the **Tools** menu.

Figure: XML Schema Regular Expressions Builder Dialog Box



The dialog box contains the following:

Regular expressions editor

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing **Ctrl + Space (Command + Space on OS X)**.

Error display area

If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button ( ) highlights the error inside the regular expression.

Category

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the **Available expressions** table.

Available expressions

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous **Category** combo box. You can add an expression in the **Regular expressions editor** by double-clicking the expression row in the table. You will notice that in the case of **Character categories** and **Block names**, the expressions are also listed in complementary format.

Evaluate expression on

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the **Test** area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

Test

A text editor that allows you to enter a text sample for which the regular expression will be applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The **Insert** button will become active when an editor is opened in the background and there is an expression in the **Regular expressions editor**.

The regular expression builder cannot be used to insert regular expressions in the **Grid** mode *(page 390)* or schema **Design** mode *(page 617)*. Accordingly, the **Insert** button will be not available if the current document is edited in these modes.

Note: Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

XML Schema 1.1

Oxygen XML Editor offers full support for XML Schema 1.1, including:

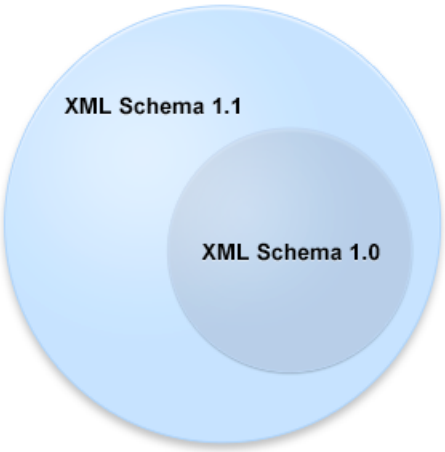
- XML Documents Validation *(page 1068)* and Content Completion *(page 836)* based on XML Schema 1.1.
- XML Schema 1.1 Validation *(page 1275)* and Content Completion *(page 1277)*.
- Editing XML Schema 1.1 files in the Schema **Design** mode *(page 617)*.
- The Flatten Schema *(page 1318)* action.
- Resource Hierarchy/Dependencies *(page 1286)* and Refactoring Actions *(page 1291)*.
- *Master files (page 3231)*.
- Generating Documentation for XML Schema 1.1 *(page 1302)*.
- Support for generating XML instances based on XML Schema.
- Support for validating XML documents with an NVDL schema that contains an XML Schema 1.1 validation step.

  Note: To enable XML Schema 1.1 validation in NVDL, you need to pass the following option to the validation engine to specify the schema version: `http://www.thaiopensource.com/validate/xsd-version` (the possible values are `1.0` or `1.1`.

  Tip: To enable the full XPath expression in assertions and type alternatives, you need to set the `http://www.thaiopensource.com/validate/full-xpath` option.

XML Schema 1.1 is a superset of XML Schema 1.0, that offers lots of new powerful capabilities.

Figure: XML Schema 1.1



The significant new features in XSD 1.1 are:

- **Assertions** - Support to define assertions against the document content using XPath 2.0 expressions (an idea borrowed from Schematron).
- **Conditional type assignment** - The ability to select the type of schema an element is validated against, based on the values of the attribute of the element.
- **Open content** - Content models can use the `openContent` element to specify content models with *open content*. These content models allow elements not explicitly mentioned in the content model to appear in the document instance. It is as if wildcards were automatically inserted at appropriate points within the content model. A default may be set that causes all content models to be open unless specified otherwise.

To see the complete list with changes since version 1.0, go to http://www.w3.org/TR/xmlschema11-1/#ch_specs.

XML Schema 1.1 is intended to be mostly compatible with XML Schema 1.0 and to have approximately the same scope. It also addresses bug fixes and brings improvements that are consistent with the constraints on scope and compatibility.

Note: An XML document conforming to a 1.0 schema can be validated using a 1.1 validator, but an XML document conforming to a 1.1 schema may not validate using a 1.0 validator.

If you are constrained to use XML Schema 1.0 (for example, if you develop schemas for a server that uses an XML Schema 1.0 validator that cannot be updated), change the default XML Schema version to 1.0. If you keep the default XML Schema version set to 1.1, the *Content Completion Assistant (page 3227)* presents XML Schema 1.1 elements that you can insert accidentally in an 1.0 XML Schema. So even if you make a document invalid conforming with XML Schema 1.0, the validation process does not signal any issues.

To change the default XML Schema version, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **XML > XML Parser > XML Schema**.

For more information about the XML Schema 1.1 support, watch our video demonstration:

Related Information:

Setting the XML Schema Version *(page 1324)*

Setting the XML Schema Version

Oxygen XML Editor lets you set the version of the XML Schema you are editing either in the **XML Schema** preferences page, or through the versioning attributes. If you want to use the versioning attributes, set the *minVersion* and *maxVersion* attributes, from the *http://www.w3.org/2007/XMLSchema-versioning* namespace, on the *schema* root element.

Note: The versioning attributes take priority over the XML Schema version defined in the preferences page.

Table 69. Using the *minVersion* and *maxVersion* Attributes to Set the XML Schema Version

Versioning Attributes	XML Schema Version
minVersion = "1.0" **maxVersion** = "1.1"	1.0
minVersion = "1.1"	1.1
minVersion = "1.0" **maxVersion** = greater than "1.1"	The XML Schema version defined in the **XML Schema** preferences page *(page 190)*
Not set in the XML Schema document	The XML Schema version defined in the **XML Schema** preferences page *(page 190)*

To change the XML Schema version of the current document, use the **Change XML Schema version** action from the contextual menu. This is available both in the **Text** mode, and in the **Design** mode and opens the **Change XML Schema version** dialog box. The following options are available:

- **XML Schema 1.0** - Inserts the *minVersion* and *maxVersion* attributes on the *schema* element and gives them the values "1.0" and "1.1" respectively. Also, the namespace declaration (*xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning*) is inserted automatically if it does not exist.
- **XML Schema 1.1** - Inserts the *minVersion* attribute on the *schema* element and gives it the value "1.1". Also, removes the *maxVersion* attribute if it exists and adds the versioning namespace (*xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning*) if it is not declared.
- **Default XML Schema version** - Removes the *minVersion* and *maxVersion* attributes from the *schema* element. The default schema version, defined in the **XML Schema** preferences page, is used.

Note: The **Change XML Schema version** action is also available in the informative panel presented at the top of the edited XML Schema. If you close this panel, it will no longer appear until you restore Oxygen XML Editor to its default options.

Oxygen XML Editor automatically uses the version set through the versioning attributes, or the default version if the versioning attributes are not declared, when proposing content completion elements and validating an XML Schema. Also, the XML instance validation against an XML Schema is aware of the versioning attributes defined in the XML Schema.

When you generate sample XML files from an XML Schema, Oxygen XML Editor takes into account the *minVersion* and *maxVersion* attributes defined in the XML Schema.

XML Schema 1.1 *(page 1323)*

Editing XQuery Documents

XQuery is the query language for XML and is officially defined by a W3C Recommendation document. The many benefits of XQuery include:

- XQuery allows you to work in one common model no matter what type of data you are working with: relational, XML, or object data.
- XQuery is ideal for queries that must represent results as XML, to query XML stored inside or outside the database, and to span relational and XML sources.
- XQuery allows you to create many different types of XML representations of the same data.
- XQuery allows you to query both relational sources and XML sources, and create one XML result.

Related Information:

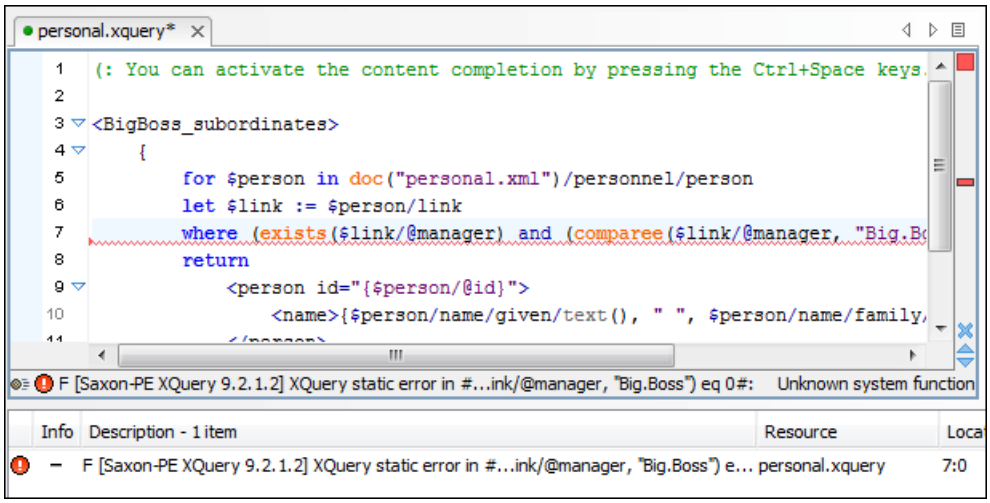
XQuery and Databases *(page 2168)*

XQuery Validation

With Oxygen XML Editor, you can validate your documents before using them in your transformation scenarios. The validation uses the Saxon 9.8.0.12 PE, EE, or HE processor, or you can use some database engines (such as MarkLogic or eXist) if you installed them. Any other XQuery processor that offers an XQJ API implementation *(page 2162)* can also be used. This is in conformance with the XQuery Working Draft. The processor is used in two cases: validation of the expression and execution. Although the execution implies a validation, it is faster to check the expression syntactically, without executing it. The errors that occurred in the document are presented in the messages view at the

bottom of editor window, with a full description message. As with all error messages, if you click an entry, the line where the error appeared is highlighted.

Figure: XQuery Validation



Note: If you choose a processor that does not support XQuery validation, Oxygen XML Editor displays a warning when trying to validate.

The **Validation options** button, available in the **Document > Validate** menu, allows quick access to the XQuery options *(page 206)* in the Oxygen XML Editor preferences.

When you open an XQuery document from a connection that supports validation (for example, MarkLogic, or eXist), by default Oxygen XML Editor uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation resolves imports better.

Content Completion in XQuery

Oxygen XML Editor provides content completion for keywords and all known XQuery functions and operators. The *Content Completion Assistant (page 3227)* can be manually activated with the **(Ctrl (Meta on Mac OS)+Space)** shortcut. The functions and operators are presented together with a description of the parameters and functionality, depending on the validation or transformation engine.

For some supported database engines such as MarkLogic, eXist, and Berkeley DB, the content completion list offers the specific XQuery functions implemented by that engine. This feature is available when the XQuery file has an associated transformation scenario that uses one of these database engines or the XQuery validation engine is set to one of them via a validation scenario or in the XQuery Preferences *(page 206)* page. For more information about the support for working with XQuery with regards to databases, see XQuery and Databases *(page 2168)*.

The extension functions included in the Saxon engine are available on content completion if one of the following conditions are true:

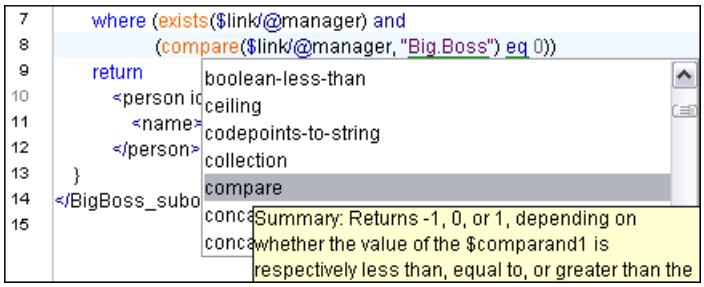
- The edited file has a transformation scenario associated that uses as transformation engine Saxon 9.8.0.12 PE or Saxon 9.8.0.12 EE.
- The edited file has a validation scenario associated that use as validation engine Saxon 9.8.0.12 PE or Saxon 9.8.0.12 EE.
- The validation engine specified in Preferences *(page 206)* is Saxon 9.8.0.12 PE or Saxon 9.8.0.12 EE.

If the Saxon namespace (http://saxon.sf.net) is mapped to a prefix, the functions are presented using this prefix. Otherwise, the default prefix for the Saxon namespace (`saxon`) is used.

If you want to use a function from a namespace mapped to a prefix, just type that prefix and the content completion displays all the XQuery functions from that namespace. When the default namespace is mapped to a prefix, the XQuery functions from this namespace offered by content completion are also prefixed. Otherwise, only the function name being used.

The content completion pop-up window presents all the variables and functions from both the edited XQuery file and its imports.

Figure: XQuery Content Completion



Syntax Highlighting in XQuery

Oxygen XML Editor supports syntax highlighting in XQuery documents to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for XQuery files, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*.
2. Go to **Editor > Syntax Highlight** *(page 171)*.
3. Select and expand the **XQuery/XPath** section in the top pane.

4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

Customize Syntax Highlight colors *(page 171)*

Formatting and Indenting XQuery Documents

Editing XQuery documents may lead to large chunks of content that are not easily readable by human audience. Also, each developer may have a particular way of writing XQuery code. Oxygen XML Editor assists you in maintaining a consistent code writing style with the **Format and Indent** action that is available in the **Document > Source** menu and also on the toolbar..

The **Format and Indent** action achieves this by performing the following steps:

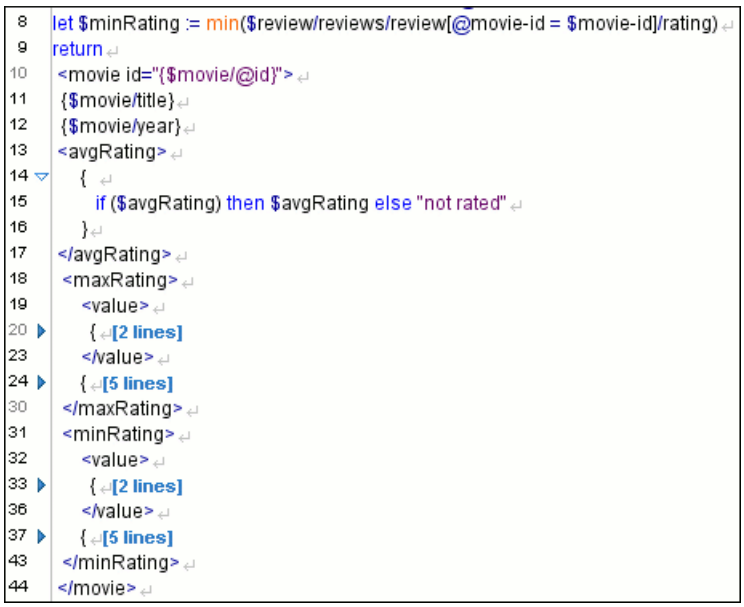
- Manages whitespaces, by collapsing or inserting space characters where needed.
- Formats complex expressions on multiple, more readable lines by properly indenting each of them. The amount of whitespaces that form an indent unit is controlled through one of the **Indent with tabs** and **Indent size** options from the **Format Preferences** page *(page 157)*.

Note: These operations can be performed only if your XQuery document conforms with XQuery 1.0, XQuery Update Facility 1.0, and XQuery 3.0 specifications. If the *Format and Indent* operation fails, the document is left unaltered and an error message is presented in the **Results** view *(page 354)*.

Folding in XQuery Documents

In a large XQuery document, the instructions enclosed in the '{' and '}' characters can be collapsed so that only the needed instructions remain in focus. The same folding features available for XML documents *(page 832)* are also available in XQuery documents.

Figure: Folding in XQuery Documents

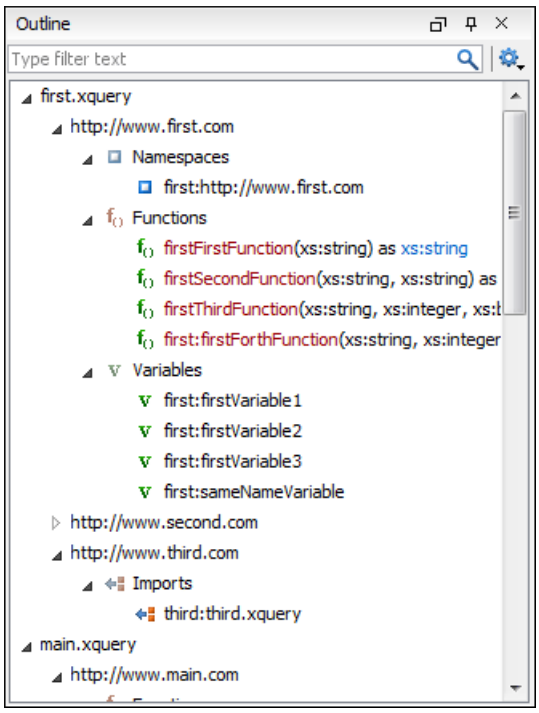


There is available the action **Go to Matching Bracket** **Ctrl + Shift + G** on contextual menu of XQuery editor for going to matching character when cursor is located at '{' character or '}' character. It helps for finding quickly matching character of current *folding element (page 3229)*.

XQuery Outline View

The XQuery document structure is presented in the **Outline** view. The outline tree presents the list of all the components (namespaces, imports, variables, and functions) from both the edited XQuery file and its imports and it allows quick access to components. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: XQuery Outline View



The following actions are available in the **Settings** menu on the **Outline** view toolbar:

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes performed in the XQuery editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Sort

Allows you to alphabetically sort the XQuery components.

Show all components

Displays all collected components starting from the current file. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/namespace/type

Allows you to group the components by location, namespace, and type. When grouping by namespace, the main XQuery module namespace is presented first in the **Outline** view.

If you know the component name, you can search it in the **Outline** view by typing its name in the filter text field from the top of the view or directly on the tree structure. When you type the component name in the filter text field you can switch to the tree structure using the arrow keys of the keyboard, **(Enter)**, **(Tab)**, **(Shift-Tab)**. To switch from tree structure to the filter text field, you can use **(Tab)**, **(Shift-Tab)**.

Tip: The search filter is case insensitive. The following wildcards are accepted:

- ***** - any string
- **?** - any character
- **,** - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

XQuery Builder View

The **XPath/XQuery Builder** view allows you to compose complex XQuery expressions and execute them over the currently edited XML document. You can use the `doc()` function to specify the source file for which the expressions are executed. When you connect to a database, the expressions are executed over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Editor executes the expressions over the XML document in the associated scenario.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view contains the following actions:

XPath version chooser drop-down menu

A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0SA, XPath 3.0, XPath 3.0SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

Note: The results returned by XPath 2.0 SA and XPath 3.0 SA have a location limited to the line number of the start element (there are no column information and no end specified).

Note: Oxygen XML Editor uses Saxon to execute XPath 3.0 expressions. Since Saxon implements a part of the 3.0 functions, when using a function that is not implemented, Oxygen XML Editor returns a compilation error.

Execute XPath button

Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the **Results** view *(page 354)*.

Favorites button

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, press the star button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Editor automatically groups favorites in folders named after the method of execution.

History drop-down menu

Keeps a list of the last 15 executed XPath or XQuery expressions. Use the **Clear history** action from the bottom of the list to remove them.

Settings drop-down menu

Contains the following three options:

- **Update on cursor move** - When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed.
- **Evaluate as you type** - When you select this option, the XPath expression you are composing is evaluated in real time.

  Note: This option and the automatic validation are disabled when you edit huge documents *(page 774)* or when the scope is other than **Current file**.

- **Options** - Opens the Preferences page of the currently selected processing engine.

XPath scope menu

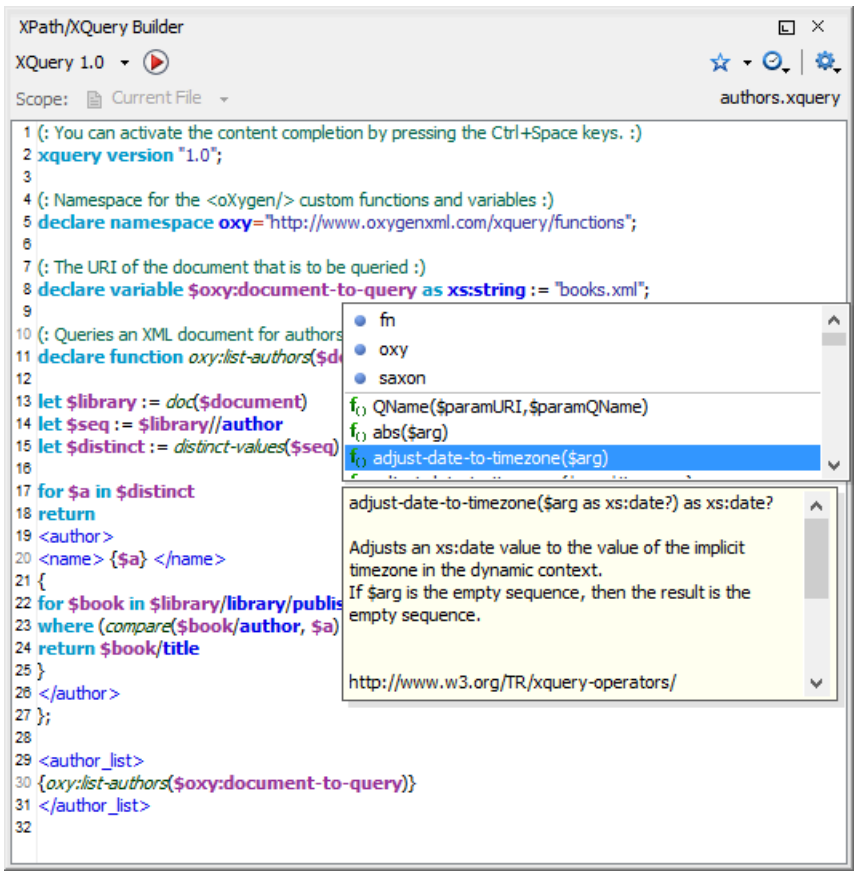
Oxygen XML Editor allows you to define a scope for which the XPath operation will be executed. You can choose where the XPath expression will be executed:

- **Current file** - Current selected file only.
- **Project** - All the files in the project.
- **Selected project resources** - The files selected in the project.
- **All opened files** - All files opened in the application.
- **Current DITA Map hierarchy** - All resources referenced in the currently selected *DITA map*, opened in the **DITA Maps Manager** view *(page 2943)*.
- **Opened archive** - Files open in the **Archive Browser** view *(page 2091)*.
- **Working sets** - The selected *working sets (page 3235)*.

At the bottom of the scope menu the following scope configuration actions are available:

- **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets (page 3235)*.
- **XPath file filter** - You can filter the files from the selected scope for which the XPath expression will be executed. By default, the XPath expression will be executed only on XML files, but you can also define a set of patterns that will filter out files from the current scope. If you select the **Include archive** option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

Figure: XPath/XQuery Builder View



While you edit an XPath or XQuery expression, Oxygen XML Editor assists you with the following features:

- *Content Completion Assistant (page 3227)* - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the *Content Completion Assistant* also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.
- Syntax Highlighting - Allows you to identify the components of an expression. To customize the colors of the components of the expression, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Editor > Syntax Highlight** *(page 171)*.
- Automatic validation of the expression as you type.

  Note: When you type invalid syntax a red serrated line underlines the invalid fragments.

- Function signature and documentation balloon, when the cursor is located inside a function.

The usual edit actions (**Cut**, **Copy**, **Paste**, **Select All**, **Undo**, **Redo**) are available in the contextual menu of the top editable part of the view.

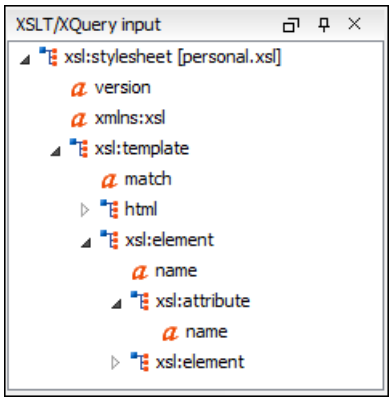
XSLT/XQuery Input View

The structure of the XML document associated to the edited XSLT stylesheet, or the structure of the source documents of the edited XQuery is displayed in a tree form in a view called the **XSLT/XQuery Input** view. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. The tree nodes represent the elements of the documents.

XSLT

If you click a node in the **XSLT/XQuery Input** view, the corresponding template from the stylesheet is highlighted. A node can be dragged from this view and dropped in the editor area for quickly inserting `xsl:template`, `xsl:for-each`, or other XSLT elements that have the `match` / `select` / `test` attribute already completed. The value of the attribute is the correct XPath expression that refers to the dragged tree node. This value is based on the current editing context of the drop spot.

Figure: XSLT Input View



XSLT Example:

For the following XML document:

```
<personnel>
    <person id="Big.Boss">
        <name>
            <family>Boss</family>
            <given>Big</given>
        </name>
        <email>chief@oxygenxml.com</email>
        <link subordinates="one.worker"/>
    </person>
    <person id="one.worker">
        <name>
```

```
            <family>Worker</family>
            <given>One</given>
        </name>
        <email>one@oxygenxml.com</email>
        <link manager="Big.Boss"/>
    </person>
</personnel>
```

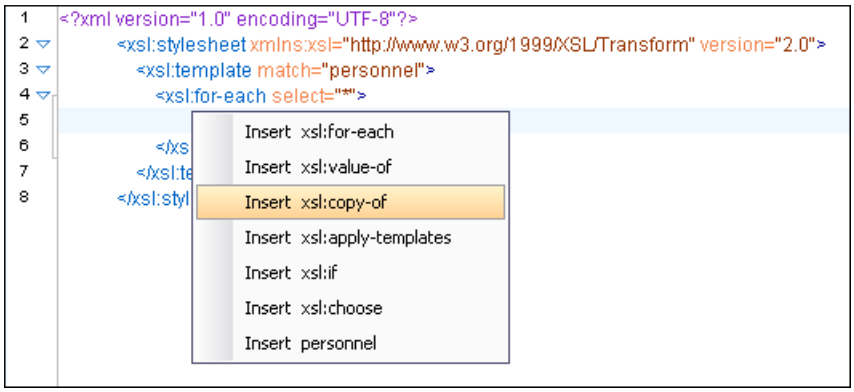
and the following XSLT stylesheet:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
        version="2.0">
    <xsl:template match="personnel">
        <xsl:for-each select="*">

        </xsl:for-each>
    </xsl:template>
</xsl:stylesheet>
```

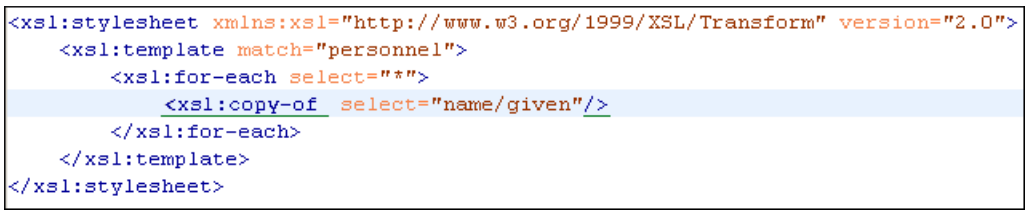
if you drag the `given` element and drop it inside the `xsl:for-each` element, the following pop-up menu is displayed:

Figure: XSLT Input Drag and Drop Pop-up Menu



If you select **Insert xsl:copy-of** (for example), the resulting document will look like this:

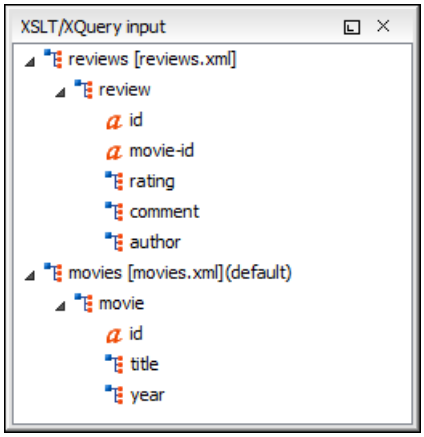
Figure: XSLT Input Drag and Drop Result



XQuery

You can also use the **XSLT/XQuery Input** view to drag and drop a node into the editing area to quickly insert XQuery expressions.

Figure: XQuery Input View



XQuery Example:

For the following XML documents:

```
<movies>
<movie id="1">
<title>The Green Mile</title>
<year>1999</year>
</movie>
<movie id="2">
<title>Taxi Driver</title>
<year>1976</year>
</movie>
</movies>
```

```
<reviews>
<review id="100" movie-id="1">
<rating>5</rating>
<comment>It is made after a great Stephen King book.
</comment>
<author>Paul</author>
</review>
```

```
<review id="101" movie-id="1">
<rating>3</rating>
<comment>Tom Hanks does a really nice acting.</comment>
<author>Beatrice</author>
</review>
<review id="104" movie-id="2">
<rating>4</rating>
<comment>Robert De Niro is my favorite actor.</comment>
<author>Maria</author>
</review>
</reviews>
```

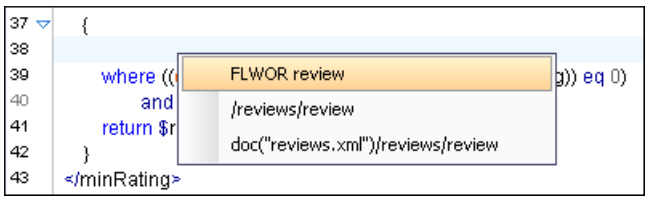
and the following XQuery:

```
let $review := doc("reviews.xml")
for $movie in doc("movies.xml")/movies/movie
let $movie-id := $movie/@id
return
<movie id="{$movie/@id}">
{$movie/title}
{$movie/year}
<maxRating>
{

}
</maxRating>
</movie>
```

If you drag the **review** element and drop it between the braces, the following pop-up menu is displayed:

Figure: XQuery Input Drag and Drop Pop-up Menu



Select **FLWOR review**, the resulting document will look like this:

Figure: XQuery Input Drag and Drop Result

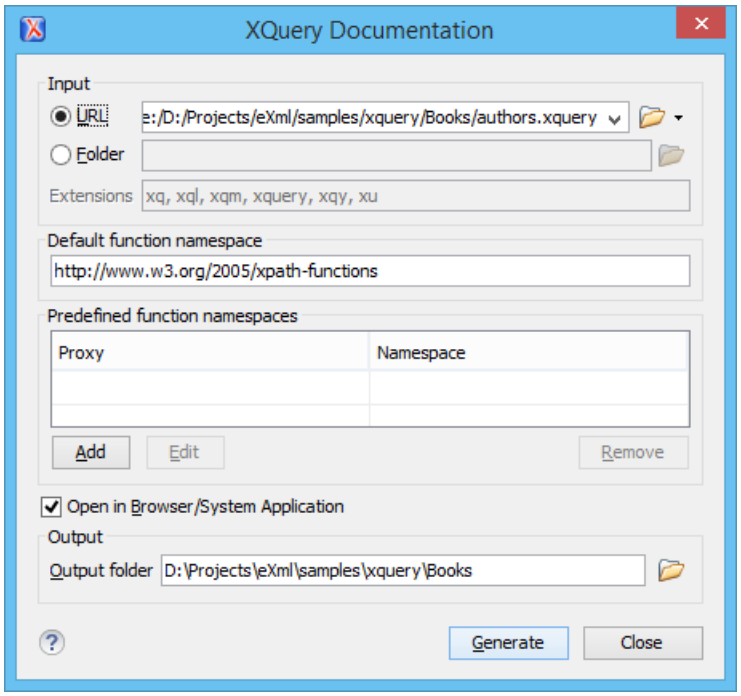
```
37      {
38          for $review in doc("reviews.xml")/reviews/review
39          return
40          where ((compare($rev/rating/text(), string($minRating)) eq 0)
41                  and ($rev/@movie-id = $movie/@id))
42          return $rev/author
43      }
```

Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the **XQuery Documentation** dialog box. It is opened with the **XQuery Documentation** action that is available from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view *(page 332)*.

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

Figure: XQuery Documentation Dialog Box



The following options are available:

- **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
  # **URLFile** - The URL of the file in which you want to generate the documentation.

    # **Folder** - The directory that contains the files for which you want to generate the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.
- **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.
- **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).
- **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.

  Note: To set the browser or system application that will be used, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Output** - Allows you to specify where the generated documentation is saved on disk.

Transforming XML Documents Using XQuery

XQuery is similar to XSL stylesheets, both being capable of transforming an XML input into another format. You specify the input URL when you define the transformation scenario *(page 1644)*. The result can be saved and opened in the associated application. You can even run a FO processor *(page 2076)* on the output of an XQuery. The transformation scenarios may be shared between many XQuery files, are exported *(page 275)* together with the XSLT scenarios and can be managed in the **Configure Transformation Scenario** dialog box *(page 1722)* ,or in the **Scenarios** view *(page 1728)*. The transformation can be performed on the XML document specified in the **XML URL** field, or, if this field is empty, the documents referenced from the query expression. The parameters of XQuery transforms must be set in the **Parameters** dialog box *(page 1644)*. Parameters that are in a namespace must be specified using the qualified name (for example, a `param` parameter in the *http://www.oxygenxml.com/ns* namespace must be set with the name `{http://www.oxygenxml.com/ns}param`).

The transformation uses one of the Saxon 9.8.0.12 HE, Saxon 9.8.0.12 PE, Saxon 9.8.0.12 EE processors, a database connection (details can be found in the Working with Databases *(page 2098)* chapter - in the XQuery transformation *(page 2169)* section) or any XQuery processor that provides an XQJ API implementation.

The Saxon 9.8.0.12 EE processor also supports XQuery 3.0 transformations.

Related Information:

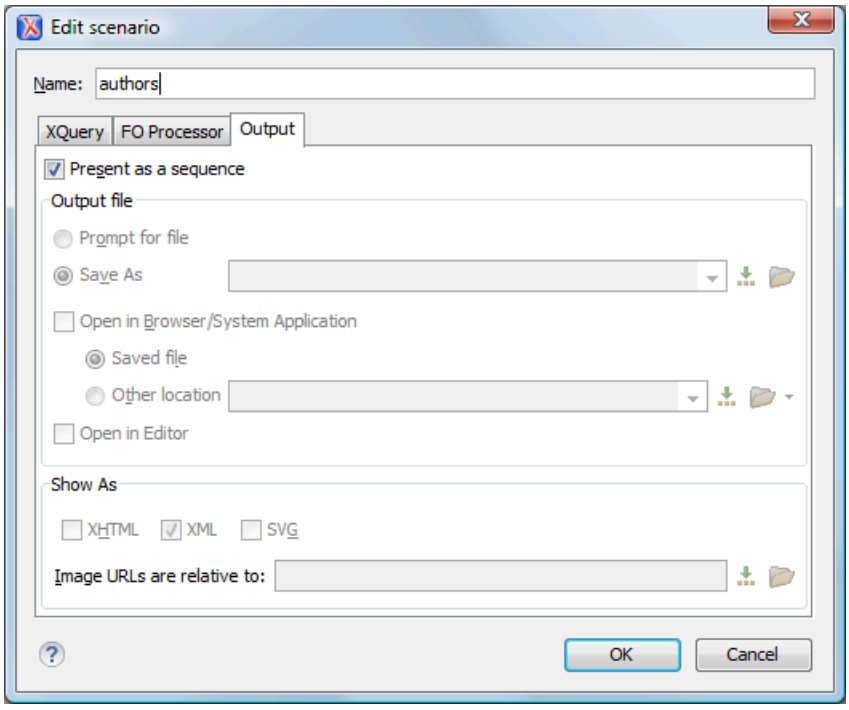
XQuery and Databases *(page 2168)*

Display XQuery Result in Sequence View

The result of an XQuery executed on a database can be very large and sometimes only a part of the full result is needed. To avoid the long time necessary for fetching the full result, select the **Present as a sequence** option *(page 1666)* in the **Output** tab of the **Edit scenario** dialog box. This option fetches only the first chunk of the result. Clicking the **More results available** label that is displayed at the bottom of the **Sequence** view fetches the next chunk of results.

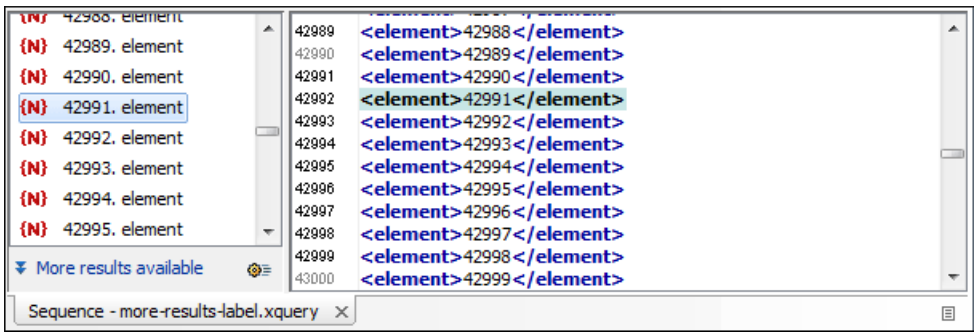
The size of a chunk can be set with the **Size limit of Sequence view** option *(page 206)*. The **XQuery options** button from the **More results available** label provides a quick access to this option by opening the **XQuery** preferences page *(page 206)* where the option can be modified.

Figure: XQuery transformation result displayed in Sequence view



A chunk of the XQuery transformation result is displayed in the **Sequence** view.

Figure: XQuery transformation result displayed in Sequence view



Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the **Saxon HE/PE/EE** preferences page *(page 207)* but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options *(page 3230)* defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 9.8.0.12 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Recoverable errors ("-warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.

- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces ("-strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the *net.sf.saxon.lib.Initializer* interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Updating XML Documents using XQuery

Using the bundled Saxon 9.8.0.12 EE XQuery processor Oxygen XML Editor offers support for XQuery Update 1.0. The XQuery Update Facility provides expressions that can be used to make persistent changes to instances of the XQuery 1.0 and XPath 2.0 Data Model. Thus, besides querying XML documents, you can modify them using the various insert/delete/modify/create methods available in the XQuery Update 1.0 standard.

Choose Saxon 9.8.0.12 EE as a transformer in the scenario associated with the XQuery files containing update statements and Oxygen XML Editor will notify you if the update was successful.

Example: Using XQuery Update to modify a tag name in an XML file

```
rename node doc("books.xml")//publisher[1]//book[1] as "firstBook"
```

Editing WSDL Documents

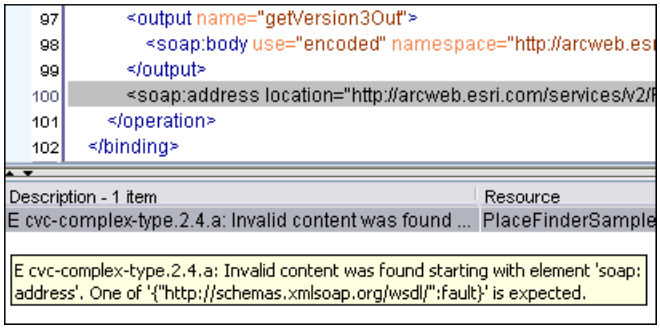
WSDL is an XML format for describing network services as a set of endpoints operating on messages containing either document-oriented or procedure-oriented information. The operations and messages are described abstractly, and then bound to a concrete network protocol and message format to define an endpoint. Related concrete endpoints are combined into abstract endpoints (services).

Oxygen XML Editor provides a special type of editor dedicated to WSDL documents. The WSDL editor offers support for validation, a specialized *Content Completion Assistant (page 3227)*, a component oriented **Outline** view *(page 1349)*, searching and refactoring operations, and support to generate documentation.

Both WSDL version 1.1 and 2.0 are supported and SOAP versions 1.1 and 1.2. That means that in the location where a SOAP extension can be inserted the *Content Completion Assistant* offers elements from both SOAP 1.1 and SOAP 1.2. Validation of SOAP requests is executed first against a SOAP 1.1 schema and then against a SOAP 1.2 schema. In addition to validation against the XSD schemas, Oxygen XML Editor also checks if the WSDL file conforms with the WSDL specification (available only for WSDL 1.1 and SOAP 1.1).

In the following example you can see how the errors are reported.

Figure: Validating a WSDL file



For more information about the WSDL editing support in Oxygen XML Editor, watch our video demonstration:

Related Information:

Editing XML Documents in Text Mode *(page 819)*

Editing WSDL Documents in the Master Files Context

Smaller interrelated modules that define a complex WSDL structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Editor provides the support for defining the main module (or modules), allowing you to edit any of the imported/ included files in the context of the larger WSDL structure.

You cat set a main WSDL document either using the *master files* support from the **Project** view *(page 719)*, or using a validation scenario.

To set a *master file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main WSDL document. In this case, it considers the current module as the main WSDL document.

The advantages of editing in the context of a *master file (page 3231)* include:

- Correct validation of a module in the context of a larger WSDL structure.
- *Content Completion Assistant (page 3227)* displays all components valid in the current context.
- The **Outline** view *(page 1349)* displays the components collected from the entire WSDL structure.

Note: When you edit an XML schema document that has a WSDL document set as master, the validation operation is performed over the master WSDL document.

For more information about editing WSDL documents in the *master files* context, watch our video demonstration:

Validating WSDL Documents

By default, WSDL files are validated as you type. To change this, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option *(page 156)*.

To validate a WSDL document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

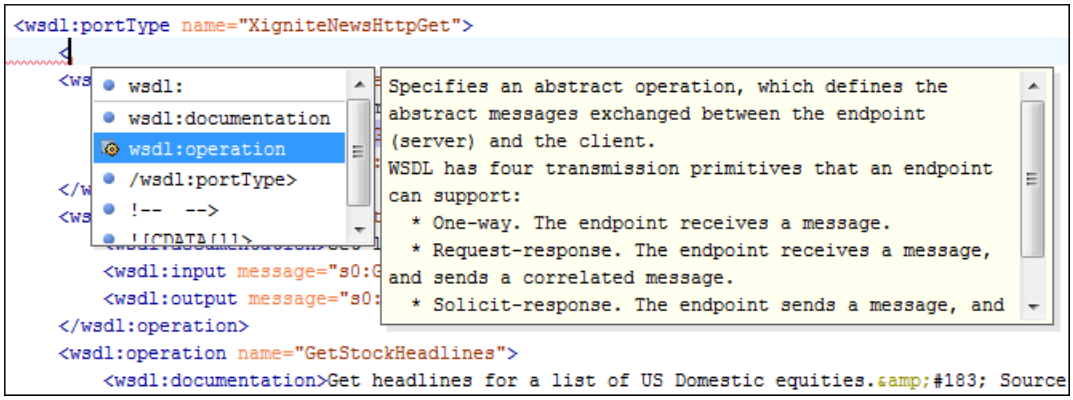
Content Completion Assistance in WSDL Documents

The *Content Completion Assistant (page 3227)* is a powerful feature that enhances the editing of WSDL documents. It helps you define WSDL components by proposing context-sensitive element names. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut.

Another important capability of the *Content Completion Assistant* is to propose references to the defined components when you edit attribute values. For example, when you edit the `type` attribute of a `binding` element, the *Content Completion Assistant* proposes all the defined port types. Each proposal that the *Content Completion Assistant* offers is accompanied by a documentation hint.

Note: XML schema specific elements and attributes are offered when the current editing context is the internal XML schema of a WSDL document.

Figure: WSDL Content Completion Assistant



Note: If you are using the concept of *master files (page 3231)* to import/include modules, the *Content Completion Assistant* collects its components starting from the *master files*. The *master files* can be defined in the project or in the associated validation scenario. For more information about the *Master Files* support in Oxygen XML Editor, see Defining Master Files at Project Level *(page 719)*.

Namespace prefixes in the scope of the current context are presented at the top of the content completion assistance window to speed up the insertion into the document of prefixed elements.

Figure: Namespace Prefixes in the Content Completion Assistant

For the common namespaces, such as XML Schema namespace (*http://www.w3.org/2001/XMLSchema*) or SOAP namespace (*http://schemas.xmlsoap.org/wsdl/soap/*), Oxygen XML Editor provides an easy mode to declare them by proposing a prefix for these namespaces.

WSDL Syntax Highlighting

Oxygen XML Editor supports syntax highlighting in WSDL documents to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for WSDL files, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*.
2. Go to **Editor > Syntax Highlight** *(page 171)*.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

Tip: Oxygen XML Editor also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page *(page 172)*.

Related Information:

Customize Syntax Highlight colors *(page 171)*

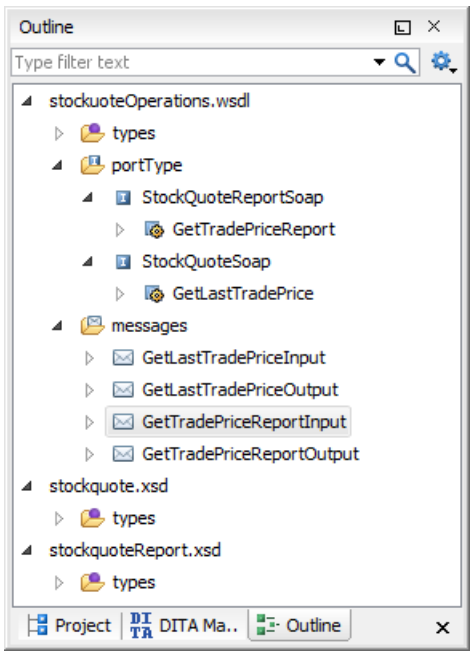
WSDL Outline View

The **Outline** view for WSDL documents displays the list of all the components (services, bindings, port types and so on) of the currently open WSDL document along with the components of its imports.

If you use the **Master Files** support *(page 719)*, the **Outline** view collects the components of a WSDL document starting from the *master files* of the current document.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: WSDL Outline View



The **Outline** view can display both the components of the current document and its XML structure, organized in a tree-like fashion. You can switch between the display modes by using the **Show XML structure** and **Show components** actions in the **Settings** menu on the **Outline** view toolbar. The following actions are available:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Controls the synchronization between the **Outline** view and the current document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the WSDL editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the current document.

When the **Show components** option is selected, the following actions are available:

Show XML structure

Displays the XML structure of the current document in a tree-like manner.

Sort

Sorts the components in the **Outline** view alphabetically.

Show all components

Displays all the components that were collected starting from current document or from the main document, if it is defined.

Show referable components

Displays all the components that you can reference from the current document.

Show only local components

Displays the components defined in the current file only.

Group by location

Groups the WSDL components by their location.

Group by type

Groups the WSDL components by their type.

Group by namespace

Groups the WSDL components by their namespace.

Note: By default, all the three grouping criteria are active.

When the **Show XML structure** option is selected, the following actions are available:

Show components

Switches the **Outline** view to the components display mode.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel *(page 257)*.

Configure displayed attributes

Displays the **XML Structured Outline** preferences page *(page 257)*.

The following contextual menu actions are available in the **Outline** view when the **Show components** option is selected in the **Settings** menu:

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Delete

Deletes the currently selected component.

Search references

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Opens the **Component Dependencies** view *(page 1357)* that displays the dependencies of the currently selected component.

Resource Hierarchy

Opens the **Resource Hierarchy/Dependencies** view *(page 1354)* that displays the hierarchy for the currently selected resource.

Resource Dependencies

Opens the **Resource Hierarchy/Dependencies** view *(page 1354)* that displays the dependencies of the currently selected resource.

Rename Component in

Renames the currently selected component in the context of a scope that you define.

The following contextual menu actions are available in the **Outline** view when the **Show XML structure** option is selected in the **Settings** menu:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

Toggle Comment

Comments/uncomments the currently selected element.

Search references

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Opens the **Component Dependencies** view *(page 1357)* that displays the dependencies of the currently selected component.

Rename Component in

Renames the currently selected component in the context of a scope that you define.

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Delete

Deletes the currently selected component.

Expand More

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

To switch from the tree structure to the text filter, use **Tab** and **Shift-Tab**.

Tip: The search filter is case insensitive. The following wildcards are accepted:

- ***** - any string
- **?** - any character
- **,** - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

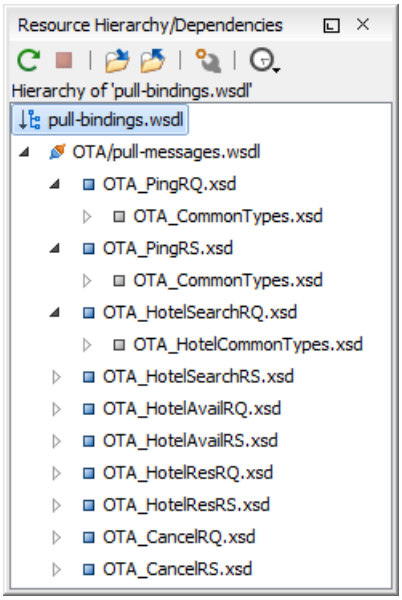
WSDL Resource Hierarchy/Dependencies View in WSDL Documents

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a WSDL resource. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Note: The hierarchy of a WSDL resource includes the hierarchy of imported XML Schema resources. The dependencies of an XML Schema resource present the WSDL documents that import the schema.

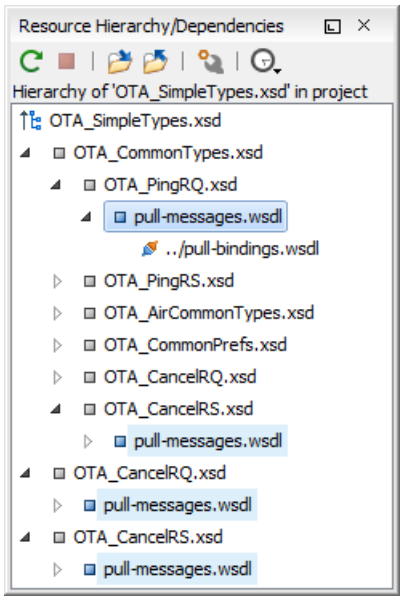
To view the hierarchy of a WSDL document, select the document in the **Project** view *(page 332)* and choose **Resource Hierarchy** from the contextual menu.

Figure: Resource Hierarchy/Dependencies View



If you want to see the dependencies of a WSDL document, select the document in the **Project** view *(page 332)* and choose **Resource Dependencies** from the contextual menu.

Figure: Resource Hierarchy/Dependencies View



The following actions are available in the **Resource Hierarchy/Dependencies** view:

Refresh

Refreshes the Hierarchy/Dependencies structure.

Stop

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the **Master Files** directory *(page 719)*.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

Note: The **Move resource** or **Rename resource** actions give you the option to update the references to the resource *(page 1356)*.

Related Information:

Working with Modular XML Files in the Master Files Context *(page 1114)*

Search and Refactor Operations Scope *(page 1116)*

Moving/Renaming WSDL Resources

You can move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Select this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is selected, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

WSDL Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

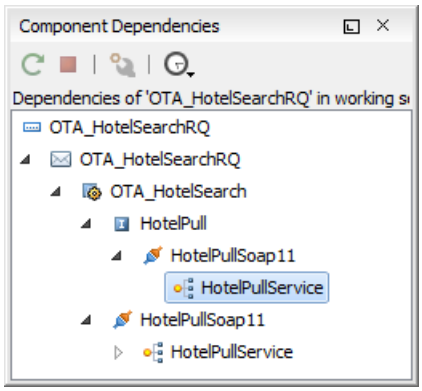
To see the dependencies of a WSDL component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

This action is available for all WSDL components (`messages` , `port types` , `operations` , `bindings` , and so on).

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

Figure: Component Dependencies View



The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:

Searching and Refactoring Operations Scope in WSDL Documents *(page 1360)*

Highlight Component Occurrences in WSDL Documents

When you position your mouse cursor over a component in a WSDL document, Oxygen XML Editor searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of **Highlight Component Occurrences**, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Editor > Mark Occurrences**. You can also trigger a search using the **Search > Search Occurrences in File ()** action from contextual menu. Matches are displayed in separate tabs of the **Results** view *(page 354)*.

Searching and Refactoring Operations in WSDL Documents

Search Actions

The following search actions are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **Document > Schema** menu:

- **Go to Definition** - Takes you to the location of the definition of the current item.

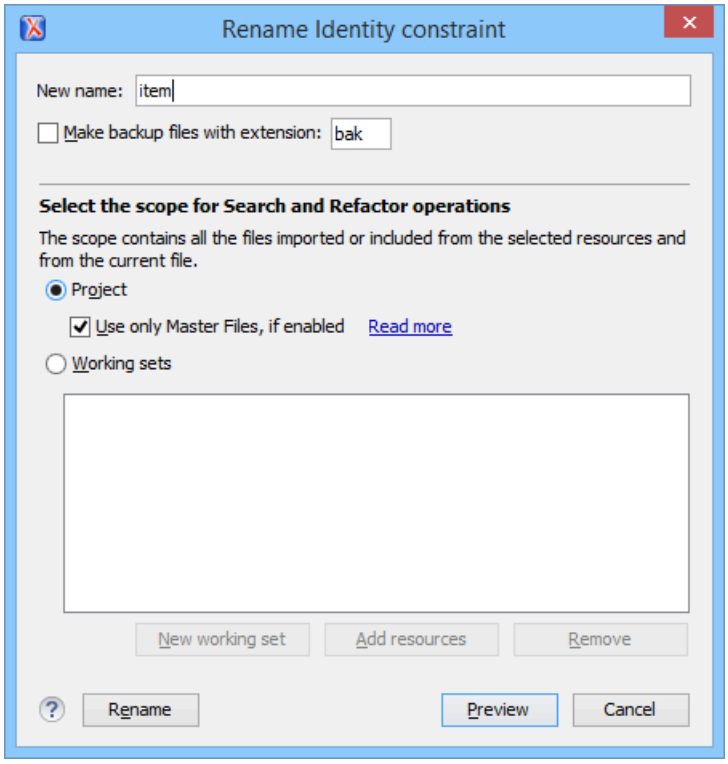
Note: You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions are available from the **Refactoring** submenu from the **Document > Refactoring** menu or in the contextual menu of the current editor:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure: Rename Identity Constraint Dialog Box

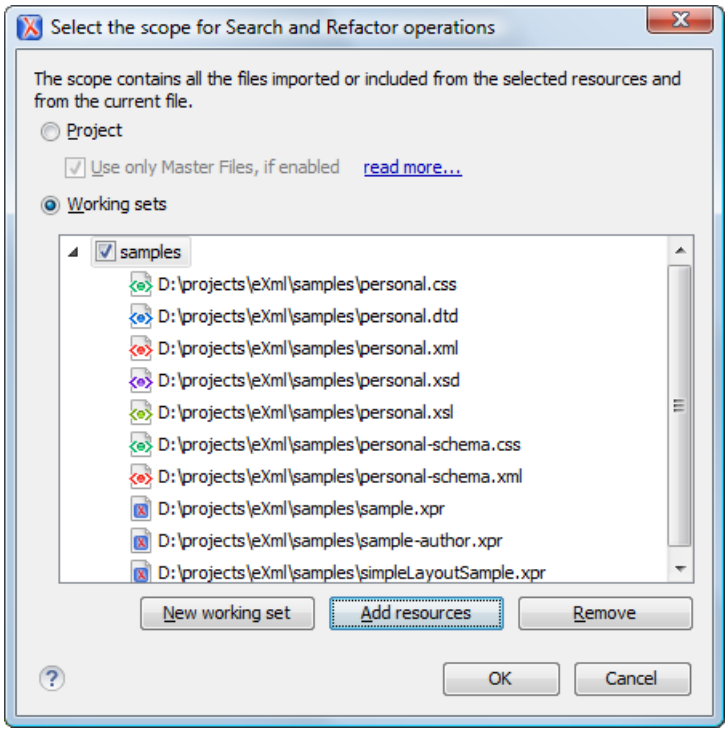


Searching and Refactoring Operations Scope in WSDL Documents

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the **Change scope** operation, available in the *Quick Assist* action set or on the **Resource Hierarchy/Dependency View** toolbar. You can restrict the scope to the current project or

to one or multiple *working sets (page 3235)*. The **Use only Master Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Master Files** directory. Click **read more** for details about the *Master Files* support *(page 719)*.

Figure: Change Scope Dialog Box

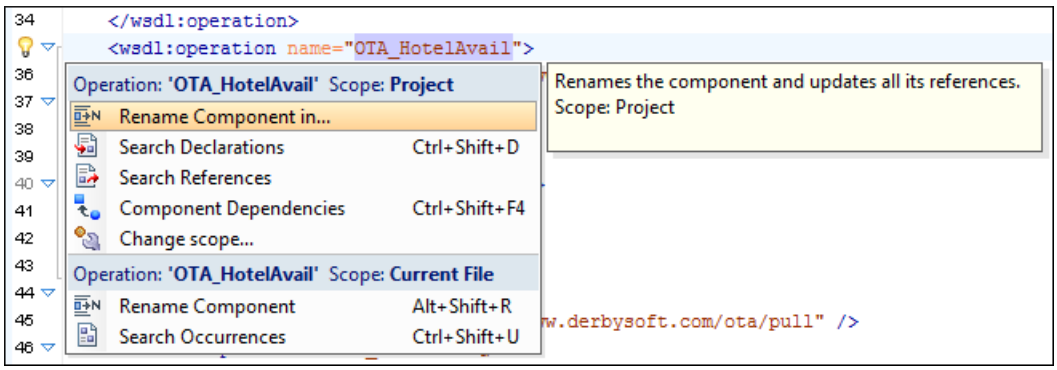


The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the *working set (page 3235)* structure.

Quick Assist Support in WSDL Documents

The *Quick Assist* feature *(page 3233)* is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon ( ) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Alt + 1** (**Meta + Alt + 1** on Mac OS X) keyboard shortcuts.

Figure: WSDL Quick Assist Support



The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

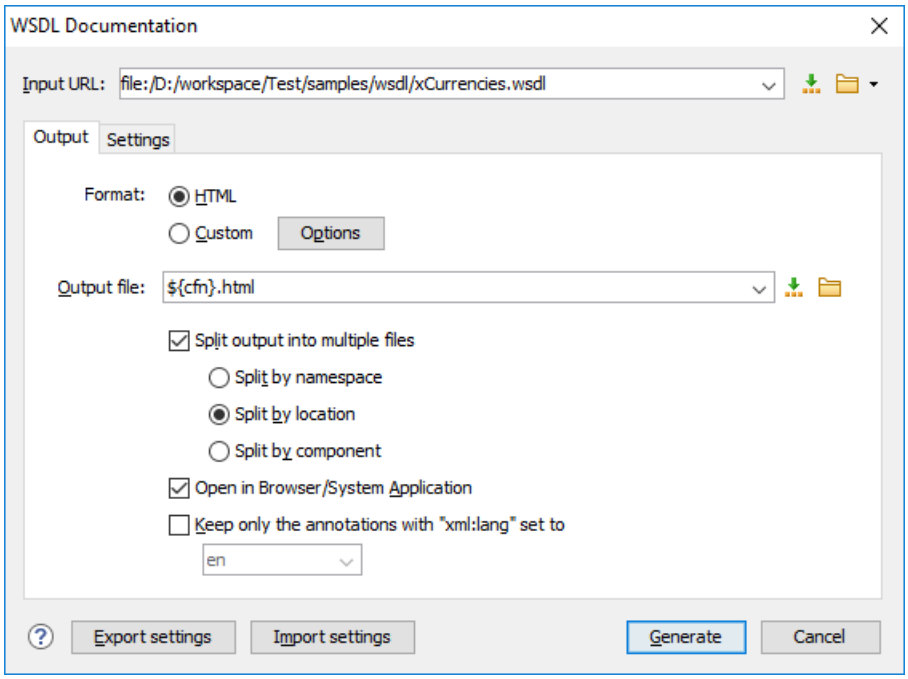
Generating Documentation for WSDL Documents

You can use Oxygen XML Editor to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a custom output format *(page 1367)* by using a custom stylesheet.

Note: The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **Tools > Generate Documentation** menu or from the **Generate Documentation** submenu in the contextual menu of the **Project** view *(page 332)*.

Figure: WSDL Documentation Dialog Box



The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
  # **HTML** - The documentation is generated in HTML output format *(page 1366)*.
  # **Custom** - The documentation is generated in a custom output format *(page 1367)*, allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate

XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

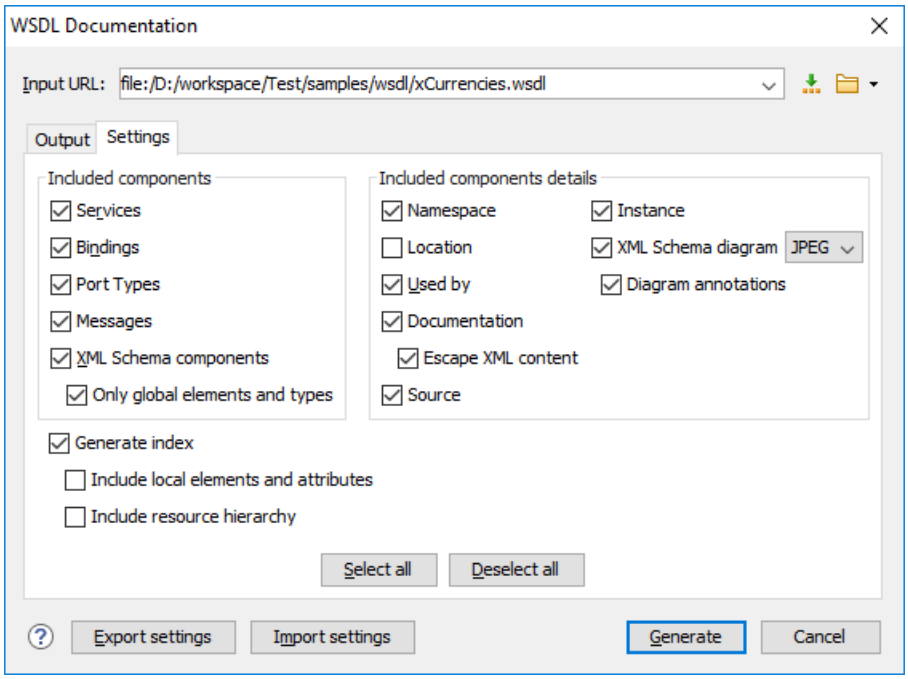
Note: To set the browser or system application that will be used, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Global**, and set it in the **Default Internet browser** field. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `xml:lang` attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

Figure: Settings Tab of the WSDL Documentation Dialog Box



The **Settings** tab allows you to choose whether or not to include the following:

- **Components**
  - # **Services** - Specifies whether or not the generated documentation includes the WSDL services.
  - # **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
  - # **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.
  - # **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
  - # **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
    - # **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.
- **Component Details**
  - # **Namespace** - Presents the namespace information for WSDL or XML Schema components.
  - # **Location** - Presents the location information for each WSDL or XML Schema component.
  - # **Used by** - Presents the list of components that reference the current one.
  - # **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
  - # **Source** - Presents the XML fragment that defines the current component.
  - # **Instance** - Generates a sample XML instance for the current component.

    Note: This option applies to the XML Schema components only.

  - # **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, GIF, SVG) to use for the diagram section.
    - # **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.
- **Generate index** - Displays an index with the components included in the documentation.
  - # **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
  - # **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, with the exported settings file you can generate the same documentation from the command-line interface *(page 1367)*.)

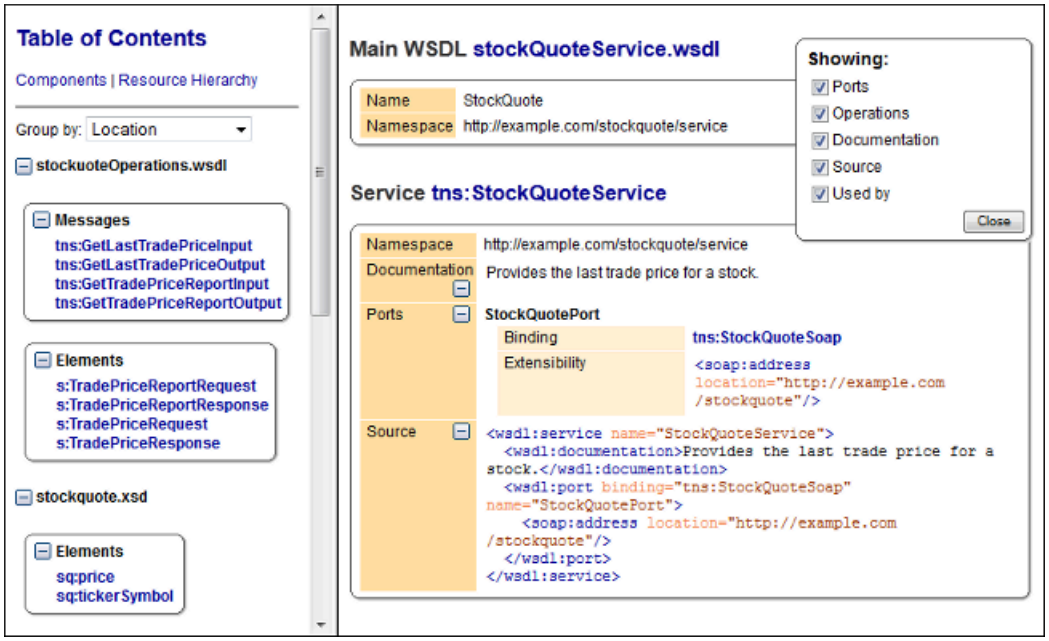
Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the WSDL documentation.

Generating WSDL Documentation in HTML Format

The WSDL documentation generated in HTML format is presented in a visual diagram style with various sections, hyperlinks, and options.

Figure: WSDL Documentation in HTML Format



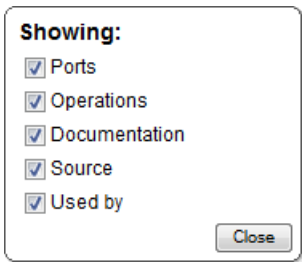
The documentation of each component is presented in a separate section. The title of the section is composed of the component type and the component name. The component information (namespace, documentation, etc.) is presented in a tabular form.

If you choose to split the output into multiple files, the table of contents is displayed in the left frame and is divided in two tabs: **Components** and **Resource Hierarchy**.

The **Components** tab allows you to group the contents by namespace, location, or component type. The WSDL components from each group are sorted alphabetically. The **Resource Hierarchy** tab displays the dependencies between WSDL and XML Schema modules in a tree-like fashion. The root of the tree is the WSDL document that you generate documentation for.

After the documentation is generated, you can collapse or expand details for some WSDL components by using the **Showing** options or the ⊟ **Collapse** or ⊞ **Expand** buttons.

Figure: Showing Options



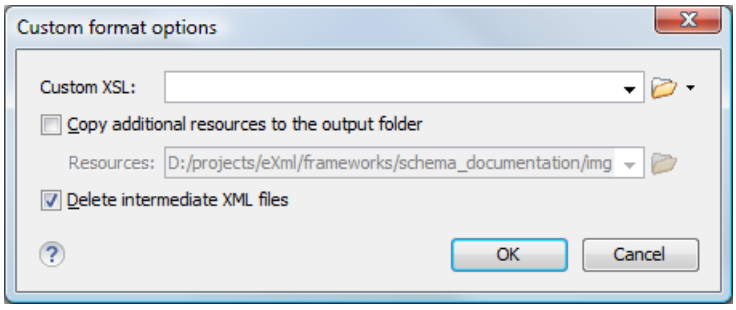
Generating WSDL Documentation in a Custom Format

To obtain the default HTML documentation output from a WSDL document, Oxygen XML Editor uses an intermediary XML document to which it applies an XSLT stylesheet. To create a custom output from your WSDL document, edit the `wsdlDocHtml.xsl` XSLT stylesheet or create your own.

Note: The `wsdlDocHtml.xsl` stylesheet that is used to obtain the HTML documentation is located in the *`[OXYGEN_INSTALL_DIR]`*`/frameworks/wsdl_documentation/xsl` folder.

Note: The intermediary XML document complies with the `wsdlDocSchema.xsd` XML Schema. This schema is located in the *`[OXYGEN_INSTALL_DIR]`*`/frameworks/wsdl_documentation` folder.

Figure: Custom Format Options Dialog Box



When using a custom format, you can also copy additional resources into the output folder or choose to keep the intermediate XML files created during the documentation process.

Generating WSDL Documentation from the Command-Line Interface

To generate documentation for a WSDL document from the command line, open the **WSDL Documentation** dialog box and click **Export settings**. Using the exported settings file you can generate the same documentation from the command line by running the following scripts:

- `wsdlDocumentation.bat` on Windows.
- `wsdlDocumentation.sh` on Mac OS X and Linux.

The scripts are located in the installation folder of Oxygen XML Editor. You can integrate the scripts in an external batch process launched from the command-line interface.

WSDL SOAP Analyzer

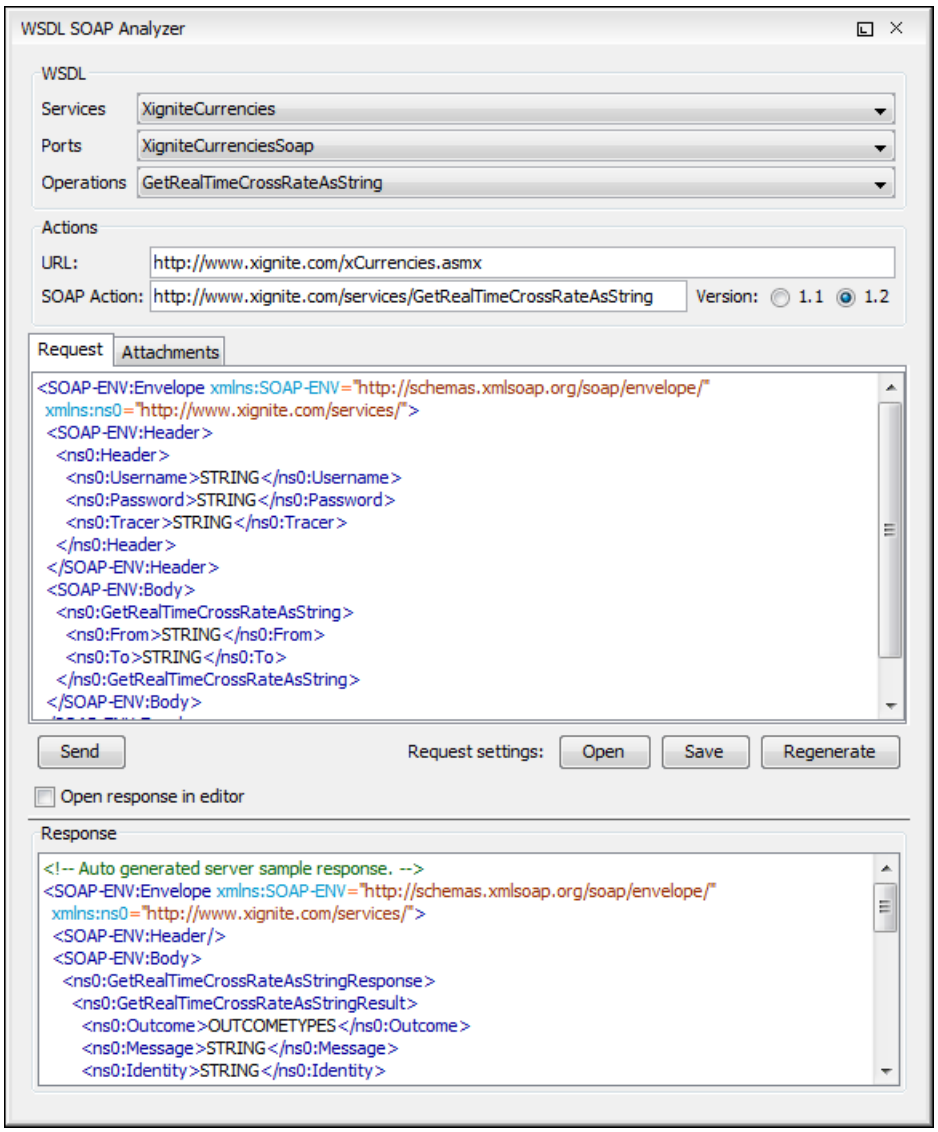
WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated **WSDL SOAP Analyzer** tool (available from the toolbar or **Tools** menu).

Oxygen XML Editor provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the **WSDL SOAP Analyzer** tool for the currently edited WSDL document do one of the following:

- Click the **WSDL SOAP Analyzer** toolbar button.
- Use the **WSDL SOAP Analyzer** action from the **Tools** menu.
- Go to **Open with > WSDL SOAP Analyzer** in the contextual menu of the **Project** *(page 332)* view.

Figure: WSDL SOAP Analyzer Dialog Box



This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.
- **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor tries to generate as much content as possible for the SOAP request. The

envelope of the SOAP request has the correct namespace for the selected SOAP version, that is *http://schemas.xmlsoap.org/soap/envelope/* for SOAP 1.1 or *http://www.w3.org/2003/05/soap-envelope* for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The *Content Completion Assistant (page 3227)* is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Editor remembers the modified request for each one. You can press the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.

- **Attachments List** - You can define a list of file URLs to be attached to the request.
- **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Editor prompts you to save them, then tries to open them with the associated system application.
- **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.
- **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor is connecting to the server.

The testing of a WSDL file is straight-forward: click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the Testing Remote WSDL Files *(page 1370)* section.

Note: SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

1. Go to **Tools >** **WSDL SOAP Analyzer** .
2. On the **WSDL File** tab enter the URL of the remote WSDL file.
   You enter the URL:
   - by typing

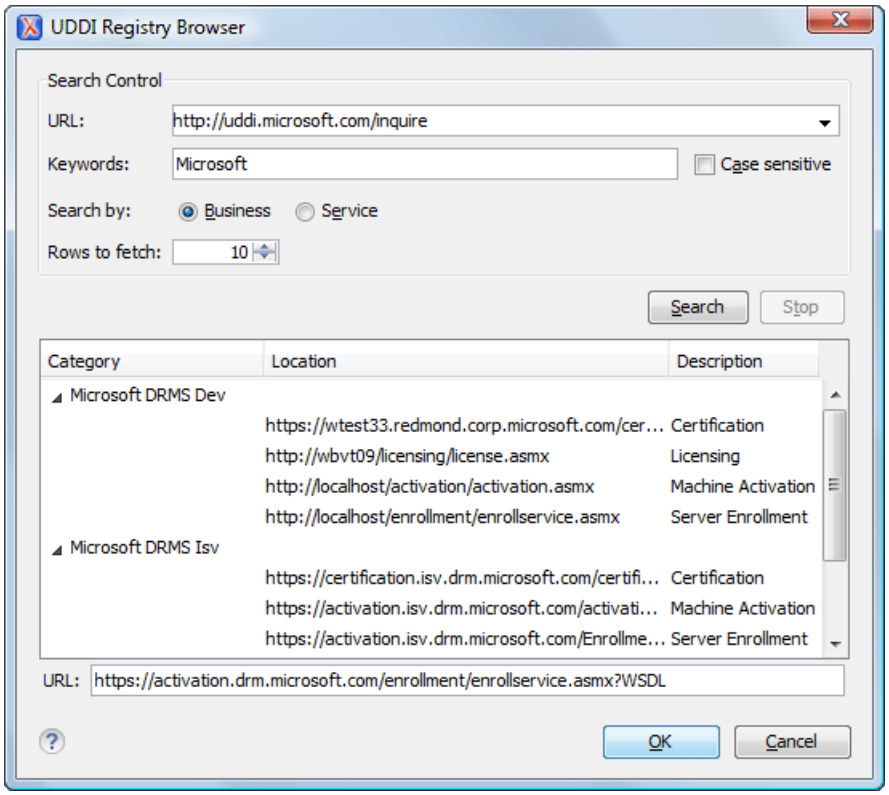
- by browsing the local file system
- by browsing a remote file system
- by browsing a UDDI Registry *(page 1371)*

3. Press the **OK** button.
   This will open the **WSDL SOAP Analyzer** tool *(page 1368)*. In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

UDDI Registry Browser

Pressing the button in the **WSDL File Opener** dialog box (menu **Tools > WSDL SOAP Analyzer**) opens the **UDDI Registry Browser** dialog box.

Figure: UDDI Registry Browser Dialog Box



The fields of the dialog box are as follows:

- **URL** - Type the URL of an UDDI registry or choose one from the default list.
- **Keywords** - Enter the string you want to be used when searching the selected UDDI registry for available Web services.
- **Rows to fetch** - The maximum number of rows to be displayed in the result list.
- **Search by** - You can choose to search either by company or by provided service.

- **Case sensitive** - When selected, the search takes into account the keyword case.
- **Search** - The WSDL files that matched the search criteria are added in the result list.

When you select a WSDL from the list and click the **OK** button, the **UDDI Registry Browser** dialog box is closed and you are returned to the **WSDL File Opener** dialog box.

Editing CSS Stylesheets

Oxygen XML Editor includes a built-in editor for CSS stylesheets. This section presents the features of the CSS editor and how these features should be used. The features of the CSS editor include:

- **Create new CSS files and templates** - You can use the built-in new file wizards to create new CSS documents or templates *(page 673)*.
- **Open and Edit CSS files** - CSS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in CSS files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Syntax highlighting** - The syntax highlighting in Oxygen XML Editor makes CSS files more readable.
- **Shortcut to open resources** - You can use **Ctrl + Single-Click (Command + Single-Click on OS X)** to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

Validating CSS Stylesheets

Oxygen XML Editor includes a built-in *CSS Validator*, integrated with general validation support. This makes the usual validation features *(page 1071)* for presenting errors also available for CSS stylesheets.

When you edit a CSS document, you can access the CSS validator options *(page 185)* by selecting **Validation options** from the **Document > Validate** menu.

The CSS properties accepted by the validator are those included in the current CSS profile that is selected in the CSS validation preferences *(page 185)*. The **CSS 3 with Oxygen extensions** profile includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen *(page 2417)* that can be used in Author mode *(page 400)*. That means all Oxygen specific extensions are accepted in a CSS stylesheet by the built-in CSS validator *(page 1372)* when this profile is selected.

Specify Custom CSS Properties

To specify custom CSS properties, follow these steps:

1. Create a file named `CustomProperties.xml` that has the following structure:

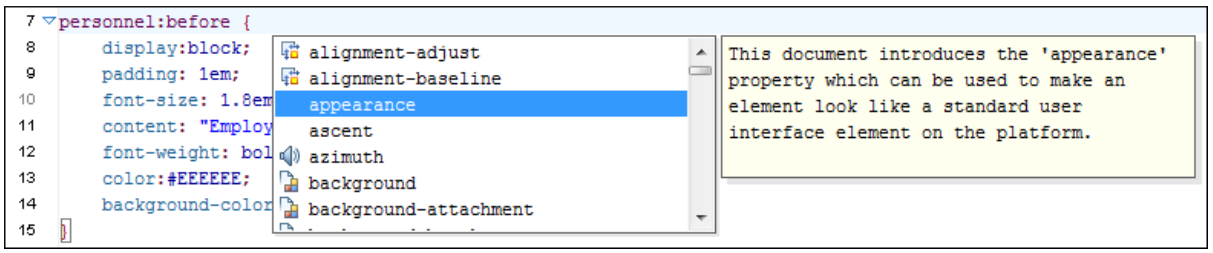
```
<?xml version="1.0" encoding="UTF-8"?>
<css_keywords
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:schemaLocation="http://www.oxygenxml.com/ns/css
 http://www.oxygenxml.com/ns/css/CssProperties.xsd"
      xmlns="http://www.oxygenxml.com/ns/css">
      <property name="custom">
      <summary>Description for custom property.</summary>
        <value name="customValue"/>
        <value name="anotherCustomValue"/>
      </property>
</css_keywords>
```

2. Go to your desktop and create the `builtin/css-validator/` folder structure.
3. Press and hold **Shift** and right-click anywhere on your desktop. From the contextual menu, select **Open Command Window Here**.
4. In the command line, run the `jar cvf custom_props.jar builtin/` command.
   The `custom_props.jar` file is created.
5. Go to *`[OXYGEN_INSTALL_DIR]`*`/lib` and create the `endorsed` folder. Copy the `custom_props.jar` file to *`[OXYGEN_INSTALL_DIR]`*`/lib/endorsed`.

Content Completion in CSS Stylesheets

A *Content Completion Assistant (page 3227)*, similar to the one available for XML documents *(page 836)* offers the CSS properties and the values available for each property. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut and is context-sensitive when invoked for the value of a property. The *Content Completion Assistant* also includes code templates that can be used to quickly insert code fragments *(page 848)* into CSS stylesheets. The code templates that are proposed include form controls, actions, and **Author** mode operations.

Figure: Content Completion in CSS Stylesheets



The properties and values available are dependent on the CSS Profile selected in the **CSS** preferences *(page 185)*. The CSS 2.1 set of properties and property values is used for most of the profiles. However, with CSS 1 and CSS 3 specific proposal sets are used.

The profile *CSS 3 with Oxygen extensions* includes all the CSS 3 standard properties plus the CSS extensions specific for Oxygen XML Editor *(page 2417)* that can be used in **Author** mode *(page 400)*.

Proposals for CSS Selectors - After inserting a *CSS selector*, the content completion assistance will propose a list of pseudo-elements and pseudo-classes that are available for the selected CSS profile.

Proposals for `@media` and `@import` Rules - After inserting `@media` or `@import <url>` rules, the content completion assistance will propose a list of supported media types.

Related Information:

Specify Custom CSS Properties *(page 1372)*

Syntax Highlighting in CSS Files

Oxygen XML Editor supports syntax highlighting in CSS files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for CSS files, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*.
2. Go to **Editor > Syntax Highlight** *(page 171)*.
3. Select and expand the **CSS** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

Syntax Highlight Preferences *(page 171)*

CSS Outline View

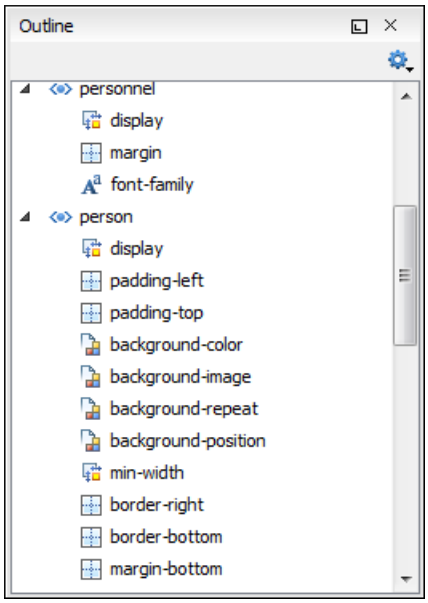
The **Outline** view for CSS stylesheets presents the import declarations for other CSS stylesheet files and all the selectors defined in the current CSS document. The selector entries can be presented as follows:

- In the order they appear in the document.
- Sorted by the element name used in the selector.
- Sorted by the entire selector string representation.

You can synchronize the selection in the **Outline** view with the cursor moves or changes you make in the stylesheet document. When you select an entry from the **Outline** view, Oxygen XML Editor highlights the corresponding import or selector in the CSS editor.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: CSS Outline View



The selectors presented in this view can be found quickly using the key search field. When you press a sequence of character keys while the focus is in the view, the first selector that starts with that sequence is selected automatically.

Folding in CSS Stylesheets

In a large CSS stylesheet document, some styles can be collapsed so that only the styles that are needed remain in focus. The same folding features available for XML documents *(page 832)* are also available in CSS stylesheets.

Note: To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

Formatting and Indenting CSS Stylesheets (Pretty Print)

If the edited CSS stylesheet becomes unreadable because of the bad alignment of the text lines, the format and indent operation available for XML documents *(page 854)* is also available for CSS stylesheets. It works in the same way as for XML documents and is available as the same menu and toolbar action.

Minifying CSS Stylesheets

Minification (or *compression*) of a CSS document is the practice of removing unnecessary code without affecting the functionality of the stylesheet.

To minify a CSS, invoke the contextual menu anywhere in the edited document and choose the **Minify CSS** action. Oxygen XML Editor opens a dialog box that allows you to:

- Set the location of the resulting CSS.
- Place each style rule on a new line.

After pressing **OK**, Oxygen XML Editor performs the following actions:

- All spaces are normalized (all leading and trailing spaces are removed, while sequences of white spaces are replaced with single space characters).
- All comments are removed.

Note: The CSS minifier relies heavily upon the W3C CSS specification. If the content of the CSS file you are trying to minify does not conform with the specifications, an error dialog box will be displayed, listing all errors encountered during the processing.

The resulting CSS stylesheet gains a lot in terms of execution performance, but loses in terms of readability. The source CSS document is left unaffected.

Note: To restore the readability of a minified CSS, invoke the **Format and Indent** action from the **Document > Source** menu, the **Source** submenu from the contextual menu, or **Source** toolbar. However, this action will not recover any of the deleted comments.

Editing LESS Stylesheets

Oxygen XML Editor provides support for stylesheets coded with the LESS dynamic stylesheet language. LESS extends the CSS language by adding features that allow mechanisms such as *variables*, *nesting*, *mixins*, *operators*, and *functions*. Oxygen XML Editor offers additional LESS features that include:

- **Create new LESS files and templates** - You can use the built-in new file wizards to create new LESS documents or templates *(page 673)*.
- **Open and Edit LESS files** - LESS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in LESS files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Compile to CSS** - Options are available to compile LESS files to CSS.
- **Syntax highlighting** - Oxygen XML Editor supports syntax highlighting in LESS files, although there may be some limitations in supporting all the LESS constructs.
- **Shortcut to open resources** - While editing LESS files, you can use **Ctrl + Single-Click (Command + Single-Click on OS X)** to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

For more information about LESS go to http://lesscss.org/.

Validating LESS Stylesheets

Oxygen XML Editor includes a built-in *LESS CSS Validator*, integrated with general validation support. The usual validation features *(page 1071)* for presenting errors also available for LESS stylesheets.

Oxygen XML Editor provides three validation methods:

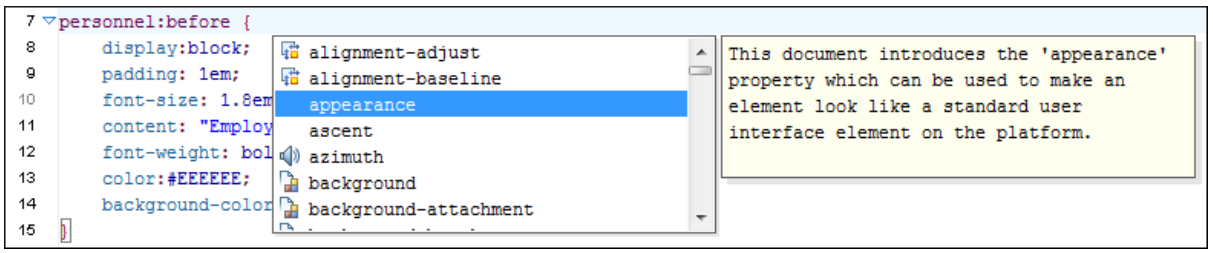
- Automatic validation as you type - marks validation errors in the document as you are editing.
- Validation upon request, by pressing the **Validate** button from the **Validation** toolbar drop-down menu. An error list is presented in the message panel at the bottom of the editor.
- Validation scenarios, by selecting **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu. Errors are presented in the message panel at the bottom of the editor.

This is useful when you need to validate the current file as part of a larger LESS import hierarchy (for instance, you may change the URL of the file to validate to the root of the hierarchy).

Content Completion in LESS Stylesheets

A *Content Completion Assistant (page 3227)* offers the LESS properties and the values available for each property. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut and is context-sensitive when invoked for the value of a property in a LESS file. The *Content Completion Assistant* also includes code templates that can be used to quickly insert code fragments *(page 848)* into LESS stylesheets. The code templates that are proposed include form controls, actions, and **Author** mode operations.

Figure: Content Completion in LESS Stylesheets



The properties and values available are dependent on the CSS Profile selected in the CSS preferences *(page 185)*.

Syntax Highlighting in LESS Files

Oxygen XML Editor supports syntax highlighting in LESS files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for LESS files, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*.
2. Go to **Editor > Syntax Highlight** *(page 171)*.
3. Select and expand the **LESS** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

Syntax Highlight Preferences *(page 171)*

Compiling LESS Stylesheets to CSS

When editing LESS files, you can compile the files into CSS. Oxygen XML Editor provides both manual and automatic options to compile LESS stylesheets into CSS.

Important: The LESS processor works well only with files having the *UTF-8* encoding. Thus, it is highly recommended that you always use the `utf-8` encoding when working with LESS files or the files they import (other LESS or CSS files). You can use the following directive at the beginning of your files:

```
@charset "utf-8";
```

You have two options for compiling LESS files to CSS:

1. Use the contextual menu in a LESS file and select **Compile to CSS (Ctrl + Shift + C (Command + Shift + C on OS X))**.
2. Select the **Automatically compile LESS to CSS when saving** option *(page 176)* in the settings (open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Editor > Open/Save > Save Hooks**). If selected, when you save a LESS file it will automatically be compiled to CSS (this option is deselected by default).

   Important: If this option is selected, when you save a LESS file, the CSS file that has the same name as the LESS file is overwritten without warning. Make sure all your changes are made in the LESS file. Do not edit the CSS file directly, as your changes might be lost.

Editing Relax NG Schemas

An XML Schema describes the structure of an XML document and is used to validate XML document instances against it, to check that the XML instances conform to the specified requirements. If an XML instance conforms to the schema then it is said to be valid. Otherwise, it is invalid.

Oxygen XML Editor offers support for editing Relax NG schema files in the following editing modes:

- **Text editing mode *(page 1274)*** - Allows you to edit Relax NG schema files in a source editing mode, along with a schema design pane with two tabs that offer a **Full Model View** *(page 1381)* and **Logical Model View** *(page 1382)*.

- **Grid editing mode** *(page 390)* - Displays Relax NG schema files in a structured spreadsheet-like grid.
- **Author editing mode** *(page 885)* - The visual **Author** mode is also available for Relax NG schema files, presenting the schema similar to the Relax NG compact syntax. It links to imported schemas and external references. Embedded Schematron is also supported in Relax NG schemas with XML syntax.

For information about applying and detecting schemas, see Associating a Schema to XML Documents *(page 1099)*.

Related Information:

Associating a Schema to XML Documents *(page 1099)*

Editing Relax NG Schema in the Master Files Context

Smaller interrelated modules that define a complex Relax NG Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You cat set a main Relax NG document either using the *master files* support from the **Project** view *(page 719)*, or using a validation scenario.

To set a *master file* using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The main advantage of editing in the context of a *master file (page 3231)* is that it provides correct validation of a module in the context of a larger schema structure.

Related Information:

Creating a New Validation Scenario *(page 1082)*

XML Schema Outline View *(page 620)*

Relax NG Schema Diagram Editor

This section explains how to use the graphical diagram editor for Relax NG schemas.

Introduction to Relax NG Schema Diagram Editor

Oxygen XML Editor provides a simple, expressive, and easy-to-read schema diagram editor for Relax NG schemas.

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, or BMP images. It helps both schema authors in developing the schema and content authors who are using the schema to understand it.

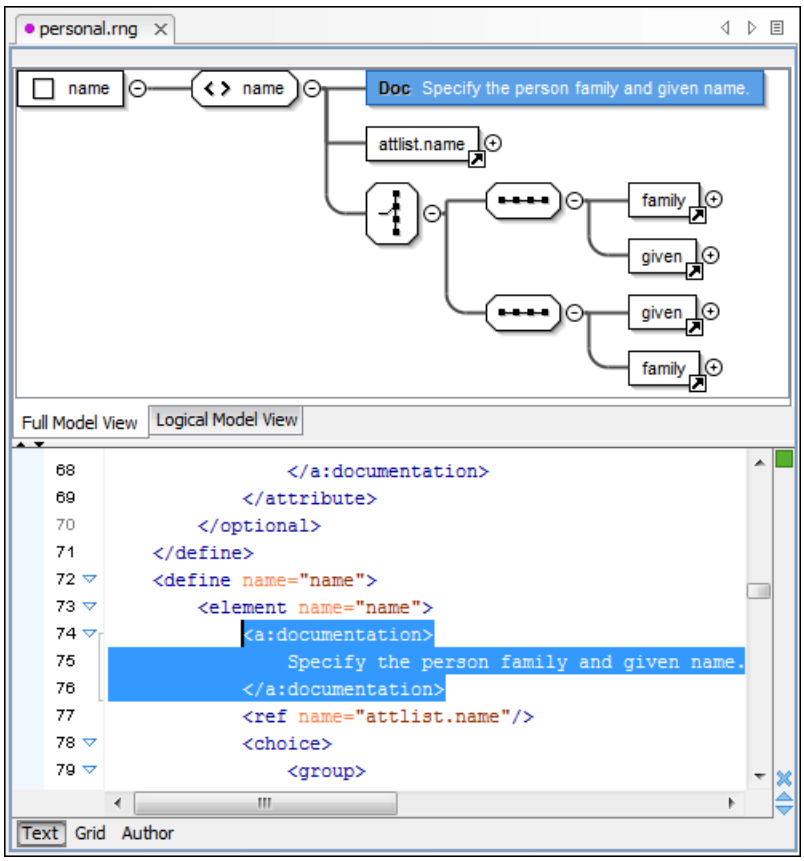
Oxygen XML Editor is the only XML editor to provide a side by side source and diagram presentation and have them real-time synchronized:

- The changes you make in the Editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram selects the underlying code in the source editor.

Full Model View

When you create a new schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The schema diagram editor has two tabs that offer a **Full Model View** and **Logical Model View** *(page 1382)*.

Figure: Relax NG Schema Editor - Full Model View



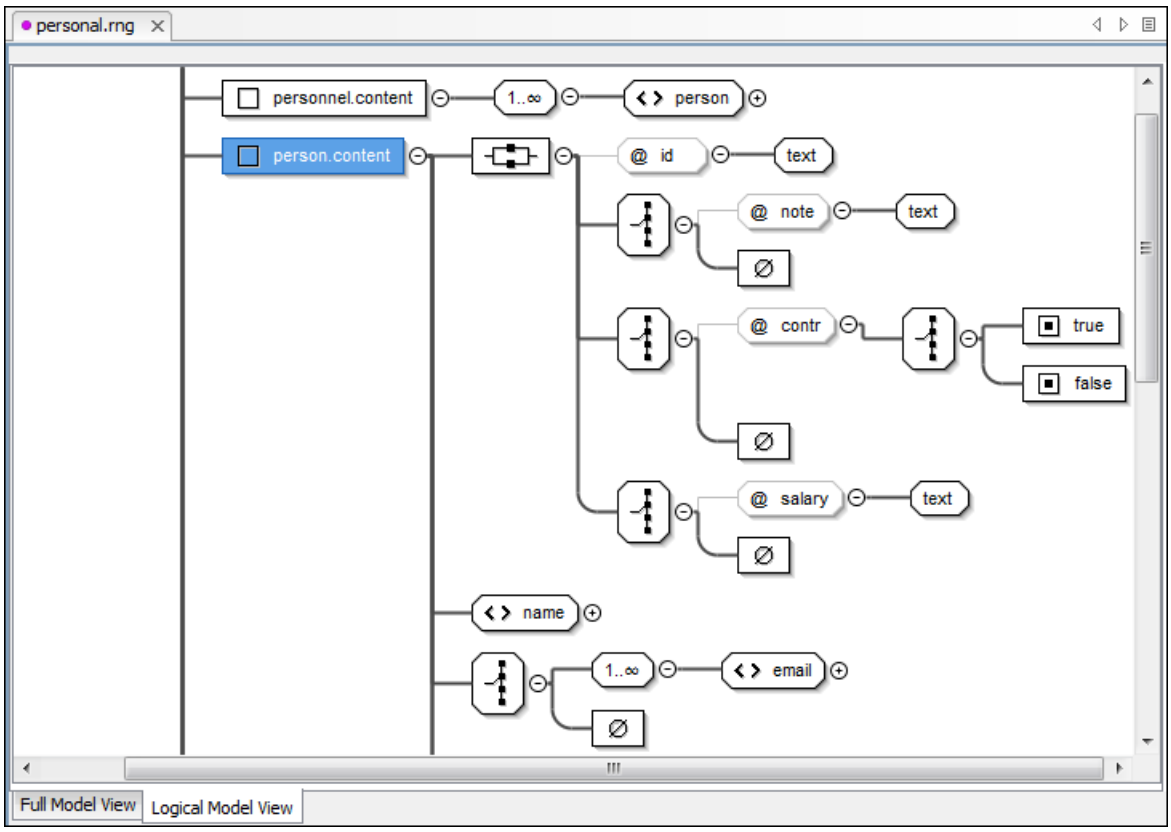
The following references can be expanded in place: patterns, includes, and external references. This expansion mechanism, coupled with the synchronization support, makes the schema navigation easy.

All the element and attribute names are editable by double-clicking the names.

Logical Model View

The **Logical Model View** presents the compiled schema in the form of a single pattern. The patterns that form the element content are defined as top level patterns with generated names. These names are generated depending of the elements name class.

Figure: Logical Model View for a Relax NG Schema



Symbols Used in the Schema Diagram

The views in the schema diagram editor renders all the Relax NG schema patterns with the following intuitive symbols:

- 
- `define` pattern with the `name` attribute set to the value shown inside the rectangle (in this example `name`).
-

- `define` pattern with the `combine` attribute set to `interleave` and the `name` attribute set to the value shown inside the rectangle (in this example `attlist.person`).
-

- `define` pattern with the `combine` attribute set to `choice` and the `name` attribute set to the value shown inside the rectangle (in this example `attlist.person`).
- 
- `element` pattern with the `name` attribute set to the value shown inside the rectangle (in this example `name`).
- 
- `attribute` pattern with the `name` attribute set to the value shown inside de rectangle (in this case `note`).

- 
- `ref` pattern with the `name` attribute set to the value shown inside the rectangle (in this case `family`).
-

- `oneOrMore` pattern.
-

- `zeroOrMore` pattern.
-

- `optional` pattern.
-
- `choice` pattern.
-

- `value` pattern (for example, used inside a `choice` pattern).
-
- `group` pattern.
- 
- A pattern from the Relax NG Annotations namespace (http://relaxng.org/ns/compatibility/annotations/1.0) that is treated as a documentation element in a Relax NG schema.
-

- `text` pattern.
-
- `empty` pattern.

Actions Available in the Schema Diagram Editor

When editing Relax NG schemas in **Full Model View** *(page 1381)*, the contextual menu offers the following actions:

Append child

Appends a child to the selected component.

Insert Before

Inserts a component before the selected component.

Insert After

Inserts a component after the selected component.

Edit attributes

Edits the attributes of the selected component.

Remove

Removes the selected component.

Show only the selected component

Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

Show Annotations

Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

Auto expand to references

This option controls how the schema diagram is automatically expanded. If you select it and then edit a top-level element or you make a refresh, the diagram is expanded until it reaches referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

Collapse Children

Collapses the children of the selected view.

Expand Children

Expands the children of the selected view.

Print Selection

Prints the selected view.

Save as Image

Saves the current selection as JPEG, BMP, SVG or PNG image.

Refresh

Refreshes the schema diagram according to the changes in your code. They represent changes in your imported documents or changes that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the **Logical Model View** *(page 1382)* instead of the diagram.

Validating Relax NG Schema Documents

By default, Relax NG schema files are validated as you type. To change this, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option *(page 156)*.

To validate a Relax NG schema document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu. When Oxygen XML Editor

validates a Relax NG schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Content Completion in Relax NG Schemas

The intelligent *Content Completion Assistant (page 3227)* allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Editor > Content Completion**, and deselect the **Enable content completion** option *(page 166)*.

When active, the *Content Completion Assistant* displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

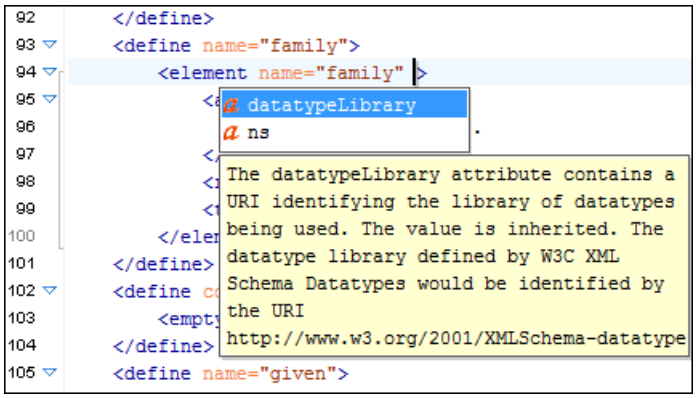
- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on OS X)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

If you are using the concept of *master files (page 3231)* to import/include modules, the *Content Completion Assistant* collects its components starting from the *master files*. The *master files* can be

defined in the project or in the associated validation scenario. For more information about the *Master Files* support in Oxygen XML Editor, see Defining Master Files at Project Level *(page 719)*.

The *Content Completion Assistant* also offers additional information for the element and attribute proposals in the form of schema annotations that is displayed in a tooltip.

Figure: Relax NG Content Completion Assistant



Syntax Highlighting in Relax NG Schemas

Oxygen XML Editor supports syntax highlighting in Relax NG schemas to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for Relax NG schemas, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*.
2. Go to **Editor > Syntax Highlight** *(page 171)*.
3. Select and expand the **XML** section in the top pane (for RELAX NG Compact Syntax schemas, select and expand the **RNC** section).
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes (for RELAX NG Compact Syntax schemas, the tab is **RNC**).

Tip: Oxygen XML Editor also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page *(page 172)*.

Related Information:

Syntax Highlight Preferences *(page 171)*

Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor offers *Quick Fixes (page 3233)* for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

Note: For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

Quick Fixes are available in **Text** mode and **Author** mode.

Oxygen XML Editor provides *Quick Fixes* for numerous types of problems, including the following:

Problem Type	Available Quick Fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

Related Information:

Schematron Quick Fixes (SQF) *(page 1098)*

Relax NG Outline View

The **Outline** view for Relax NG schemas presents a list with the patterns that appear in the diagram in both the **Full Model View** *(page 1381)* and **Logical Model View** *(page 1382)* cases and it allows for quick access to a component by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: Relax NG Outline View

This view has two modes, with the tree showing either the XML structure or the defined pattern (components) collected from the current document. By default, the **Outline** view presents the components.

When the **Show components** option is selected in the **Settings** menu on the **Outline** view toolbar, the following option is available:

Show XML structure

Shows the XML structure of the current document in a tree-like manner.

The following actions are available in the **Settings** menu on the **Outline** view toolbar when the **Show XML structure** option is selected:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram will be also selected in the **Outline** view.

Show components

Shows the defined pattern collected from the current document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel *(page 257)*.

Configure displayed attributes

Displays the **XML Structured Outline** preferences page *(page 257)*.

The following contextual menu actions are also available in the **Outline** view when the **Show XML structure** option is selected in the **Settings** menu:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

Toggle Comment

Comments/uncomments the currently selected element.

Search references

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Opens the **Component Dependencies** view *(page 1394)* that displays the dependencies of the currently selected component.

Rename Component in

Renames the currently selected component in the context of a scope that you define.

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Delete

Deletes the currently selected component.

Expand More

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

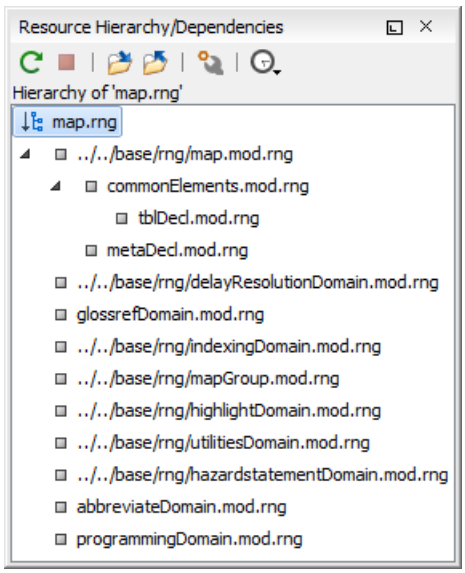
The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

RNG Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a schema. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

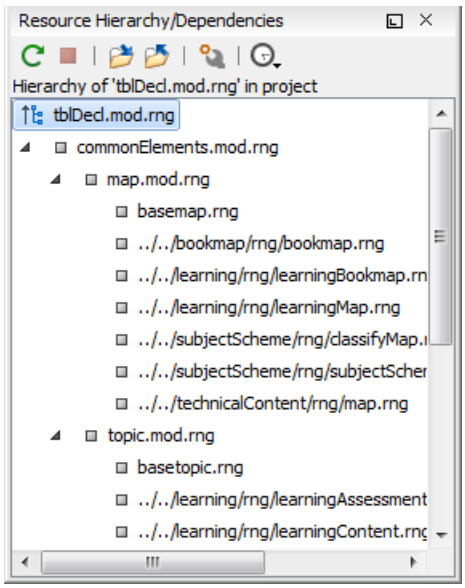
If you want to see the hierarchy of a schema, select the desired schema in the **Project** view *(page 332)* and choose **Resource Hierarchy** from the contextual menu.

Figure: Resource Hierarchy/Dependencies View - hierarchy for `map.rng`



If you want to see the dependencies of a schema, select the desired schema in the **Project** view and choose **Resource Dependencies** from the contextual menu.

Figure: Resource Hierarchy/Dependencies View - Dependencies for `tblDecl.mod.rng`



The following actions are available in the **Resource Hierarchy/Dependencies** view:

Refresh

Refreshes the Hierarchy/Dependencies structure.

Stop

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the **Master Files** directory *(page 719)*.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

Note: The **Move resource** or **Rename resource** actions give you the option to update the references to the resource *(page 1356)*.

Related Information:

Working with Modular XML Files in the Master Files Context *(page 1114)*

Search and Refactor Operations Scope *(page 1116)*

Moving/Renaming RNG Resources

You can move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Select this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is selected, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

Note: Updating the references of a resource that is resolved through a catalog is not supported. Also, the update references operation is not supported if the path to the renamed or moved resource contains entities.

Relax NG Schema Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

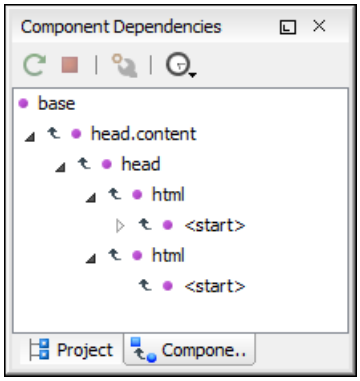
To see the dependencies of a RelaxNG component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named defines.

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

Figure: Component Dependencies View - Hierarchy for `base.rng`



The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:

Search and Refactor Operations Scope *(page 1116)*

Searching and Refactoring Actions in RNG Schemas

Search Actions

The following search actions can be applied on named *defines* and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

- **Go to Definition** - Moves the cursor to the definition of the current element in the Relax NG (full syntax) schema.

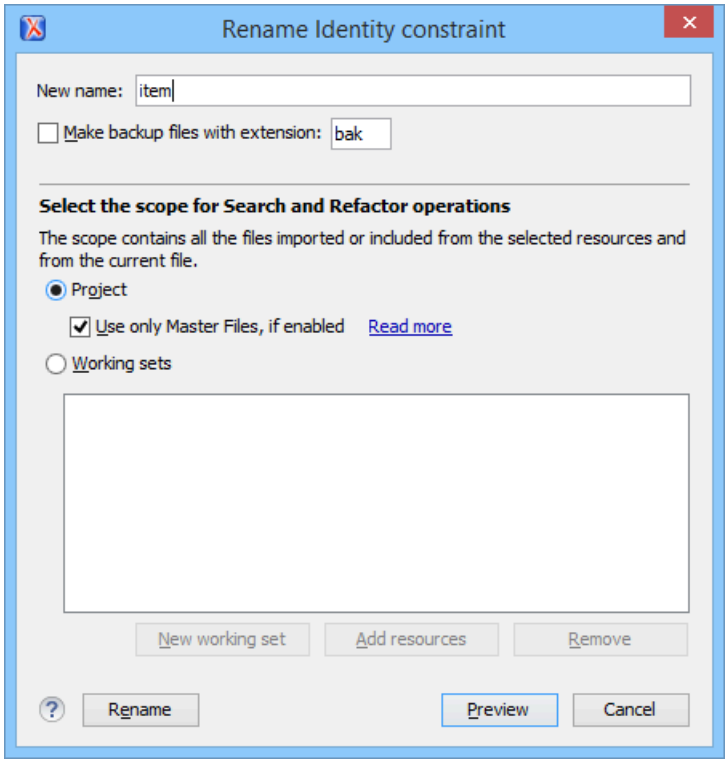
Note: You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on named *defines* and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure: Rename Identity Constraint Dialog Box

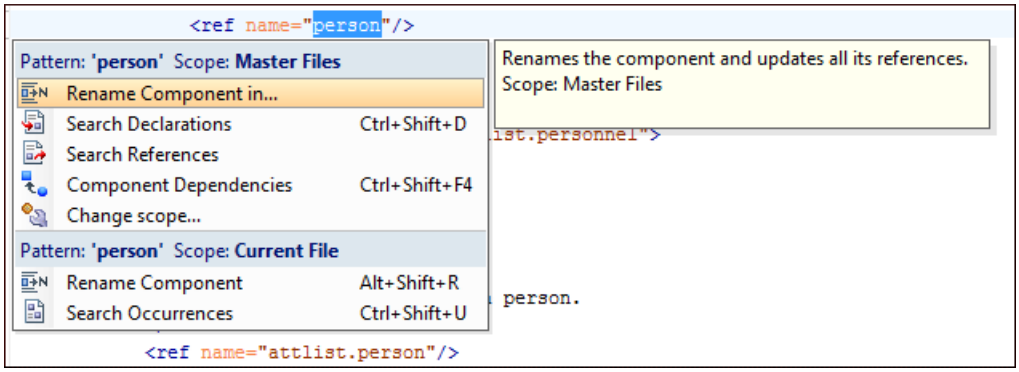


RNG Quick Assist Support

The *Quick Assist* support *(page 3233)* improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist* feature *(page 3233)* is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon ( ) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Alt + 1** (**Meta + Alt + 1** on Mac OS X) keyboard shortcuts.

Figure: RNG Quick Assist Support



The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Configuring a Custom Datatype Library for a RELAX NG Schema

A RELAX NG schema can declare a custom datatype library for the values of elements found in XML document instances. The datatype library must be developed in Java and it must implement the interface specified on the www.thaiopensource.com website.

The *JAR (page 3230)* file containing the custom library and any other dependent *JAR* file must be added to the classpath of the application, that is the *JAR* files must be added to the folder `[OXYGEN_INSTALL_DIR]/lib` .

To load the custom library, restart Oxygen XML Editor.

Editing NVDL Schemas

Some complex XML documents are composed by combining elements and attributes from namespaces. Furthermore, the schemas that define these namespaces are not even developed in the same schema language. In such cases, it is difficult to specify in the document all the schemas that must be taken into account for validation of the XML document or for content completion. An NVDL (Namespace Validation Definition Language) schema can be used. This schema allows the application to combine and interleave multiple schemas of different types (W3C XML Schema, RELAX NG schema, Schematron schema) in the same XML document.

Oxygen XML Editor offers support for editing NVDL schema files in the following editing modes:

- **Text editing mode *(page 1274)*** - Allows you to edit NVDL schema files in a source editing mode, along with a schema design pane with two tabs that offer a **Full Model View** *(page 1400)* and **Logical Model View** *(page 1401)*.
- **Grid editing mode *(page 390)*** - Displays NVDL schema files in a structured spreadsheet-like grid.

- **Author editing mode** - The visual **Author** mode is also available for Relax NG schema files, presenting them in a compact and easy to understand representation.

For information about applying and detecting schemas, see Associating a Schema to XML Documents *(page 1099)*.

Related Information:

Associating a Schema to XML Documents *(page 1099)*

NVDL Schema Diagram

This section explains how to use the graphical diagram of a NVDL schema.

Introduction to NVDL Schema Diagram Editor

Oxygen XML Editor provides a simple, expressive, and easy-to-read schema diagram editor for NVDL schemas.

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, and BMP images. It helps both schema authors in developing the schema and content authors that are using the schema to understand it.

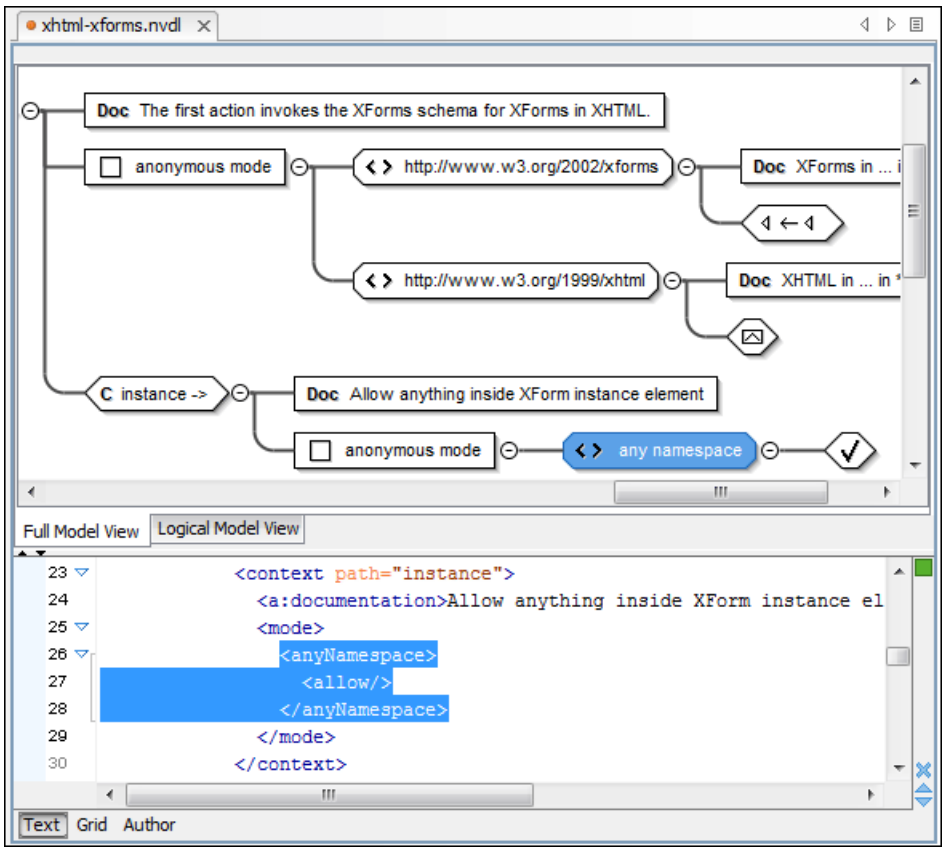
Oxygen XML Editor is the only XML Editor to provide a side by side source and diagram presentation and have them real-time synchronized:

- The changes you make in the Editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram, selects the underlying code in the source editor.

Full Model View

When you create a schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The diagram view has two tabbed panes offering a **Full Model View** and a **Logical Model View** *(page 1401)*.

Figure: NVDL Schema Editor - Full Model View



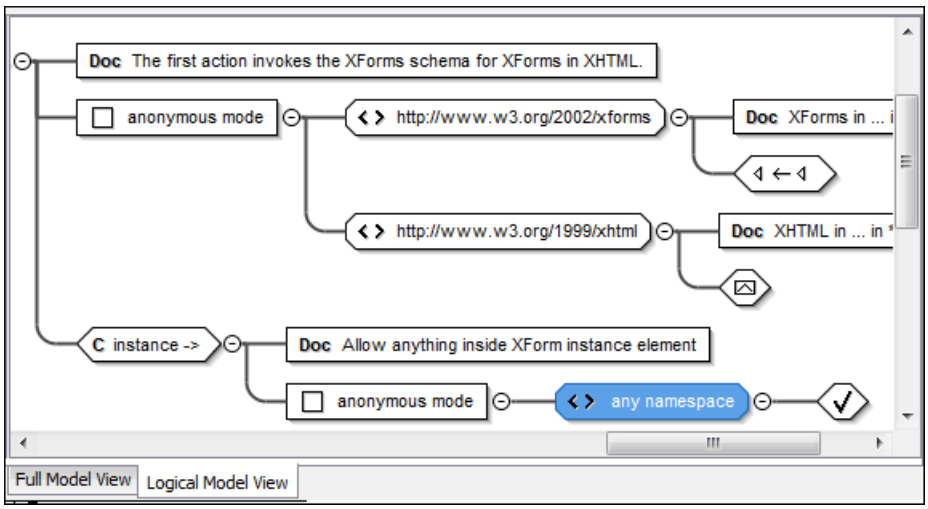
The **Full Model View** renders all the NVDL elements with intuitive icons. This representation coupled with the synchronization support makes the schema navigation easy.

Double-click any diagram component to edit its properties.

Logical Model View

The **Logical Model View** presents the compiled schema in the form of a single pattern. The patterns that form the element content are defined as top level patterns with generated names. These names are generated depending of the elements name class.

Figure: Logical Model View for an NVDL Schema



Actions Available in the Diagram Editor

The contextual menu offers the following actions:

Show only the selected component

Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

Show Annotations

Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

Auto expand to references

This option controls how the schema diagram is automatically expanded. For instance, if you select it and then edit a top-level element or you trigger a diagram refresh, the diagram will be expanded until it reaches the referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

Collapse Children

Collapses the children of the selected view.

Expand Children

Expands the children of the selected view.

Print Selection

Prints the selected view.

Save as Image

Saves the current selection as image, in JPEG, BMP, SVG or PNG format.

Refresh

Refreshes the schema diagram according to the changes in your code (changes in your imported documents or those that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the **Logical Model View** *(page 1401)* instead of the diagram.

Validating NVDL Schema Documents

By default, NVDL schema files are validated as you type. To change this, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option *(page 156)*.

To validate an NVDL schema document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu. When Oxygen XML Editor validates an NVDL schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Related Information:

Validating XML Documents Against a Schema *(page 1071)*

Content Completion in NVDL Schemas

The intelligent *Content Completion Assistant (page 3227)* allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Editor > Content Completion**, and deselect the **Enable content completion** option *(page 166)*.

When active, the *Content Completion Assistant* displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a

documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

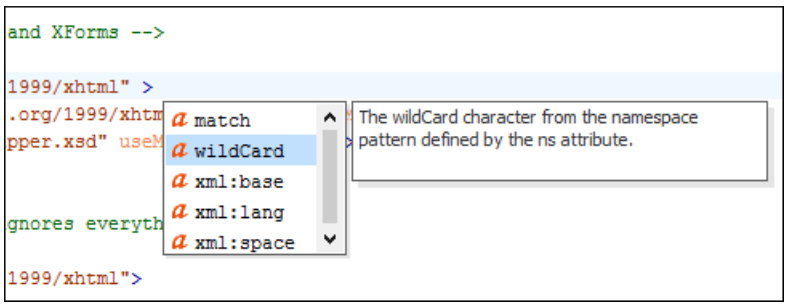
To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on OS X)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

If you are using the concept of *master files (page 3231)* to import/include modules, the *Content Completion Assistant* collects its components starting from the *master files*. The *master files* can be defined in the project or in the associated validation scenario. For more information about the *Master Files* support in Oxygen XML Editor, see Defining Master Files at Project Level *(page 719)*.

The *Content Completion Assistant* also offers additional information for the element and attribute proposals in the form of schema annotations that is displayed in a tooltip.

Figure: NVDL Content Completion Assistant



Syntax Highlighting in NVDL Schemas

Oxygen XML Editor supports syntax highlighting in NVDL schemas to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for NVDL schemas, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*.
2. Go to **Editor > Syntax Highlight** *(page 171)*.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

Tip: Oxygen XML Editor also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page *(page 172)*.

Related Information:

Syntax Highlight Preferences *(page 171)*

NVDL Outline View

The **Outline** view for NVDL schemas presents a list with the named or anonymous rules that appear in the diagram and it allows for quick access to a rule by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

NVDL Schema Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

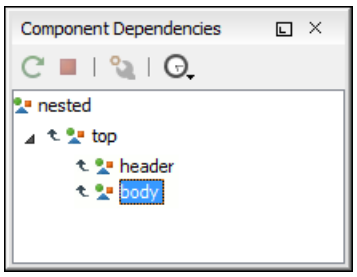
To see the dependencies of an NVDL component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named modes.

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

Figure: Component Dependencies View - Hierarchy for `test.nvdl`



The **Component Dependencies** view includes the following toolbar actions:

Refresh

Refreshes the dependencies structure.

Stop

Stops the dependency computation.

Configure

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

History

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Searching and Refactoring Actions in NVDL Schemas

Search Actions

The following search actions can be applied on `name`, `useMode`, and `startMode` attributes and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the contextual menu and the **Document > Schema** menu:

- **Go to Definition** - Moves the cursor to its definition in the schema used by the NVDL to validate it.

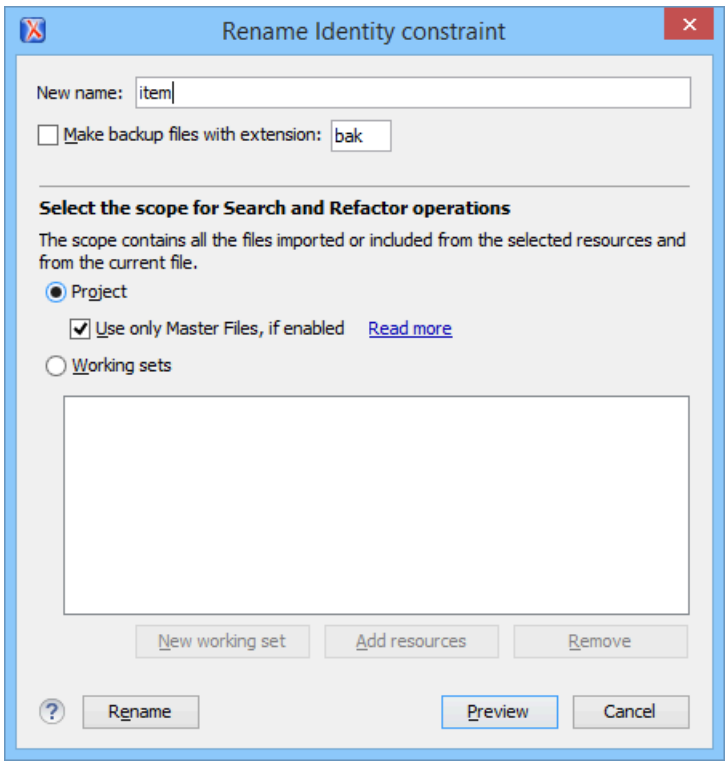
  Note: You can also use the **Ctrl + Single-Click (Command + Single-Click on OS X)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on `name`, `useMode`, and `startMode` attributes and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure: Rename Identity Constraint Dialog Box



Editing JSON Documents

Oxygen XML Editor includes a document template to help you get started with JSON documents. The template is called **JSON** and it can be found in the **New Document** folder in the **New** document wizard *(page 673)*.

This section explains the features of the Oxygen XML Editor JSON Editor and how to use them.

Editing JSON Documents in Text Mode

When editing JSON documents in the **Text** editing mode, the usual text editing actions *(page 823)* are available, along with other editor specific actions, including:

- Find / Replace *(page 735)*
- Drag and Drop *(page 833)*
- Validation *(page 1411)*
- Format and Indent (Pretty Print) *(page 854)*

Note: You can run XPath expressions on opened JSON documents, but in **Text** mode the XPath results cannot be mapped in the document. However, they can be mapped in the **Grid** editing mode. You can use the **Grid** button at the bottom of the editor panel to switch to that editing mode.

Navigating References in JSON Documents

When editing JSON documents (or JSON Schema), you can easily navigate *JSON Pointer* references and hyperlinks by using the **CTRL + Click** shortcut. Holding the **CTRL** key while hovering over a *JSON Pointer* references or hyperlink will change the reference to a clickable link.

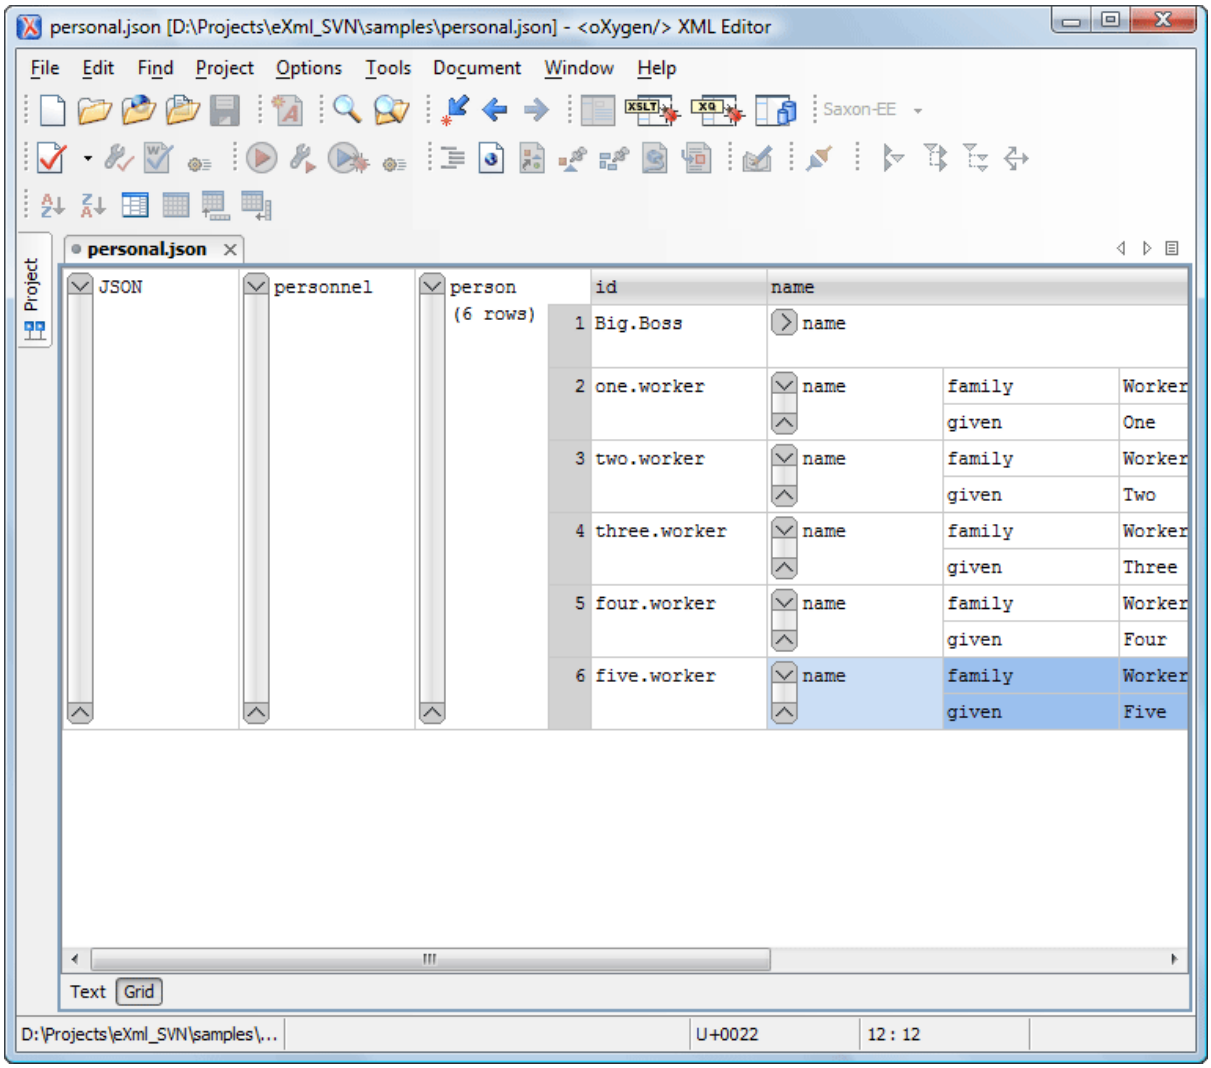
Editing JSON Documents in Grid Mode

Figure: JSON Editor Grid Mode



Oxygen XML Editor allows you to view and edit the JSON documents in the **Grid** mode *(page 390)*. The JSON is represented in **Grid** mode as a compound layout of nested tables in which the JSON data and structure can be easily manipulated with table-specific operations or drag and drop operations on the grid components. You can also use the following JSON-specific contextual actions:

Array

Useful when you want to convert a JSON *value* to *array*.

Insert value before

Inserts a value before the currently selected one.

Insert value after

Inserts a value after the currently selected one.

Append value as child

Appends a value as a child of the currently selected value.

You can customize the JSON grid appearance *(page 128)* according to your needs. For instance, you can change the font, the cell background, foreground, or even the colors from the table header gradients. The default width of the columns can also be changed.

Related Information:

Grid Editing Mode *(page 390)*

Grid Preferences *(page 128)*

Validating JSON Documents

Oxygen XML Editor includes a built-in JSON validator that is used to validate JSON documents against JSON Schemas, as well as a built-in JSON *Well-Formedness* validator (based on the free JAVA source code available on www.json.org).

For more information, see the following video demonstration:

Checking Well-Formedness in JSON Documents

A *Well-formed* JSON document is a sequence of Unicode code points that strictly conforms to the JSON grammar defined by the JSON Data Interchange Syntax specification. By default, Oxygen XML Editor automatically checks the document for *Well-formedness* as you type.

Check for Well-Formedness Manually

To manually check documents for *Well-Formedness*:

- Select the **Check Well-Formedness (Ctrl + Shift + W (Command + Shift + W on OS X))** action from the **Validation** drop-down menu on the toolbar or from the **Document > Validate** menu.
- A selection of files can be checked for well-formedness by selecting the **Check Well-Formedness** action from the **Validate** submenu when invoking the contextual menu in the **Project** view *(page 332)*.

Result: If any errors are found, the result is displayed in the message panel at the bottom of the editor. Each error is displayed as one record in the result list and is accompanied by an error message. Clicking the record will open the document containing the error and highlight its approximate location.

Example: A non *Well-formed* JSON Document

```
{"person": { "name": "John Doe" }
```

This would result in the following error:

```
Expected a ',' or '}'
```

To resolve the error, click the record in the result list and it will locate and highlight the approximate position of the error. In this case, you would need to identify where the missing end bracket needs to be placed.

Validating JSON Documents Against JSON Schema

A *Valid* JSON document is a *Well-Formed* document that also conforms to the rules of a JSON Schema that defines the legal syntax of a JSON document. The purpose of the JSON schema is to define the legal properties and values of a JSON document.

This section contains topics that explain the automatic and manual validation possibilities in Oxygen XML Editor, how validation errors are presented, and information about built-in validation scenarios.

For information about how to associate a JSON schema for the purposes of validation, see Using a JSON Schema to Validate a JSON Document *(page 1419)*.

Automatic Validation

By default, Oxygen XML Editor is configured to automatically mark validation errors in the JSON document as you are editing. The **Enable automatic validation** option *(page 156)* in the **Document Checking** preferences page *(page 156)* controls whether or not all validation errors and warnings will automatically be highlighted in the editor panel.

The automatic validation starts parsing the document and marking the errors after a configurable delay *(page 156)* from the last key typed. Errors are highlighted with underline markers in the main editor panel and small rectangles on the right side ruler of the editor panel. Hovering over a validation error presents a tooltip message with more details about the error.

If the error message is long and it is not displayed completely in the error line at the bottom of the editing area, double-clicking the error icon at the left of the error line or on the error line displays an information dialog box with the full error message. You can use the arrow buttons in this dialog box to navigate through the errors issued by the Automatic Validation feature.

Related Information:

Manual Validation Actions *(page 1413)*

Presenting Validation Errors in JSON Documents *(page 1414)*

Manual Validation Actions

You can choose to validate JSON documents at any time by using the manual validation actions that are available in Oxygen XML Editor.

Manual Validation Actions

To manually validate the currently edited document, use one of the following actions:

Validate (Ctrl + Shift + V (Command + Shift + V on OS X))

Available from the **Validation** drop-down menu on the toolbar, the **Document > Validate** menu, or from the **Validate** submenu when invoking the contextual menu in the **Project** view *(page 332)*.

Validate with

Available from the **Validation** drop-down menu on the toolbar or the **Document > Validate** menu.

This action opens a dialog box that allows you to specify a schema for validating the current document *(page 1420)*.

Note: The **Validate with** action does not work for files loaded through an Oxygen XML Editor custom protocol plugin *(page 2543)* developed independently and added to Oxygen XML Editor after installation.

Validate with Schema

Available from the **Validate** submenu when invoking the contextual menu in the **Project** view *(page 332)*.

This action opens a dialog box that allows you to specify a schema for validating the current document *(page 1420)*.

Other Validation Options

Tip: If a large number of validation errors are detected and the validation process takes too long, you can limit the maximum number of reported errors in the **Document Checking** preferences page *(page 156)*.

Related Information:

Automatic Validation *(page 1412)*

Presenting Validation Errors in JSON Documents *(page 1414)*

Presenting Validation Errors in JSON Documents

Validation errors in JSON documents are presented in various locations of the interface.

Validation Marker Locations

Validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

You can configure the color for each type in the **Document Checking** preferences page *(page 156)*.

Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

Upper Part of the Stripe

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tool tip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tool tip.

Middle Part of the Stripe

Errors are depicted with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights** option *(page 156)*.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tool tip (when hovering over the marker) and in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the **Document Checking** preferences page *(page 156)*.

Bottom Part of the Stripe

Two navigation arrows () allow you to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next error** (**Ctrl + Period (Command + Period on OS X)**) and **Document > Automatic validation > Previous error** (**Ctrl + Comma (Command + Comma on OS X)**). Also, the **Remove All** button can be used to clear all the validation markers.

Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem. Also, when hovering over an issue, pressing **F2** will change the focus to the tooltip.

Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the **Document checking options** button opens the **Document Checking** preferences page *(page 156)* where you can configure some validation options (such as the colors used to present the validation issues).
- Status messages from every validation action are also logged in the **Information** view *(page 815)*.
- If you want to see all the validation messages grouped in the **Results** panel *(page 354)*, you should use the **Validate** action from the toolbar or **Document > Validate** menu..

Creating a JSON Validation Scenario

Validation scenarios can be used to associate one or more JSON Schemas with a JSON document *(page 1419)*.

Creating a JSON Validation Scenario

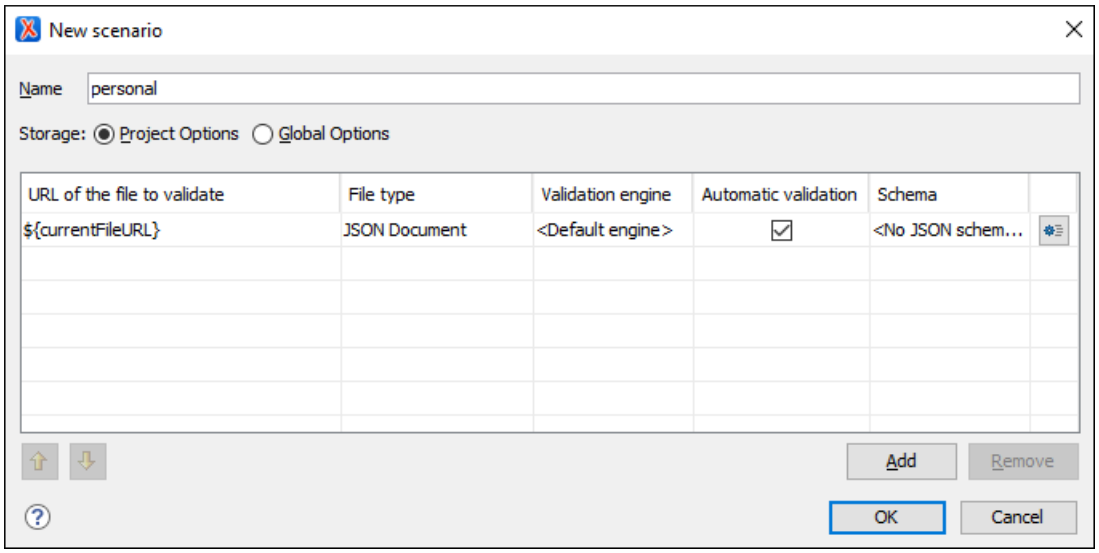
To create a validation scenario, follow these steps:

1. Select the **Configure Validation Scenario(s)** action in one of the following ways:
   - From the **Validation** toolbar drop-down menu.
   - From the **Document > Validate** menu.
   - From the **Validate** submenu, when invoking the contextual menu on a file in the **Project** view *(page 332)*.

   Step Result: The **Configure Validation Scenario(s)** dialog box is displayed.
2. Click the **New** button.

   Step Result: A validation scenario configuration dialog box is displayed.

   Figure: Validation Scenario Configuration Dialog Box



This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

Storage

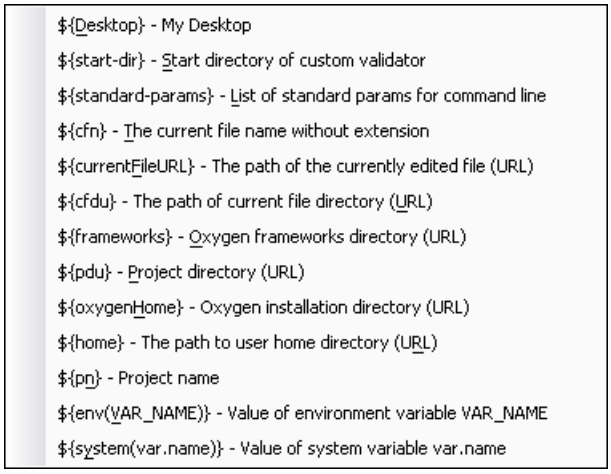
You can choose between storing the scenario in the **Project Options** *(page 3233)* or **Global Options** *(page 3230)*.

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, double-click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an editor variable *(page 275)* or a custom editor variable *(page 283)*.

Figure: Insert an Editor Variable



File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

For normal JSON documents, the **Default engine** should be used. For JSON Schemas, you could use the **Default engine** (if they have a schema version specified) or the **JSON Schema Validator**. The latter does not require a schema version to be specified. If the version is missing, JSON Schema draft-04 will be used as a default.

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature *(page 1071)*. If the **Automatic validation** feature is disabled in the Document Checking preferences page *(page 156)*, then this option is ignored, as the preference setting has a higher priority.

Schema

Displays the specified schema.

Specify Schema

Opens the **Specify Schema** dialog box that allows you to set a schema to be used for validating JSON documents.

Move Up

Moves the selected scenario up one spot in the list.

Move Down

Moves the selected scenario down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above. You can use the buttons at the bottom of the table to add, remove, or move validation units.
4. Press **OK**.

Result: The newly created validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current document and press the **Apply associated** button to run the validation scenario.

Sharing JSON Validation Scenarios

The validation scenarios and their settings can be shared with other users by saving them at project level *(page 3233)* or by exporting them to a specialized scenarios file *(page 275)* that can then be imported. When you create a new validation scenario or edit an existing one, there is a **Storage** option to control whether the scenarios are stored in **Project Options** *(page 3233)* or **Global Options** *(page 3230)*.

Selecting **Project Options** *(page 3233)* stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Selecting **Global Options** *(page 3230)* stores the scenario in the global options that are stored in the user home directory.

You can also change the storage options of existing validation scenarios by using the **Change storage** action from the contextual menu of the list of scenarios in the **Configure Validation Scenario(s)** dialog box.

Resolving References with an XML Catalog

When a reference to a remote JSON schema must be used but a local copy of the schema should actually be preferred for performance reasons, the reference can be resolved to the local copy with an *XML Catalog (page 3235)*.

For example, if the JSON schema contains a reference to a remote schema such as:

```
{"$ref": "http://json-schema.org/example/geo.json"}
```

the reference can be resolved to a local copy of the schema by inserting the following catalog entry:

```
<uri name="http://json-schema.org/example/geo.json" uri="schemas/geo.json"/>
```

Related Information:

Working with XML Catalogs *(page 1110)*

Using a JSON Schema to Validate a JSON Document

Oxygen XML Editor uses the rules defined in the detected JSON schema to report errors and warnings during automatic and manual validations that help maintain the structural integrity of your JSON documents. There are several methods that can be used to validate with a JSON schema.

Configure a Validation Scenario and Specify the JSON Schema

You can specify the schema to be used for validation directly in the JSON validation scenario *(page 1415)*. To associate a JSON schema to a validation scenario to be used whenever the scenario is invoked, follow these steps:

1. Select the **Configure Validation Scenario(s)** from the **Validation** toolbar drop-down menu, from the **Document > Validate** menu, or from the **Validate** submenu when invoking the contextual menu on a file in the **Project** view *(page 332)*).
2. Press the **New** button to create a new validation scenario *(page 1415)* or the **Edit** button to modify an existing one.
3. Add or configure validation units according to your needs and click the **Specify Schema** button.
4. Select the schema to be associated with the validation unit.
5. Click **OK** on both dialog boxes.

Result: The JSON schema is now associated with that validation scenario whenever it is invoked.

Use the Validate with Action to Specify a JSON Schema for Validating the Current Document

To validate the current document using a specified schema, follow these steps:

1. Select the **Validation with** action from the **Validation** drop-down menu on the toolbar (or **Document > Validate** menu).

   Step Result: The **Validate with** dialog box is displayed:

   Figure: Validate with Dialog Box

   
   This dialog box contains the following options:

   - **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(page 2564)*. You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list.
   - **Schema type** - Select **JSON** for the schema type (other types of schema will not work with JSON documents).
2. Select the schema to be associated with the manual validation.

3. Click **OK**.

Result: The current document is validated using the JSON schema you specified.

Use the Validate with Schema Action to Specify a JSON Schema for Validating all Selected JSON Documents

To validate multiple JSON documents using a specified JSON schema, follow these steps:

1. Select all the JSON documents you want to validate in the **Project** view .
2. Invoke the contextual menu (right-click) and select the **Validate with Schema** action from the **Validate** submenu.

   Step Result: The **Validate with** dialog box is displayed:

   Figure: Validate with Dialog Box

   
   This dialog box contains the following options:

   - **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S) or a custom protocol *(page 2564)*.

     You can specify the URL by using the text field, the history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list.
   - **Schema type** - Select **JSON** for the schema type (other types of schema will not work with JSON documents).
3. Select the JSON schema that you want to use to validate all selected JSON documents.
4. Click **OK**.

Result: The selected JSON documents are validated using the JSON schema you specified.

Syntax Highlighting in JSON Documents

Oxygen XML Editor supports syntax highlighting in JSON files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for JSON files, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*.
2. Go to **Editor > Syntax Highlight** *(page 171)*.
3. Select and expand the **JSON** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

Syntax Highlight Preferences *(page 171)*

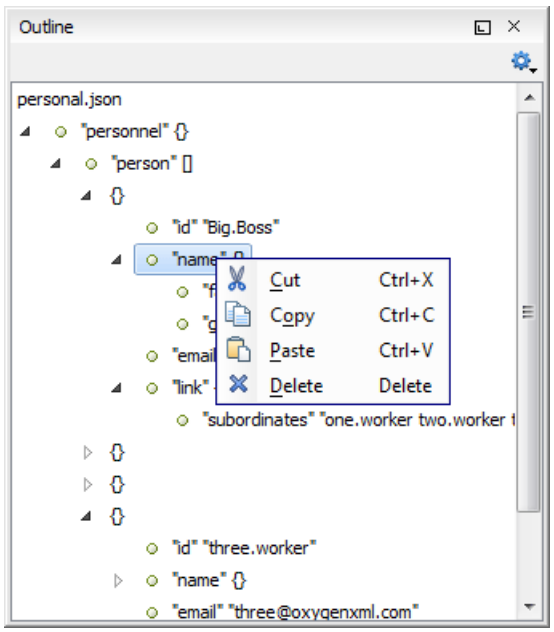
Folding in JSON

In a large JSON document, the data enclosed in the '{' and '}' characters can be collapsed so that only the needed data remain in focus. The folding features available for XML documents *(page 832)* are available in JSON documents.

JSON Outline View

The **Outline** view for JSON documents displays the list of all the components of the JSON document you are editing. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: JSON Outline View



The following actions are available in the contextual menu of the JSON **Outline** view:

- **Cut**
- **Copy**
- **Paste**
- **Delete**

The **Settings** menu on the JSON **Outline** view toolbar includes a **Selection update on cursor move** option that allows you to control the synchronization between the **Outline** view and source the document. Oxygen XML Editor synchronizes the selection in the **Outline** view with the cursor moves or the changes you make in the JSON editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

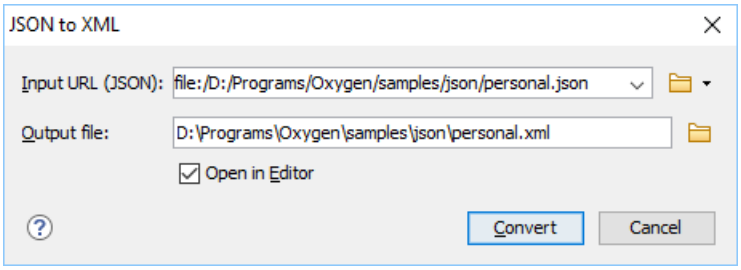
JSON to XML Converter

Oxygen XML Editor includes a useful and simple tool for converting JSON files to XML. It can be found in the **Tools** menu.

To convert a JSON document to XML, follow these steps:

1. Select the **JSON to XML** action from the **Tools** menu. The **JSON to XML** dialog box is displayed:

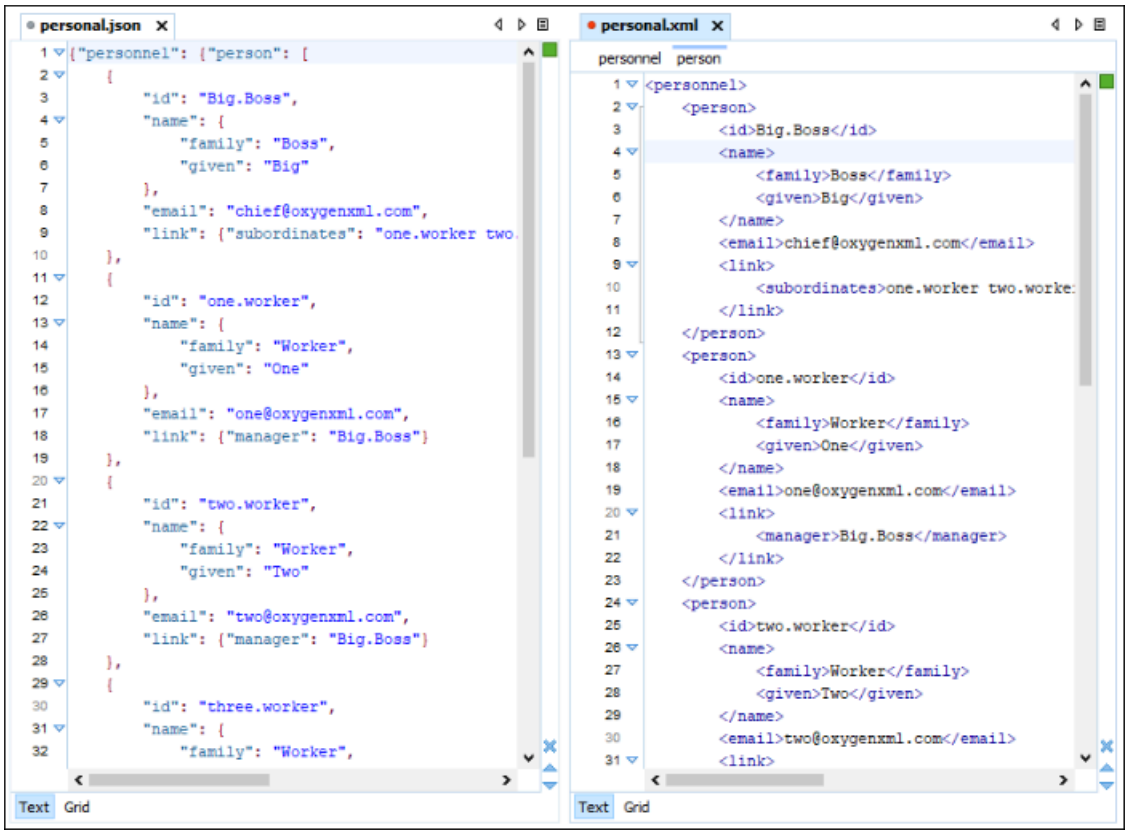
Figure: JSON to XML Dialog Box



2. Choose or enter the **Input URL** of the JSON document.
3. Choose the path of the **Output file** that will contain the resulting XML document.
4. Select the **Open in Editor** option to open the resulting XML document in the main editing pane.
5. Click the **Convert** button.

The original JSON document is now converted to an XML document.

Figure: Example: XML to JSON Operation Result



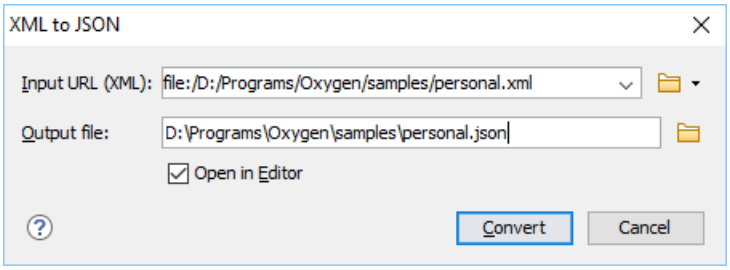
XML to JSON Converter

Oxygen XML Editor includes a useful and simple tool for converting XML files to JSON. It can be found in the **Tools** menu.

To convert an XML document to JSON, follow these steps:

1. Select the **XML to JSON** action from the **Tools** menu. The **XML to JSON** dialog box is displayed:

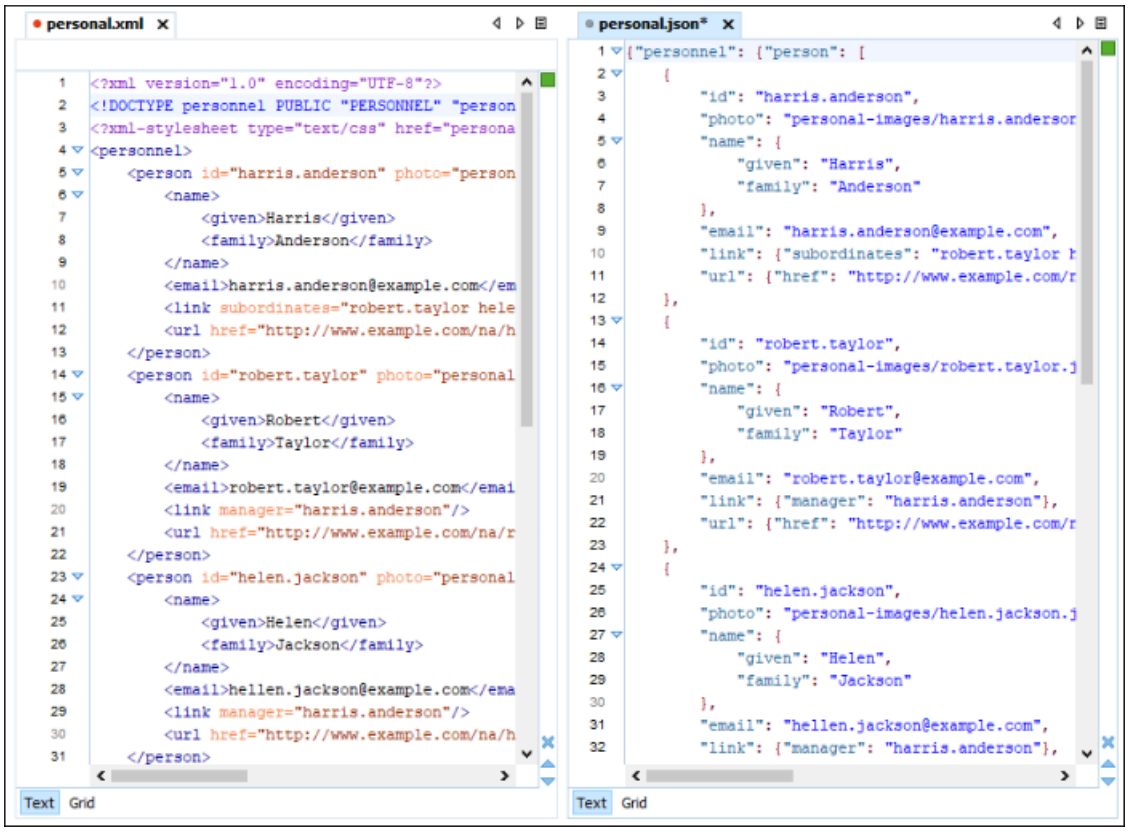
   Figure: XML to JSON Dialog Box

2. Choose or enter the **Input URL** of the XML document.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
5. Click the **Convert** button.

The original XML document is now converted to a JSON document.

Figure: Example: XML to JSON Operation Result



Contextual Menu Actions in JSON Documents

When editing JSON documents, Oxygen XML Editor provides the following actions in the contextual menu:

Cut, Copy, Paste

Executes the typical editing actions on the currently selected content.

Go to Matching Bracket (Ctrl + Shift + G)

Moves the cursor to the end bracket that matches the start bracket, or vice versa.

Source submenu

This submenu includes the following actions:

To Lower Case

Converts the content selection to lower case characters. This works with contiguous and multiple selections.

To Upper Case

Converts the selected content to upper case characters. This works with contiguous and multiple selections.

Capitalize Lines

It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `E`
- `0X0125` to `#`
- `265` to `#`
- `2190` to `#`

Base64 Encode/Decode submenu

This submenu include the following actions for encoding or decoding **base 64** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(page 121)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(page 260)*.

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(page 121)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(page 260)*.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Base32 Encode/Decode submenu

This submenu include the following actions for encoding or decoding **base32** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(page 121)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(page 260)*.

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(page 121)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(page 260)*.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle

replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Hex Encode/Decode submenu

This submenu include the following actions for encoding or decoding **hex** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(page 121)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(page 260)*.

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(page 121)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(page 260)*.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Join and Normalize Lines (Ctrl + J (Command + J on OS X))

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

Insert new line after (Ctrl + Alt + Enter (Command + Alt + Enter on OS X))

This action has the same result as moving the cursor to the end of the current line and pressing the *ENTER* key.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Open submenu

The following actions are available in this submenu:

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

Compare

Opens the current file in the **Compare Files** tool *(page 2728)*.

Editing JSON Schema Documents

The purpose of the JSON schema is to define the legal properties and values of a JSON document to keep it valid and well formed. When editing JSON Schema, all of the same features in the JSON editor *(page 1408)* are available.

Oxygen XML Editor includes a new document template to help you get started creating a JSON Schema document. The template is called **JSON Schema** and it can be found in the **New Document** folder in the **New** document wizard *(page 673)*. You can also customize your own JSON Schema templates *(page 680)* and specify other versions (draft 04, 06, or 07).

For information about using a JSON Schema to validate documents, see Validating JSON Documents Against JSON Schema *(page 1412)*

For information about how to associate a JSON schema for the purposes of validation, see Using a JSON Schema to Validate a JSON Document *(page 1419)*.

Validating JSON Schema Documents

A *Valid* JSON Schema document is a *Well-Formed* document that also conforms to the JSON meta-schema rules that defines the legal syntax of a JSON Schema document.

If a JSON document includes a meta-schema URL in the document root with the **"$schema"** key, the file will be validated as a JSON Schema against the specified meta-schema.

Quick Reference

- If there is a **"$schema": "http://json-schema.org/draft-04/schema"** property in the schema root, then Draft 4 will be used.
- If there is a **"$schema": "http://json-schema.org/draft-06/schema"** property in the schema root, then Draft 6 will be used.
- If there is a **"$schema": "http://json-schema.org/draft-07/schema"** property in the schema root, then Draft 7 will be used.
- If there is a **"$schema"** property in the schema root, but with a different draft value, then an error will be displayed (*"no meta-schema is known with URI"*).
- If none of these are found, then it's validated as a simple JSON instance.

- You could also select the **JSON Schema Validator** in a JSON validation scenario *(page 1415)* and it will use the version specified in the JSON Schema, or if a version is not specified, the JSON Schema draft-04 will be used.

For information about how to associate a JSON schema for the purposes of validation, see Using a JSON Schema to Validate a JSON Document *(page 1419)*.

Editing StratML Documents

Strategy Markup Language (StratML) is an XML vocabulary and schema for strategic plans. Oxygen XML Editor supports StratML Part 1 (Strategic Plan) and StratML Part 2 (Performance Plans and Reports) and provides templates for the following documents:

- **Strategic Plan** (StratML Part 1)
- **Performance Plan** (StratML Part 2)
- **Performance Report** - (StratML Part 2)
- **Strategic Plan** - (StratML Part 2)

You can view the components of a StratML document in the **Outline** view *(page 345)*. Oxygen XML Editor implements a default XML with XSLT transformation scenario for this document type, called StratML to HTML.

Editing XLIFF Documents

XLIFF (*XML Localization Interchange File Format*) is an XML-based format that was designed to standardize the way multilingual data is passed between tools during a localization process. Oxygen XML Editor provides the following support for editing XLIFF documents:

XLIFF Version 1.2 and 2.0 Support:

- New document templates for XLIFF documents.
- A default CSS file (`xliff.css`) used for rendering XLIFF content in **Author** mode is stored in *`[OXYGEN_INSTALL_DIR]`*`/frameworks/xliff/css/`.
- Validation and content completion support using local catalogs. The default catalog (`catalog.xml`) for version 1.2 is stored in *`[OXYGEN_INSTALL_DIR]`*`/frameworks/xliff/xsd/1.2`, and for version 2.0 in *`[OXYGEN_INSTALL_DIR]`*`/frameworks/xliff/xsd/2.0`.

XLIFF Version 2.0 Enhanced Support:

- Support for validating XLIFF 2.0 documents using modules. The default modules are stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/xsd/2.0/modules`.

Editing XLIFF Documents in Author Mode

By default, when you create a new XLIFF document from a template *(page 673)*, Oxygen XML Editor opens it in **Text** mode. Aside from the normal editing features found in **Text** mode, you can also switch to **Author** mode where Oxygen XML Editor offers some special form controls specifically for XLIFF documents. These form controls simply allow you to add or edit XLIFF attribute values and content in a visual mode.

For XLIFF version 2.0 documents, you can also change the style of the visual editing mode. The **Styles** drop-down menu on the toolbar offers the following styles that are specifically designed to render XLIFF 2.0 documents in **Author** mode:

- **Default**
- **Classic**
- **Translate**

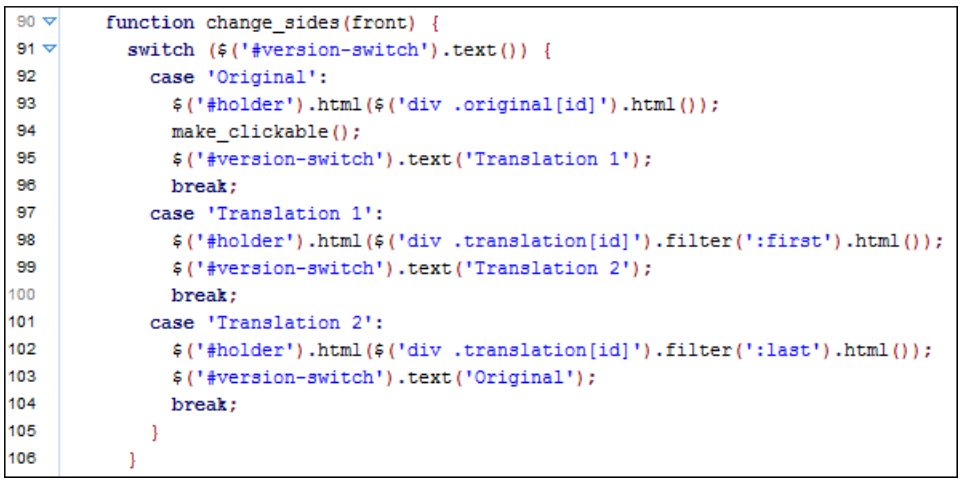
Editing JavaScript Documents

This section explains the features of the Oxygen XML Editor JavaScript Editor and how you can use them.

JavaScript Editing Actions

Oxygen XML Editor allows you to create and edit JavaScript files and assists you with useful features such as syntax highlight, content completion, and outline view. To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

Figure: JavaScript Editor Text Mode



The contextual menu of the **JavaScript** editor offers the following actions:

Cut

Allows you to cut fragments of text from the editing area.

Copy

Allows you to copy fragments of text from the editing area.

Paste

Allows you to paste fragments of text in the editing area.

Toggle Comment

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a single comment for the entire fragment you want to comment.

Toggle Line Comment

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a comment for each line of the fragment you want to comment.

Go to Matching Bracket

Use this option to find the closing, or opening bracket, matching the bracket at the cursor position. When you select this option, Oxygen XML Editor moves the cursor to the matching bracket, highlights its row, and decorates the initial bracket with a rectangle.

Note: A rectangle decorates the opening or closing bracket that matches the current one, at all times.

Source

Allows you to select one of the following actions:

To Lower Case

Converts the selection content to lower case characters.

To Upper Case

Converts the selection content to upper case characters.

Capitalize Lines

Converts to upper case the first character of every selected line.

Join and Normalize Lines

Joins all the rows you select to one row and normalizes the content.

Insert new line after

Inserts a new line after the line at the cursor position.

Modify all matches

Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Open

Allows you to select one of the following actions:

- **Open File at Cursor** - select this action to open the source of the file located at the cursor position
- **Open File at Cursor in System Application** - select this action to open the source of the file located at the cursor position with the application that the system associates with the file

Compare

Select this option to open the **Compare Files** tool to compare the file you are editing with a file you choose in the dialog box.

Folding

When you invoke the contextual menu from the *folding (page 3229)* triangles in the stripe on the left side of the editor, the following actions are available:

Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))

Folds all the elements except the current element.

Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))

Folds the elements indented with one level inside the current element.

Expand Child Folds

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))

Unfolds all elements in the current document.

Validating JavaScript Files

You have the possibility to validate the JavaScript document you are editing. Oxygen XML Editor uses the Mozilla Rhino library for validation. For more information about this library, go to http://www.mozilla.org/rhino/doc.html. The JavaScript validation process checks for errors in the syntax. Calling a function that is not defined is not treated as an error by the validation process. The interpreter discovers this error when executing the faulted line. Oxygen XML Editor can validate a JavaScript document both on-request and automatically.

Content Completion in JavaScript Documents

When you edit a JavaScript document, the *Content Completion Assistant (page 3227)* presents you a list of the elements you can insert at the cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut.

For an enhanced assistance, JQuery methods are also presented. The following icons decorate the elements in the content completion list of proposals depending on their type:

- f() - function
- v - variable
- ▪ - object
- ● - property
- f() - method

Note: These icons decorate both the elements from the content completion list of proposals and from the **Outline** view *(page 1438)*.

Figure: JavaScript Content Completion Assistant

The *Content Completion Assistant* collects:

- Method names from the current file and from the library files.
- Functions and variables defined in the current file.

If you edit the content of a function, the content completion list of proposals contains all the local variables defined in the current function, or in the functions that contain the current one.

Syntax Highlighting in JavaScript Documents

Oxygen XML Editor supports syntax highlighting in JavaScript files to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for JavaScript files, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*.
2. Go to **Editor > Syntax Highlight** *(page 171)*.
3. Select and expand the **JavaScript** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

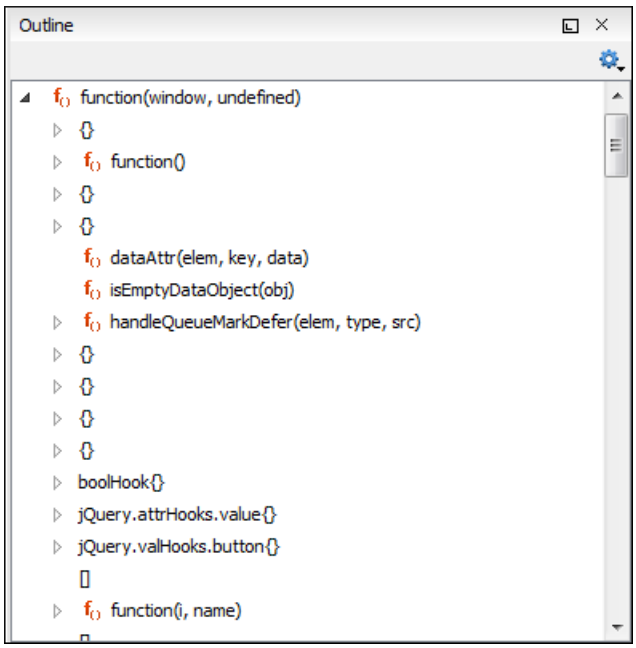
Related Information:

Syntax Highlight Preferences *(page 171)*

JavaScript Outline View

Oxygen XML Editor present a list of all the components of the JavaScript document you are editing in the **Outline** view. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: JavaScript Outline View



The following icons decorate the elements in the **Outline** view depending on their type:

- f() - function
- v - variable
- ▪ - object
- ● - property
- f() - method

The contextual menu of the JavaScript **Outline** view contains the usual **Cut**, **Copy**, **Paste**, and **Delete** actions. From the **Settings** menu, you can select the **Update selection on cursor move** option to synchronize the **Outline** view with the editing area.

Editing XProc Scripts

An XProc script is edited as an XML document that is validated against a RELAX NG schema. If the script has an associated transformation scenario, then the XProc engine from the scenario is invoked as validating engine. The default engine for XProc scenarios is the Calabash engine that comes bundled with Oxygen XML Editor version 20.1.

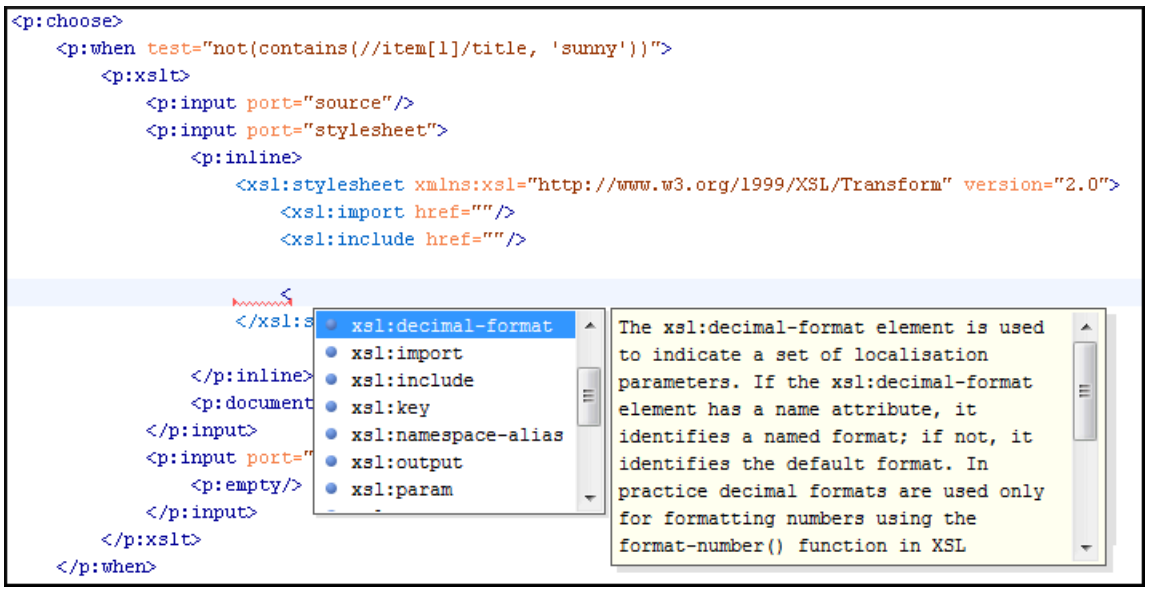
XProc Content Completion

Oxygen XML Editor helps you edit a XProc scripts through the *Content Completion Assistant (page 3227)*, offering proposals that are valid at the cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut.

The content completion inside the element `input/inline` from the XProc namespace *http://www.w3.org/ns/xproc* offers elements from the following schemas depending both on the `port` attribute and the parent of the `input` element. When invoking the content completion inside the XProc element `inline`, the list of content completion proposals is populated as follows:

- If the value of the `port` attribute is `stylesheet` and the `xslt` element is the parent of the `input` elements, the *Content Completion Assistant* offers XSLT elements.
- If the value of the `port` attribute is `schema` and the `validate-with-relax-ng` element is the parent of the `input` element, the *Content Completion Assistant* offers RELAX NG schema elements.
- If the value of the `port` attribute is `schema` and the `validate-with-xml-schema` element is the parent of the `input` element, the *Content Completion Assistant* offers XML Schema schema elements.
- If the value of the `port` attribute is `schema` and the `validate-with-schematron` element is the parent of the `input` element , the *Content Completion Assistant* offers either ISO Schematron elements or Schematron 1.5 schema elements.
- If the above cases do not apply, then the *Content Completion Assistant* offers elements from all the schemas from the above cases.

Figure: XProc Content Completion



XProc Syntax Highlighting

The XProc editor assists you in writing XPath expressions by offering dedicated coloring schemes for syntax highlighting.

To customize the colors or styles used for the syntax highlighting colors for XProc, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*.
2. Go to **Editor > Syntax Highlight** *(page 171)*.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

Enabling Extensions in Calabash

If you are using the default Calabash engine, it is possible to configure extensions (for a list of the valid extensions, see http://xmlcalabash.com/docs/reference/cfg.extension.html).

To configure an extension:

1. Edit the following file: `OXYGEN_INSTALL_DIR/lib/xproc/calabash/engine.xml`.
2. Add the extension and its value as a `system-property`, as in the following example:

```
<system-property name="com.xmlcalabash.allow-text-results" value="true"/>
```

Editing Schematron Schemas

Schematron is a simple and powerful Structural Schema Language for making assertions about patterns found in XML documents. It relies almost entirely on XPath query patterns for defining rules and checks. Schematron validation rules allow you to specify a meaningful error message. This error message is provided to you if an error is encountered during the validation stage.

There are numerous online resources out there to help you get started with writing Schematron rules. Here are just a few that might help you:

- Guide to Schema Writing with Schematron
- Presentation: Schematron Development with Oxygen

Oxygen XML Editor assists you in editing Schematron documents with schema-based content completion, syntax highlight, search and refactor actions, and dedicated icons for the **Outline** view *(page 1449)*. You can create a new Schematron schema using one of the Schematron templates available in the **New** document wizard *(page 673)*.

For information about applying and detecting Schematron schemas, see Associating a Schema to XML Documents *(page 1099)*.

Validating XML Documents Against Schematron

The Skeleton XSLT processor is used for validation and conforms with ISO Schematron or Schematron 1.5. It allows you to validate XML documents against Schematron schemas *(page)* or against combined RELAX NG / W3C XML Schema and Schematron.

How to Specify the Query Language Binding

You can specify the query language binding to be used in the Schematron schema by doing the following:

- For embedded ISO schematron, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **XML > XML Parser > Schematron**, and select it in the **Embedded rules query language binding** option *(page 192)*.

- For standalone ISO Schematron, specify the version by setting the query language to be used in a `queryBinding` attribute on the schema root element. For more information, see the Query Language Binding section of the Schematron specifications.
- For Schematron 1.5 (standalone and embedded), open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **XML > XML Parser > Schematron**, and select the version in the **XPath Version** option *(page 193)*.

Multi-Lingual Support in Schematron Messages

You can specify the desired language for the validation messages in the **Schematron Preferences** page *(page 192)*. The Schematron validation messages can be presented in multiple languages by defining the language for each message using the Schematron `diagnostics`. For more information, see the Use of Schematron for Multi-Lingual Schemas specification.

How to Customize Color Schemes in Schematron

The Schematron editor renders the XPath expressions with dedicated coloring schemes . To customize the coloring schemes, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Editor > Syntax Highlight**.

Schematron Transformation Scenario

When you create a Schematron document, Oxygen XML Editor provides a built-in transformation scenario. You can use this scenario to obtain the XSLT style-sheet corresponding to the Schematron schema. You can apply this XSLT stylesheet to XML documents to obtain the Schematron validation results.

For more information about the Schematron support in Oxygen XML Editor, watch our video demonstrations:

Related Information:

Editing XML Documents in Text Mode *(page 819)*

Associating a Schema to XML Documents *(page 1099)*

Editing Schematron Schema in the Master Files Context

Smaller interrelated modules that define a complex Schematron cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a diagnostic

defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You cat set a main Schematron document either using the *master files* support from the **Project** view *(page 719)*, or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger schema structure.
- *Content Completion Assistant (page 3227)* displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.

Presenting Schematron Validation Issues

The possible issues that might occur during the validation process when validating XML documents against Schematron are presented with colored underlines in the editing pane, colored markers in the right vertical stripe, and details about the issues are presented in the **Errors** panel at the bottom area of the Oxygen XML Editor window. Each error is flagged with a severity level that can be: *warning*, *error*, *fatal* or *info*.

To set a severity level, Oxygen XML Editor looks for the following information:

- The **role** attribute, which can have one of the following values:
  # **warn** or **warning** - Sets the severity level to *warning*. By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
  # **error** - Sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
  # **fatal** - Sets the severity level to *fatal*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
  # **info** or **information** - Sets the severity level to *info*. By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.
- The start of the message, after trimming leading white-spaces. Oxygen XML Editor looks to match the following exact string of characters (case sensitive):
  # **Warning:** - Sets the severity level to *warning*. By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
  # **Error:** - Sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.

    # **Fatal:** - Sets the severity level to *fatal*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
    # **Info:** - Sets the severity level to *info*. By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.
- If none of the previous rules match, Oxygen XML Editor sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.

Tip: You can configure the color for each type in the **Document Checking** preferences page *(page 156)*.

Integrating Schematron Rules in a Framework and Sharing Them

Custom **Schematron** rules are a great way to ensure consistency for XML authoring, especially when there is a large team working on the same set of documents. You can use **Schematron** for numerous use cases. For example, to restrict certain elements from being used, to impose restrictions on the amount of text for an element, or to impose restrictions on certain elements based on various attribute values or text content set in other elements. Furthermore, you can define quick fixes for each **Schematron** rule *(page 1461)* to offer technical writers proposed solutions for reported problems.

Once you define the **Schematron** rules, they can be shared with the other members of your team by integrating them in a *framework (page 3229)* (document type) configuration.

How to Integrate Schematron Rules in a Framework

To integrate a Schematron rule in an existing framework bundled with the application, follow these steps:

1. Create a folder structure for an extended framework and save it somewhere on disk where you have full write access (for example, `custom_frameworks/dita-extension`).
2. In that new folder structure, create another folder that will contain all of your custom Schematron files (for example, `custom_frameworks/dita-extension/rules`).

3. Define the Schematron rules in an existing or new Schematron file and save it in the folder you created in step 2. There are numerous online resources out there to help you get started with writing Schematron rules. Here are just a few that might help you:
   - Guide to Schema Writing with Schematron
   - Presentation: Schematron Development with Oxygen
4. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Document Type Association > Locations** *(page 94)*. In this preferences page, add the path to your `custom_frameworks` folder in the **Additional frameworks directories** list, then click **OK** or **Apply** to save your changes.
5. Go to the **Document Type Association** preferences page *(page 92)* and select a *framework* configuration (for example, **DITA**) and use the **Extend** button to create an extension for it.
6. Give the extension an appropriate name (for example, *DITA - Custom*), select **External** for the **Storage** option, and specify an appropriate path to your framework configuration file (for example, `path/to/.../custom_frameworks/dita-extension/dita-extension.framework`).
7. Make whatever changes you desire to the extension, then go to the **Validation** tab, edit the default validation scenario (select the scenario and click the **Edit** button), and add an extra validation unit to it (one that uses your custom Schematron file). For more details about editing validation scenarios, see Configuring Validation Scenarios for a Framework *(page 2305)*.
8. Click **OK** to close the dialog box and then **OK** or **Apply** to save the changes to the **Document Type Association** preferences page *(page 92)*.
9. Open an XML document that matches your framework configuration and test the new rule.
10. You can continue to refine the Schematron and develop additional rules as needed.

Sharing Schematron Rules

To share Schematron rules with other members of your team, you simply need to share the framework where you integrated the Schematron rules. There are several methods for sharing frameworks and you can find details here: Sharing an Extended Framework (Document Type) *(page 2360)*.

Related Information:

Defining Schematron Quick Fixes *(page 1461)*

Associating a Schema in Validation Scenarios Defined in the Document Type *(page 1103)*

Sharing an Extended Framework (Document Type) *(page 2360)*

Validating Schematron Documents

By default, a Schematron schema is validated as you type. To change this, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option *(page 156)*.

To validate a Schematron document manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu. When Oxygen XML Editor validates a Schematron schema, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Oxygen XML Editor offers an error management mechanism capable of pinpointing errors in XPath expressions and in the included schema modules.

Related Information:

Presenting Schematron Validation Issues *(page)*

Content Completion in Schematron Documents

Oxygen XML Editor helps you edit a Schematron schema through the *Content Completion Assistant (page 3227)*, offering proposals that are valid at the cursor position. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut.

When you edit the value of an attribute that refers a component, the proposed components are collected from the entire schema hierarchy. For example, if the editing context is `phase/active/@pattern`, the *Content Completion Assistant* proposes all the defined patterns.

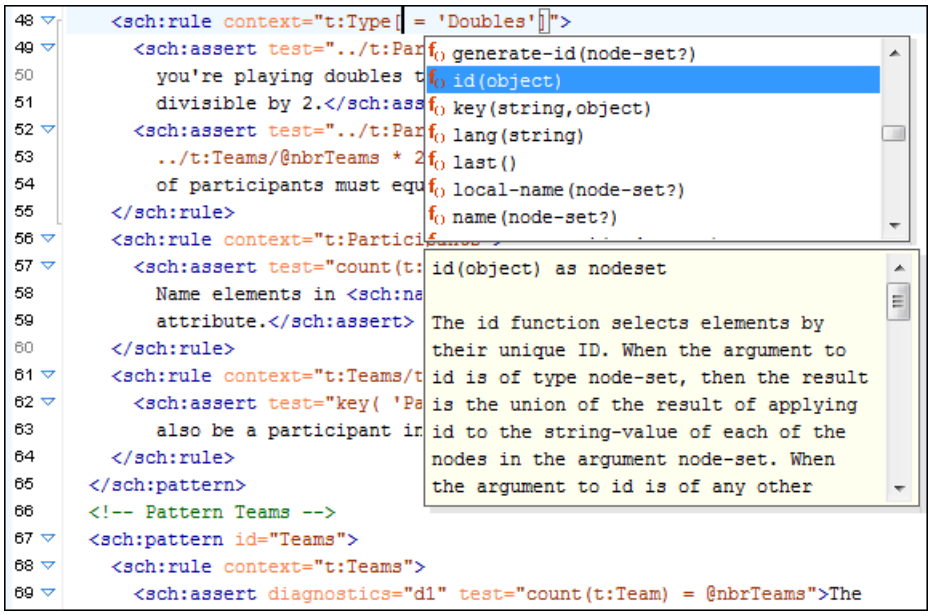
Note: For Schematron resources, the *Content Completion Assistant* collects its components starting from the *master files (page 3231)*. The *master files* can be defined in the project or in the associated validation scenario. For further details about the *Master Files* support go to Defining Master Files at Project Level *(page 719)*.

If the editing context is an attribute value that is an XPath expression (such as `assert/@test` or `report/@test`), the *Content Completion Assistant* offers the names of XPath functions, the XPath axes, and user-defined variables.

The *Content Completion Assistant* displays XSLT 1.0 functions and optionally XSLT 2.0 / 3.0 functions in the attributes *path*, *select*, *context*, *subject*, *test* depending on the Schematron options *(page 192)* that are set in Preferences pages. If the Saxon 6.5.5 namespace (`xmlns:saxon="http://icl.com/saxon"`) or the Saxon 9.8.0.12 namespace is declared in the Schematron schema

(`xmlns:saxon="http://saxon.sf.net/"`) the content completion also displays the XSLT Saxon extension functions as in the following figure:

Figure: XSLT Extension Functions in Schematron Schema Content Completion



The *Content Completion Assistant* also includes code templates that can be used to quickly insert code fragments *(page 848)* into Schematron documents.

Syntax Highlighting in Schematron

Oxygen XML Editor supports syntax highlighting in Schematron schemas to improve the readability of the content and reduce the time it takes to internalize the semantics of the structured content.

To customize the colors or styles used for the syntax highlighting colors for Schematron schemas, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*.
2. Go to **Editor > Syntax Highlight** *(page 171)*.
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

Tip: Oxygen XML Editor also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page *(page 172)*.

Related Information:

Syntax Highlight Preferences *(page 171)*

Embedding Schematron Rules in XML Schema or RELAX NG

Schematron rules can be embedded into an XML Schema through annotations (using the `appinfo` element), or in any element on any level of a RELAX NG Schema (taking into account that the RELAX NG validator ignores all elements that are not in the RELAX NG namespace).

Oxygen XML Editor accepts such documents as Schematron validation schemas and it is able to extract and use the embedded rules.

Validating XML Documents with XML Schema and Embedded Schematron

To validate an XML document with XML Schema and its embedded Schematron, you can associate the document like this:

```
<?xml-model href="percent.xsd" type="application/xml"
            schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

Validating XML Documents with Relax NG and Embedded Schematron

To validate an XML document with RELAX NG schema and its embedded Schematron rules, you need to associate the document with both schemas like this:

```
<?xml-model href="percent.rng" type="application/xml"
            schematypens="http://relaxng.org/ns/structure/1.0"?>
<?xml-model href="percent.rng" type="application/xml"
            schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

The second association validates your document with Schematron rules extracted from the RELAX NG Schema.

Note: When you work with XML Schema or Relax NG documents that have embedded Schematron rules Oxygen XML Editor provides two built-in validation scenarios: **Validate XML Schema with embedded Schematron** for XML schema , and **Validate Relax NG with embedded Schematron** for Relax NG. You can use one of these scenarios to validate the embedded Schematron rules.

Example: Embedded Schematron in XML Schema

```
<xsd:appinfo>
  <sch:pattern>
```

```
    <sch:rule context="...">
 <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
  </sch:pattern>
</xsd:appinfo>
```

Example: Embedded Schematron in Relax NG Schema

```
<grammar
    xmlns="http://relaxng.org/ns/structure/1.0"
    xmlns:sch="http://purl.oclc.org/dsdl/schematron" >
    <sch:pattern>
      <sch:rule context="...">
        <sch:assert test="...">Message.</sch:assert>
      </sch:rule>
    </sch:pattern>
    <start>
     ..............
    </start>
</grammar>
```

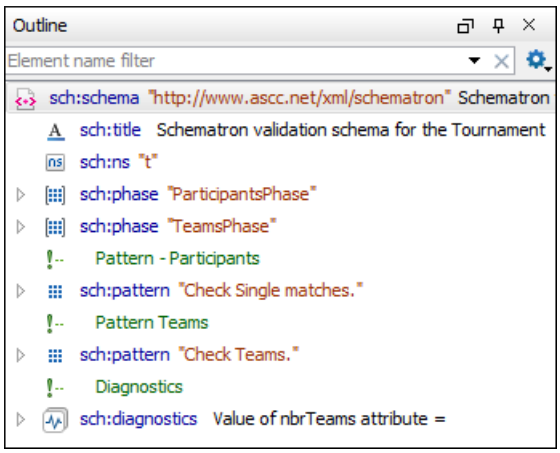
Related Information:

Embedding Schematron Quick Fixes in Relax NG or XML Schema *(page 1476)*

Schematron Outline View

The **Outline** view for Schematron schemas presents a list of components in a tree-like structure and it allows for quick access to a component by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: Schematron Outline View



The following actions are available in the **Settings** menu on the **Outline** view toolbar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the Outline preferences panel *(page 257)*.

Configure displayed attributes

Displays the XML Structured Outline preferences page *(page 257)*.

The following contextual menu actions are also available in the **Outline** view:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

Toggle Comment

Comments/uncomments the currently selected element.

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Delete

Deletes the currently selected component.

Expand More

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

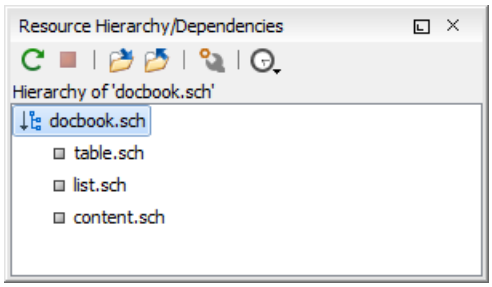
The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (*, ?) and separate multiple patterns with commas.

Schematron Resource Hierarchy/Dependencies View

The **Resource Hierarchy/Dependencies** view allows you to see the hierarchy/dependencies for a Schematron schema. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

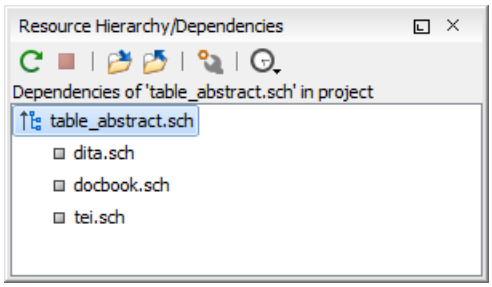
If you want to see the hierarchy of a schema, select the desired schema in the **Project** view *(page 332)* and choose **Resource Hierarchy** from the contextual menu.

Figure: Resource Hierarchy/Dependencies View



If you want to see the dependencies of a schema, select the desired schema in the **Project** view *(page 332)* and choose **Resource Dependencies** from the contextual menu.

Figure: Resource Hierarchy/Dependencies View - Dependencies for `table_abstract.sch`



The following actions are available in the **Resource Hierarchy/Dependencies** view:

Refresh

Refreshes the Hierarchy/Dependencies structure.

Stop

Stops the hierarchy/dependencies computing.

Show Hierarchy

Allows you to choose a resource to compute the hierarchy structure.

Show Dependencies

Allows you to choose a resource to compute the dependencies structure.

Configure

Allows you to configure a scope to compute the dependencies structure. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the **Clear history** button to remove all items from this list.

The contextual menu contains the following actions:

Open

Opens the resource. You can also double-click a resource in the Hierarchy/Dependencies structure to open it.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show Resource Hierarchy

Shows the hierarchy for the selected resource.

Show Resource Dependencies

Shows the dependencies for the selected resource.

Add to Master Files

Adds the currently selected resource in the **Master Files** directory *(page 719)*.

Expand All

Expands all the children of the selected resource from the Hierarchy/Dependencies structure.

Collapse All

Collapses all children of the selected resource from the Hierarchy/Dependencies structure.

Tip: When a recursive reference is encountered in the Hierarchy view, the reference is marked with a special icon .

Note: The **Move resource** or **Rename resource** actions give you the option to update the references to the resource *(page 1454)*.

Moving/Renaming Schematron Resources

You can move and rename a resource presented in the **Resource/Hierarchy Dependencies** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references** - Select this option to update the references to the resource you are renaming.

When you select the **Move** action from the contextual menu of the **Resource/Hierarchy Dependencies** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name.

If the **Update references of the moved resource(s)** option is selected, a **Preview** option (which opens the **Preview** dialog box) is available for both actions. The **Preview** dialog box presents a list with the resources that are updated.

Highlight Component Occurrences in Schematron Documents

When you position your mouse cursor over a component in a Schematron document, Oxygen XML Editor searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of **Highlight Component Occurrences**, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Editor > Mark Occurrences**. You can also trigger a search using the **Search > Search Occurrences in File** **Ctrl + Shift + U (Command + Shift + U on OS X)** action from contextual menu. Matches are displayed in separate tabs of the **Results** view *(page 354)*.

Searching and Refactoring Operations in Schematron Documents

Search Actions

The following search actions can be applied on `pattern`, `phase`, or `diagnostic` types and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

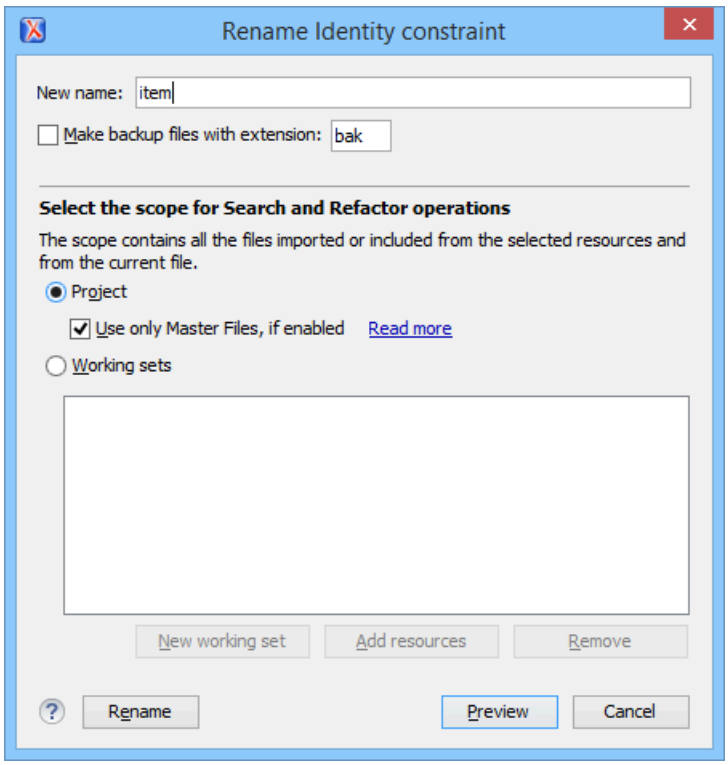
- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

Refactoring Actions

The following refactoring actions can be applied on `pattern`, `phase`, or `diagnostic` types and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

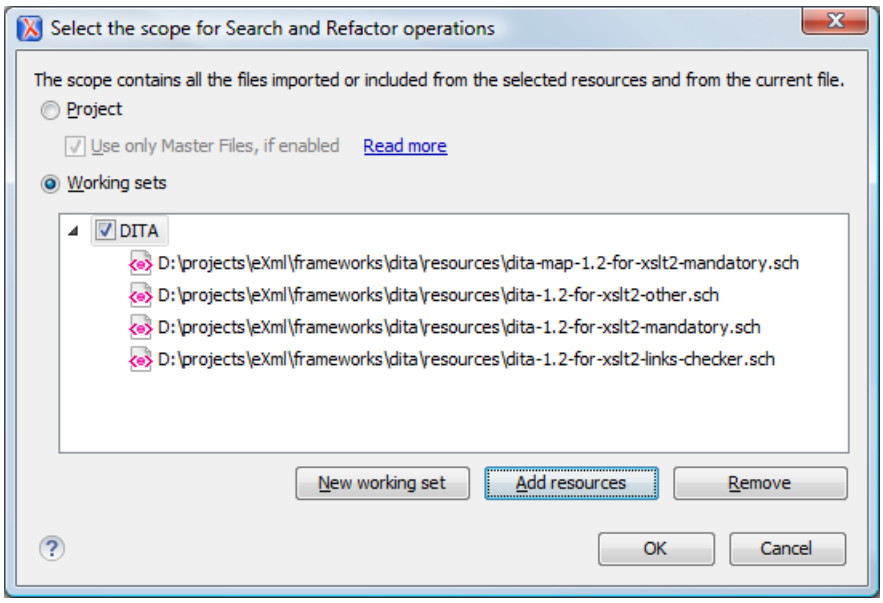
Figure: Rename Identity Constraint Dialog Box



Searching and Refactoring Operations Scope in Schematron Documents

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the **Change scope** operation, available in the *Quick Assist* action set or on the **Resource Hierarchy/Dependency View** toolbar. You can restrict the scope to the current project or to one or multiple *working sets (page 3235)*. The **Use only Master Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Master Files** directory. Click **read more** for details about the *Master Files* support *(page 719)*.

Figure: Change Scope Dialog Box



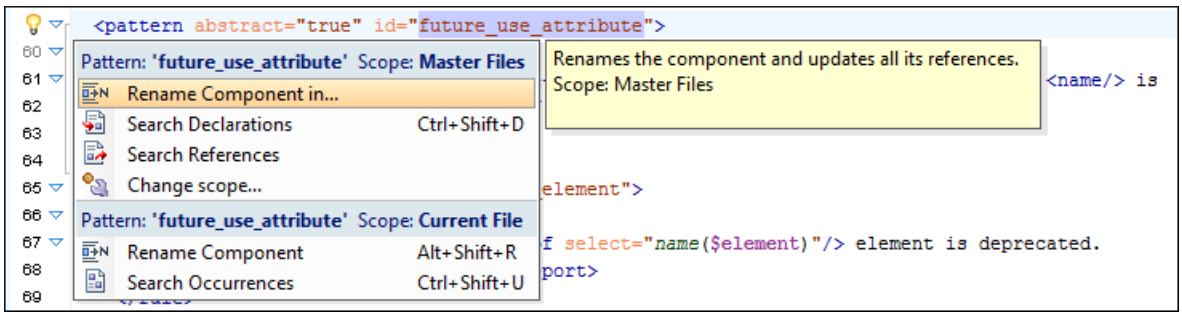
The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the *working set (page 3235)* structure.

Quick Assist Support in Schematron Documents

The *Quick Assist* support *(page 3233)* improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist* feature *(page 3233)* is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon ( ) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Alt + 1** (**Meta + Alt + 1** on Mac OS X) keyboard shortcuts.

Figure: Schematron Quick Assist Support



The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Schematron Unit Test (XSpec)

XSpec is a behavior driven development (BDD) *framework* for XSLT, XQuery, and Schematron. XSpec consists of a syntax for describing the behavior of your XSLT, XQuery, or Schematron code, and some code that enables you to test your code against those descriptions.

Creating a Schematron Unit Test

To create a Schematron Unit Test, go to **File > New > Schematron Unit Test**. This is simple document template to help you get started.

Running a Schematron Unit Test

To run a Schematron Unit Test, open the XSpec file in an editor and click **Apply Transformation Scenario(s)** on the main toolbar. This will run the built-in **Run XSpec Test** transformation scenario that is defined in the XSpec *framework (page 3229)*.

Testing a Stylesheet

An XSpec file contains one or more test scenarios.

Example

Suppose you have this Schematron rule that says sections should have a title:

```
<sch:pattern>
  <sch:rule context="section">
    <sch:assert test="title" id="a002">
      section should have a title
    </sch:assert>
  </sch:rule>
</sch:pattern>
```

The XSpec test could look like this:

```
<x:description xmlns:x="http://www.jenitennison.com/xslt/
xspec" schematron="demo-01.sch">
    <x:scenario label="section should have a title">
      <x:context>
        <article>
          <section>
            <title>Introduction</title>
            <p>This is an example.</p>
          </section>
          <section>
            <p>This is an example.</p>
          </section>
        </article>
      </x:context>

      <x:expect-not-assert id="a002" location="/article[1]/section[1]"/>
      <x:expect-assert id="a002" location="/article[1]/section[2]"/>
    </x:scenario>
</x:description>
```

The `sch:assert` with the `id="a002"` is not expected to be triggered on the first section since it includes a title. This requirement is expressed with the `x:expect-not-assert` element.

Since the second section does not have a title, you would expect the Schematron rule to be triggered and this requirement is expressed with the `x:expect-assert` element.

For more details about how to write Schematron tests and various samples, see https://github.com/xspec/xspec/wiki/Writing-Scenarios-for-Schematron#writing-tests.

Adding a Catalog to an XSpec Transformation

If your Schematron needs a catalog, you can add one to the XSpec transformation by doing one of the following:

- If you are using a project *(page 702)* in Oxygen XML Editor, create a `catalog.xml` file in the project directory. This catalog will then be loaded automatically.
- Edit *(page 1718)* the **Run XSpec Test** transformation scenario, go to the **Parameters** tab *(page 1686)*, and set the value of the `catalog` parameter to the location of your catalog file.

Editing Schematron Quick Fixes

Oxygen XML Editor provides support for editing the Schematron *Quick Fixes (page 1098)*. You can define a library of *Quick Fixes* by editing them directly in the current Schematron file or in a separate file. Oxygen XML Editor assists you in editing Schematron *Quick Fixes* with schema-based content completion, syntax highlighting, and validation as you type.

For information about applying and detecting the Schematron schemas that include SQF, see Associating a Schema to XML Documents *(page 1099)*.

Related Information:

Oxygen XML Blog: Schematron Checks to Help Technical Writing

Schematron Quick Fixes (SQF)

Oxygen XML Editor provides support for Schematron *Quick Fixes (page 3233)* (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron *Quick Fixes* are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with *assert* or *report* messages.

A typical use case is using Schematron *Quick Fixes* to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, please see the following blog post: http://blog.oxygenxml.com/2015/05/schematron-checks-to-help-technical.html.

Displaying the Schematron Quick Fix Proposals

The defined Schematron *Quick Fixes* are displayed on validation errors in **Text** mode and **Author** mode.

Figure: Example of a Schematron Quick Fix

Editing Schematron Quick Fixes *(page 1460)*

Schematron Quick Fix Specifications

Presenting Schematron Validation Issues *(page)*

Defining Schematron Quick Fixes

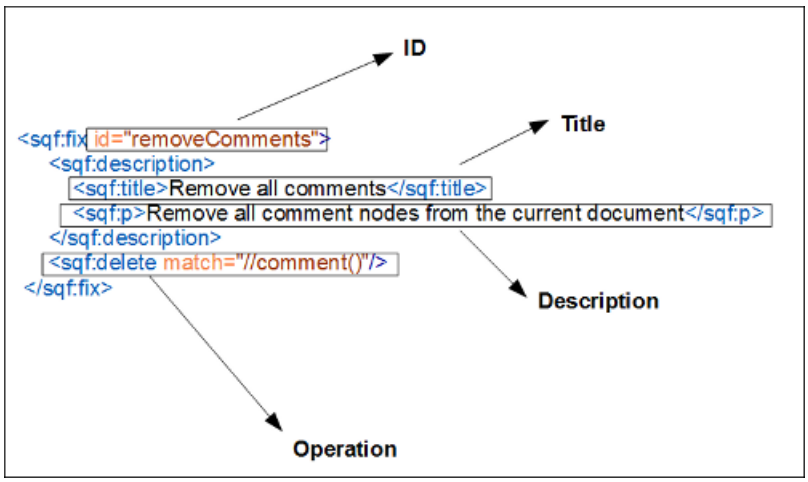
You can define and customize Schematron *Quick Fixes (page 3233)* directly in the current Schematron file or in a separate Schematron file. The Schematron *Quick Fixes* are an extension of the Schematron language and they allow you to define fixes for Schematron error messages. You can refer the *Quick Fixes* from the `assert` or `report` elements in the values of the `sqf:fix` attributes.

Defining a Schematron Quick Fix

The basics of a Schematron *Quick Fix* is defined by an ID, name, description, and the operations to be executed.

- **ID** - Defined by the `id` attribute from the `fix` element and must be unique in the current context. It is used to refer the *Quick Fix* from a `report` or `assert` element.
- **Name** - The name of the *Quick Fix* is defined by the `title` element.
- **Description** - Defined by the text in the paragraphs (`p`) of the `description` element.
- **Operations** - The following basic types of operations (elements) *(page 1463)* are supported:
  # `<sqf:add>` Element - To add a new node or fragment in the document.
  # `<sqf:delete>` Element - To remove a node from the document.
  # `<sqf:replace>` Element - To replace a node with another node or fragment.
  # `<sqf:stringReplace>` Element - To replace text content with other text or a fragment.

Figure: Schematron Quick Fix Components



The assertion message that generates the *Quick Fix* is added as the `description` of the problem to be fixed. The `title` is presented as the name of the *Quick Fix*. The content of the paragraphs (`p`) within the `description` element are presented in the tooltip message when the *Quick Fix* is selected.

Additional Elements Supported in the Schematron Quick Fixes

`<sqf:user-entry>`

This element defines a value that must be set manually by the user. For more information, see User Entry SQF Operation *(page 1467)*.

`<sqf:call-fix>`

This element calls another *Quick Fix* within a *Quick Fix*. The called *Quick Fix* must be defined globally or in the same Schematron rule as the calling *Quick Fix*. A calling *Quick Fix* adopts the activity elements of the called *Quick Fix* and should not include other activity elements. You can also specify which parameters are sent by using the `<sqf:with-param>` child element.

`<sqf:group>`

Allows you to group multiple *Quick Fixes* and refer them from an `assert` or `report` element.

`<sqf:fixes>`

Is defined globally and contains global fixes and groups of fixes.

`<sqf:copy-of>`

Used to copy the selected nodes that are specified by the `select` attribute. The element with its attribute is treated as an `xsl:copy-of` with a `select` attribute, as defined in the XSLT specification.

`<sqf:param>`

Defines a parameter for a *Quick Fix*. If the parameter is defined as `abstract` then the `type` and default value should not be specified and the fix can be called from an abstract pattern that defines this parameter.

Other SQF Notes

Note: The `sqf:default-fix` attribute is ignored in Oxygen XML Editor.

For more details on editing Schematron *Quick Fixes*, go to: Schematron Quick Fix Specifications

Basic Schematron Quick Fix Operations

There are four basic operations that can be executed in a Schematron *Quick Fix (page 3233)*: **Add**, **Delete**, **Replace**, and **String Replace**.

Add

The `<sqf:add>` element allows you to add a node to the instance. An *anchor* node is required to select the position for the new node. The *anchor* node can be selected by the `match` attribute. Otherwise, it is selected by the `context` attribute of the rule.

The `target` attribute defines the name of the node to be added. It is required if the value of the `node-type` attribute is set to anything other than "comment".

The `<sqf:add>` element has a `position` attribute and it determines the position relative to the *anchor* node. The new node could be specified as the first child of the *anchor* node, the last child of the *anchor* node, before the *anchor* node, or after the *anchor* node (`first-child` is the default value). If you want to add an attribute to the *anchor* node, do not use the `position` attribute.

Note: If you insert an element and its content is empty, Oxygen XML Editor will insert the required element content.

An Example of the `<sqf:add>` Element:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
   xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
 queryBinding="xslt2">
   <pattern>
     <rule context="head">
        <assert test="title" sqf:fix="addTitle">title element missing.</
assert>
        <sqf:fix id="addTitle">
            <sqf:description>
```

```
                <sqf:title>Insert title element.</sqf:title>
            </sqf:description>
            <sqf:add target="title" node-type="element">Title text</sqf:add>
        </sqf:fix>
    </rule>
  </pattern>
</schema>
```

Specific Add Operations:

- **Insert Element** - To insert an element, use the `<sqf:add>` element, set the value of the `node-type` to "element", and specify the element *QName (page 3233)* with the `target` attribute. If the element has a prefix, it must be defined in the Schematron using a namespace declaration (`<ns uri="namespace" prefix="prefix"/>`).
- **Insert Attribute** - To insert an attribute, use the `<sqf:add>` element, set the value of the `node-type` to "attribute", and specify the attribute *QName (page 3233)* with the `target` attribute. If the attribute has a prefix, it must be defined in the Schematron using a namespace declaration (`<ns uri="namespace" prefix="prefix"/>`).
- **Insert Fragment** - If the `node-type` is not specified, the `<sqf:add>` element will insert an XML fragment. The XML fragment must be well formed. You can specify the fragment in the `add` element or by using the `select` attribute.
- **Insert Comment** - To insert a comment, use the `<sqf:add>` element and set the value of the `node-type` to "comment".
- **Insert Processing Instruction** - To insert a processing instruction, use the `<sqf:add>` element, set the value of the `node-type` to "pi" or "processing-instruction", and specify the name of the processing instruction in the `target` attribute.

Delete

The `<sqf:delete>` element allows you to remove any type of node (such as elements, attributes, text, comments, or processing instructions). To specify nodes for deletion the `<sqf:delete>` element can include a `match` attribute that is an XPath expression (the default value is `.`). If the `match` attribute is not included, it deletes the context node of the Schematron rule.

An Example of the `<sqf:delete>` Element:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
    xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
    <pattern>
        <rule context="*[@xml:lang]">
```

```
            <report test="@xml:lang" sqf:fix="remove_lang">
                The attribute "xml:lang" is forbidden.</report>
            <sqf:fix id="remove_lang">
                <sqf:description>
                    <sqf:title>Remove "xml:lang" attribute</sqf:title>
                </sqf:description>
                <sqf:delete match="@xml:lang"/>
            </sqf:fix>
        </rule>
    </pattern>
</schema>
```

Replace

The `<sqf:replace>` element allows you to replace nodes. Similar to the `<sqf:delete>` element, it can include a `match` attribute. Otherwise, it replaces the context node of the rule. The `<sqf:replace>` element has three tasks. It identifies the nodes to be replaced, defines the replacing nodes, and defines their content.

An Example of the `<sqf:replace>` Element:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
    xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
 queryBinding="xslt2">
    <pattern>
        <rule context="title">
            <report test="exists(ph)" sqf:fix="resolvePh" role="warn">
                ph element is not allowed in title.</report>
            <sqf:fix id="resolvePh">
                <sqf:description>
                    <sqf:title>Change the ph element into text</sqf:title>
                </sqf:description>
                <sqf:replace match="ph">
                    <value-of select="."/>
                </sqf:replace>
            </sqf:fix>
        </rule>
    </pattern>
</schema>
```

Other Attributes for Replace Operations:

- `node-type` - Determines the type of the replacing node. The permitted values include:
  # `keep` - Keeps the node type of the node to be replaced.
  # `element` - Replaces the node with an element.
  # `attribute` - Replaces the node with an attribute.
  # `pi` - Replaces the node with a processing instruction.
  # `comment` - Replaces the node with a comment.
- `target` - By using a *QName (page 3233)* it gives the replacing node a name. This is necessary when the value of the `node-type` attribute is anything other than "comment".
- `select` - Allows you to choose the content of the replacing nodes. You can use XPath expressions with the `select` attribute. If the `select` attribute is not specified then the content of the `<sqf:replace>` element is used instead.

String Replace

The `<sqf:stringReplace>` element is different from the others. It can be used to find a sub-string of text content and replace it with nodes or other strings.

Attributes for the String Replace Operation:

- `match` - Allows you to select text nodes that contain the sub-strings you want to replace.
- `select` - Allows you to select the replacing fragment, in case you do not want to set it in the content of the `stringReplace` element.
- `regex` - Matches the sub-strings using a regular expression.

Note: Consider the following information about using regular expressions in the `stringReplace` element:

The regular expressions from this operation are compiled as Java regular expressions. For more information, see https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html.
The ***j flag*** allows you to use the standard Java regular expression engine, which allows native Java regular expression syntax. This allows, for example, the use of `\b` in a regular expression to match word boundaries. For more information, see http://www.saxonica.com/html/documentation/functions/fn/matches.html.
Regular expressions in the `<sqf:stringReplace>` element always have the *dot matches all* flag set to "true". Therefore, the line terminator will also be matched by the regular expression.

- `flags` - Specifies flags to control the interpretation of the regular expression (given in the `regex` attribute).

Attention: The context of the content within the `<sqf:stringReplace>` element is set to the whole text node, rather than the current sub-string.

An Example of the `<sqf:stringReplace>` Element:

```
<?xml version="1.0" encoding="UTF-8"?>
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
    xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
 queryBinding="xslt2">
    <sch:pattern>
        <sch:rule context="text()">
            <sch:report test="matches(., 'Oxygen', 'i')"
 sqf:fix="changeWord">The oXygen word is not allowed</sch:report>
            <sqf:fix id="changeWord">
                <sqf:description>
                    <sqf:title>Replace word with product</sqf:title>
                </sqf:description>

  <sqf:stringReplace regex="Oxygen" flags="i"><ph keyref="product"/>
                </sqf:stringReplace>
            </sqf:fix>
        </sch:rule>
    </sch:pattern>
</sch:schema>
```

Related Information:

User Entry SQF Operation *(page 1467)*

Restricting Quick Fix Operations *(page 1468)*

User Entry SQF Operation

The `<sqf:user-entry>` element defines a value that must be set manually by the user. If multiple `user-entry` elements are defined, Oxygen XML Editor will display a dialog box for each one, in which the user can specify values. Also, the `<user-entry>` element can be used as an XPath variable where the XPath variable is the name of the `user-entry`. Note that the `default` attribute defines a default

value for the operation by using an XPath expression (as in the example below) and its value will be presented in the user entry dialog box.

An Example of the `<sqf:user-entry>` Element:

```
<sqf:fix id="editTitle">
    <sqf:description>
        <sqf:title>Edit the jurnal title</sqf:title>
    </sqf:description>
    <sqf:user-entry name="newTitle" default="@title">
        <sqf:description>
            <sqf:title>Edit the title:</sqf:title>
        </sqf:description>
    </sqf:user-entry>
    <sqf:replace match="@title" target="title" node-type="keep" select="$newTitle"/>
</sqf:fix>
```

Related Information:

Basic Schematron Quick Fix Operations *(page 1463)*

Restricting Quick Fix Operations

To restrict a *Quick Fix (page 3233)* or a specific operation to only be available if certain conditions are met, the `use-when` attribute can be included in the `<sqf:fix>` element or any of the SQF operation elements. The condition of the `use-when` attribute is an XPath expression and the fix or operation will be performed only if the condition is satisfied. In the following example, the `use-when` condition is applied to the `<sqf:fix>` element:

```
<sqf:fix id="last" use-when="$colWidthSummarized - 100 lt $lastWidth"
 role="replace">
   <sqf:description>
       <sqf:title>Subtract excessive width from the last element.</sqf:title>
   </sqf:description>
   <let name="delta" value="$colWidthSummarized - 100"/>
   <sqf:add match="html:col[last()]" target="width" node-type="attribute">
    <let name="newWidth" value="number(substring-before(@width,'%')) - $delta"/>
       <value-of select="concat($newWidth,'%')"/>
   </sqf:add>
</sqf:fix>
```

Related Information:

Basic Schematron Quick Fix Operations *(page 1463)*

Formatting/Indenting Content Inserted by SQF Operations

Content that is inserted by the **Add**, **Replace**, or **String Replace** Schematron *Quick Fix (page 3233)* operations is automatically indented unless you set the value of the `xml:space` attribute to `preserve` on the operation element. There are several methods available to format the content that is inserted:

- **`xsl:text`** - You can use an `xsl:text` element to format the inserted content and keep the automatic indentation, as in the following example:

```
<sqf:add position="last-child">
    <row><xsl:text>
    </xsl:text>
        <entry>First column</entry><xsl:text>
        </xsl:text>
        <entry>Second column</entry><xsl:text>
        </xsl:text>
    </row><xsl:text>
    </xsl:text>
</sqf:add>
```

- **`xml:space`** - Use the `xml:space` attribute and set its value to `preserve` to format the content and specify the spacing between elements, as in the following example:

```
<sqf:add node-type="element" target="codeblock" xml:space="preserve">
    /* a long sample program */
    Do forever
     Say "Hello, World"
    End</sqf:add>
```

Basic Schematron Quick Fix Operations *(page 1463)*

Executing Schematron Quick Fixes in Other Documents

You can apply Schematron *Quick Fixes (page 3233)* over nodes from referenced documents (using XInclude or external entities), and you can access them as nodes in your current document.

Also, you can apply the *Quick Fixes* over other documents using the `doc()` function in the value of the `match` attribute. For example, you can add a new key in the `keylist.xml` file using the following operation:

```
<sqf:add match="doc('keylist.xml')/KeyList" target="Key"
 node-type="element" select="Key2">
```

Generate Multiple Similar Quick Fixes

You can generate the same Schematron *Quick Fix (page 3233)* for multiple matches. To do this, you can add the `use-for-each` attribute inside the `sqf:fix` element and for each match of the XPath expression in the value of the `use-for-each` attribute, a Quick Fix will be presented to the user. The XPath expression does not change the context of the Quick Fix. If you want to access the current match from the XPath expression, you can use the `$sqf:current` variable.

Example:

Suppose you want to restrict the user from entering more than 4 list items in a list. The following example presents an error on any list that has more than 4 list items and offers a Quick Fix with multiple proposals where the user would specify which list item to remove.

```
<sch:rule context="ul">
    <sch:report test="count(li) gt 4" sqf:fix="removeAnyItem">
        The list cannot contain more than 4 entries.
    </sch:report>
    <sqf:fix id="removeAnyItem" use-for-each="1 to count(li)">
        <sqf:description>
            <sqf:title>Remove item #<sch:value-of select="$sqf:current"/></sqf:title>
        </sqf:description>
        <sqf:delete match="li[$sqf:current]"/>
    </sqf:fix>
</sch:rule>
```

Localizing SQF Messages

Oxygen XML Editor provides support for presenting Schematron Quick Fix messages in multiple languages. The language used for the SQF messages is the language specified in the '**Message**

Language option in the **Schematron** preferences page *(page 193)*. If you want to provide an alternative message for a specific language, you can reference IDs or key values for the specific alternate text phrase. In Oxygen XML Editor, the alternate text phrase is defined in a `sch:diagnostic` element.

Example:

The following example presents a quick fix with a different message depending on whether the user's language is English or German.

```
<sch:rule context="dog">
  <sch:assert test="bone" diagnostics="d_en d_de" sqf:fix="addBone" >
    A dog should have a bone.</sch:assert>

  <sqf:fix id="addBone">
    <sqf:description>
      <sqf:title ref="fix_en fix_de" xml:lang="en">Add a bone</sqf:title>
      <sqf:p ref="fix_desc_en fix_desc_de" xml:lang="en">Add bone element as child</
sqf:p>
    </sqf:description>
    <sqf:add node-type="element" target="bone"/>
  </sqf:fix>
</sch:rule>
....
<sch:diagnostics xml:lang="en">
  <sch:diagnostic id="d_en"> A dog should have a bone. </sch:diagnostic>
  <sch:diagnostic id="fix_en"> Add a bone </sch:diagnostic>
  <sch:diagnostic id="fix_desc_en">Add a bone element as child</sch:diagnostic>
</sch:diagnostics>
<sch:diagnostics xml:lang="de">
  <sch:diagnostic id="d_de"> Ein Hund sollte ein Bein haben. </sch:diagnostic>
  <sch:diagnostic id="fix_de"> FÃ¼gen Sie einen Knochen hinzu </sch:diagnostic>
  <sch:diagnostic id="fix_desc_de"> FÃ¼gen Sie ein Knochenelement als
    untergeordnetes Element hinzu </sch:diagnostic>
</sch:diagnostics>
```

Integrating SQF in a Framework and Sharing Them

You can use Schematron *Quick Fixes (page 3233)* to assist your content authors by imposing rules for an entire *framework (page 3229)* (document type) and offering fixes when a rule violation is detected.

For example, if you are using DITA, you may want your contributors to avoid inserting a figure (`fig` element) inside a paragraph (`p` element) that contains other content since it may result in undesirable placement or spacing in the output. The Schematron rule and its *Quick Fix* for this particular use-case could look like this:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
    xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
 queryBinding="xslt2">
   <pattern id="check.figure.location">
     <rule context="p/fig">
         <report test="true()" role="warn" sqf:fix="moveAfter">
         A figure inside a paragraph doesn't transform well into PDF. </report>
         <sqf:fix id="moveAfter">
             <sqf:description>
                 <sqf:title>Move after the paragraph.</sqf:title>
             </sqf:description>
             <let name="figToMove" value="."/>
             <sqf:add match="parent::p" select="$figToMove" position="after"/>
             <sqf:delete match="."/>
         </sqf:fix>
     </rule>
   </pattern>
</schema>
```

The result of this example would be that the user will see a warning if they insert a `fig` element inside a `p` element and they are presented with the option of selecting the *Quick Fix* that would move the figure outside the paragraph.

How to Integrate SQF in a Framework

To integrate a Schematron *Quick Fix* in a *framework (page 3229)*, follow these steps:

1. Create a folder structure for an extended framework and save it somewhere on disk where you have full write access (for example, `custom_frameworks/dita-extension`).
2. In that new folder structure, create another folder that will contain all of your custom Schematron files (for example, `custom_frameworks/dita-extension/rules`).
3. Define the Schematron *Quick Fix* for a rule *(page 1461)* in an existing or new Schematron file and save it in the folder you created in step 2.
4. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Document Type Association > Locations** *(page 94)*. In this preferences page, add the path to your

`custom_frameworks` folder in the **Additional frameworks directories** list, then click **OK** or **Apply** to save your changes.

5. Go to the **Document Type Association** preferences page *(page 92)* and select a *framework* configuration (for example, **DITA**) and use the **Extend** button to create an extension for it.
6. Give the extension an appropriate name (for example, *DITA - Custom*), select **External** for the **Storage** option, and specify an appropriate path to your framework configuration file (for example, `path/to/.../custom_frameworks/dita-extension/dita-extension.framework`).
7. Make whatever changes you desire to the extension, then go to the **Validation** tab, edit the default validation scenario (select the scenario and click the **Edit** button), and add an extra validation unit to it (one that uses your custom Schematron file that includes the SQF). For more details about editing validation scenarios, see Configuring Validation Scenarios for a Framework *(page 2305)*.
8. Click **OK** to close the dialog box and then **OK** or **Apply** to save the changes to the **Document Type Association** preferences page *(page 92)*.
9. Add a reference to the Schematron file that includes the SQF in your *framework* by following the procedure in Associating a Schema in Validation Scenarios Defined in the Document Type *(page 1103)*.
10. Open a document in your *framework* and test the new rule and *Quick Fix*.
11. You can continue to refine the Schematron and develop additional rules as needed.

Sharing Schematron Quick Fixes

To share Schematron Quick Fixes with other members of your team, you simply need to share the framework where you integrated the SQF. There are several methods for sharing frameworks and you can find details here: Sharing an Extended Framework (Document Type) *(page 2360)*.

Related Information:

Defining Schematron Quick Fixes *(page 1461)*

Basic Schematron Quick Fix Operations *(page 1463)*

Associating a Schema in Validation Scenarios Defined in the Document Type *(page 1103)*

Sharing an Extended Framework (Document Type) *(page 2360)*

Validating Schematron Quick Fixes

By default, Schematron *Quick Fixes (page 3233)* are validated as you edit them within the Schematron file or while editing them in a separate file. To change this, open the **Preferences** dialog

box **(Options > Preferences)** *(page 80)*, go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option *(page 156)*.

To validate Schematron *Quick Fixes* manually, select the **Validate** action from the **Validation** toolbar drop-down menu or the **Document > Validate** menu. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Related Information:

Validating XML Documents Against a Schema *(page 1071)*

Validation Scenario *(page 1081)*

Presenting Validation Errors in Author Mode *(page 443)*

Presenting Validation Errors in Text Mode *(page 361)*

Content Completion in SQF

Oxygen XML Editor helps you edit Schematron *Quick Fixes (page 3233)* embedded in a Schematron document by offering proposals that are valid at the cursor position in a *Content Completion Assistant (page 3227)*. It can be manually activated with the **Ctrl + Space (Command + Space on OS X)** shortcut.

When you edit the value of an attribute that references a *Quick Fix ID*, the ids are collected from the entire definition scope. For example, if the editing context is `assert/@sqf:fix`, the *Content Completion Assistant* proposes all fixes defined locally and globally.

If the editing context is an attribute value that is an XPath expression (such as `sqf:add/@match` or `replace/@select`), the *Content Completion Assistant* offers the names of XPath functions, the XPath axes, and user-defined variables and parameters.

The *Content Completion Assistant* displays XSLT 1.0 functions (and optionally XSLT 2.0 / 3.0 functions) in the attributes *path*, *select*, *context*, *subject*, and *test*, depending on the Schematron options *(page 192)* that are set in Preferences pages. If the Saxon 6.5.5 namespace (`xmlns:saxon="http://icl.com/saxon"`) or the Saxon 9.8.0.12 namespace is declared in the Schematron schema (`xmlns:saxon="http://saxon.sf.net/"`) the content completion also displays the XSLT Saxon extension functions.

Highlight Quick Fix Occurrences in SQF

When you position your mouse cursor over a *Quick Fix (page 3233)* ID in a Schematron document, Oxygen XML Editor searches for the *Quick Fix* declaration and all its references and highlights them automatically.

Customizable colors are used: one for the *Quick Fix* definition and another one for its references. Occurrences are displayed until another *Quick Fix* is selected.

To change the default behavior of **Highlight Component Occurrences**, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Editor > Mark Occurrences**. You can also trigger a search using the **Search > Search Occurrences in File (Ctrl + Shift + U (Command + Shift + U on OS X))** action from contextual menu. Matches are displayed in separate tabs of the **Results** view *(page 354)*.

Searching and Refactoring Operations in SQF

Search Actions

The following search actions can be applied on *Quick Fix (page 3233)* IDs and are available from the **Search** submenu in the contextual menu of the current editor or from the **Document > References** menu:

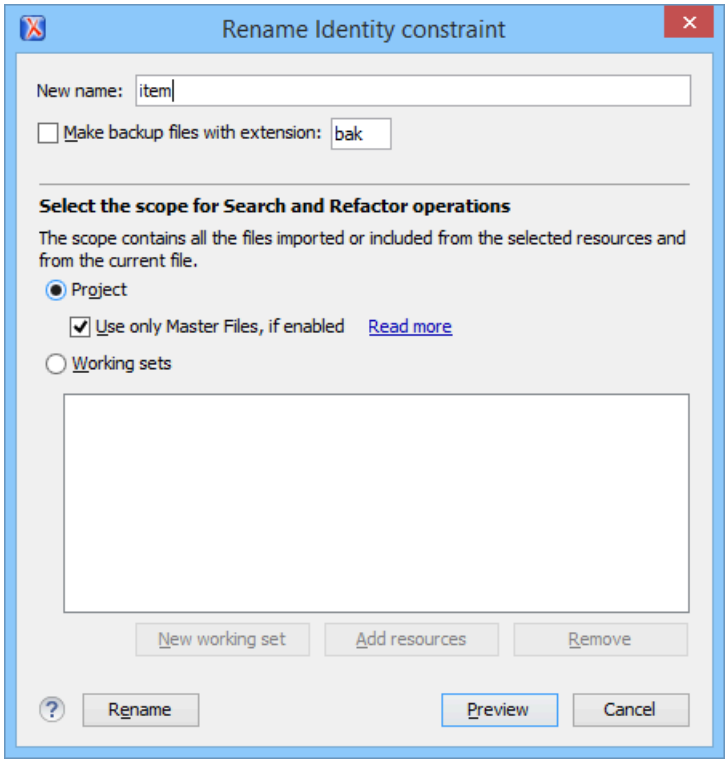
- **Search References** - Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.
- **Search References in** - Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.
- **Search Declarations** - Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the current edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.
- **Search Declarations in** - Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.
- **Search Occurrences in File** - Searches all occurrences of the item at the cursor position in the currently edited file.

Refactoring Actions

The following refactoring actions can be applied on *Quick Fix* IDs and are available from the **Refactoring** submenu in the contextual menu of the current editor or from the **Document > Refactoring** menu:

- **Rename Component** - Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.
- **Rename Component in** - Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

  Figure: Rename Identity Constraint Dialog Box



Embedding Schematron Quick Fixes in Relax NG or XML Schema

Schematron *Quick Fixes (page 3233)* can be embedded into an XML Schema through annotations (using the `appinfo` element), or in a schematron rule embedded in the RELAX NG Schema. For more information about embedding schematron in XML Schema or Relax NG, see Embedding Schematron Rules in XML Schema or RELAX NG *(page 1448)*.

Oxygen XML Editor is able to extract and use the embedded Schematron *Quick Fixes*. To make the embedded Schematron *Quick Fixes* available, follow these steps:

1. Define a validation against a schema *(page 1071)*.
2. For the **Schema type**, choose `XML Schema` or `Relax NG`.
3. Select the **Embedded schematron rules** option.

Example: Embedded Schematron Quick Fix in XML Schema

```
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="...">
 <sch:assert test="..." sqf:fix="fixId">Message.</sch:assert>
   <sqf:fix id="fixId">
     ......
   </sqf:fix>
    </sch:rule>
  </sch:pattern>
</xsd:appinfo>
```

Example: Embedded Schematron Quick Fix in Relax NG

```
<grammar
    xmlns="http://relaxng.org/ns/structure/1.0"
    xmlns:sch="http://purl.oclc.org/dsdl/schematron" >
    <sch:pattern>
      <sch:rule context="...">
        <sch:assert test="..." sqf:fix="fixId">Message.</sch:assert>
     <sqf:fix id="fixId">
       .....
     </sqf:fix>
      </sch:rule>
     </sch:pattern>
     <start>
      ..............
     </start>
</grammar>
```

Tip: For more extensive examples, see our samples in the *[OXYGEN_INSTALL_DIR]*`/samples/schematron` folder.

Defining Schematron Quick Fixes *(page 1461)*

Editing SVG Files

SVG (Scalable Vector Graphics) is a platform for two-dimensional graphics. It has two parts: an XML-based file format and a programming API for graphical applications. Some of the key features include support for shapes, text, and embedded raster graphics with many painting styles, scripting through languages such as *ECMAScript*, and support for animation.

SVG is a vendor-neutral, open standard that has important industry support. Companies such as Adobe, Apple, and IBM have contributed to its W3C specifications. Many documentation *frameworks (page 3229)* (including DocBook) have support for SVG by defining the graphics directly in the document.

Oxygen XML Editor adds SVG support by using the Batik distribution package (an open source project developed by the Apache Software Foundation) and the default *XML Catalog (page 1110)* resolves the SVG DTD.

Note: Batik partially supports SVG 1.1. For a detailed list of supported elements, attributes, and properties, see the Batik Implementation Status page.

How to Render SVG Images that Use Java Scripting

1. Copy the `js.jar` library from the Batik distribution into the Oxygen XML Editor `lib` folder.
2. Restart the application.

SVG 1.2 Rendering Issues

Oxygen XML Editor uses the *Apache Batik* open source library to render SVG images and it only has partial support for SVG 1.2. For more information, see http://xmlgraphics.apache.org/batik/dev/svg12.html.

This partial support could lead to some rendering issues in Oxygen XML Editor. For example, if you are using the *Inkscape* SVG editor, it is possible for it to save the SVG as 1.1, while using SVG 1.2 elements (such as `flowRoot`) inside it. This means that the image will not be properly rendered inside the application.

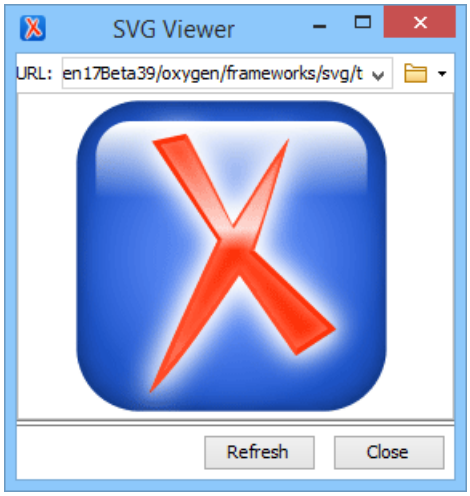
Note: SVG images shown in the **Author** visual editing mode are rendered as static images, without support for animations and JavaScript.

Standalone SVG Viewer

Oxygen XML Editor includes a simple **SVG Viewer** that allows you to work with SVG images.

To open the viewer, select **SVG Viewer** from the **Tools** menu.

Figure: SVG Viewer



You can browse for and open any SVG file that has the `.svg` or `.svgz` extension.

If the file is included in the current project, you can open it in the viewer by right-clicking the image file in the **Project** view *(page 332)* and selecting **Open with > SVG Viewer**.

Actions Available in the SVG Viewer

The following actions are available in the **SVG Viewer**:

Zoom in

To zoom in on an image, use any of the following methods:

- Scroll **forward** with the mouse wheel.
- Select **Zoom in** from the contextual menu.
- Use the **Ctrl + I (Command + I on OS X)** keyboard shortcut.

Zoom out

To zoom in on an image, use any of the following methods:

- Scroll **backward** with the mouse wheel.

- Use the **Ctrl + O (Command + O on OS X)** keyboard shortcut.
- Select **Zoom out** from the contextual menu.

Rotate

To rotate an image, use either of the following methods:

- Use the **Ctrl + Right-Click + Drag (Command + Right-Click + Drag on OS X)** shortcut.
- Select **Rotate** from the contextual menu. This rotates the image exactly 90 degrees clockwise.

Refresh

To refresh (or reset) an image, use either of the following methods:

- Use the **Ctrl + T (Command + T on OS X)** keyboard shortcut.
- Select **Refresh** from the contextual menu.

Move

To move an image, use either of the following methods:

- Use the **Arrow Keys** on your keyboard.
- Use the **Shift + Left-Click + Drag** shortcut.

Pan

To pan an image, **click and drag** the image with your mouse.

Related Information:

Editing SVG Files *(page 1478)*

Integrated SVG Viewer in the Results Panel

Oxygen XML Editor includes an integrated **SVG Viewer** that can render the results of an XSLT transformation scenario that generates SVG images in the **Results** panel *(page 354)* at the bottom of the editor. This is useful for developing XSL stylesheets with the capability of producing SVG graphics.

To enable this feature, select **Show in results view as > SVG** in the **Output** tab of the XSLT transformation scenario configuration dialog box *(page 1653)*. When you run the transformation, the SVG result is then rendered in an integrated SVG viewer in the **Results** panel *(page 354)*.

Example of a Use-Case

Suppose you have an XML document that describes the evolution of your sales over a time period and you want to create a graphic for it. You could use the following steps to accomplish this task:

1. Start with a static SVG image, written directly in Oxygen XML Editor or exported from a external graphics tool.
2. Extract the parts that are dependent upon the data from the XML document and create an XSL template to produce the image.
3. Create an **XML transformation with XSLT** scenario *(page 1644)*.
4. While configuring the transformation scenario, select **Show in results view as > SVG** in the **Output** tab *(page 1653)* of the configuration dialog box.
5. Run the transformation.

The SVG image is rendered in an integrated SVG viewer in the **Results** panel *(page 354)* at the bottom of the editor.

Figure: Integrated SVG Viewer

Editing XHTML Documents

Oxygen XML Editor provides support for editing XHTML files. Oxygen XML Editor includes XHTML catalogs and document templates to help you get started. You can also find a sample file in the `[OXYGEN_INSTALL_DIR]/samples/xhtml` folder.

The XHTML editing features include:

- **Framework-specific Support** - The built-in XHTML framework *(page 1577)* includes new document templates, XHTML-specific validation, content completion, and built-in transformation scenarios.

- **Source Editing** - You can edit XHTML files in the **Text** editing mode *(page 819)* (XML source editor) using all of its useful features *(page 819)*.
  # **Syntax Highlighting** - XHTML documents with embedded CSS, JS, PHP, and JSP scripts are rendered with dedicated coloring schemes. To customize them, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Editor > Syntax Highlight** *(page 171)*. Select and expand the **XHTML** section in the top pane and you can see the effects of your changes in the **Preview** pane.
- **Visual Editing** - You can edit XHTML files in the visual **Author** editing mode *(page 885)* using all of its authoring features *(page 885)*.
  # **XHTML-specific Author Mode Actions** - A variety of **Author Mode** default actions *(page 1579)* are available on the toolbar, in the contextual menu, and in the **XHTML** menu.
  # **XHTML-specific CSS Rendering** - Oxygen XML Editor includes built-in default CSS files used for rendering XHTML content in **Author** mode *(page 1578)*.
  # **Print Ready CSS Style** - You can select **+Print ready** from the **Styles** toolbar drop-down menu to render XHTML documents with an *alternate CSS style (page 3226)* that displays the document in **Author** mode similar to how the document will look when printed.
- **Import HTML as XHTML** - Oxygen XML Editor includes support for importing HTML files as an XML document *(page 2194)*.
- **Remote Editing** - Oxygen XML Editor has built-in support for editing documents that are stored on remote servers through FTP, SFTP, and WebDAV protocols *(page 687)*, allowing you to edit XHTML pages from your web server.

XHTML Document Type (Framework) *(page 1577)*

Editing Markdown Documents

Markdown was created as a lightweight markup language with plain text formatting syntax designed to provide a syntax that is very easy to read and write, and to convert it to HTML and other formats. It is often used by content contributors who want a quick and easy way to write content without having to take their fingers off the keyboard and without having to learn numerous codes or shortcuts, and it can easily be shared interchangeably between virtually any types of contributor and system.

Oxygen XML Editor provides a built-in Markdown editor that allows you to convert Markdown syntax to HTML or DITA and it includes a preview panel to help you visualize the final output. Aside from the plain text syntax that is common amongst most Markdown applications, the editor in Oxygen XML Editor also integrates many other powerful features that content authors are accustomed to using for other types of documents. Some of these additional unique features include:

- Additional toolbar and contextual menu actions.
- Automatic validation to help keep the syntax valid.
- Dedicated syntax highlighting to make Markdown documents even easier to read and write.
- Unique features for creating Markdown documents directly in *DITA maps (page 3228)* and converting Markdown documents to DITA topics.
- Specialized syntax rules to combine popular syntax features from several specifications.

Markdown Editor

Oxygen XML Editor provides an intuitive, dynamic, and easy-to-use Markdown editor for writing and converting Markdown documents. It is a split-screen editor with two panels that are synchronized in real-time. The left side is a simple text editor that is specially designed for writing Markdown syntax. The right side is a WYSIWYG style preview of how changes will look in the output.

Markdown Text Editor Pane (Left Side)

The left pane is a simple text editor that is refined to accept Markdown syntax. At the same time, you still have many of the actions, options, and features that you are used to when editing any other type of document in Oxygen XML Editor.

The features of this special editor that are unique for Markdown documents include:

- **Unique Markdown Syntax Rules** - The Markdown editor in Oxygen XML Editor uses an integration of rules *(page 1498)* that combine rules from common default Markdown syntax along with many of the rules used in the GitHub Flavored Markdown syntax.
- **Syntax Highlighting** - The Oxygen XML Editor syntax highlighting feature is integrated into the Markdown text editor to make it easier to read and write Markdown syntax. You can even customize the colors and styles for the syntax highlighting *(page 1494)*.
- **Automatic Spell Checking** - The Markdown editor supports the Oxygen XML Editor automatic spell checking feature *(page 758)* that reports possible misspelled words as you type. You simply need to select the **Automatic spell check** option in the **Spell Check** preferences page *(page 152)*, then click the **Select editors** button and select **Markdown Editor**.
- **Helpful Toolbar and Contextual Menu Actions** - A variety of unique actions *(page 1486)* are available from the toolbar to help you insert proper Markdown syntax. The contextual menu also includes some common editing actions, as well as unique actions to export (convert) Markdown documents to HTML or DITA.
- **Shortcut Keys** - Many of the shortcut keys that are most commonly used *(page 27)* in Oxygen XML Editor also work in the Markdown editor.

WYSIWYG Preview Pane (Right Side)

The right pane is a WYSIWYG *Preview* pane that shows a visual representation of how changes made in the left-side text editor will be converted to HTML or DITA output. The changes you make in the text editor are parsed continually and they are immediately visible in the *Preview* pane. There are two tabs available in the *Preview* pane, one for visualizing DITA output and one for visualizing HTML output. You can switch between the two tabs at the bottom of the pane.

The *Preview* pane includes the following unique features:

- **WYSIWYG Visualization** - This pane presents the Markdown syntax from the left-side text editor in a visual WYSIWYG style interface that is automatically synchronized as you type.
- **Export Options** - The **DITA** tab includes a contextual menu action to export (convert) the current Markdown document to a DITA topic *(page 1493)*. Similarly, the **HTML** tab includes a contextual menu action to export (convert) it to an XHTML document *(page 1494)*.
- **Automatic Validation** - As you edit Markdown documents, they are validated automatically *(page 1494)*. The conversion engine constantly tries to parse your changes and if a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the *Preview* pane or **Results** view *(page 354)* at the bottom of the editor.
- **Print Feature** - The Markdown editor includes a **Print** action that is available in the contextual menu and it allows you to configure options for printing the current document as you see it in the *Preview* pane.
- **Preview Markup** - The Markdown editor includes a **Tags Display Mode** drop-down menu *(page 1488)* that is available on the toolbar and it allows you to control the amount of markup that is displayed in the *Preview* pane.
- **Specialized DITA Features** - The Markdown editor includes some unique, specialized features to integrate it with the powerful DITA support *(page 1495)* in Oxygen XML Editor.

Actions Available in the Markdown Editor

Aside from the actions that are available in Oxygen XML Editor for any type of document (such as the actions in the various menus and the common sections of the toolbar), a variety of unique actions are also available in the Markdown editor, from the toolbar and contextual menu.

Toolbar Actions

The following default actions are readily available on the toolbar when editing Markdown documents:

Header (1st Level)

Inserts an *atx-style* first level header *(page 1498)* at the cursor position.

Header (2st Level)

Inserts an *atx-style* second level header *(page 1498)* at the cursor position.

Header (3rd Level)

Inserts an *atx-style* third level header *(page 1498)* at the cursor position.

Horizontal Rule

Inserts a horizontal rule *(page 1499)* at the cursor position.

Bold (Strong)

Marks the selected text with bold *(page 1500)*.

Italic (Emphasis)

Marks the selected text with italics *(page 1500)*.

Strikethrough

Marks the selected text with a strikethrough *(page 1500)*.

Code Block

Inserts (or surrounds selected text in) a codeblock *(page 1504)*.

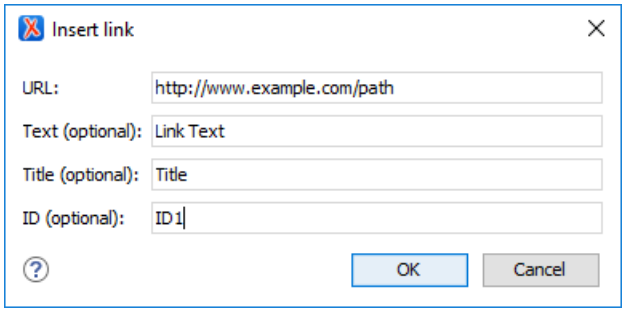
Blockquote

Inserts a blockquote *(page 1503)* at the cursor position.

Insert Link

Opens the **Insert Link** dialog box that allows you to define a link *(page 1500)* to insert at the cursor position.

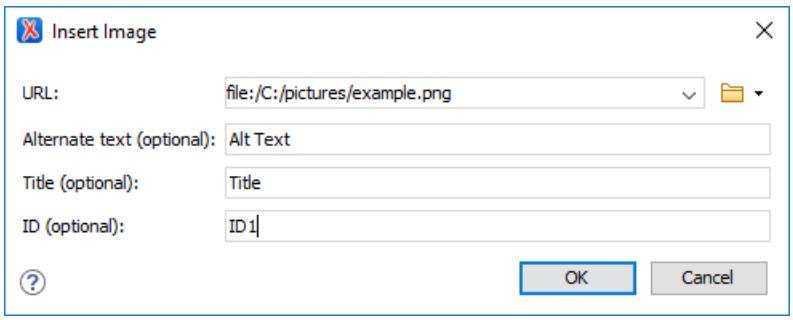
Figure: Insert Link Dialog Box



Insert Image

Opens the **Insert Image** dialog box that allows you to define an image *(page 1502)* to insert at the cursor position. You can type the URL of the image you want to insert or use browsing actions in the **Browse** drop-down menu.

Figure: Insert Link Dialog Box



Insert Ordered List

Inserts an ordered list *(page 1506)* at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an ordered list.

Insert Unordered List

Inserts an unordered list *(page 1506)* at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an unordered list.

Insert Task List

Inserts a task list *(page 1508)* at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to a task list.

Insert Table

Inserts a table *(page 1508)* at the cursor position.

Tags Display Mode drop-down menu

Allows you to control the amount of markup that is displayed in the *Preview* pane and offers the following choices:

Full Tags with Attributes

Displays full tag names with attributes for both *block* and *inline* elements.

Full Tags

Displays full tag names without attributes for both *block* and *inline* elements.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Opens the **Author** preferences page *(page 129)* where you can configure options in regards to *tags*, such as the default **Tags Display Mode**, **Tags Background Color**, **Tags Foreground Color**, and **Tags Font**.

Contextual Menu Actions

The following default actions are available in the contextual menu when editing Markdown documents:

Cut, Copy, Paste

Use these actions to execute the typical editing actions on the currently selected content.

Source submenu

This submenu includes the following actions:

To Upper Case

Converts the content selection to upper case characters.

To Lower Case

Converts the content selection to lower case characters.

Capitalize Lines

It capitalizes the first letter found on every new line that is selected. Only the first letter is affected, the rest of the line remains the same. If the first character on the new line is not a letter then no changes are made.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `E`
- `0X0125` to `#`
- `265` to `#`
- `2190` to `#`

Base64 Encode/Decode submenu

This submenu includes the following actions for encoding or decoding **base 64** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(page 121)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(page 260)*.

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(page 121)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(page 260)*.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Base32 Encode/Decode submenu

This submenu includes the following actions for encoding or decoding **base32** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(page 121)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(page 260)*.

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(page 121)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(page 260)*.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Hex Encode/Decode submenu

This submenu includes the following actions for encoding or decoding **hex** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(page 121)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(page 260)*.

Decode Selection

Replaces a selection of text with the result of decoding that selection. By default, a dialog box is displayed that allows you to select the encoding to use. There is an option to choose to not show this dialog box in the future. In this case, the encoding that is specified in the **Encoding for Base64, Base32, Hex conversions** option in the **Encoding** preferences page *(page 121)* will be used. Likewise, the same is true if the **Show the dialog box for choosing the encoding for Base64, Base 32, Hex conversions** option is not selected in the **Messages** preference page *(page 260)*.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Join and Normalize Lines (Ctrl + J (Command + J on OS X))

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

Insert new line after (Ctrl + Alt + Enter (Command + Alt + Enter on OS X))

This action has the same result as moving the cursor to the end of the current line and pressing the *ENTER* key.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Open submenu

The following actions are available in this submenu:

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

Open File at Cursor in System Application

Opens the file (identified by its link) or web page (identified by a web link) found at cursor position. The target is opened in the default system application associated with that file type.

Compare

Opens the current file in the **Compare Files** tool *(page 2728)*.

Show/Hide Preview

A toggle action that shows or hides the *Preview* pane.

Export as DITA Topic

Converts the current Markdown document into a DITA topic.

Export as HTML

Converts the current Markdown document into an XHTML document.

Print (Available in the *Preview* pane)

Opens a page setup dialog box that allows you to configure printing options for the current document.

Syntax Highlighting in the Markdown Editor

Oxygen XML Editor supports syntax highlighting in the Markdown editor to improve the readability of the content and make it easier to internalize the semantics of the content.

To customize the colors or styles used for the syntax highlighting colors for Markdown documents, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*.
2. Go to **Editor > Syntax Highlight** *(page 171)*.
3. Select and expand the **Markdown** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

Syntax Highlight Preferences *(page 171)*

Markdown Editor *(page 1483)*

Automatic Validation in Markdown Documents

Markdown documents are validated automatically as you type. The conversion engine constantly tries to parse your changes to display the results in the *Preview* pane. If a change results in an error that

prevents the parser from converting the syntax, an error message will be displayed in the **DITA** tab or in the **Results** view *(page 354)* at the bottom of the editor.

The types of errors that will be reported include the following:

- Improper order of headers.
- The syntax in a documents begins with something other than a 1st level header.
- Tags are not closed properly if XHTML markup is used in the document.
- Invalid tag names if XHTML markup is used in the document.
- Markup is not well formed if XHTML markup is used in the document.

Related Information:

Markdown Editor *(page 1483)*

Working with Markdown Documents in DITA

Oxygen XML Editor includes some unique features that allow you to easily integrate Markdown documents in a DITA project. This is especially helpful for teams that have contributors who are familiar with the Markdown syntax, but they want their output to be generated from DITA projects. The integration between the Markdown editor and DITA includes actions to export or convert Markdown documents to DITA topics and the **DITA** tab in the *Preview* pane provides a visualization of how the topic will look after conversion.

Export Markdown as a DITA Topic

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The **Export as DITA Topic** action is available in the contextual menu.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the **Text** editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

Working with Markdown Documents in the DITA Maps Manager

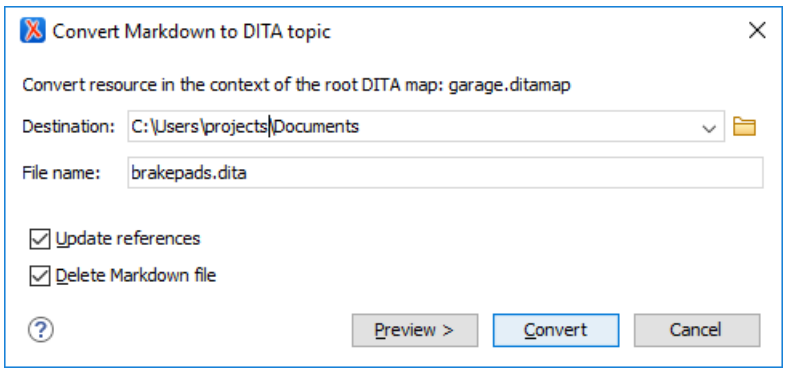
Oxygen XML Editor has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the **DITA Maps Manager** *(page 2943)*. The following features are available for Markdown documents in the **DITA Maps Manager** view:

- **Insert Reference to Markdown Document** - You can use the **New**, **Reference**, and **Reference to the currently edited file** actions from the **Append Child**, **Insert Before**, or **Insert After** submenu

when invoking the contextual menu in the **DITA Maps Manager** to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (`topicref` element) with the `format` attribute set to `markdown`.

- **Validate Markdown Documents in DITA Maps** - When you use the **Validate and Check for Completeness** action from the **DITA Maps Manager** toolbar to check the integrity of the structure of a *DITA map*, Markdown documents that are referenced in the *DITA map* will be converted to DITA topics in the background and validated the same as any other DITA topic.
- **Transforming DITA Maps with Markdown Documents** - When transforming *DITA maps* that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.
- **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the **DITA Maps Manager** and select **Refactoring > Convert Markdown to DITA Topic**. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

Figure: Convert Markdown to DITA Topic Dialog Box



This dialog box includes the following options:

Destination

The destination path for the new DITA topic.

File Name

Presents the current name and allows you to change it.

Update references

Select this option to update all references of the file in the *DITA map* and in the files referenced from the *DITA map*.

Delete Markdown file

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

Preview

Select this button to display a preview of the changes Oxygen XML Editor is about to make.

Convert

Select this button to perform the conversion.

Tip: Oxygen XML Editor comes with a sample ditamap project for converting Markdown to DITA. Go to the **Project** view *(page 332)*, open the `sample.xpr` project, and navigate to the `dita/markdown-dita` folder.

Converting Markdown to DITA Using the Lightweight DITA Standard

The bundled DITA-OT 2.x does not support converting Markdown documents to DITA using the Lightweight DITA standard specification (which is more strict than the normal Markdown to DITA format conversion), but Oxygen XML Editor provides a way to enable this support by using a special add-on.

To convert Markdown documents to Lightweight DITA topics, follow this procedure:

1. Install the DITA OT 3.x Publishing Engine Add-on *(page 2646)*.
2. Restart the application.
3. Go to **Options > Preferences > DITA** and in the **DITA Open Toolkit** section, select the **DITA OT 3.x** option.

   Step Result: Markdown documents referenced in a DITA map can now accept the `mdita` format (**Right-Click MD document in DITA Maps Manager > Edit Properties > Attributes tab > Select 'mdita' from drop-down menu in the Format attribute**).
4. Double-click the Markdown document in the **DITA Maps Manager**.

   Step Result: This will open the Markdown document in the editor and the **DITA** preview pane will show the conversion using the Lightweight DITA `mdita` format encoding rules.
5. Right-click anywhere in the **DITA** preview pane (or the left-side editor) and select **Export as DITA Topic**.

   Step Result: The Markdown document is converted to DITA using the Lightweight DITA `mdita` format encoding rules.

Markdown Editor Syntax Rules and Specifications

The Markdown editor in Oxygen XML Editor uses rules that were integrated from the most common set of default Markdown syntax rules along with many of the GitHub Flavored Markdown rules.

The Oxygen XML Editor implementation of the most commonly used syntax rules are as follows:

Headers

The Markdown editor supports two styles of headers, *Setext* and *Atx*.

- **Setext Style**

  Setext-style headers are underlined using equal signs (for first-level headers) and dashes (for second-level headers). Any number of equal signs or dashes will result in the same output.

  Example: Setext Style Headers

  ```
  First-Level Header (H1)
  ========

  Second-Level Header (H2)
  ------------
  ```

- **Atx Style**

  Atx-style headers use 1-6 hash characters at the start of the line, corresponding to header levels 1-6. Optionally, you may close atx-style headers. This is purely cosmetic and the closing hashes do not need to match the number of hashes used to open the header. It is the number of opening hashes that determines the header level.

  Example: Atx Style Headers

  ```
  # H1 text #
  ## H2 text
  ```

```
### H3 text ######
#### H4 text
##### H5 text ###
###### H6 text
```

Horizontal Rules (for HMTL output only)

You can produce a horizontal rule tag (`<hr />`) by placing three or more hyphens, asterisks, or underscores on a line by themselves (they also need to be preceded and followed by a blank line). Optionally, they can be separated by spaces.

- **Example: Horizontal Rules**

```
* * *

*****

---------------------------------------

_ _ _ _
```

Paragraphs and Line Breaks

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines. The text at the beginning of a paragraph should not be indented with spaces or tabs. To create a new paragraph, simply insert a blank line in between them.

⚠ **Important:** When converting to HTML, if you break a paragraph on multiple lines (without a blank line in between them), it will create a break tag (`<br />` . When converting to DITA, the text is kept in a single paragraph in this case and a blank line is required to break a paragraph. This behavior differs slightly from the default Markdown rules.

- **Example: Paragraphs**

```
This is a paragraph that contains
two lines of text. (In HTML, a break tag is created in between the two lines)

This is a new paragraph.
```

Styling Text

The Markdown editor supports some syntax rules for styling text (such as bold, italic, or strikethrough).

- **Italic (Emphasis)** - Text wrapped with one asterisk or underscore produces an italic (emphasis) tag.

```
*italic*
_italic_
```

- **Bold (Strong)** - Text wrapped with two asterisks or underscores produces a bold (strong) tag.

```
**bold**
__bold__
```

- **Strikethrough** - In HTML only, text wrapped with two tildes (~~) produces a strikethrough tag.

```
~~strikethrough~~
```

Tip: You can also combine these styling rules. For example, `**BoldText _ItalicText_ BoldText**` would produce italicized text within bold text. Also, if you surround an asterisk or underscore with spaces, it will be treated as a literal asterisk or underscore. To produce a literal asterisk or underscore at a position where it would otherwise be used as an styling delimiter, you can escape it with a backslash (for example, `\*literal asterisks\*`.

Links

The Markdown editor supports two types of links, *inline* and *reference*. In both cases, it begins with link text that is delimited by [square brackets].

- **Inline Links**

  To create an inline link, use a set of regular parentheses immediately after the closing square bracket for the link text. Inside the parentheses, put the URL where you want the link to point, and optionally a title surrounded in quotes. Also, if you referencing a local resource on the same server, you can use relative paths.

  Examples: Inline Link

  With a title:

```
Text with [example link text](http://www.example.com/path "Title") inline link and
 title.
```

Without a title:

```
Text with [example link text](http://www.example.com/path) inline link without a
 title.
```

Relative path:

```
Text with [example link text](/relative_path/) inline link with relative path.
```

- **Reference Links**

Reference-type links use a second set of square brackets that include a label (link identifier) to identify the link (it may consist of letters, numbers, spaces, and punctuation and it is not case sensitive). You can optionally use a space to separate the sets of brackets. The labels (link identifiers) are only used for creating the links and do not appear in the output.

```
Text with [link text1][id 1] a reference-type link and [link text2][id_2] another
 one.
```

Then, somewhere in the document, you need to define your link label on a line by itself. The link identifier must be within square brackets followed by a colon, then after one or more spaces the URL for the link. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses. Also, the link may optionally be enclosed in angle brackets (< >).

```
[id 1]: http://example1.com/ "Optional Title"
[id_2]: <http://example2.com/> "Optional Title2"
```

Other notes about Reference Links:

You can put the title on a second line and use extra spaces or tabs for padding. This is useful for aesthetics when the URL is long.

```
[id]: http://example.com/long/path/to/resource/here
    "Optional Title Here"
```

The label (link identifier) can be missing, in which case the link text (in square brackets) is used as the name.

```
[My Link][]
```

and then defined as:

```
[My Link]: http://example.com/
```

Automatic Links

The Markdown editor supports a shortcut style for creating automatic links for URLs and email addresses. You simply surround the URL or email address with angle brackets.

Note: These automatic links only work properly in HTML conversions. The *Preview* pane may display them properly in the DITA tab, but the DITA output will not properly recognize the format.

- **URLs**

  By surrounding a URL with angle brackets, you can show the actual text of the URL while also making it clickable in the output.

  ```
  <http://example.com/>
  ```

  For example, in HTML it is converted to:

  ```
  <a href="http://example.com/">http://example.com/</a>
  ```

- **Email Addresses**

  Automatic links for email addresses work similarly, except that Markdown will also perform a bit of randomized decimal and hex entity-encoding to help obscure your address from address-harvesting *spambots*.

  ```
  <address@example.com>
  ```

  In HTML, it is converted to something like:

  ```
  <a href="&#x6D;&#x61;i&#x6C;&#x74;&#x6F;:&#x61;&#x64;&#x64;&#x72;&#x65;
  &#115;&#115;&#64;&#101;&#120;&#x61;&#109;&#x70;&#x6C;e&#x2E;&#99;&#111;
  &#109;">&#x61;&#x64;&#x64;&#x72;&#x65;&#115;&#115;&#64;&#101;&#120;&#x61;
  &#109;&#x70;&#x6C;e&#x2E;&#99;&#111;&#109;</a>
  ```

Images

The Markdown editor uses an image syntax that is intended to resemble the syntax for links, allowing for the same two types: *inline* and *reference*. In both cases, the syntax for images begin with an exclamation mark, followed by `alt` attribute text surrounded by square brackets., and then followed by a set of parentheses that contain the URL or path to the image.

- **Inline Images**

For inline images, use a set of regular parentheses immediately after the closing square bracket for the `alt` attribute text. Inside the parentheses, put the URL or path of the image, and optionally a title surrounded in quotes.

Examples: Inline Images

With a title:

```
Text with ![Alt text](/path/to/img.jpg "Optional title") inline image and a title.
```

Without a title:

```
Text with ![Alt text](/path/to/img.jpg) inline link without a title.
```

- **Reference Images**

For reference-type images, use a second set of square brackets that include a label (image identifier) to identify the image (it may consist of letters, numbers, spaces, and punctuation and it is not case sensitive). You can optionally use a space to separate the sets of brackets. The labels (image identifiers) do not appear in the output.

```
Text with ![Alt text1][id] a reference-type image.
```

Then, somewhere in the document, you need to define your image label on a line by itself. The image identifier must be within square brackets followed by a colon, then after one or more spaces the URL or path of the image. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses.

```
[id]: url/to/image "Optional Title"
```

Blockquotes

The Markdown editor uses email-style greater than characters (>) for *blockquotes*. You only need to put the > before the first line of a hard-wrapped paragraph, but it looks better (and is more clear) if you put a > before every line.

- **Example: Blockquotes**

```
> This is a blockquote with two paragraphs. Lorem ipsum dolor sit amet,
> consectetuer adipiscing elit. Aliquam hendrerit mi posuere lectus.
> Vestibulum enim wisi, viverra nec, fringilla in, laoreet vitae, risus.
>
> Donec sit amet nisl. Aliquam semper ipsum sit amet velit. Suspendisse
> id sem consectetuer libero luctus adipiscing.
```

- *Blockquotes* can be nested by adding additional levels of > characters.

  Example: Nested Blockquotes

  ```
  > This is the first level of quoting.
  >
  > > This is nested blockquote.
  >
  > Back to the first level.
  ```

- *Blockquotes* can also contain other Markdown elements (such as headers, lists, and code blocks).

  Example: Blockquotes with Other Markdown Elements

  ```
  > ## This is a header.
  >
  > 1.   This is the first list item.
  > 2.   This is the second list item.
  >
  > Here's some example code:
  >
  >     return shell_exec("echo $input | $markdown_script")
  ```

Quoting Code (Inline and Code Blocks)

The Markdown editor supports quoting code or commands inline within a sentence or in distinct blocks.

- **Inline**

  You can quote or emphasize code within a sentence (inline) with single backticks (`). The text within the backticks will not be formatted.

  Example: Inline Code Emphasis

  ```
  This is a normal sentence with a `code` in the middle.
  ```

- **Code Blocks**

  You can format code or text into its own distinct block by inserting a blank line before and after the content and using at least 4 spaces (or 1 tab), or by using opening and closing triple backticks (```) on separate lines.

  Example: Code Block

```
This is a normal paragraph:

    This is a code block

This is a normal paragraph:
```

````
```
This is a code block
```
````

One level of indentation is removed from each line of a codeblock and it continues until it reaches a line that is not indented (or until the closing backticks).

Example: Code Block with Indentation

```
    tell application "something"
        beep
    end tell
```

For example, in HTML the result would look like this:

```
<pre><code>tell application "Foo"
    beep
end tell
</code></pre>
```

You can also add an optional language identifier to enable syntax highlighting in your code blocks. The Oxygen XML Editor Markdown editor supports the following languages: *Java*, *JavaScript*, *CSS*, and *Python*.

Example: Syntax Highlighting in Code Block

````
```css
input[type="submit"] {
    color: white;
    font-weight: bold;
```
````

Inline XHTML (for HMTL output only)

The Markdown editor supports writing inline XHTML. Since Markdown is just a writing format, it requires a conversion for publishing purposes. If you are using the HTML conversion, for any markup that is not covered by Markdown syntax, you can simply use XHTML syntax.

- **Example: Inline XHTML**

```
This is a regular paragraph.

<table>
    <tr>
        <td>Col 1</td>
        <td>Col 2</td>
    </tr>
</table>

This is another regular paragraph.
```

Lists

The Markdown editor supports ordered and unordered lists. You can also insert *blockquotes (page 1503)* and *code blocks (page 1504)* inside list items. List markers typically start at the left margin, but may be indented by up to three spaces.

- **Unordered Lists**

  For unordered lists, you can use asterisks (*), plus signs (+), and hyphens (-) interchangeably.

```
* List item 1
+ List item 2
- List item 3
```

- **Ordered Lists**

  For ordered lists, use numbers followed by periods. The actual numbers you use have no effect on the output. It simply converts them to list items within an ordered list an the actual number of list items will determine the numbers in the output.

```
1. List item 1
8. List item 2
5. List item 3
```

- **Nested Lists**

  You can create nested lists by indenting lines by two spaces.

```
1. Ordered list item 1
  1. Nested ordered list item 1
  2. Nested ordered list item 2
```

```
    * 2nd level nested unordered list item 1
    * 2nd level nested unordered list item 2
      * 3rd level nested unordered list item 1
2. Ordered list item 2
```

- **Paragraphs Inside Lists**

  If list items are separated by blank lines, Markdown will wrap the items in a paragraph in the output.

```
* List item 1

* List item 2
```

  For both DITA and HTML output, this would result in:

```
<ul>
<li><p>List item 1</p></li>
<li><p>List item 2</p></li>
</ul>
```

- **Multiple Paragraphs Inside Lists**

  List items may consist of multiple paragraphs. Each subsequent paragraph in a list item must be indented by either 4 spaces or one tab. Optionally, you can also indent each line of a paragraph to make it look nicer.

```
1.  This is a list item with two paragraphs. Lorem ipsum dolor
    sit amet, consectetuer adipiscing elit. Aliquam hendrerit
    mi posuere lectus.

    Vestibulum enim wisi, viverra nec, fringilla in, laoreet
    vitae, risus. Donec sit amet nisl. Aliquam semper ipsum
    sit amet velit.

2.  Suspendisse id sem consectetuer libero luctus adipiscing.
```

- **Blockquotes Inside Lists**

  To put a *blockquote* within a list item, the blockquote delimiters (>) need to be indented so that it is under the first letter of the text after the list item marker.

```
*   A list item with a blockquote:
    > This is a blockquote
    > inside a list item.
```

- **Code Blocks Inside Lists**

  To put a code block within a list item, insert an empty line in between the list item and the code block, and the code block needs to be indented twice (with 8 spaces or 2 tabs), or if you are using the triple backticks method, the opening triple backtick needs to be indented with 4 spaces or 1 tab.

  ```
  *   A list item with a code block:

          This is a code block inside a list item

      ```
      This is a code block inside a list item using the backticks method
      ```
  ```

Task Lists

You can create task lists by prefacing list items with a hyphen followed by a space followed by square brackets (`- [ ]`). To mark a task as complete, use `- [x]`.

- **Example: Task Lists**

  ```
  - [ ] Unfinished task 1
  - [x] Finished task 2
  ```

Definition Lists

You can create definition lists by using a colon plus a space for each list item.

- **Example: Definition Lists**

  ```
  Term 1
  : Definition A
  : Definition B
  ```

Tables

You can create tables in the Markdown editor by using pipes (`|`) and hyphens (`-`).

- **Creating a Table**

  Pipes are used to separate each column, while hyphens are used to create column headers. The pipes on either end of the table are optional. Cells can vary in width and do not need to be

perfectly aligned within columns, but there must be at least three hyphens in each column of the header row.

```
| First Header  | Second Header |
| ------------- | ------------- |
| Column 1 Row 1 Cell  | Column 2 Row 1 Cell  |
| Column 1 Row 2 Cell  | Column 2 Row 2 Cell  |
```

- **Formatting Rules in Table Cells**

  You can use formatting rules inside the cells of the table (such as links, inline code blocks, and text styling).

```
| First Header  | Second Header |
| --- | --- |
| `inline code`  | Content with **bold text** inside cell  |
```

- **Aligning Text in Tables**

  You can align text to the left, right, or center of a column by including colons (`:`) to the left, right, or on both sides of the hyphens within the header row.

```
| Left-aligned | Center-aligned | Right-aligned |
| :---         |     :---:      |          ---: |
| Content Cell | Content Cell   | Content Cell  |
```

- **Joining Cells (Span a Cell Over Multiple Columns)**

  You can join cells horizontally (span a cell over multiple columns) by using multiple consecutive pipe characters (`|`) to the right of the particular cell. The number of consecutive pipes indicate the number of columns the cell will span (`||` for two, `|||` for three, and so on).

```
| First Header | Second Header | Third Header | Fourth Header |
| ------------ | ------------- | ------------ | ------------- |
| Content Cell | *Cell Span Over 3 Columns* |||
```

Emoji

You can add *emoji* in the Markdown editor by surrounding the EMOJICODE with colons (`:EMOJICODE:`).

- **Example: Emoji**

```
:smile:
:laughing:
```

  The resulting emoticons will appear in the output, but they are not displayed in the *Preview* pane.

For a full list of available emoji codes, see Emoji Cheat Sheet.

Backslash Escapes

You can ignore Markdown formatting by using backslash escapes (\) to generate literal characters that would otherwise have special meaning in the Markdown syntax. For example, if you want to surround a word with literal asterisks (instead of an italic or emphasis tag), you can use backslashes to escape the asterisks.

```
\*literal asterisks\*
```

The Markdown editor provides backslash escapes for the following characters:

```
\   backslash
`   backtick
*   asterisk
_   underscore
{}  curly braces
[]  square brackets
()  parentheses
#   hash mark
+   plus sign
-   minus sign (hyphen)
.   dot
!   exclamation mark
```

Automatic Escaping for Special Characters

The Markdown editor includes support for automatically escaping special characters such as angle brackets (< >) and ampersands (&). If you want to use them as literal characters, you must escape them as entities, as in the table below. The exception to this is in HTML output, if the special characters for a valid tag (for example, `<b>`), they are treated as literal characters and escaping is not necessary.

Literal Character	Escaping Code
<	<
>	>
&	&

Footnotes

The Markdown editor in Oxygen XML Editor supports normal and inline footnotes. The following examples show the required syntax.

- **Example: Normal Footnote**

```
Here is a footnote reference,[^1]

[^1]: Here is the footnote.
```

- **Example: Normal Footnote with Multiple Blocks**

```
Here is a footnote reference,[^longnote]

[^longnote]: Here is the footnote with multiple blocks.

    Subsequent paragraphs are indented with 4 spaces or 1 tab to show that they
belong to the previous footnote.
```

- **Example: Inline Footnote**

```
Here is an inline note.^[Inlines notes are easier to write, since
you don't have to pick an identifier and move down to type the
note.]
```

Built-in XML Frameworks

A *framework (page 3229)* is associated to an XML document type according to a set of rules. It also includes a variety of settings that improve editing capabilities in the **Author** mode for its particular file type. These settings include:

- A default grammar used for validation and content completion in both **Author** mode and **Text** mode.
- CSS stylesheets for rendering XML documents in **Author** mode.
- User actions invoked from toolbars or menus in **Author** mode.
- Built-in scenarios used for transformations for the class of XML documents defined by the document type.
- *XML Catalogs (page 3235)*.
- Directories with document templates.
- User-defined extensions for customizing the interaction with the content author in **Author** mode.

Oxygen XML Editor includes built-in support for many common document types. Each document type is defined in a *framework (page 1512)*. You can create new *frameworks* or make changes to existing *frameworks (page 2251)* to suit your individual requirements.

For more information about configuring a *framework* in Oxygen XML Editor, watch our video:

Related Information:

Advanced Framework Customization *(page 2240)*

Document Type Configuration Dialog Box *(page 95)*

Built-in Document Types (Frameworks)

Oxygen XML Editor includes a variety of specialized editors, views, and features that are dynamic according to the type of document that you open or create. The type of documents that are supported include the most popular XML *frameworks (page 3229)* that include a full set of features as well as other document types that include more generic or common features.

Built-in Frameworks

The following built-in document types (*frameworks*) are fully supported in Oxygen XML Editor and each of these document types include built-in transformation scenarios, validation, content completion, document templates , default CSS files for rendering content in **Author** mode, and default actions for editing in **Author** mode:

- DocBook 4 *(page 1513)* - A document type standard for books, articles, and other prose documents (particularly technical documentation).
- DocBook 5 *(page 1529)* - An enhanced (version 5) document type standard designed for a variety of documents (particularly technical documentation).
- DITA *(page 1548)* - An XML-based architecture designed for authoring, producing, and delivering technical information.
- DITA Map *(page 1570)* - A document type that collects and organizes references to DITA topics or other maps.
- XHTML *(page 1577)* - Extensible HyperText Markup Language includes the same depth of expression as HTML, but also conforms to XML syntax.
- TEI ODD *(page 1594)* - Text Encoding Initiative One Document Does it all is an XML-conformant specification that allows you to create TEI P5 schema in a literate programming style.
- TEI P5 *(page 1585)* - The Text Encoding Initiative guidelines is a standard for the academic community that collectively define an XML format for text that is primarily semantic rather than presentational.
- JATS *(page 1603)* - The NISO Journal Article Tag Suite is a technical standard that defines an XML format for scientific literature.

Advanced Framework Customization *(page 2240)*

Document Type Association Preferences *(page 92)*

DocBook 4 Document Type (Framework)

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, *block-level*, and *inline*. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

File Definition

A file is considered to be a *DocBook 4* document when one of the following conditions are true:

- The root element name is `book` or `article`.
- The PUBLIC ID of the document contains the string `-//OASIS//DTD DocBook XML`.

Default Document Templates

There are a variety of default *DocBook 4* templates available when creating new documents from templates *(page 673)* and they can be found in: **Framework Templates > DocBook 4**.

The default templates for DocBook 4 documents are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/templates/Docbook 4` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the DocBook 4 file is `docbookxi.dtd` and it is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/4.5/dtd/`.

Default CSS

The default CSS files used for rendering DocBook content in **Author** mode are stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles *(page 2391)*.

Default XML Catalog

The default *XML Catalog (page 3235)*, `catalog.xml`, is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/`.

Transformation Scenarios

Oxygen XML Editor includes numerous built-in DocBook transformation scenarios that allow you to transform DocBook 4 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. All of them are listed in the **DocBook 4** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

For more information, see the DocBook Transformation Scenarios *(page 1638)* section.

DocBook 4 Author Mode Actions

A variety of actions are available in the DocBook 4 *framework (page 3229)* that can be added to the **DocBook4** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant (page 3227)*.

DocBook 4 Toolbar Actions

The following default actions are readily available on the **DocBook (Author Custom Actions)** toolbar when editing in **Author** mode (by default, most of them are also available in the **DocBook4** menu and in various submenus of the contextual menu):

Bold

Emphasizes the selected text by surrounding it with `<emphasis role="bold">` tag. You can use this action on multiple non-contiguous selections.

Italic

Emphasizes the selected text by surrounding it with `<emphasis role="italic">` tag. You can use this action on multiple non-contiguous selections.

Underline

Emphasizes the selected text by surrounding it with `<emphasis role="underline">` tag. You can use this action on multiple non-contiguous selections.

Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross reference (link)

Opens a dialog box that allows you to select a target to insert as a hypertext link.

Cross reference (xref)

Inserts a cross reference to other parts of the document.

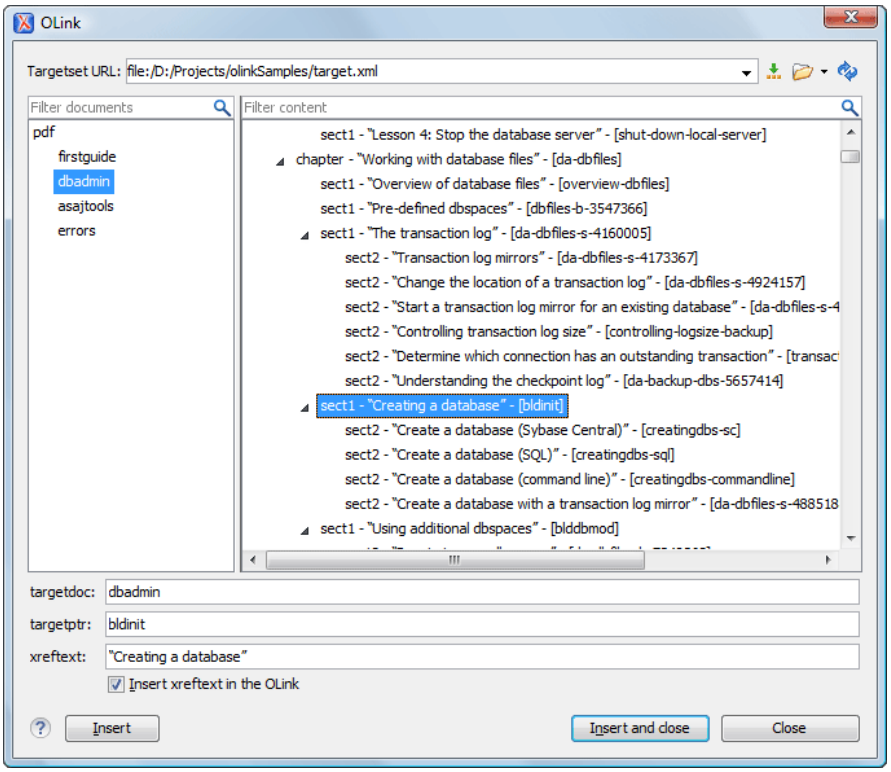
Web Link (ulink)

Inserts a link that addresses its target with a URL (Universal Resource Locator).

Insert OLink

Opens an **OLink** dialog box that allows you to insert a link that addresses its target indirectly, using the `targetdoc` and `targetptr` values that are present in a **Targetset** *(page 1547)* file.

Figure: Insert OLink Dialog Box



After you choose the **Targetset URL**, the structure of the target documents is presented. For each target document (`targetdoc`), its content is displayed allowing you to easily identify the `targetptr` for the `olink` element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for **targetdoc** and **targetptr**, you can insert them directly in the corresponding fields. You can also edit an `olink` using the **Edit OLink** action that is available on the contextual menu. The last used **Targetset** URL will be used to identify the edited target.

To insert XREF text into the `olink`, enter the text in the **xreftext** field and make sure the **Insert xreftext in the OLink** option is selected.

Insert URI

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

Insert Image

Opens a dialog box that allows you to select the path of an image to insert at the cursor position *(page 1013)*. Depending on the current location, an image-type element is inserted. If the action is invoked between two block elements (such as paragraphs), the dialog box also allows you to provide a title.

Insert Media Resource

Opens a **Choose Media** dialog box *(page 1046)* that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

Section Drop-Down Menu

The following actions are available from this menu:

Insert Section

Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is `sect1`, then a `sect2` is inserted. By default, this action also inserts a `para` element as a child node. The `para` element can be deleted if it is not needed.

Promote Section (Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X))

Promotes the current node as a sibling of the parent node.

Demote Section (Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X))

Demotes the current node a child of the previous node.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations *(page 1048)*.

Insert List Item

Inserts a list item in the current list type.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Insert Variable List

Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

Insert Procedure List

Inserts a DocBook `procedure` element. A step `child` item is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a *block element (page 3226)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DocBook4 Menu Actions

The following additional actions can be found in the **DocBook4** menu when editing in **Author** mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 4 *framework*:

Paste As XInclude

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Subscript

Surrounds the selected text with a *subscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

Superscript

Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor a new cell at cursor

position. If the cursor is inside a cell, the new cell is created after the current cell.

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor Editor Variables *(page 275)*.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block (page 3226)* and *inline elements (page 3230)*.Oxygen XML Editor

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page *(page 129)* where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes *(page 959)* and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set *(page 966)* to activate it.

Profiling Settings

Opens the profiling options preferences page *(page 142)*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page *(page 144)* and the attributes rendering preferences page *(page 146)*.

DocBook 4 Contextual Menu Actions

In addition to many of the DocBook 4 toolbar actions *(page 1515)* and the *general* **Author** mode contextual menu actions *(page 1055)*, the following DocBook 4 *framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 4 *framework*:

Paste As XInclude

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link > Edit OLink

Opens a dialog box that allows you edit an existing OLink. See the **Insert OLink** action for more information.

Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

DocBook 4 Drag/Drop (or Copy/Paste) Actions

Dragging a file from the **Project** view *(page 332)* or **DITA Maps Manager** view *(page 2943)* and dropping it into a DocBook 4 document that is edited in **Author** mode, creates a link to the dragged file (the `ulink` DocBook element) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Project** view *(page 332)* and drop them into a DocBook 4 document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the `inlinegraphic` DocBook element with a `fileref` attribute).

Inserting an `olink` in DocBook Documents

The `olink` element is used for linking to resources outside the current DocBook document. The `targetdoc` attribute is used for the document ID that contains the target element and the `targetptr` attribute for the ID of the target element (the value of an `id` or `xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
```

You can form a cross reference to that chapter by adding an `olink`, as in the following example:

```
You may need to update your
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>
when you get a new machine.
```

To use an `olink` to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.
   A unique ID must be assigned to each document that will be referenced with an `olink`. It is usually added as an `id` (or `xml:id` for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.
   For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: `<dir name="directory_name">`, in the target database document.

3. Create the target database document.
   Each collection of documents has a master target database document that is used to resolve all `olinks` from that collection. The target database document is an XML file that is created once. It provides a means for pulling in the target data for each document. The database document is static and all the document data is pulled in dynamically.

   Tip: Oxygen XML Editor includes a built-in new document template called **DocBook Targetset Map** available in the **New** document wizard *(page 673)* that will help you get started.

   Example: The following is an example of a target database document. It structures a collection of documents in a `sitemap` element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

   ```
   <?xml version="1.0" encoding="utf-8"?>
   <!DOCTYPE targetset [
   <!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
   ```

```
<!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db">
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
]>
<targetset>
  <targetsetinfo>
    Description of this target database document,
    which is for the examples in olink doc.
  </targetsetinfo>

  <!-- Site map for generating relative paths between documents -->
  <sitemap>
    <dir name="documentation">
      <dir name="guides">
        <dir name="mailuser">
          <document targetdoc="MailUserGuide"
                    baseuri="userguide.html">
            &ugtargets;
          </document>
        </dir>
        <dir name="mailadmin">
          <document targetdoc="MailAdminGuide">
            &agtargets;
          </document>
        </dir>
      </dir>
      <dir name="reference">
        <dir name="mailref">
          <document targetdoc="MailReference">
            &reftargets;
          </document>
        </dir>
      </dir>
    </dir>
  </sitemap>
</targetset>
```

4. Generate the target data files by executing a DocBook transformation scenario.
   Before applying the transformation, you need to edit the transformation scenario, go to the **Parameters** tab, and make sure the value of the `collect.xref.targets` parameter is set to `yes`.

The default name of a target data file is `target.db`, but it can be changed by setting an absolute file path in the `targets.filename` parameter.

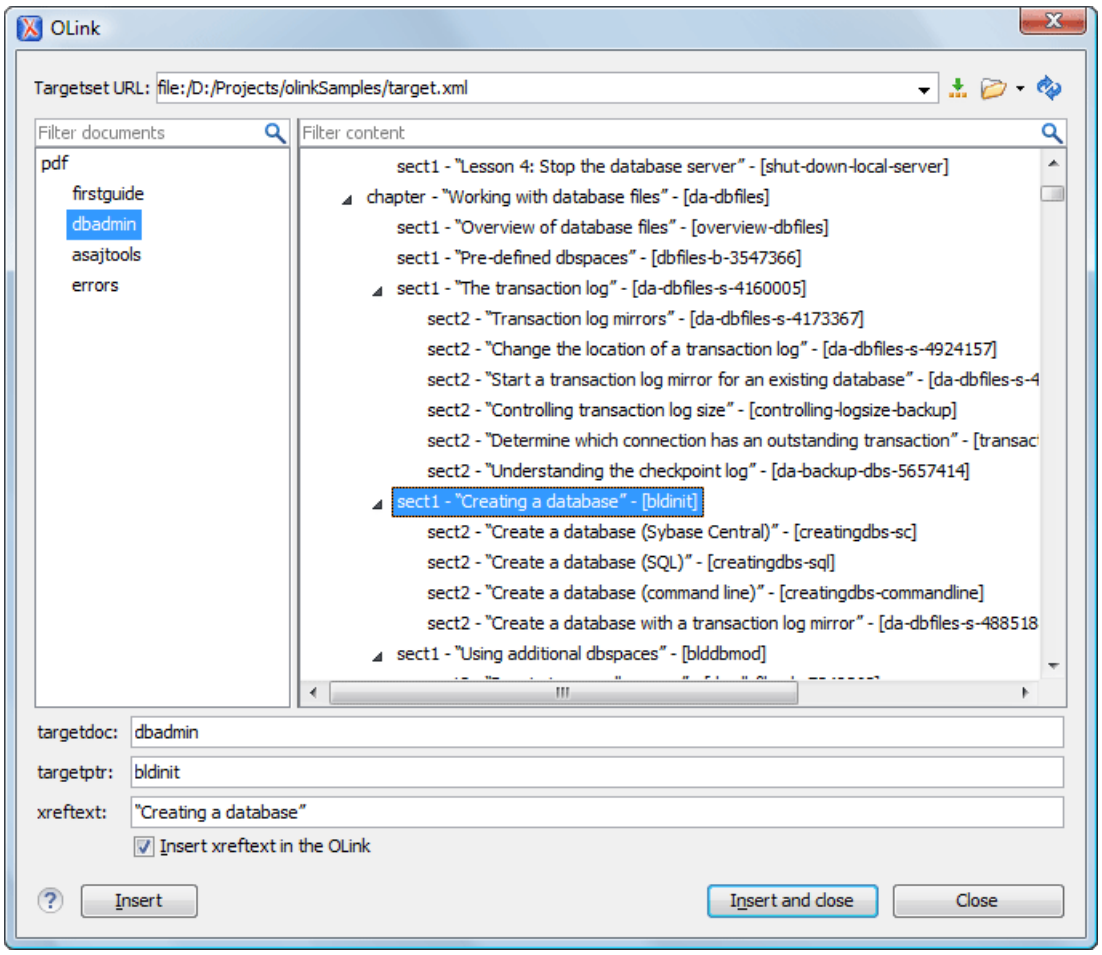
Example: An example of a `target.db` file:

```
<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
 <ttl>Administering User Accounts</ttl>
 <xreftext>How to administer user accounts</xreftext>
 <div element="part" href="#d5e4" number="I">
  <ttl>First Part</ttl>
  <xreftext>Part I, “First Part”</xreftext>
  <div element="chapter" href="#d5e6" number="1">
    <ttl>Chapter Title</ttl>
    <xreftext>Chapter 1, Chapter Title</xreftext>
    <div element="sect1" href="#src_chapter" number="1" targetptr="src_chapter">
      <ttl>Section1 Title</ttl>
      <xreftext>xreflabel_here</xreftext>
    </div>
  </div>
 </div>
</div>
```

5. Insert `olink` elements in the DocBook documents.
   When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the **Link** drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an `olink` from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (`targetdoc`), its content is displayed, allowing you to easily identify the appropriate `targetptr`. You can also use the search fields to quickly identify a target. If you already know the values for the `targetdoc` and `targetptr` attributes, you can insert them directly in the corresponding fields.

   Example: In the following image, the target database document is called `target.xml`, *dbadmin* is selected for the target document (`targetdoc`), and *bldinit* is selected as the value for the `targetptr` attribute. Notice that you can also add XREF text into the `olink` by using the `xreftext` field.

Figure: Insert OLink Dialog Box



6. Process a DocBook transformation for each document to generate the output.
   a. Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
   b. Apply the transformation scenario.

DocBook 5 Document Type (Framework)

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, *block-level*, and *inline*. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

File Definition

A file is considered to be a DocBook 5 document when the namespace is *http://docbook.org/ns/docbook*.

Default Document Templates

There are a variety of default *DocBook 5* templates available when creating new documents from templates *(page 673)* and they can be found in: **Framework Templates > DocBook 5 > DocBook 5.0** and **Framework Templates > DocBook 5 > DocBook 5.1**.

New document templates for both DocBook 5 documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.0` folder.

New document templates for both DocBook 5.1 documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.1` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.0/rng/` (or for DocBook 5.1 in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.1/rng/`). Other types of schemas for various DocBook versions are also located in various folders inside the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/` directory.

Default CSS

The default CSS files used for rendering DocBook content in **Author** mode is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles *(page 2391)*.

Transformation Scenarios

Oxygen XML Editor includes numerous built-in DocBook transformation scenarios that allow you to transform DocBook 5 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Editor also includes a DocBook 5.1 transformation scenario for *Assembly* documents *(page 1545)*. All of them are listed in the **DocBook 5** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

For more information, see the DocBook Transformation Scenarios *(page 1638)* section.

DocBook 5 Author Mode Actions

A variety of actions are available in the DocBook 5 *framework (page 3229)* that can be added to the **DocBook5** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant (page 3227)*.

DocBook 5 Toolbar Actions

The following default actions are readily available on the **DocBook (Author Custom Actions)** toolbar when editing in **Author** mode (by default, most of them are also available in the **DocBook5** menu and in various submenus of the contextual menu):

Bold

Emphasizes the selected text by surrounding it with `<emphasis role="bold">` tag. You can use this action on multiple non-contiguous selections.

Italic

Emphasizes the selected text by surrounding it with `<emphasis role="italic">` tag. You can use this action on multiple non-contiguous selections.

Underline

Emphasizes the selected text by surrounding it with `<emphasis role="underline">` tag. You can use this action on multiple non-contiguous selections.

Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross reference (link)

Opens a dialog box that allows you to select a target to insert as a hypertext link.

Cross reference (xref)

Inserts a cross reference to other parts of the document.

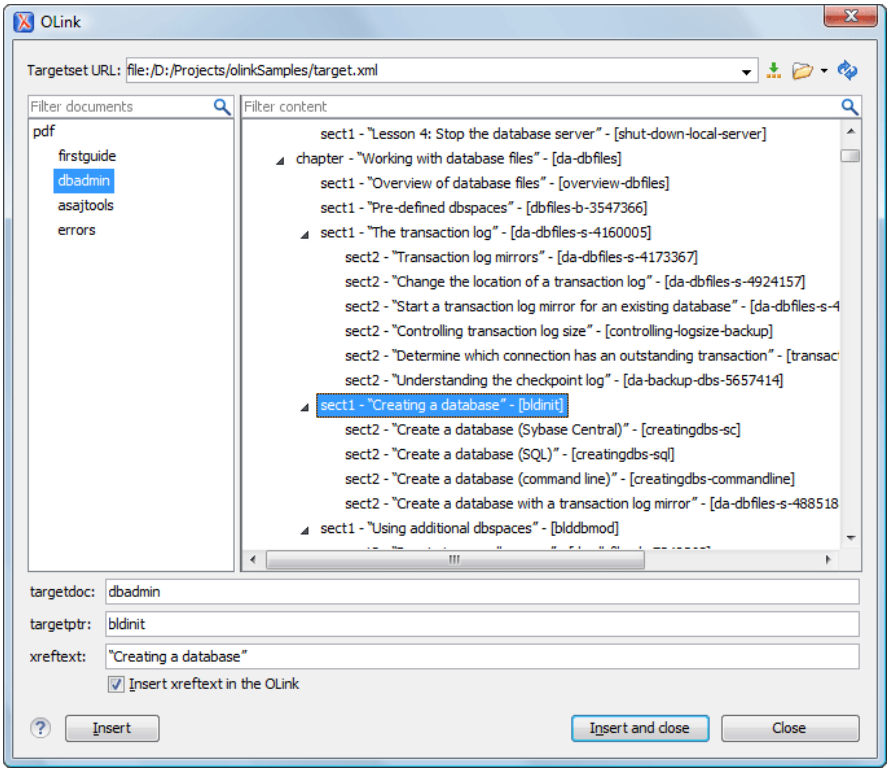
Web Link (ulink)

Inserts a link that addresses its target with a URL (Universal Resource Locator).

Insert OLink

Opens an **OLink** dialog box that allows you to insert a link that addresses its target indirectly, using the `targetdoc` and `targetptr` values that are present in a **Targetset** *(page 1547)* file.

Figure: Insert OLink Dialog Box



After you choose the **Targetset URL**, the structure of the target documents is presented. For each target document (`targetdoc`), its content is displayed allowing you to easily identify the `targetptr` for the `olink` element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for **targetdoc** and **targetptr**, you can insert them directly in the corresponding fields. You can also edit an `olink` using the **Edit OLink** action that is available on the contextual menu. The last used **Targetset** URL will be used to identify the edited target.

To insert XREF text into the `olink`, enter the text in the **xreftext** field and make sure the **Insert xreftext in the OLink** option is selected.

Insert URI

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

Insert Image

Opens a dialog box that allows you to select the path of an image to insert at the cursor position *(page 1013)*. Depending on the current location, an image-type element is inserted. If the action is invoked between two block elements (such as paragraphs), the dialog box also allows you to provide a title.

Insert Media Resource

Opens a **Choose Media** dialog box *(page 1046)* that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

Section Drop-Down Menu

The following actions are available from this menu:

Insert Section

Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is `sect1`, then a `sect2` is inserted. By default, this action also inserts a `para` element as a child node. The `para` element can be deleted if it is not needed.

Promote Section (Ctrl + Alt + LeftArrow (Command + Alt + LeftArrow on OS X))

Promotes the current node as a sibling of the parent node.

Demote Section (Ctrl + Alt + RightArrow (Command + Alt + RightArrow on OS X))

Demotes the current node a child of the previous node.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations *(page 1048)*.

Insert List Item

Inserts a list item in the current list type.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Insert Variable List

Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

Insert Procedure List

Inserts a DocBook `procedure` element. A step `child` item is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a *block element (page 3226)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DocBook5 Menu Actions

The following additional actions can be found in the **DocBook5** menu when editing in **Author** mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 5 *framework*:

Paste As XInclude

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Subscript

Surrounds the selected text with a *subscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

Superscript

Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor a new cell at cursor

position. If the cursor is inside a cell, the new cell is created after the current cell.

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor Editor Variables *(page 275)*.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block (page 3226)* and *inline elements (page 3230)*.Oxygen XML Editor

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page *(page 129)* where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes *(page 959)* and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set *(page 966)* to activate it.

Profiling Settings

Opens the profiling options preferences page *(page 142)*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page *(page 144)* and the attributes rendering preferences page *(page 146)*.

DocBook 5 Contextual Menu Actions

In addition to many of the DocBook 5 toolbar actions *(page 1531)* and the *general* **Author** mode contextual menu actions *(page 1055)*, the following DocBook 5 *framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Paste special submenu

This submenu includes the following special paste actions that are specific to the DocBook 5 *framework*:

Paste As XInclude

Allows you to create an `xi:include` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a `link` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `xref` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link > Edit OLink

Opens a dialog box that allows you edit an existing OLink. See the **Insert OLink** action for more information.

Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

DocBook 5 Drag/Drop (or Copy/Paste) Actions

Dragging a file from the **Project** view *(page 332)* or **DITA Maps Manager** view *(page 2943)* and dropping it into a DocBook 5 document that is edited in **Author** mode, creates a link to the dragged file (the `link` DocBook element) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Project** view *(page 332)* and drop them into a DocBook 5 document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the `imageobject` DocBook element with an `imagedata` child element and a `fileref` attribute).

Inserting an `olink` in DocBook Documents

The `olink` element is used for linking to resources outside the current DocBook document. The `targetdoc` attribute is used for the document ID that contains the target element and the `targetptr` attribute for the ID of the target element (the value of an `id` or `xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
```

You can form a cross reference to that chapter by adding an `olink`, as in the following example:

```
You may need to update your
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>
when you get a new machine.
```

To use an `olink` to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.
   A unique ID must be assigned to each document that will be referenced with an `olink`. It is usually added as an `id` (or `xml:id` for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.
   For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: `<dir name="directory_name">`, in the target database document.

3. Create the target database document.
   Each collection of documents has a master target database document that is used to resolve all `olinks` from that collection. The target database document is an XML file that is created once. It provides a means for pulling in the target data for each document. The database document is static and all the document data is pulled in dynamically.

   Tip: Oxygen XML Editor includes a built-in new document template called **DocBook Targetset Map** available in the **New** document wizard *(page 673)* that will help you get started.

   Example: The following is an example of a target database document. It structures a collection of documents in a `sitemap` element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

   ```
   <?xml version="1.0" encoding="utf-8"?>
   <!DOCTYPE targetset [
   <!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
   ```

```
<!ENTITY agtargets SYSTEM "file:///doc/adminguide/target.db">
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
]>
<targetset>
  <targetsetinfo>
    Description of this target database document,
    which is for the examples in olink doc.
  </targetsetinfo>

  <!-- Site map for generating relative paths between documents -->
  <sitemap>
    <dir name="documentation">
      <dir name="guides">
        <dir name="mailuser">
          <document targetdoc="MailUserGuide"
                    baseuri="userguide.html">
            &ugtargets;
          </document>
        </dir>
        <dir name="mailadmin">
          <document targetdoc="MailAdminGuide">
            &agtargets;
          </document>
        </dir>
      </dir>
      <dir name="reference">
        <dir name="mailref">
          <document targetdoc="MailReference">
            &reftargets;
          </document>
        </dir>
      </dir>
    </dir>
  </sitemap>
</targetset>
```

4. Generate the target data files by executing a DocBook transformation scenario.
   Before applying the transformation, you need to edit the transformation scenario, go to the **Parameters** tab, and make sure the value of the `collect.xref.targets` parameter is set to `yes`.

The default name of a target data file is `target.db`, but it can be changed by setting an absolute file path in the `targets.filename` parameter.

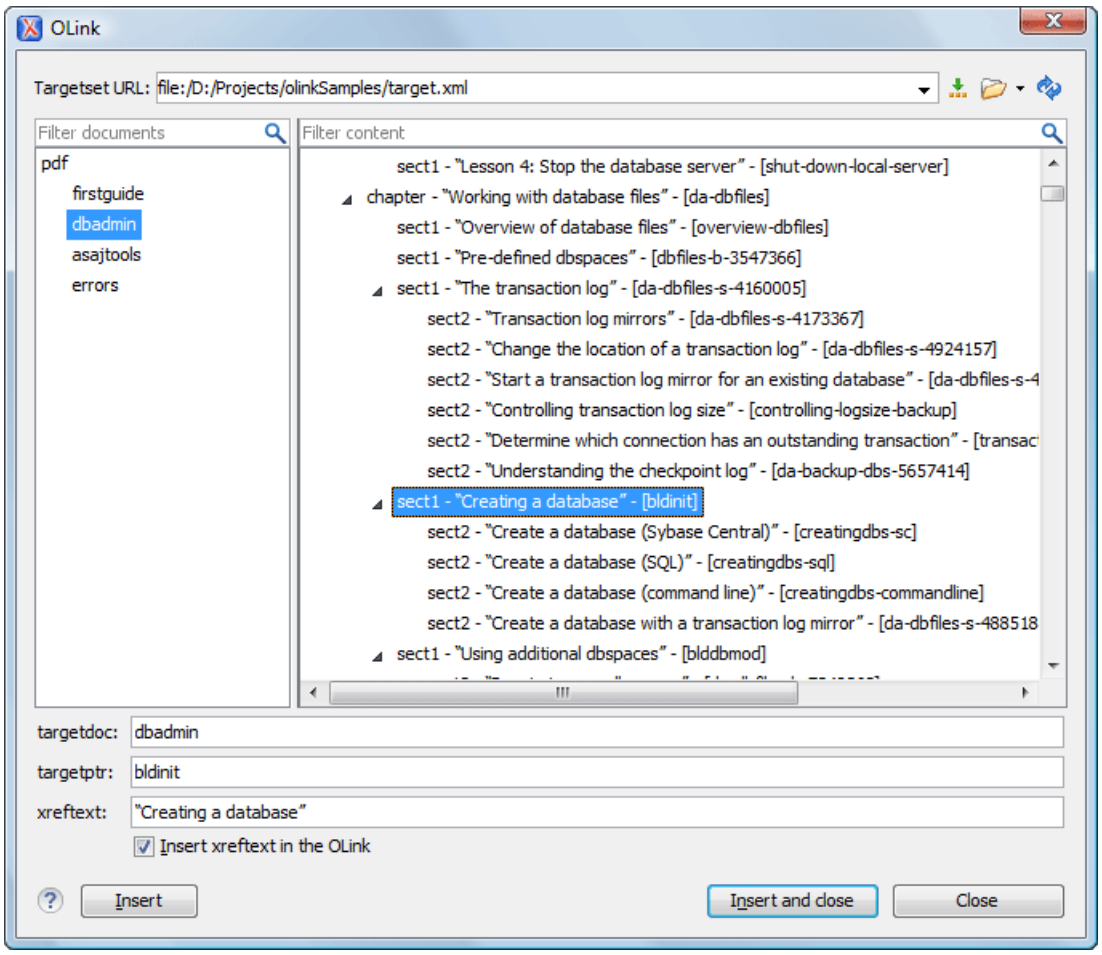
Example: An example of a `target.db` file:

```
<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
 <ttl>Administering User Accounts</ttl>
 <xreftext>How to administer user accounts</xreftext>
 <div element="part" href="#d5e4" number="I">
  <ttl>First Part</ttl>
  <xreftext>Part I, “First Part”</xreftext>
  <div element="chapter" href="#d5e6" number="1">
    <ttl>Chapter Title</ttl>
    <xreftext>Chapter 1, Chapter Title</xreftext>
    <div element="sect1" href="#src_chapter" number="1" targetptr="src_chapter">
      <ttl>Section1 Title</ttl>
      <xreftext>xreflabel_here</xreftext>
    </div>
  </div>
 </div>
</div>
```

5. Insert `olink` elements in the DocBook documents.
   When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the **Link** drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an `olink` from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (`targetdoc`), its content is displayed, allowing you to easily identify the appropriate `targetptr`. You can also use the search fields to quickly identify a target. If you already know the values for the `targetdoc` and `targetptr` attributes, you can insert them directly in the corresponding fields.

   Example: In the following image, the target database document is called `target.xml`, *dbadmin* is selected for the target document (`targetdoc`), and *bldinit* is selected as the value for the `targetptr` attribute. Notice that you can also add XREF text into the `olink` by using the `xreftext` field.

Figure: Insert OLink Dialog Box



6. Process a DocBook transformation for each document to generate the output.
   a. Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
   b. Apply the transformation scenario.

DocBook 5.1 Assembly

The DocBook *Assembly* document type was introduced with DocBook 5.1 and it is used to define the hierarchy and relationships for a collection of resources. It is especially helpful for topic-oriented authoring scenarios since it assembles a set of resources (such as DocBook 5.1 *topics (page 1546)*) to form a hierarchical structure for a larger publication.

An *Assembly* document usually has four major parts:

- **Resources** - Identifies a collection of resources (such as topics). An *Assembly* may identify one or more collections.

- **Structure** - Identifies an artifact to be assembled. A document in this case is the particular collection of resources (such as topics) that forms the documentation. Within the `structure` element, an `output` element can be used to identify the type of output to be generated and `module` elements can be used to identify the resources to be included. An *Assembly* may identify one or more *structures*.
- **Relationships** - Identifies relationships between resources. These relationships may be manifested in any number of *structures* during assembly. An *Assembly* may identify any number of relationships.
- **Transformations** - Identifies transformations that can be applied during assembly. An *Assembly* may identify any number of transformations.

For detailed information about the DocBook *Assembly* document type, see DocBook 5.1: The Definitive Guide - DocBook Assemblies.

File Definition

A file is considered to be an *Assembly* when the root name is `assembly`.

Default Document Templates

A default **Assembly** document template is available when creating new documents from templates *(page 673)* and it can be found in: **Framework Templates > DocBook 5 > DocBook 5.1**.

The default template for DocBook Assembly documents is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/templates/Docbook5.1` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/5.1/rng/`.

Transformation Scenarios

Oxygen XML Editor includes a built-in transformation scenario that can be applied on an *Assembly* file to generate an *assembled* (merged) DocBook file. The scenarios is called **DocBook Assembly** and is found in the **DocBook 5** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

Resources

- DocBook 5.1: The Definitive Guide - DocBook Assemblies
- Docbook 5.1 Specifications
- Sample files: *[OXYGEN_INSTALL_DIR]*`/samples/docbook/v5/assembly/`

DocBook 5.1 Topic

The DocBook *Topic* document type was introduced with DocBook 5.1 and it is used as a modular unit of documentation. It is similar to the concept of the DITA *Topic* and can be used as modular resources in conjunction with DocBook 5.1 *Assembly (page 1545)* documents.

For detailed information about the DocBook *Topic* document type, see DocBook 5.1: The Definitive Guide - Topic.

File Definition

A DocBook file is considered to be a *Topic* when the root name is `topic`.

Default Document Templates

A default **Topic** document template is available when creating new documents from templates *(page 673)* and it can be found in: **Framework Templates > DocBook 5 > DocBook 5.1**.

The default template for DocBook Assembly documents is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/templates/Docbook5.1` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/5.1/rng/`.

Transformation Scenarios

Since DocBook *Topics* are modular resources, they are *assembled* and transformed in the **DocBook Assembly** transformation process *(page 1546)*. You can also use any of the built-in DocBook transformation scenarios to transform individual DocBook Topics to a variety of outputs, such as PDF, HTML, EPUB, and more. They are found in the **DocBook 5** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

DocBook 5.1 Assembly *(page 1545)*

DocBook Targetset Document Type (Framework)

DocBook *Targetset* documents are used to resolve cross references with the DocBook `olink`.

File Definition

A file is considered to be a *Targetset* when the root name is `targetset`.

Default Document Templates

A default **DocBook Targetset Map** document template is available when creating new documents from templates *(page 673)* and it can be found in: **Framework Templates > DocBook Targetset**.

The default template for DocBook Targetset documents is located in the *[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Targetset* folder.

Default Schema for Validation and Content Completion

The default schema, `targetdatabase.dtd`, for this type of document is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/docbook/xsl/common/`.

DITA Topics Document Type (Framework)

The Darwin Information Typing Architecture (DITA) is an XML-based architecture for authoring, producing, and delivering technical information. It divides content into small, self-contained topics that you can reuse in various deliverables. The extensibility of DITA permits organizations to define specific information structures while still using standard tools to work with them. DITA content is created as topics, each an individual XML file. Typically, each topic has a defined primary objective and structure, and DITA also includes several specialized topic types (*task*, *concept*, *reference*, *glossary entry*).

For much more detailed information, resources, and instructions, see the DITA Authoring *(page 2934)* chapter.

File Definition

A file is considered to be a DITA topic document when one of the following conditions are true:

- The root element name is one of the following: `concept`, `task`, `reference`, `dita`, or `topic`.
- The PUBLIC ID of the document is a PUBLIC ID for the elements listed above.

- The root element of the file has an attribute named `DITAArchVersion` for the "http://dita.oasis-open.org/architecture/2005/" namespace. This enhanced case of matching is only applied when the **Enable DTD/XML Schema processing in document type detection** option *(page 93)* is selected from the **Document Type Association** preferences page *(page 92)*.

Default Document Templates

There are a variety of default *DITA topic* templates available when creating new documents from templates *(page 673)* and they can be found in various folders inside: **Framework Templates > DITA**.

The default templates for DITA topic documents are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/templates/topic` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the DITA documents are stored in the various folders inside *DITA-OT-DIR*`/dtd/` or *DITA-OT-DIR*`/schema/`.

Default CSS

The default CSS files used for rendering DITA content in **Author** mode are stored in the various folders inside: *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles *(page 2391)*.

Default XML Catalogs

The default *XML Catalogs (page 3235)* for the DITA topic document type are as follows:

- *DITA-OT-DIR*`/catalog-dita.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/catalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/plugin/catalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/styleguide/catalog.xml`

Transformation Scenarios

Oxygen XML Editor includes built-in transformation scenarios that allow you to transform individual DITA Topics to a XHTML or PDF output. They can be found in the **DITA** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

Editing XML Documents in Text Mode *(page 819)*

DITA Author Mode Actions

A variety of actions are available for the DITA *framework (page 3229)* that can be found on the toolbar, the contextual menu, or the **DITA** menu.

DITA Toolbar Actions

The following default actions are readily available on the **DITA (Author Custom Actions)** toolbar when editing in **Author** mode (by default, most of them are also available in the **DITA** menu and in various submenus of the contextual menu):

Bold

Surrounds the selected text with a `b` tag. You can use this action on multiple non-contiguous selections.

Italic

Surrounds the selected text with an `i` tag. You can use this action on multiple non-contiguous selections.

Underline

Surrounds the selected text with a `u` tag. You can use this action on multiple non-contiguous selections.

Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross Reference

Opens the **Cross Reference (xref)** dialog box *(page 3113)* that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map (page 3228)* structure. Once the target

resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics *(page 3112)*.

File Reference

Opens the **File Reference** dialog box *(page 3113)* that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. For more information, see Linking in DITA Topics *(page 3112)*.

Web Link

Opens the **Web Link** dialog box *(page 3113)* that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. For more information, see Linking in DITA Topics *(page 3112)*.

Related Link to Topic

Opens the **Cross Reference (xref)** dialog box *(page 3113)* that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure.
Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(page 3112)*.

Related Link to File

Opens the **File Reference** dialog box *(page 3114)* that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(page 3112)*.

Related Link to Web Page

Opens the **Web Link** dialog box *(page 3114)* that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. If a related links section

does not already exist, this action creates one. For more information, see Linking in DITA Topics *(page 3112)*.

Insert Image

Opens the **Insert Image** dialog box *(page 3014)* that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

Insert Media Resource

Opens the **Insert Media** dialog box *(page 3017)* that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an `object` element and it is rendered in **Author** mode so that it can be played directly from there.

Insert Section Drop-Down Menu

The following insert actions are available from this menu:

Insert Section

Inserts a new `section` element in the document, depending on the current context.

Insert Concept

Inserts a new `concept` element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

Insert Task

Inserts a new `task` element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

Insert Topic

Inserts a new `topic` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Reference

Inserts a new `reference` element, depending on the current context. A reference is a top-level container for a reference topic.

Insert Paragraph

Inserts a new paragraph at current cursor position.

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the **Reuse Content** dialog box *(page 3084)* that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (*conref*) *(page 3086)*, content key references (*conkeyref*) *(page 3088)*, or key references to metadata (*keyref*) *(page 3091)*.

Insert step or list item

Inserts a new list or step item in the current list type.

Insert Unordered List

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a *block element (page 3226)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DITA Contextual Menu Actions

In addition to many of the DITA toolbar actions *(page 1550)* and the *general* **Author** mode contextual menu actions *(page 1055)*, there are numerous DITA-specific actions that are available in the contextual menu when editing DITA documents in **Author** mode (most of them are also available in the **DITA** menu at the top of the interface):

Edit Attributes

Displays an in-place attributes editor *(page 427)* that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the profiling attributes *(page 959)* defined on all selected elements.

Cut (Ctrl + X (Command + X on OS X))

Removes the current selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on OS X))

Places a copy of the current selected content in the clipboard.

Paste (Ctrl + V (Command + V on OS X))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA *framework*:

Paste as content reference

Inserts a content reference (a DITA element with a `conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the `conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from *DITA maps (page 3228)*. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box *(page 2948)* points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an `xref` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Root map** combo box *(page 2948)* points to the correct map that stores the keys.

3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Insert submenu

This submenu includes the following insert actions that are specific to the DITA *framework*:

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a *block element (page 3226)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

Insert Image

Inserts an image reference *(page 1013)* at the cursor position. Depending on the current location, an image-type element is inserted.

Insert Media Resource

Opens a **Choose Media** dialog box *(page 1046)* that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations *(page 1048)*.

Insert Paragraph

Inserts a new paragraph at current cursor position.

Insert Section

Inserts a new `section` element in the document, depending on the current context.

Insert Topic

Inserts a new `topic` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- #<*decimal value*> - e. g. #65
- &#<*decimal value*>; - e. g. &#65
- #x<*hexadecimal value*> - e. g. #x41
- &#x<*hexadecimal value*>; - e. g. &#x41

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link submenu

The following link actions are available from this submenu:

Cross Reference

Opens the **Cross Reference (xref)** dialog box *(page 3113)* that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map (page 3228)* structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see Linking in DITA Topics *(page 3112)*.

File Reference

Opens the **File Reference** dialog box *(page 3113)* that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. For more information, see Linking in DITA Topics *(page 3112)*.

Web Link

Opens the **Web Link** dialog box *(page 3113)* that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. For more information, see Linking in DITA Topics *(page 3112)*.

Related Link to Topic

Opens the **Cross Reference (xref)** dialog box *(page 3113)* that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(page 3112)*.

Related Link to File

Opens the **File Reference** dialog box *(page 3114)* that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(page 3112)*.

Related Link to Web Page

Opens the **Web Link** dialog box *(page 3114)* that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see Linking in DITA Topics *(page 3112)*.

Sort

Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.

Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.

- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Reuse submenu

This submenu includes the following actions in regards to reusing content in DITA:

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the **Reuse Content** dialog box *(page 3084)* that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include content references (*conref*) *(page 3086)*, content key references (*conkeyref*) *(page 3088)*, or key references to metadata (*keyref*) *(page 3091)*.

Push Current Element

Opens the **Push current element** dialog box *(page 3094)* that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

Edit Content Reference

This action is available for elements with a `conref` or `conkeyref` attribute. it opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`conref` / `conkeyref` and `conrefend` attributes). For more information, see Reuse Content Dialog Box *(page 3084)*.

Replace Reference with Content

Replaces the referenced fragment (`conref` or `conkeyref`) at the cursor position with its content from it source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (*hrefs*), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

Replace All References with Content

Replaces all referenced fragments (`keyref` , `conref` , or `conkeyref`) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `id` attributes.

For *keyrefs* inside `xref` or `link` elements, the `keyref` attribute is changed to an `href` attribute, while the rest of the content for the *keyref* is replaced with its source content.

If the source content includes references to other topics/resources (*hrefs*), the operation also resolves those references relative to the new location.

Remove Content Reference

Removes the content reference (`conref` or `conkeyref`) inside the element at the cursor position.

Create Reusable Component

Creates a reusable component from the selected fragment of text. For more information, see Creating a Reusable Content Component *(page 3097)*.

Insert Reusable Component

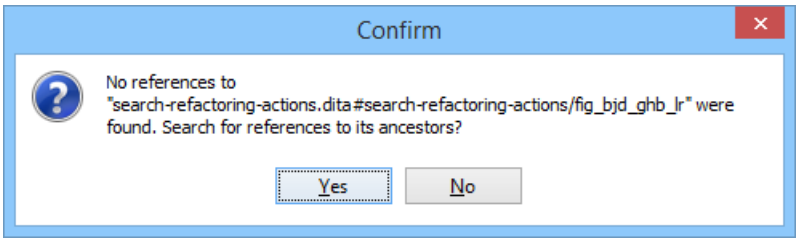
Inserts a reusable component at cursor location. For more information, see Inserting a Reusable Content Component *(page 3098)*.

Search References (Ctrl + Shift + G)

Finds the references to the `id` attribute value for the element at the current cursor position, in all the topics contained in the current *DITA map (page 3228)* (opened in the **DITA Maps Manager** view *(page 2943)*). If no references are found for the current

element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

Figure: Search References to Ancestors Dialog Box



Show Key Definition

Available for elements that have a `conkeyref` or `keyref` attribute set (or elements with an ancestor element that has a `conkeyref` or `keyref` attribute). It computes the key name and opens the *DITA map (page 3228)* that contains the definition of the key with the element that defines that key selected.

About Element submenu

This submenu includes the following actions:

Style Guide

Opens the **DITA Style Guide Best Practices for Authors** in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the **About Element** sub-menu), in the **DITA** menu, and in some of the documentation tips that are displayed by the *Content Completion Assistant (page 3227)*.

Browse reference manual

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

Go to Definition

Moves the cursor to the definition of the current element.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word. 0034

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note: The content marked as deleted with *change tracking (page 3235)* is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + X (Command + Shift + X on OS X))

Converts a sequence of hexadecimal characters to the corresponding Unicode character. The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `E`
- `0X0125` to `#`
- `265` to `#`

- `2190` to `#`

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

Toggle Comment

Encloses the currently selected text in an XML comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow)

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow)

Moves the current node or selected nodes after the subsequent node.

Split Element (Alt + Shift + D (Ctrl + Alt + D on OS X))

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent *block elements (page 3226)* that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Ctrl + E (Command + E on OS X))

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option *(page 166)* is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option *(page 166)* is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Ctrl + ForwardSlash (Command + ForwardSlash on OS X))

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup in tact with empty elements.

DITA Refactoring Actions

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

Change Topic ID to File Name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS Tables to Simple Tables

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert conrefs to conkeyrefs

Use this operation to convert `conref` attributes to `conkeyref` attributes.

Convert Simple Tables to CALS Tables

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If

it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

Track Changes

Enables or disables the *Track Changes (page 3235)* support for the current document.

Accept Change(s) and Move to Next

Accepts the *Tracked Change (page 3235)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

Accept All Changes

Accepts all *Tracked Changes (page 3235)* in the current document.

Reject Change(s) and Move to Next

Rejects the *Tracked Change (page 3235)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

Reject All Changes

Rejects all *Tracked Changes (page 3235)* in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (page 3235)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the **Review** view *(page 955)*.

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds (Ctrl + NumPad/ (Command + NumPad/ on OS X))

Folds all the elements except the current element.

Collapse Child Folds (Ctrl + NumPad. (Command + NumPad. on OS X))

Folds the elements indented with one level inside the current element.

Expand Child Folds

Unfolds all child elements of the currently selected element.

Expand All (Ctrl + NumPad* (Command + NumPad* on OS X))

Unfolds all elements in the current document.

Inspect Styles

Opens the **CSS Inspector** view *(page 437)* that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the Author mode options page *(page 129)*.

DITA Drag/Drop (or Copy/Paste) Actions

Dragging a file from the **Project** view *(page 332)* or **DITA Maps Manager** view *(page 2943)* and dropping it into a DITA document that is edited in **Author** mode, creates a link to the dragged file (the `xref` DITA element with the `href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Project** view *(page 332)* and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA `image` element with an `href` attribute).

DITA Map Document Type (Framework)

DITA maps (page 3228) are documents that collect and organize references to DITA topics to indicate the relationships between the topics. They can be used as a container for topics used to transform a collection of content into a publication and they offer a sequence and structure to the topics. They can also serve as outlines or tables of contents for DITA deliverables and as build manifests for DITA projects. *DITA maps* allow scalable reuse of content across multiple contexts. Maps can reference topics or other maps, and can contain a variety of content types and metadata.

For much more detailed information, resources, and instructions, see the DITA Authoring *(page 2934)* chapter.

File Definition

A file is considered to be a *DITA map* document when one of the following conditions are true:

- The root element name is one of the following: `map`, `bookmap`.
- The public ID of the document is `-//OASIS//DTD DITA Map` or `-//OASIS//DTD DITA BookMap`.
- The root element of the file has an attribute named `class` that contains the value `map/map` and a `DITAArchVersion` attribute from the *http://dita.oasis-open.org/architecture/2005/* namespace. This enhanced case of matching is only applied when the **Enable DTD/XML Schema processing in document type detection** option *(page 93)* from the **Document Type Association** preferences page *(page 92)* is selected.

Default Document Templates

There are a variety of default *DITA map* templates available when creating new documents from templates *(page 673)* and they can be found in various folders inside: **Framework Templates > DITA Map**.

The default templates for *DITA map* documents are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/sita/templates/map` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the *DITA map* document are stored in the various folders inside *DITA-OT-DIR*`/dtd/` or *DITA-OT-DIR*`/schema/`.

Default CSS

The default CSS files used for rendering DITA content in **Author** mode are stored in the various folders inside: *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles *(page 2391)*.

Default XML Catalogs

The default *XML Catalogs (page 3235)* for the *DITA map* document type are as follows:

- *[OXYGEN_INSTALL_DIR]*`/frameworks/dita/catalog.xml`
- *DITA-OT-DIR*`/catalog-dita.xml`

Transformation Scenarios

Oxygen XML Editor includes numerous built-in transformation scenarios that allow you to transform *DITA maps* to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, and CHM. All of them

are listed in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

For more information, see the DITA Map Transformation Scenarios *(page 1614)* section.

Getting Started with DITA *(page 13)*

Editing XML Documents in Author Mode *(page 885)*

Editing XML Documents in Text Mode *(page 819)*

DITA Map Author Mode Actions

A variety of actions are available in the *DITA map (page 3228) framework (page 3229)* that can be added to the **DITA** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant (page 3227)*.

DITA Map Toolbar and Menu Actions

When a *DITA map* is opened in **Author** mode, the following default actions are available on the **DITA Map Author Custom Actions** toolbar (by default, they are also available in the **DITA** menu and in various submenus of the contextual menu):

Insert New Topic

Opens a **New** DITA topic dialog box *(page 3002)* that allows you to create a new topic and inserts a reference to it at the cursor position.

Insert Topic Reference

Opens the **Insert Reference** dialog box *(page 2969)* that allows you to insert and configure a reference to a topic at the cursor position.

Reuse Content

Opens the **Reuse Content** dialog box *(page 3084)* that allows you to insert and configure a content reference (`conref`), or a content key reference (`conkeyref`) at the cursor position.

Insert Topic Heading

Opens the **Insert Reference** dialog box *(page 2969)* that allows you to insert a topic heading at the cursor position.

Insert Topic Group

Opens the **Insert Reference** dialog box *(page 2969)* that allows you to insert a topic group at the cursor position.

Insert Relationship Table

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

Relationship Table Properties

Allows you to change the properties of rows in relationship tables.

Insert Relationship Row

Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

Insert Relationship Column

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

Delete Relationship Column

Deletes the table column where the cursor is located.

Delete Relationship Row

Deletes the table row where the cursor is located.

Move Up

Moves the selected node up one position on its same level.

Move Down

Moves the selected node down one position on its same level.

Promote(Alt + LeftArrow)

Moves the selected node up one level to the level of its parent node.

Demote(Alt + RightArrow)

Moves the selected node down one level to the level of its child nodes.

DITA Menu Actions

The following additional actions can be found in the **DITA** menu when editing a *DITA map* in **Author** mode:

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block (page 3226)* and *inline elements (page 3230)*.Oxygen XML Editor

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page *(page 129)* where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes *(page 959)* and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set *(page 966)* to activate it.

Profiling Settings

Opens the profiling options preferences page *(page 142)*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page *(page 144)* and the attributes rendering preferences page *(page 146)*.

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor Editor Variables *(page 275)*.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note: This option does not have an effect on content that is *cut* and *pasted*.

Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

DITA Map Contextual Menu Actions

In addition to many of the **DITA Map** toolbar actions *(page 1572)* and the *general* **Author** mode contextual menu actions *(page 1055)*, the following *DITA map framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see Edit Properties Dialog Box *(page 2979)*.

Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Search References

Finds the references to the `href` or `keys` attribute value of the topic/map reference element at the current cursor position, in all the topics from the current *DITA map* (opened in the **DITA Maps Manager** view *(page 2943)*). The current topic/map reference element must have an `href` or `keys` attribute defined to complete the search.

Show Key Definition

Available for elements that have a `conkeyref` or `keyref` attribute set (or elements with an ancestor element that has a `conkeyref` or `keyref` attribute). It computes the key name and opens the *DITA map (page 3228)* that contains the definition of the key with the element that defines that key selected.

DITA Map Drag/Drop Actions

Dragging a file from the **Project** view *(page 332)* or **DITA Maps Manager** view *(page 2943)* and dropping it into a *DITA map* document that is edited in **Author** mode creates a link to the dragged file (a `topicref` element, `chapter`, `part`, etc.) at the drop location.

Open Topic from DITA Map in Author Mode

When a *DITA map* is opened in **Author** mode, you can click the icon to the left of a topic to open that particular topic in the editor.

XHTML Document Type (Framework)

The Extensible HyperText Markup Language (XHTML), is a markup language that has the same depth of expression as HTML, but also conforms to XML syntax.

File Definition

A file is considered to be an XHTML document when the root element name is `html`.

Default Document Templates

There are a variety of default *XHTML* templates available when creating new documents from templates *(page 673)* and they can be found in: **Framework Templates > XHTML**.

The default templates for XHTML documents are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml/templates/` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the XHTML file are stored in the following locations:

- XHTML 1.0 - *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml/dtd/` or *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml/nvdl/`.
- XHTML 1.1 - *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml11/dtd/` or *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml11/schema/`.
- XHTML 5 - *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml/xhtml5 (epub3)/`.

Default CSS

The default CSS files used for rendering XHTML content in **Author** mode are stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles *(page 2391)*.

Default XML Catalogs

The default *XML Catalogs (page 3235)* for the XHTML document type are as follows:

- *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml/dtd/xhtmlcatalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/relaxng/catalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/nvdl/catalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml11/dtd/xhtmlcatalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/xhtml11/schema/xhtmlcatalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/xhtml5 (epub3)/catalog-compat.xml`

Transformation Scenarios

Oxygen XML Editor includes built-in transformation scenarios that allow you to transform XHTML documents to several types of DITA document types (topic, task, concept, reference). They can be found in the **XHTML** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

Editing XHTML Documents *(page 1481)*

Editing XML Documents in Text Mode *(page 819)*

Editing XML Documents in Author Mode *(page 885)*

Adding Tables in XHTML Documents *(page 1004)*

XHTML Author Mode Actions

A variety of actions are available in the XHTML *framework (page 3229)* that can be added to the **XHTML** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant (page 3227)*.

XHTML Toolbar Actions

The following default actions are readily available on the **XHTML (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **XHTML** menu and some of them are in various submenus of the contextual menu):

Bold

Changes the style of the selected text to `bold` by surrounding it with `b` tag. You can use this action on multiple non-contiguous selections.

Italic

Changes the style of the selected text to `italic` by surrounding it with `i` tag. You can use this action on multiple non-contiguous selections.

Underline

Changes the style of the selected text to `underline` by surrounding it with `u` tag. You can use this action on multiple non-contiguous selections.

Link

Inserts an `a` element with an `href` attribute at the cursor position. You can type the URL of the reference you want to insert or use the browsing actions in the **Browse** drop-down menu.

Insert Image

Inserts a graphic object at the cursor position. This is done by inserting an `img` element regardless of the current context. The following graphical formats are supported: GIF, JPG, JPEG, BMP, PNG, SVG.

Insert Media Resource

Opens a **Choose Media** dialog box *(page 1046)* that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

Headings Drop-down Menu

A drop-down menu that includes actions for inserting `h1`, `h2`, `h3`, `h4`, `h5`, `h6` elements.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations *(page 1048)*.

Insert List Item

Inserts a list item in the current list type.

Insert Unordered List

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert a definition list at the cursor position

Inserts a definition list (`dl` element) with one list item (a `dt` child element and a `dd` child element). You can also use this action to convert selected paragraphs or other types of lists to a definition list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a *block element (page 3226)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

XHTML Menu Actions

The following additional actions can be found in the **XHTML** menu when editing in **Author** mode (some of them are also available in the contextual menu):

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block (page 3226)* and *inline elements (page 3230)*.Oxygen XML Editor

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page *(page 129)* where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes *(page 959)* and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set *(page 966)* to activate it.

Profiling Settings

Opens the profiling options preferences page *(page 142)*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page *(page 144)* and the attributes rendering preferences page *(page 146)*.

XHTML Contextual Menu Actions

In addition to many of the XHTML toolbar actions *(page 1579)* and the *general* **Author** mode contextual menu actions *(page 1055)*, the following XHTML *framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

XHTML Drag/Drop (or Copy/Paste) Actions

Dragging a file from the **Project** view *(page 332)* or **DITA Maps Manager** view *(page 2943)* and dropping it into an XHTML document that is edited in **Author** mode, creates a link to the dragged file (the `a` element with the `href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Project** view *(page 332)* and drop them into an XHTML document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the `img` element with the `src` attribute).

TEI P5 Document Type (Framework)

The *TEI (Text Encoding Initiative)* document type is an international and interdisciplinary standard that enables libraries, museums, publishers, and individual scholars to represent a variety of literary and linguistic texts for online research, teaching, and preservation.

File Definition

A file is considered to be a TEI P5 document when one of the following conditions are true:

- The document namespace is *http://www.tei-c.org/ns/1.0*.
- The public ID of the document is *-//TEI P5*.

Default Document Templates

There are a variety of default *TEI P5* templates available when creating new documents from templates *(page 673)* and they can be found in: **Framework Templates > TEI P5**.

The default templates for TEI P5 documents are located in the *[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI P5* folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the TEI P5 document is `tei_all.rng` and it is stored in *`[OXYGEN_INSTALL_DIR]`*`/frameworks/tei/xml/tei/custom/schema/relaxng/`.

Default CSS

The default CSS files used for rendering TEI content in **Author** mode are stored in *`[OXYGEN_INSTALL_DIR]`*`/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles *(page 2391)*.

Default XML Catalogs

The default *XML Catalogs (page 3235)* for the TEI P5 document type are as follows:

- *`[OXYGEN_INSTALL_DIR]`*`/frameworks/tei/xml/tei/schema/dtd/catalog.xml`
- *`[OXYGEN_INSTALL_DIR]`*`/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml`
- *`[OXYGEN_INSTALL_DIR]`*`/frameworks/tei/xml/tei/stylesheet/catalog.xml`

Transformation Scenarios

Oxygen XML Editor includes built-in transformation scenarios that allow you to transform TEI P5 documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, and ODT. They can be found in the **TEI P5** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

TEI P5 Author Mode Actions

A variety of actions are available in the TEI P5 *framework (page 3229)* that can be added to the **TEI P5** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant (page 3227)*.

TEI P5 Toolbar Actions

The following default actions are readily available on the **TEI P5 (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **TEI P5** menu and some of them are in various submenus of the contextual menu):

Bold

Changes the style of the selected text to `bold` by surrounding it with `hi` tag and setting the `rend` attribute to `bold`. You can use this action on multiple non-contiguous selections.

Italic

Changes the style of the selected text to `italic` by surrounding it with `hi` tag and setting the `rend` attribute to `italic`. You can use this action on multiple non-contiguous selections.

Underline

Changes the style of the selected text to `underline` by surrounding it with `hi` tag and setting the `rend` attribute to `ul`. You can use this action on multiple non-contiguous selections.

Insert Section

Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Image

Inserts an image reference *(page 1013)* at the cursor position. Depending on the current location, an image-type element is inserted.

Insert List Item

Inserts a list item in the current list type.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a *block element (page 3226)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

TEI P5 Menu Actions

The following additional actions can be found in the **TEI P5** menu when editing in **Author** mode (some of them are also available in the contextual menu):

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor Editor Variables *(page 275)*.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note: This option does not have an effect on content that is *cut* and *pasted*.

Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block (page 3226)* and *inline elements (page 3230)*.Oxygen XML Editor

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page *(page 129)* where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes *(page 959)* and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set *(page 966)* to activate it.

Profiling Settings

Opens the profiling options preferences page *(page 142)*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page *(page 144)* and the attributes rendering preferences page *(page 146)*.

TEI Contextual Menu Actions

In addition to many of the TEI toolbar actions *(page 1587)* and the *general* **Author** mode contextual menu actions *(page 1055)*, the following TEI *framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

TEI P5 Drag/Drop Actions

Dragging a file from the **Project** view *(page 332)* or **DITA Maps Manager** view *(page 2943)* and dropping it into a TEI P5 document that is edited in **Author** mode, creates a link to the dragged file (the `ptr` element with the `target` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a TEI P5 document inserts a graphic element (the `graphic` element with the `url` attribute) at the drop location, similar to the **Insert Image** toolbar action.

Customization of TEI Frameworks Using the Latest Sources

The TEI P5 *(page 1585) framework (page 3229)* is available as a public project at the following SVN repository: https://github.com/TEIC/oxygen-tei. This project is the base for customizing a TEI *framework*.

To customize a TEI *framework*, follow this procedure:

1. Check out the project on a local computer from the SVN repository.
   This action is done with an SVN client application that creates a working copy of the SVN repository on a local computer.
2. Customize the TEI *framework* in Oxygen XML Editor.
   a. Set the Oxygen XML Editor `frameworks` folder to the `oxygen/frameworks` subfolder of the folder of the SVN working copy.

Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Global**, and set the path of the SVN working copy in the **Use custom frameworks** option.

b. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Document Type Association > Locations**, and select **Custom**.

3. Build a *JAR (page 3230)* file with the TEI *framework*.
   The SVN project includes a `build.xml` file that can be used for building a *JAR* file using the Ant tool. The command that should be used:

   ```
   ant -f build.xml
   ```

4. Distribute the *JAR* file to the users that need the customized TEI *framework*.
   The command from the above step creates a file `tei.zip` in the `dist` subfolder of the SVN project. Each user that needs the customized TEI *framework* will receive the `tei.zip` file and will unzip it in the `frameworks` folder of the Oxygen XML Editor install folder.

Customization of TEI Frameworks Using the Compiled Sources

The following procedure describes how to update to the latest stable version of TEI Schema and TEI XSL, already integrated in the TEI *framework (page 3229)* for Oxygen XML Editor.

1. Go to https://code.google.com/p/oxygen-tei/;
2. Go to **Downloads**;
3. Download the latest uploaded `.zip` file;
4. Unpack the `.zip` file and copy its content in the Oxygen XML Editor `frameworks` folder.

TEI ODD Document Type (Framework)

The *TEI ODD (Text Encoding Initiative - One Document Does it all)* document type is a TEI XML-conformant specification format that allows you to create a custom TEI P5 schema in a literate programming fashion. A system of XSLT stylesheets called Roma was created by the TEI Consortium for manipulating the ODD files.

File Definition

A file is considered to be a TEI ODD document when the following conditions are true:

- The file extension is `.odd`.
- The document namespace is *http://www.tei-c.org/ns/1.0*.

Default Document Templates

There is a default *TEI ODD* document template available when creating new documents from templates *(page 673)* and they can be found in: **Framework Templates > TEI ODD**.

The default template is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/templates/TEI ODD` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the TEI ODD document is `tei_odds.rng` and it is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/xml/tei/custom/schema/relaxng/`.

Default CSS

The default CSS files used for rendering TEI ODD content in **Author** mode are stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles *(page 2391)*.

Default XML Catalogs

The default *XML Catalogs (page 3235)* for the TEI ODD document type are as follows:

- *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/xml/tei/custom/schema/catalog.xml`
- *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/xml/tei/schema/catalog.xml`

Transformation Scenarios

Oxygen XML Editor includes built-in transformation scenarios that allow you to transform TEI ODD documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, ODT, RNG, DTD, and XML Schema. They can be found in the **TEI ODD** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

TEI ODD Author Mode Actions

A variety of actions are available in the TEI ODD *framework (page 3229)* that can be added to the **TEI ODD** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant (page 3227)*.

TEI ODD Toolbar Actions

The following default actions are readily available on the **TEI ODD (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **TEI ODD** menu and some of them are in various submenus of the contextual menu):

Bold

Changes the style of the selected text to `bold` by surrounding it with `hi` tag and setting the `rend` attribute to `bold`. You can use this action on multiple non-contiguous selections.

Italic

Changes the style of the selected text to `italic` by surrounding it with `hi` tag and setting the `rend` attribute to `italic`. You can use this action on multiple non-contiguous selections.

Underline

Changes the style of the selected text to `underline` by surrounding it with `hi` tag and setting the `rend` attribute to `ul`. You can use this action on multiple non-contiguous selections.

Insert Section

Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Image

Inserts an image reference *(page 1013)* at the cursor position. Depending on the current location, an image-type element is inserted.

Insert List Item

Inserts a list item in the current list type.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content — text + markup — that is rendered inside a *block element (page 3226)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note: If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables**.

Insert Row Below

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Insert Column After

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor a new cell at cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

TEI ODD Menu Actions

The following additional actions can be found in the **TEI ODD** menu when editing in **Author** mode (some of them are also available in the contextual menu):

Table submenu

In addition to the table actions available on the toolbar, the following actions are available in this submenu:

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Insert Column Before

Inserts a column before the current one.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

ID Options

Opens the **ID Options** dialog box that allows you to configure options for generating IDs in **Author** mode. The dialog box includes the following:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor Editor Variables *(page 275)*.

Element name or class value to generate ID for

The elements for which ID values will be generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content in the same document

When copying and pasting content in the same document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note: This option does not have an effect on content that is *cut* and *pasted*.

Generate IDs

Oxygen XML Editor generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements from the list in the **ID Options** dialog box that are found in the current selection.

Note: The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `id` attribute.

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block (page 3226)* and *inline elements (page 3230)*.Oxygen XML Editor

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page *(page 129)* where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes *(page 959)* and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set *(page 966)* to activate it.

Profiling Settings

Opens the profiling options preferences page *(page 142)*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page *(page 144)* and the attributes rendering preferences page *(page 146)*.

TEI Contextual Menu Actions

In addition to many of the TEI toolbar actions *(page 1596)* and the *general* **Author** mode contextual menu actions *(page 1055)*, the following TEI *framework*-specific actions are also available in the contextual menu when editing in **Author** mode:

Table Actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

TEI ODD Drag/Drop Actions

Dragging a file from the **Project** view *(page 332)* or **DITA Maps Manager** view *(page 2943)* and dropping it into a TEI ODD document that is edited in **Author** mode, creates a link to the dragged file (the `ptr` element with the `target` attribute) at the drop location.

jTEI Document Type (Framework)

The *jTEI (Journal of the Text Encoding Initiative)* document type is a highly restrictive customization (only about 80 elements are included) of the TEI P5 *framework*.

File Definition

A file is considered to be a *jTEI* document when the root element is named *TEI*, it is in the namespace *http://www.tei-c.org/ns/1.0*, and the `@rend` attribute is set to *"jTEI"*.

Default Document Templates

There is a default **jTEI Article** template available when creating new documents from templates *(page 673)* and they can be found in: **Framework Templates > TEI JTEI**.

The default template is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/tei/templates/TEI jTEI` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `tei_jtei.rng` and it is stored in *`[OXYGEN_INSTALL_DIR]`*`/frameworks/tei/xml/tei/custom/schema/relaxng/`.

Default CSS

The default CSS file (`jtei.css`) that is used for rendering jTEI in **Author** mode is stored in *`[OXYGEN_INSTALL_DIR]`*`/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles *(page 2391)*.

Default XML Catalogs

The default *XML Catalogs (page 3235)* for jTEI are as follows:

- *`[OXYGEN_INSTALL_DIR]`*`/frameworks/tei/xml/tei/schema/dtd/catalog.xml`
- *`[OXYGEN_INSTALL_DIR]`*`/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml`
- *`[OXYGEN_INSTALL_DIR]`*`/frameworks/tei/xml/tei/stylesheet/catalog.xml`

Transformation Scenarios

Oxygen XML Editor includes built-in transformation scenarios that allow you to transform jTEI documents to PDF and ODT. They can be found in the **TEI JTEI** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

Adding Tables in TEI Documents *(page 1007)*

JATS Document Type (Framework)

The *JATS (NISO Journal Article Tag Suite)* document type is a technical standard that defines an XML format for scientific literature.

File Definition

A file is considered to be a JATS document when the PUBLIC ID of the document contains the string `-//NLM//DTD`.

Default Document Templates

There are some default *JATS* templates available when creating new documents from templates *(page 673)* and they can be found in: **Framework Templates > JATSKit - NISO JATS and NLM BITS**

The default templates for JATS documents are located in the *[OXYGEN_INSTALL_DIR]/frameworks/jats/templates/* folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the JATS document are stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/jats/lib/schemas/`.

Default CSS

The default CSS files used for rendering JATS content in **Author** mode are stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/jats/lib/author-css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see Configuring and Managing Multiple CSS Styles *(page 2391)*.

Default XML Catalog

The default *XML Catalog (page 3235)*, `jatskit-catalog.xml`, is stored in *[OXYGEN_INSTALL_DIR]*`/frameworks/jats/lib/schemas/`.

Transformation Scenarios

Oxygen XML Editor includes built-in transformation scenarios that allow you to transform JATS documents to a variety of outputs, such as PDF, HTML, and EPUB. They can be found in the **JATSKit** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

JATS Author Mode Actions

A variety of actions are available in the JATS *framework (page 3229)* that can be added to the **JATS** menu, the **Author Custom Actions** toolbar, the contextual menu, and the *Content Completion Assistant (page 3227)*.

JATS Toolbar Actions

The following default actions are readily available on the **JATS (Author Custom Actions)** toolbar when editing in **Author** mode (by default, they are also available in the **JATS** menu and in various submenus of the contextual menu):

Paragraph Level Drop-Down Menu

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Unordered List

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Boxed Text

Inserts or wraps content in a box with a shaded background.

Code

Inserts or wraps content in a `code` element.

Display Quote

Inserts or wraps content in a `disp-quote` element.

Figure

Inserts a `fig` element with a `title` (inside a `caption` element). This action opens a dialog box that allows you to enter the text for the title for the figure.

Graphic Figure

Inserts a `fig` element with a `title` (inside a `caption` element), and a `graphic` element. A dialog box is displayed that allows you to enter the title for the figure, followed by a dialog box that allows you to select the URL of the graphic to be inserted.

Bold

Surrounds the selected text with a `bold` tag. You can use this action on multiple non-contiguous selections.

Italic

Surrounds the selected text with an `italic` tag. You can use this action on multiple non-contiguous selections.

Underline

Surrounds the selected text with an `underline` tag. You can use this action on multiple non-contiguous selections.

Monospace

Inserts or wraps content with a `monospace` element.

Insert Image

Inserts an image reference *(page 1013)* at the cursor position. Depending on the current location, an image-type element is inserted.

Insert List Item

Inserts a list item in the current list type.

Insert MathML

Opens the **XML Fragment Editor** that allows you to insert and edit MathML notations *(page 1048)*.

Subscript

Surrounds the selected text with a *subscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

Superscript

Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

JATS Menu Actions

The following additional actions can be found in the **JATS** menu when editing in **Author** mode:

Refresh References

You can use this action to manually trigger a refresh and update of all referenced resources.

Tags display mode Submenu

Full Tags with Attributes

Displays full tag names with attributes for both *block (page 3226)* and *inline elements (page 3230)*.Oxygen XML Editor

Full Tags

Displays full tag names without attributes for both *block* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page *(page 129)* where you can configure the **Tags Display Mode** options.

Profiling/Conditional Text Submenu

Edit Profiling Attributes

Allows you to configure the profiling attributes *(page 959)* and their values.

Show Profiling Colors and Styles

Select this option to turn on conditional styling.

Show Profiling Attributes

Select this option to turn on conditional text markers. They are displayed at the end of conditional text blocks, as a list of attribute name and their currently set values.

Show Excluded Content

When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.

List of all profiling condition sets that match the current document type

You can click a listed condition set *(page 966)* to activate it.

Profiling Settings

Opens the profiling options preferences page *(page 142)*, where you can manage profiling attributes and profiling conditions sets. You can also configure the profiling styles and colors options from the colors/styles preferences page *(page 144)* and the attributes rendering preferences page *(page 146)*.

JATS Drag/Drop Actions

Dragging a file from the **Project** view *(page 332)* or **DITA Maps Manager** view *(page 2943)* and dropping it into a JATS document that is edited in **Author** mode, creates a link to the dragged file (the `ext-link` element with the `xlink:href` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on Mac OS X, for example) and dropping it into a JATS document inserts an image element (the `inline-graphic` element with the `xlink:href` attribute) at the drop location, similar to the **Insert Image** toolbar action.

EPUB Document Type (Framework)

EPUB is an e-book file format that is a ZIP archive and can be downloaded and read on devices such as phones, tablets, computers, or e-readers. Oxygen XML Editor includes an **Archive Browser** view *(page 2091)* that allows you to view the contents and structure of this type of file.

Three distinct *frameworks (page 3229)* are supported for the EPUB document type:

- **NCX** - A declarative global navigation definition.
- **OCF** - The Open Container Format (OCF) defines a mechanism by which all components of an Open Publication Structure (OPS) can be combined into a single file system entity.
- **OPF** - The Open Packaging Format (OPF) defines the mechanism by which all components of a published work that conforms to the Open Publication Structure (OPS) standard (including metadata, reading order, and navigational information) are packaged in an OPS Publication.

  Note: Oxygen XML Editor supports OPF 2.0, OPF 3.0, and OPF 3.1.

File Definition

A file is considered to be an *EPUB* document if it has a file extension of `.epub`.

Default Document Templates

There are a variety of default *EPUB* templates available when creating new documents from templates *(page 673)* and they can be found the following folders in **Framework Templates**: **NCX**, **OCF**, **OPF 2.0**, **OPF 3.0**, and **OPF 3.1**.

- The default templates for the **NCX** document types are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/ncx/templates` folder.
- The default templates for the **OCF** document types are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/ocf/templates` folder.
- The default template for the **OPF 2.0** document type is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/opf/templates/2.0` folder.
- The default template for the **OPF 3.0** document type is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/opf/templates/3.0` folder.
- The default template for the **OPF 3.1** document type is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/opf/templates/3.1` folder.

Default Schema

The default schema files for the various types of EPUB document types are located in the following directories:

- The default schema files for the **NCX** document types are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/ncx/schemas` folder.
- The default schema files for the **OCF** document types are located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/ocf/schemas` folder.
- The default schema files for the **OPF 2.0** document type is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/opf/schemas/2.0` folder.
- The default schema files for the **OPF 3.0** document type is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/opf/schemas/3.0` folder.
- The default schema files for the **OPF 3.1** document type is located in the *[OXYGEN_INSTALL_DIR]*`/frameworks/opf/schemas/3.1` folder.

Working with Archive Files *(page 2094)*

Other Supported Document Types

Along with the fully supported built-in *frameworks* (document types) *(page 1512)*, Oxygen XML Editor also provides limited support (including document templates) for editing a variety of other document types. All the specialized views, editors, actions, and options are dynamic according to the type of file that is opened or created. Other document types that are supported in Oxygen XML Editor include:

- EPUB (NCX, OCF, OPF 2.0, 3.0, & 3.1) *(page 1608)* - A standard for e-book files.
- OOXML *(page 2094)* - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
- ODF *(page 2094)* - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.
- DocBook Targetset *(page 1547)* - For resolving cross-references when using *olinks*.
- Ant Build Scripts *(page 1222)* - A tool for automating software build processes, written in Java and primarily intended for use with Java.
- XSLT Stylesheets *(page 1168)* - A document type that provides a visual mode for editing XSLT stylesheets.
- WSDL *(page 1345)* - Web Services Description Language is an XML language for describing the functionality offered by a web service.
- Schematron *(page 1441)* - For making assertions about the presence or absence of patterns in XML documents. This document type applies to the ISO Schematron version.
- Schematron Quick Fixes (SQF) *(page 1098)* - An extension of the ISO standard Schematron, allows developers to define *Quick Fixes (page 3233)* for Schematron errors.

- StratML (Part 1 & 2) *(page 1432)* - Part 1 and 2 of the Strategy Markup Language specification.
- XProc *(page 1438)* - A document type for processing XProc script files.
- XML Schema *(page 1236)* - Documents that provide support for editing annotations.
- SVG *(page 1478)* - Scalable Vector Graphics is a language for describing two-dimensional graphics in XML.
- MathML *(page 1048)* - Mathematical Markup Language (2.0 and 3.0) is an application of XML for describing mathematical notations.
- XLIFF (1.2 & 2.0) *(page 1432)* - XML Localization Interchange File Format is a standard for passing data between tools during a localization process.
- XQuery *(page 1326)* - The common query language for XML.
- CSS *(page 1372)* - Cascading Style Sheets is a language used for describing the look and formatting of a document.
- LESS *(page 1377)* - A dynamic style sheet language that can be compiled into CSS.
- Relax NG Schema *(page 1379)* - A schema language that specifies a pattern for the structure and content of an XML document.
- NVDL Schema *(page 1399)* - Namespace Validation Dispatching Language allows you to specify sections of XML documents to be validated against various schemas.
- JSON *(page 1408)* - JavaScript Object Notation is a lightweight data-interchange format.
- Markdown *(page 1482)* - A lightweight markup language with plain text formatting syntax that can be converted to HTML or DITA.
- JavaScript *(page 1433)* - Programming language of HTML and the Web.
- XMLSpec - A markup language for W3C specifications and other technical reports.
- DITAVAL - DITA conditional processing profile to identify the values you want to conditionally process for a particular output, build, or other purpose.
- Daisy - A technical standard for digital audio books, periodicals, and computerized text. It is designed to be an audio substitute for print material.
- EAD - Encoded Archival Description is an XML standard for encoding archival finding aids.
- KML - Keyhole Markup Language is an XML notation for expressing geographic visualization in maps and browsers.
- Maven Project & Settings - Project or settings file for Maven build automation tool that is primarily used for Java projects.
- Oasis *XML Catalog* - An *XML Catalog (page 3235)* document that describes a mapping between external entity references and locally-cached equivalents.
- Other Non-XML Files *(page 701)*- Oxygen XML Editor also includes a simple text editor and a variety of helpful features for creating and editing non-XML files.

10.
Publishing

XML documents can be transformed into a variety of user-friendly output formats that can be viewed by end users. This process is known as a *transformation*.

Oxygen XML Editor includes numerous built-in transformation possibilities to publish XML content in various output formats (such as WebHelp, PDF, CHM, EPUB, JavaHelp, Eclipse Help, XHTML, etc.)

For transformations that are not included in your installed version of Oxygen XML Editor, simply install the tool chain required to perform the specific transformation and process the files in accordance with the processor instructions. A multitude of target formats are possible. The basic condition for a transformation to any format is that your source document is well-formed.

Transformation Scenarios

A transformation scenario is a set of complex operations and settings that gives you the possibility to obtain outputs of multiple types (XML, HTML, PDF, EPUB, etc.) from the same source of XML files and stylesheets.

Note: You need to use the appropriate stylesheet according to the source definition and the desired output. For example, if you want to transform into an HTML format using a DocBook stylesheet, your source XML document should conform with the DocBook DTD.

Executing a transformation scenario implies multiple actions, such as:

- Validating the input file.
- Obtaining intermediate output files (for example, formatting objects for the XML to PDF transformation).
- Using transformation engines to produce the output.

Before transforming an XML document in Oxygen XML Editor, you need to define a transformation scenario to apply to that document. A scenario is a set of values for various parameters that define a transformation. It is not related to a particular document, but rather to a document type. Oxygen XML Editor included preconfigured built-in transformation scenarios *(page 1613)*, but you can also create new transformation scenarios *(page 1644)*.

When creating new transformation scenarios, the types that are available include:

- **Scenarios that Apply to XML Files** - This type of scenario contains the location of an XSLT stylesheet that is applied on the edited XML document, as well as other transformation parameters. For more information, see XML Transformation with XSLT *(page 1644)* and XML Transformation with XQuery *(page 1659)*.
- **Scenarios that Apply to XSLT Files** - This type of scenario contains the location of an XML document that the edited XSLT stylesheet is applied to, as well as other transform parameters. For more information, see XSLT Transformation *(page 1688)*.
- **Scenarios that Apply to XQuery Files** - This type of scenario contains the location of an XML source, that the edited XQuery file is applied to, as well as other transform parameters. When the XML source is a native XML database, the XML source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the XML input field of the scenario. For more information, see XQuery Transformation *(page 1709)*.
- **Scenarios that Apply to SQL Files** - This type of scenario specifies a database connection for the database server that runs the SQL file that is associated with the scenario. The data processed by the SQL script is located in the database.
- **Scenarios that Apply to XProc Files** - This type of scenario contains the location of an XProc script, as well as other transform parameters. For more information, see SQL Transformation *(page 1717)*.
- **DITA-OT Scenarios** - This type of scenario provides the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Editor includes a built-in version of Ant and a built-in version of DITA-OT, although you can also set other versions in the scenario. For more information, see DITA OT Transformation *(page 1667)*.
- **ANT Scenarios** - This type of scenario contains the location of an Ant build script, as well as other transform parameters. For more information, see Ant Transformation *(page 1684)*.

Note:

Status messages generated during the transformation process are displayed in the **Information** view *(page 815)*.

Built-in Transformation Scenarios

Oxygen XML Editor includes preconfigured built-in transformation scenarios that are used for common transformations. They can be found in the various sections in the **Configure Transformation Scenario(s)** dialog box *(page 1722)* or **Transformation Scenarios** view *(page 1728)*. All the built-in *document types (frameworks) (page 3229)* that are included in Oxygen XML Editor have various transformation scenarios in their specific sections, including the most popular *frameworks*, such as DITA, DocBook, TEI, XHTML, JATS, OOXML, and more.

To obtain the desired output, use one of the following actions from the toolbar or **Transform** submenu in the contextual menu of the **Project** view *(page 332)*:

- **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** - If you have associated transformation scenarios for the current document, this action will simply apply the association *(page 1721)* and begin the transformation process. If an association is not detected, this action will open the **Configure Transformation Scenario(s)** dialog box *(page 1722)* where you can choose the scenarios you want to apply.
- **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** - This action will open the **Configure Transformation Scenario(s)** dialog box *(page 1722)* where you can choose the scenarios you want to apply.

Note:

- You can apply a transformation even if the current document is not associated with a transformation scenario.
- If the document contains an `xml-stylesheet` processing instruction that references an XSLT stylesheet (commonly used to display the document in web browsers), Oxygen XML Editor prompts you to associate the document with a built-in transformation scenario.
- The default transformation scenario is suggested based on the processing instruction from the edited document.

DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform *DITA maps (page 3228)* to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Editor also includes a special **Run DITA-OT Integrator** *(page 1637)* that can be used to integrate a DITA-OT plugin and a **DITA Map Metrics Report** transformation that generates a statistics report for your

DITA map. All of them are listed in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

A variety of transformations scenarios are available for *DITA maps (page 3228)*:

- Built-in transformation scenarios allow you to transform a *DITA map* to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word.
- **Run DITA-OT Integrator** *(page 1637)* - Use this transformation scenario if you want to integrate a DITA-OT plugin *(page 3185)*. This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.
- **DITA Map Metrics Report** - Use this type of transformation scenario if you want to generate a *DITA map* statistics report. They contain information such as the number of processed maps and topics, content reuse percentage, number of elements, attributes, words, and characters used in the entire *DITA map* structure, DITA conditional processing attributes used in the *DITA maps*, and more.

DITA Map to WebHelp Responsive Transformation

DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The WebHelp Responsive layout and features *(page 1818)* are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Editor also provides numerous possibilities for customizing the WebHelp Responsive output *(page 1899)*.

WebHelp Responsive Transformation Scenario

To publish a *DITA map (page 3228)* as **WebHelp Responsive** output, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** *(page 2943)* toolbar.
2. Select the **DITA Map WebHelp Responsive** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- Templates Tab *(page 3145)* - This tab contains a set of built-in publishing templates *(page 1849)* that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones *(page 1899)*.
- Parameters Tab *(page 3151)* - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section *(page 1617)* below for details about the most commonly used parameters for WebHelp Responsive transformations.
- Filters Tab *(page 3152)* - This tab allows you to filter certain content elements from the generated output.
- Advanced Tab *(page 3153)* - This tab allows you to specify some advanced options for the transformation scenario.
- Output Tab *(page 3155)* - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

   When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

WebHelp Responsive with Feedback Transformation Scenario

To publish a *DITA map (page 3228)* as a **WebHelp Responsive with Feedback** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** *(page 2943)* toolbar.
2. Select the **DITA Map WebHelp Responsive with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:
   - Templates Tab *(page 3145)* - This tab contains a set of built-in publishing templates *(page 1849)* that you can use for the layout of your WebHelp system output. You can also create your own publishing templates or edit existing ones *(page 1899)*.
   - Parameters Tab *(page 3151)* - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section *(page 1617)* below for details about the most commonly used parameters for WebHelp Responsive transformations.
   - Filters Tab *(page 3152)* - This tab allows you to filter certain content elements from the generated output.
   - Advanced Tab *(page 3153)* - This tab allows you to specify some advanced options for the transformation scenario.

- Output Tab *(page 3155)* - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.
5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

   When the **DITA Map WebHelp Responsive with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment *(page 1831)*.

Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

default.language

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

editlink.remote.ditamap.url

Use this parameter in conjunction with `editlink.web.author.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the *main DITA map*. For example, a GitHub custom URL might look like this: `https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap`.

editlink.web.author.url

This parameter needs to be used in conjunction with `editlink.remote.ditamap.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: `https://www.oxygenxml.com/oxygen-xml-web-author/`.

editlink.present.only.path.to.topic

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the **editlink.remote.ditamap.url** and **editlink.web.author.url** parameters are ignored.

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed *DITA map*. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

force.unique

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.reload.stylesheet

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

webhelp.search.custom.excludes.file

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `'*'` (matches zero or more characters) or `'?'` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages.

webhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

webhelp.search.page.numberOfItems

Specifies the number of search results items displayed on each page. This parameter is only used when the **webhelp.search.enable.pagination** parameter is enabled.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.show.changes.and.comments

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

webhelp.sitemap.base.url

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the *DITA map*, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

webhelp.sitemap.change.frequency

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

webhelp.sitemap.priority

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

Parameters Specific to WebHelp Responsive Output

webhelp.default.collection.type.sequence

Specifies if the **sequence** value will be used by default when the `collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.

webhelp.enable.search.autocomplete

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is `yes`.

webhelp.fragment.after.body

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.logo_and_title

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.main.page.search

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.toc_or_tiles

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.after.top_menu

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.body

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.logo_and_title

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.main.page.search

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.toc_or_tiles

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.before.top_menu

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.head

In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is `yes`.

webhelp.search.stop.words.exclude

Specifies a list of words that will be excluded from the default list of *stop words* that are filtered out before the search processing. Use comma separators to specify more than one word (for example: `if,for,is`).

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is `yes`.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is `no`.

webhelp.show.indexterms.link

Specifies if an icon that links to the index will be presented in the output. The default value is `yes`.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a *tree* style layout, this parameter should be set to `no`.

webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is `yes`.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is `yes`.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is `yes`.

webhelp.show.related.links

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is `yes`. The `webhelp.merge.nested.topics.related.links` parameter can used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is `yes`.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. The default value is `yes`.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is `yes`.

webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for *chunked* topics. The default value is `yes`.

webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

webhelp.publication.toc.tooltip.position

By default, if a topic contains a `shortdesc` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left** (default)
- **right**
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is `3`. A value of `0` means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are `collapsed` or `expanded` (default value).

WebHelp Responsive Output Layout and Features *(page 1818)*

DITA Map to WebHelp Classic Transformation

DITA content can be transformed into several types of WebHelp Classic systems (with or without a feedback section). The WebHelp Classic layout and features *(page 1733)* are designed for desktop systems and include a familiar classical style. Oxygen XML Editor also provides numerous possibilities for customizing the WebHelp Classic output *(page 1766)*.

WebHelp Classic Transformation Scenario

To publish a *DITA map (page 3228)* as a **WebHelp Classic** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** *(page 2943)* toolbar.
2. Select the **DITA Map WebHelp Classic** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:
   - Skins Tab *(page 3143)* - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
   - Parameters Tab *(page 3151)* - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section *(page 1625)* below for details about the most commonly used parameters for WebHelp Responsive transformations.
   - Filters Tab *(page 3152)* - This tab allows you to filter certain content elements from the generated output.
   - Advanced Tab *(page 3153)* - This tab allows you to specify some advanced options for the transformation scenario.
   - Output Tab *(page 3155)* - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to process the transformation.

   When the **DITA Map WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Transformation Scenario

To publish a *DITA map (page 3228)* as a **WebHelp Classic with Feedback** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** *(page 2943)* toolbar.
2. Select the **DITA Map WebHelp Classic with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:
   - Skins Tab *(page 3143)* - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
   - Parameters Tab *(page 3151)* - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the Parameters section *(page 1625)* below for details about the most commonly used parameters for WebHelp Responsive transformations.
   - Filters Tab *(page 3152)* - This tab allows you to filter certain content elements from the generated output.
   - Advanced Tab *(page 3153)* - This tab allows you to specify some advanced options for the transformation scenario.
   - Output Tab *(page 3155)* - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to begin the transformation.
5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

   When the **DITA Map WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment *(page 1831)*.

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

Parameters for Customizing WebHelp Classic Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

default.language

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

fix.external.refs.com.oxygenxml (Only supported when the DITA OT transformation process is started from Oxygen XML Editor)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed *DITA map*. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

force.unique

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.body.script

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<body>` section of every WebHelp page.

webhelp.copyright

Adds a small copyright text that appears at the end of the **Table of Contents** pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML

comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); }
       (document, 'script', 'facebook-jssdk')); -->
    </script>
    <div data-share="true" data-show-faces="true" data-action="like"
       data-layout="standard" class="fb-like"/>
</div>
```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, `no`. If set to `no`, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then a default **Oxygen** footer is inserted in each WebHelp page.

webhelp.google.search.results

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommend to set the `linkTarget` attribute to `frm` for frameless (*iframe*) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`

webhelp.google.search.script

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

webhelp.head.script

URL value that specifies the location of a well-formed XHTML file containing the custom script that will be copied in the `<head>` section of every WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.reload.stylesheet

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

webhelp.search.custom.excludes.file

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `'*'` (matches zero or more characters) or `'?'` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.show.changes.and.comments

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

webhelp.sitemap.base.url

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the *DITA map*, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

webhelp.sitemap.change.frequency

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`.

Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

webhelp.sitemap.priority

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

DITA Map to PDF - based on HTML5 and CSS Transformation

Oxygen XML Editor includes a built-in **DITA Map PDF - based on HTML5 & CSS** transformation scenario based on a *DITA-OT CSS-based PDF Publishing plugin* that convert DITA maps to PDF using a CSS-based processing engine and a HTML5 intermediate format. Oxygen XML Editor comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. Oxygen XML Editor also supports a few third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xsl:fo* customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Editor. For more information, see the Oxygen PDF Chemistry User Guide. This is the supported processor.
- **Prince Print with CSS** (not included in the Oxygen XML Editor installation kit) - A third-party component that needs to be purchased from http://www.princexml.com.
- **Antenna House Formatter** (not included in the Oxygen XML Editor installation kit) - A third-party component that needs to be purchased from http://www.antennahouse.com/antenna1/formatter/.

How to Create the Transformation Scenario

To create an **DITA Map PDF - based on HTML5 & CSS** transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** *(page 2943)* toolbar.
2. Select **DITA Map PDF - based on HTML5 & CSS** .
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:
   - **Templates** Tab *(page 3145)* - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.
   - **CSS Processor** Tab - This is where you choose the processor type. You can select between **Oxygen PDF Chemistry**, **Prince XML**, or **Antenna House**.
   - **Parameters** Tab *(page 3151)* - This tab includes numerous parameters that can be set to customize your WebHelp system output.
   - **Filters** Tab *(page 3152)* - This tab allows you to filter certain content elements from the generated output.
   - **Advanced** Tab *(page 3153)* - This tab allows you to specify some advanced options for the transformation scenario.
   - **Output** Tab *(page 3155)* - This tab allows you to configure options that are related to the location where the output is generated.
4. In the **Parameters** tab, configure any of the following parameters (if applicable):
   - **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.
   - **css.processor.path.chemistry** (if you are using the **Oxygen PDF Chemistry** processor) - Specifies the path to the **Oxygen PDF Chemistry** executable file that will be run to generate the PDF. If this parameter is not set, your system's PATH environment variable will be used to find and start the **Oxygen PDF Chemistry** processor.
   - **css.processor.path.prince** (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
   - **css.processor.path.antenna-house** (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
   - **show.changes.and.comments** - When set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output. The default value is `no`.
   - **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.

Customizing the Output

For more information, see the DITA Map to PDF - based on HTML5 and CSS Customization *(page 1963)*.

DITA Map to PDF - based on HTML5 and CSS Customization *(page 1963)*

DITA Map to PDF - based on DITA and CSS (WYSIWYG) Transformation

Oxygen XML Editor includes a built-in **DITA Map to PDF - based on DITA & CSS (WYSIWYG)** transformation scenario based on a *DITA-OT CSS-based PDF Publishing plugin* that convert DITA maps to PDF using a CSS-based processing engine. Oxygen XML Editor also comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xsl:fo* customizations. Oxygen XML Editor also supports a few third-party processors.

The following processors are supported:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Editor. For more information, see the Oxygen PDF Chemistry User Guide.
- **Prince XML** (not included in the Oxygen XML Editor installation kit) - A third-party component that needs to be purchased from http://www.princexml.com.
- **Antenna House Formatter** (not included in the Oxygen XML Editor installation kit) - A third-party component that needs to be purchased from http://www.antennahouse.com/antenna1/formatter/.

DITA Map to PDF - based on DITA and CSS (WYSIWYG) Transformation Scenario

To create an **DITA Map to PDF - based on DITA & CSS (WYSIWYG)** transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** *(page 2943)* toolbar.
2. Select **DITA Map to PDF - based on DITA & CSS (WYSIWYG)**.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:
   - **CSS Processor** Tab - This is where you choose the processor type. You can select between **Oxygen PDF Chemistry**, **Prince XML**, or **Antenna House**.
   - **Parameters** Tab *(page 3151)* - This tab includes numerous parameters that can be set to customize your WebHelp system output.
   - **Filters** Tab *(page 3152)* - This tab allows you to filter certain content elements from the generated output.
   - **Advanced** Tab *(page 3153)* - This tab allows you to specify some advanced options for the transformation scenario.
   - **Output** Tab *(page 3155)* - This tab allows you to configure options that are related to the location where the output is generated.
4. In the **Parameters** tab, configure any of the following parameters (if applicable):
   - **args.css** - Specifies a path to a custom CSS *(page 1985)* to be used in addition to those specified in the `dita.css.list` parameter OR in addition to the CSS that is currently selected in the **Styles** drop-down menu. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.
   - **dita.css.list** - Specifies a list of CSS URLs to be used by the PDF processor (instead of the default CSS files). The files must have URL syntax and be separated using semicolons. If the value is empty, the CSS associated with the current selection from the **Styles** drop-down menu is used.
   - **css.processor.path.chemistry** (if you are using the **Oxygen PDF Chemistry** processor) - Specifies the path to the **Oxygen PDF Chemistry** executable file that will be run to generate the PDF. If this parameter is not set, your system's PATH environment variable will be used to find and start the **Oxygen PDF Chemistry** processor.
   - **css.processor.path.prince** (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
   - **css.processor.path.antenna-house** (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
   - **show.changes.and.comments** - When set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output. The default value is `no`.

- **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.

Customizing the Output

The **DITA-OT CSS-based PDF Publishing plugin** makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xsl:fo* customizations. You can style the PDF output by simply using a custom CSS to change the styling and then re-running the transformation scenario until you get the desired result.

For more information, see the DITA Map to PDF - based on DITA and CSS (WYSIWYG) Customization *(page 1964)*.

Changing the Style of an Element

To change the style of a particular element, you need to create an additional CSS file that will store the customization rules. Once you have created this file, you need to instruct the editor how to use this additional CSS. This can be done in two ways:

- Specify the path to your custom CSS using the `args.css` parameter:
  1. Edit a **DITA Map to PDF - based on DITA & CSS (WYSIWYG)** transformation scenario.
  2. In the **Parameters** tab, specify the path to your custom CSS files in the `args.css` parameter.
  3. Click **OK** and run the transformation scenario.

  This method is appropriate if you just want to apply the styling customization to the output.

- Create an alternate CSS for the DITA document type:
  1. Follow the procedure for adding an alternate CSS file in Customizing the Main CSS of a Framework *(page 2359)*.
  2. Once you have configured your CSS as an additional layer, you can select it from the **Styles** drop-down menu (on the toolbar) *(page 2391)*.
  3. Run the **DITA Map to PDF - based on DITA & CSS (WYSIWYG)** transformation scenario and the customization rules from the additional CSS will be visible in the produced PDF.

  This method allows you to have many customization CSS files and simply select the one that you need at any time for both the output and the rendering in **Author** mode.

DITA Map to PDF - based on DITA and CSS (WYSIWYG) Customization *(page 1964)*

DITA Map to PDF - based on XSL-FO Transformation

Oxygen XML Editor comes bundled with the DITA Open Toolkit that provides a mechanism for converting *DITA maps (page 3228)* to PDF output.

Creating a DITA Map to PDF - based on XSL-FO Transformation Scenario

To create a *DITA Map to PDF - based on XSL-FO* transformation scenario, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** *(page 2943)* toolbar.
2. Select **DITA Map PDF - based on XSL-FO** and click the **Edit** button (or use the **Duplicate** button if your *framework (page 3229)* is read-only).
3. Use the various tabs to configure the transformation scenario. In the **Parameters** tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:
   - `show.changes.and.comments` - If set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output.
   - `customization.dir` - Specifies the path to a customization directory.
   - `editlink.remote.ditamap.url` - When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the PDF output.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

Related Information:

DITA Map to PDF - base on XSL-FO Customization *(page 2063)*

DITA Map to MS Office Word Transformation

Oxygen XML Editor comes bundled with a transformation scenario that allows you to convert *DITA maps (page 3228)* to Microsoft Office Word documents. It utilizes the **DITA to Word plugin** created by Jarno Elovirta. This *plugin* contains a Word document named **Normal.docx** (located in: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT2.x/plugins/com.elovirta.ooxml/resources`) that is used by the transformation scenario as a template to generate the final Word document.

Tip: You can make general modifications to the **Normal.docx** template file to alter the published output.

Configuring the Transformation Scenario

To configure an **DITA Map to MS Office Word** transformation scenario, follow these steps:

1. Open the DITA map in the **DITA Maps Manager** *(page 2943)*.
2. Click the **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** *(page 2943)* toolbar.
3. Select **DITA Map MS Office Word**.
4. For advanced customizations, in the **Parameters** tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
   - `dotx.file` - Specifies the path to a Word template file (`.docx`) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the **Normal.docx** file that is used by default.
   - `document.flat.xsl` - Specifies the path to a pre-process clean-up stylesheet.
   - `core.xsl` - Specifies the path to a core metadata stylesheet.
   - `custom.xsl` - Specifies the path to a custom metadata stylesheet.
   - `document.xsl` - Specifies the path to a main document stylesheet.
   - `comments.xsl` - Specifies the path to a comments stylesheet.
   - `numbering.xsl` - Specifies the path to a list and title numbering stylesheet.
   - `footnotes.xsl` - Specifies the path to a footnote stylesheet.
   - `document.xml.xsl` - Specifies the path to a document relations metadata stylesheet.
   - `inkscape.exec` - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.
5. Click **OK** and run the transformation scenario.

Result: The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

Configure Transformation Scenario(s) Dialog Box *(page 1722)*

Migrating MS Office Documents to DITA *(page 3201)*

DITA Map to CHM (Compiled HTML Help) Transformation

To perform a *Compiled HTML Help (CHM)* transformation, Oxygen XML Editor needs `Microsoft HTML Help Workshop` to be installed on your computer. Oxygen XML Editor automatically detects `HTML Help Workshop` and uses it.

Note: `HTML Help Workshop` might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the *.hhp* and *.hhc* files. If the transformation fails to produce the CHM output but the *.hhp* (HTML Help Project) file is already generated, you can manually try to build the CHM output using `HTML Help Workshop`.

Changing the Output Encoding

Oxygen XML Editor uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the *Compiled HTML Help (CHM)* transformation. By default, the **DITA Map CHM** transformation scenario that comes bundled with Oxygen XML Editor has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.
2. Select the **DITA Map CHM** transformation scenario and click the **Edit** button.
3. In the **Parameter** tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

   Note: The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (`en`, for example) and `CC` represents the country code (`US`, for example). The language codes are contained in the `ISO 639-1` standard and the country codes are contained in the `ISO 3166-1` standard. For further details about language tags, go to http://www.rfc-editor.org/rfc/rfc5646.txt.

DITA Map to Kindle Transformation

Oxygen XML Editor requires *KindleGen* to generate Kindle output from *DITA maps (page 3228)*. To install *KindleGen* for use by Oxygen XML Editor, follow these steps:

1. Go to www.amazon.com/kindleformat/kindlegen and download the zip file that matches your operating system.
2. Unzip the file on your local disk.
3. Start Oxygen XML Editor and open a *DITA map* in the **DITA Maps Manager** view *(page 2943)*.
4. Click the **Configure Transformation Scenario(s)** button.
5. Select the **DITA Map Kindle** transformation and press the **Edit** button to edit it.
6. Go to **Parameters** tab and set the **kindlegen.executable** parameter as the path to the *KindleGen* directory.
7. Accept the changes.

Run DITA OT Integrator Transformation

Oxygen XML Editor comes bundled with a transformation scenario designed to integrate DITA-OT plugins *(page 3232)*. These DITA-OT *plugins* are used for various customizations. It is called **Run DITA-OT Integrator** and is found in the **DITA Map** section of the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

Attention: The integration will be performed on the DITA-OT version specified in the **DITA Open Toolkit** section of the **DITA** preferences page *(page 223)*.

Running the Transformation Scenario

To integrate a DITA OT *plugin*, follow these steps:

1. If Oxygen XML Editor was installed in the default location, you may need to restart and run it as an administrator.
2. Select the **Apply Transformation Scenario(s)** or **Configure Transformation Scenario(s)** *(page 1722)* action from the **DITA Maps Manager** toolbar (you could also use the same action on the main toolbar or open the **Transformation Scenarios** view *(page 1728)*).
3. Select the **Run DITA-OT Integrator** transformation scenario. If the *integrator* is not visible, select the **Show all scenarios** action that is available in the **Settings** drop-down menu.
4. Apply the scenario *(page 1721)*.
5. Check the **Results** panel at the bottom of the application to make sure the build was successful.
6. Restart Oxygen XML Editor with your normal permissions.

DocBook Transformation Scenarios

Built-in transformation scenarios allow you to transform DocBook documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Editor also includes a DocBook 5.1 transformation scenario for *Assembly* documents. All of them are listed in the **DocBook 4** and **DocBook 5** sections in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

Related Information:

Applying Associated Transformation Scenarios *(page 1721)*

DocBook to WebHelp Classic Transformation

DocBook documents can be transformed into several types of WebHelp systems (with or without a feedback section). The WebHelp Classic layout and features *(page 1733)* are designed for desktop systems and include a familiar classical style. Oxygen XML Editor also provides numerous possibilities for customizing the WebHelp Classic output *(page 1766)*..

WebHelp Classic Transformation Scenario

To publish a DocBook document as a **WebHelp Classic** system, follow these steps:

1. Click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu.
2. Select the **DocBook WebHelp Classic** scenario from the **DocBook 4** or **DocBook 5** section.
3. Click **Apply associated**.

When the **DocBook WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Transformation Scenario

To publish a DocBook document as a **WebHelp Classic with Feedback** system, follow these steps:

1. Click **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic with Feedback** scenario from the **DocBook 4** or **DocBook 5** section.
3. Click **Apply associated**.
4. Enter the documentation product ID and the documentation version.

When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see Deploying a Feedback-Enabled System *(page 1831)*.

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

Customizing DocBook WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

default.language

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

l10n.gentext.default.language

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.copyright

Adds a small copyright text that appears at the end of the **Table of Contents** pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); }
       (document, 'script', 'facebook-jssdk')); -->
    </script>
    <div data-share="true" data-show-faces="true" data-action="like"
       data-layout="standard" class="fb-like"/>
</div>
```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, `no`. If set to `no`, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then a default **Oxygen** footer is inserted in each WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, `mobile-phone-user-guide`, `hvac-installation-guide`).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

webhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.skin.css

Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the built-in skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\predefined-skins` directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

For more information about all the DocBook transformation parameters, go to http://docbook.sourceforge.net/release/xsl/current/doc/fo/index.html.

Related Information:

DITA Map to WebHelp Classic Transformation *(page 1624)*

Customizing WebHelp Classic Output *(page 1766)*

DocBook to DITA Transformation

Oxygen XML Editor includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at sourceforge.net.

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:
   - To apply the transformation scenario to a newly opened file, use the **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu.
   - To customize the transformation or change the scenario that is associated with the document, use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.
2. Select the **DocBook to DITA** transformation scenario in the **DocBook 4** or **DocBook 5** section.
3. Click the **Apply associated** button to run the transformation.

   Step Result: The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.
4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

Related Information:

Editing a Transformation Scenario *(page 1718)*

Configure Transformation Scenario(s) Dialog Box *(page 1722)*

DocBook to PDF Transformation

Oxygen XML Editor includes a built-in transformation scenario that is designed to convert DocBook content to PDF.

To convert a DocBook document to PDF, follow these steps:

1. Use one of the following two methods to begin the transformation process:

- To apply the transformation scenario to a newly opened file, use the **Apply Transformation Scenario(s) (Ctrl + Shift + T (Command + Shift + T on OS X))** action from the toolbar or the **Document > Transformation** menu.
- To customize the transformation or change the scenario that is associated with the document, use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.

2. Select the **DocBook PDF** transformation scenario in the **DocBook 4** or **DocBook 5** section.
3. Click the **Apply associated** button to run the transformation.

For information about customizing the PDF output for DocBook content, see DocBook to PDF Output Customization *(page 2080)*.

Related Information:

Editing a Transformation Scenario *(page 1718)*

Configure Transformation Scenario(s) Dialog Box *(page 1722)*

DocBook to PDF Output Customization *(page 2080)*

DocBook to EPUB Transformation

Oxygen XML Editor includes a built-in transformation scenario that is designed to convert DocBook content to EPUB. The EPUB specification recommends the use of *OpenType* fonts (recognized by their `.otf` file extension) whenever possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```
@font-face {
font-family: "MyFont";
font-weight: bold;
font-style: normal;
src: url(fonts/MyFont.otf);
}
```

2. In the CSS, specify where this font is used. To set it as default for `h1` elements, use the `font-family` rule, as in the following example:

```
h1 {
font-size:20pt;
margin-bottom:20px;
font-weight: bold;
font-family: "MyFont";
```

```
text-align: center;
}
```

3. Open the **Configure Transformation Scenario(s)** dialog box *(page 1722)*, select the **DocBook EPUB** transformation scenario in the **DocBook 4** or **DocBook 5** section, and click **Edit**.
4. In the **Parameters** tab, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

   Note: The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

5. Run the transformation scenario.

DocBook PDF (Show Change Tracking and Comments)

Oxygen XML Editor includes a built-in transformation scenario that is designed to show tracked changes and comment in DocBook to PDF output.

To include comments and *tracked changes* (stored within your DocBook 5 documents) in the PDF output, follow these steps:

1. Click the **Configure Transformation Scenario(s)** button.
2. Select **DocBook PDF (Show Change Tracking and Comments)** in the **DocBook 5** section.
3. If you need to configure the transformation, click the **Edit** *(page 1718)* or **Duplicate** *(page 1720)* button, make your changes to the scenario, and click **OK**.
4. Click the **Apply Associated** button to run the transformation scenario.

   Result: Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

Creating New Transformation Scenarios

Defining a transformation scenario is the first step in the process of transforming a document. This section includes information on the types of new scenarios that are available in Oxygen XML Editor and how to create each type of transformation.

XML Transformation with XSLT

This type of transformation specifies the transformation parameters and location of an XSLT stylesheet that is applied to the edited XML document. This scenario is useful when you develop an XML document and the XSLT document is in its final form.

To create an **XML transformation with XSLT** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML transformation with XSLT**.
- Go to **Window > Show View** and select **Transformation Scenarios** to display this view *(page 1728)*. Click the **New Scenario** drop-down menu button and select **XML transformation with XSLT**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** *(page 3233)* - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** *(page 3230)* - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list. You can also use the **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page *(page 201)*, the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template *(page 1646)* is specified in the scenario, the **XML URL** field can be empty. The **XML**

URL field can also be empty if you use external XSLT processors *(page 1658)*. Otherwise, a value is mandatory in this field.

XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list. You can also use the **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xml-stylesheet" declaration

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the `xml-stylesheet` processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the **XSL URL** field.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page *(page 217)*. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine *(page 1649)* for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page *(page 199)*. For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens a **Configure parameters** dialog box *(page 1647)* that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets *(page 1647)*. If the XSLT transformation engine is custom-defined, you can not use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a dialog box for configuring the XSLT extension *JARS* or classes *(page 1648)* that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a dialog box for adding XSLT stylesheets *(page 1648)* that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets *(page 1648)*, along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables *(page 275)* (such as **${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable *(page 275)* can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter.

An editor variable *(page 275)* can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

Editor Variables *(page 275)*

XSLT Extensions

The **Extensions** button opens a dialog box that allows you to specify the *JARS (page 3230)* and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

Tip: You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the **Move up** or **Move down** buttons.

Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an editor variable *(page 275)* in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

Open

Opens the selected stylesheet in a separate view.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the **Saxon HE/PE/EE** preferences page *(page 199)* but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options *(page 3230)* defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode ("-im")

A Saxon-specific option that sets the initial mode for the transformation.

Template ("-it")

A Saxon-specific option that sets the name of the initial XSLT template to be executed.

Use a configuration file ("-config")

Sets a Saxon 9.8.0.12 configuration file that is executed for XSLT transformation and validation processes.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the XSLT Debugger *(page 2218)* to *step into* XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

Note: Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Recoverable errors ("-warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces ("-strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes

in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.

- **None ("none")** - Strips *no* whitespace before further processing.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-JS extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.8.0.12 processors.

Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the **xsl:assert** element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `xsl:assert` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The advanced options that are specific for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

XML Schema version

Use this option to change the default XML Schema version for this transformation.
To change the default XML Schema version globally, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **XML > XML Parser > XML Schema** and use the **Default XML Schema version** option *(page 190)*.

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable streaming mode

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the *net.sf.saxon.lib.Initializer* interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XSLT Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor *(page 212)*.

Output Tab (XSLT Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting *(page 171)*.
- **SVG** - If this is selected, Oxygen XML Editor displays the transformation result in an integrated SVG viewer in the **Results** panel *(page 1480)* at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

  Important: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

  # **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Attention: If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this **Output** tab. For more information, see: https://www.w3.org/TR/xslt-30/#element-result-document.

Generating Output Using an XSLT Processor

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Editor.

Supported XSLT Processors

Oxygen XML Editor includes the following XSLT processors:

- **Xalan 2.7.2** - Xalan-Java is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.
- **Saxon 6.5.5** - Saxon 6.5.5 is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.
- **Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE)** - Saxon-HE/PE implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term *basic XSLT 2.0 / 3.0 processor* is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.
- **Saxon 9.8.0.12 Enterprise Edition (EE)** - Saxon EE is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Editor. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

  The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be configured in Preferences *(page 190)*.

  Note: Oxygen XML Editor implements a Saxon *framework* that allows you to create Saxon configuration files. Two templates are available: **Saxon collection catalog** and **Saxon configuration**. Both of these templates support content completion, element annotation, and attribute annotation.

  Note: Saxon can use the *ICU-J localization library* (`saxon9-icu.jar`) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Editor installation kit. However, Saxon will use the default collation and

localization support available in the currently used JRE. To enable this capability, follow these steps:

1. Download Saxon 9.8.0.12 Professional Edition (PE) or Enterprise Edition (EE) from http://www.saxonica.com.
2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the **XSLT** tab, click the **Extensions** button to open the list of additional libraries used by the transformation process.
4. Click **Add** and browse to the folder where you unpacked the downloaded archive and choose the `saxon9-icu.jar` file.

Note that the `saxon9-icu.jar` should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Editor.

- **Saxon-CE (Client Edition)** is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Editor provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

  Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

  Note: A specific template, named **Saxon-CE stylesheet**, is available in the **New** document wizard *(page 673)*.

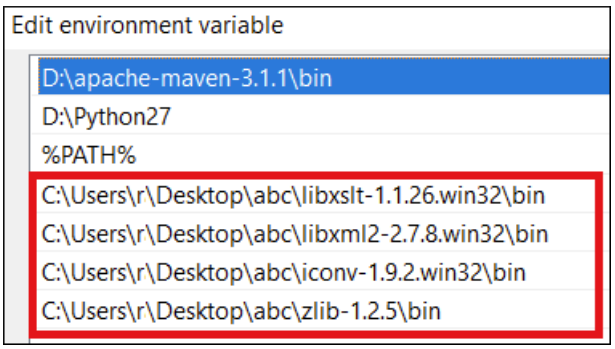
- **Xsltproc (libxslt)** - Libxslt is the XSLT C library developed for the Gnome project. **Libxslt** is based on *libxml2*, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

  Oxygen XML Editor uses **Libxslt** through its command line tool (*Xsltproc*). Depending on your operating system, you must download the Libxslt libraries on your machine from http://xmlsoft.org/XSLT/downloads.html and place them in a local folder. Then you need to update the `PATH` environmental variable to contain the parent folder where the `xsltproc` executable is located.

  Tip: As an example, a Windows installation of the Xsltproc engine would follow these steps:

  1. Go to http://ftp.zlatkovic.com/libxml.en.html and download the following ZIP files: **iconv-1.9.2.win32.zip**, **libxml2-2.7.8.win32.zip**, **libxslt-1.1.26.win32.zip**, **zlib-1.2.5.win32.zip**.
  2. Unzip all of them into the same folder of your choice.

3. Edit the `PATH` environment variable and add the `bin` folder for all four archives:



4. Restart Oxygen XML Editor.

   Result: You can now use the **xsltproc** processor as an XSLT engine in the XSLT transformation scenario.

Note: The Xsltproc processor can be configured from the **XSLTPROC** options page *(page 202)*.

CAUTION: There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in *XML Catalog (page 3235)* files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Editor is installed in the default location on Windows (C:\Program Files). This is because the built-in *XML catalog* files are stored in the `[OXYGEN_INSTALL_DIR]/frameworks` subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0** - MSXML 4.0 is available only on Windows platforms. It can be used for transformation *(page 1644)* and validation of XSLT stylesheets *(page 1172)*.

  Oxygen XML Editor uses the Microsoft XML parser through its command line tool *msxsl.exe*.

  Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.

- **MSXML .NET** - MSXML .NET is available only on Windows platforms. It can be used for transformation *(page 1644)* and validation of XSLT stylesheets *(page 1172)*.

  Oxygen XML Editor performs XSLT transformations and validations using the .NET *Framework* XSLT implementation (*System.Xml.Xsl.XslTransform* class) through the **nxslt** command line utility. The **nxslt** version included in Oxygen XML Editor is 1.6.

  You should have the .NET *Framework* version 1.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128`.

You can get the .NET *Framework* version 1.0 from the Microsoft website.

- **.NET 1.0** - A transformer based on the **System.Xml** 1.0 library available in the .NET 1.0 and .NET 1.1 *frameworks* from Microsoft (http://msdn.microsoft.com/xml/). It is available only on Windows.

  You should have the .NET *Framework* version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128`.

  You can get the .NET *Framework* version 1.0 from the Microsoft website.

- **.NET 2.0** - A transformer based on the **System.Xml** 2.0 library available in the .NET 2.0 *Framework* from Microsoft. It is available only on Windows.

  You should have the .NET *Framework* version 2.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128`.

  You can get the .NET *Framework* version 2.0 from the Microsoft website.

For information about configuring the XSLT preferences, see the XSLT options *(page 197)* section.

Configuring Custom XSLT Processors

Oxygen XML Editor allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **XML > XSLT-FO-XQuery > Custom Engines**.
2. Click the **New** button at the bottom of the dialog box.
3. Configure the parameters for the custom engine *(page 217)*.
4. Click **OK**.

Note: You can not use these custom engines in the Debugger *perspective (page 2199)*.

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Editor linked message *(page 1080)*, clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

Related Information:

Custom Engines Preferences *(page 217)*

Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- **Xalan** - http://xml.apache.org/xalan-j/extensions.html
- **Saxon 6.5.5** - http://saxon.sourceforge.net/saxon6.5.5/extensions.html
- **Saxon 9.8.0.12** - http://www.saxonica.com/documentation9.5/index.html#!extensibility

To set an XSLT processor extension (a directory or a `jar` file), use the **Extensions** button *(page 1646)* in the **Edit scenario** dialog box.

XML Transformation with XQuery

This type of transformation specifies the transform parameters and location of an XQuery file that is applied to the edited XML document.

Use the **XML transformation with XQuery** scenario to apply a transformation in which an XQuery file queries an XML file for the output results.

To create an **XML transformation with XQuery** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XML transformation with XQuery**.
- Go to **Window > Show View** and select **Transformation Scenarios** to display this view *(page 1728)*. Click the **New Scenario** drop-down menu button and select **XML transformation with XQuery**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** *(page 3233)* - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** *(page 3230)* - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list. You can also use the **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page *(page 201)*, the XML input of the transformation is passed to that URI resolver.

XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list. You can also use the **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor for performing a transformation. These include the built-in engines and

the external engines defined in the Custom Engines preferences page *(page 217)*. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine *(page 1663)* for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page *(page 199)*. For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens the **Configure parameters** dialog box *(page 1661)* for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a dialog box for configuring the XQuery extension *JARS* or classes *(page 1663)* that define extension Java functions or extension XSLT elements used in the transformation.

XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or editor variables *(page 275)* (such as **${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable *(page 275)* can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable *(page 275)* can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

Editor Variables *(page 275)*

XQuery Extensions

The **Extensions** button is used to specify the *JAR (page 3230)* and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the ⬆ **Move up** or ⬇ **Move down** buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the **Saxon HE/PE/EE** preferences page *(page 207)* but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options *(page 3230)* defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 9.8.0.12 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Recoverable errors ("-warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.

- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces ("-strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the *net.sf.saxon.lib.Initializer* interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XQuery Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor *(page 212)*.

Output Tab (XQuery Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Present as a sequence

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting *(page 171)*.
- **SVG** - If this is selected, Oxygen XML Editor displays the transformation result in an integrated SVG viewer in the **Results** panel *(page 1480)* at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

  Important: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

  # **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

DITA OT Transformation

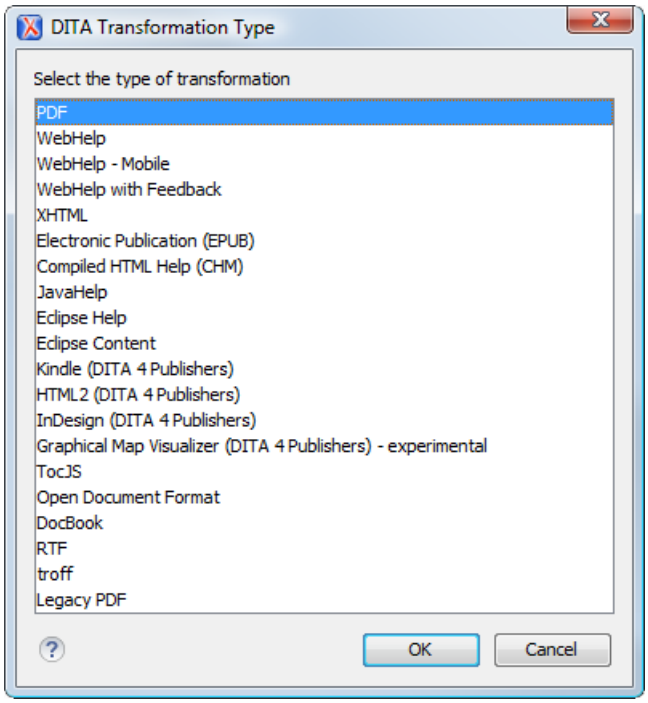
This type of transformation specifies the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Editor includes a built-in version of Ant and a built-in version of DITA-OT, but other versions can be set in the scenario.

To create a **DITA OT Transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the **DITA Maps Manager** toolbar, main toolbar, or the **Document > Transformation** menu. Then click the **New** button and select **DITA OT Transformation**.
- Go to **Window > Show View** and select **Transformation Scenarios** to display this view *(page 1728)*. Click the **New Scenario** drop-down menu button and select **DITA OT Transformation**.

Both methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

Figure: DITA Transformation Type Dialog Box



Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** *(page 3233)* - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS,

SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.

- **Global Options** *(page 3230)* - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation. Some of these tabs are only available for certain output types (for example, a **Skins** tab is only available for **WebHelp Classic** and **WebHelp Classic with Feedback** output types, a **Templates** tab is available only for **WebHelp Responsive** and **WebHelp Responsive with Feedback**, and a **FO Processor** tab is available for PDF output).

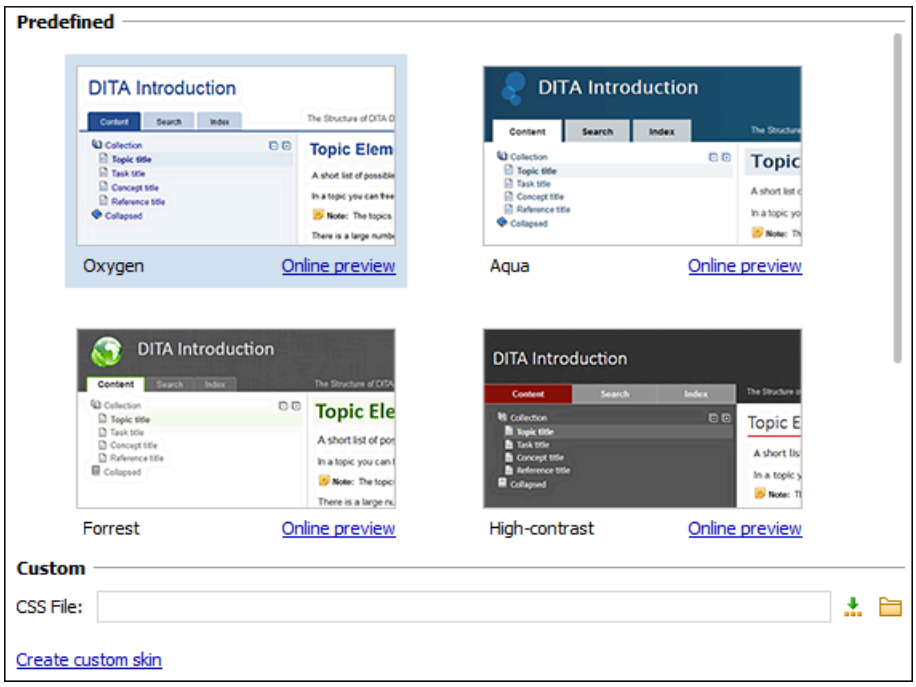
Skins Tab (DITA OT Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Skins** tab is available for DITA OT transformations with **WebHelp Classic** or **WebHelp Classic with Feedback** output types and it provides a set of built-in skins that you can use as a base for your WebHelp system output.

A *skin* is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

Figure: Skins Tab



The **Skins** tab includes the following sections:

Built-in Skins

This sections presents the built-in skins that are included in Oxygen XML Editor. The built-in skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the *skin* looks when applied on a sample documentation project that is stored on the Oxygen XML Editor website, press the **Online preview** link.

Custom Skins

You can use this section to customize the look of the output.

CSS File

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.

Note: The output can also be styled by setting the `args.css` parameter in the **Parameters tab**. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the **Skins tab**.

Create custom skin

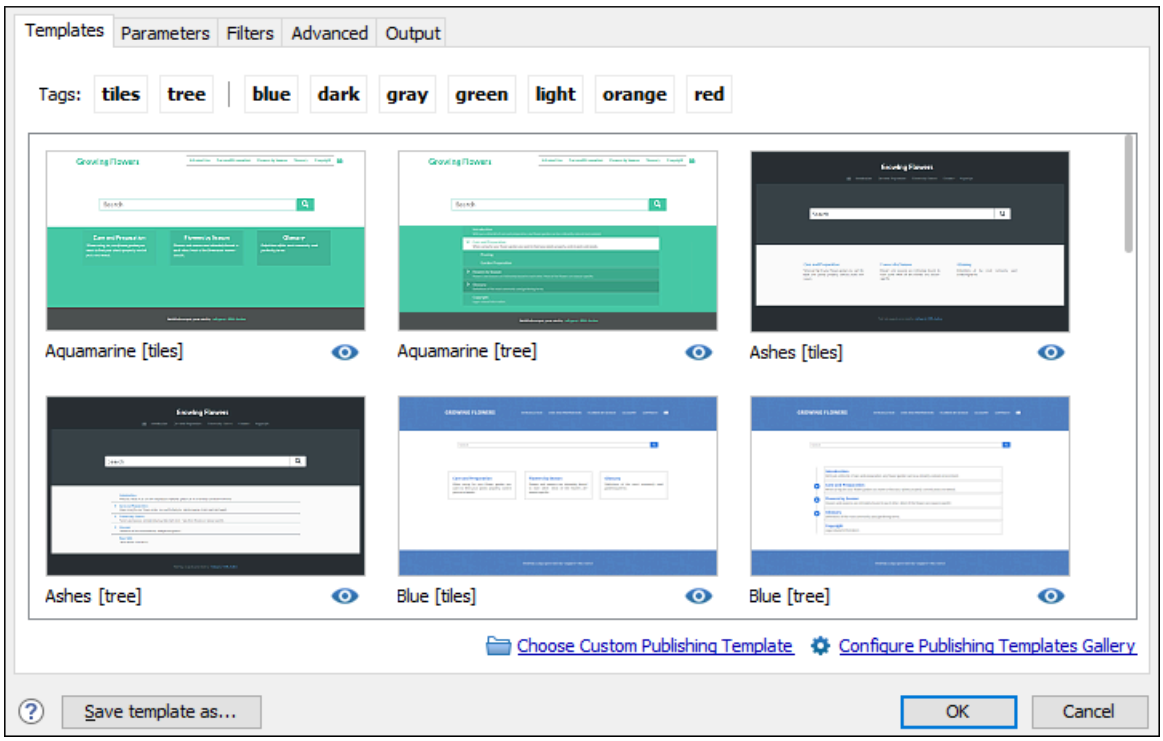
Use this link to open the **WebHelp Skin Builder** *(page 1816)* tool.

Templates Tab (DITA OT Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Templates** tab is available for DITA OT transformations with **WebHelp Responsive**, **WebHelp Responsive with Feedback**, or **PDF - based on HTML5 & CSS** output types and it provides a set of built-in publishing templates *(page 1849)*. You can use one of them to publish your documentation or as a starting point for a new publishing template.

Figure: Templates Tab



Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an **Online preview** icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.

Built-in Templates Locations

Oxygen XML Editor scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: *`DITA-OT-DIR`*`/plugins/com.oxygenxml.webhelp.responsive/templates`.
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
  # *`DITA-OT-DIR`*`/plugins/com.oxygenxml.pdf.css/templates`
  # *`DITA-OT-DIR`*`/plugins/com.oxygenxml.webhelp.responsive/templates`

Custom Templates Locations

Oxygen XML Editor scans the locations specified in the **DITA > Publishing** preferences page *(page 226)* to find custom templates to display in the dialog box. You can access that preferences page directly from the **Template** tab by clicking on the **Configure Publishing Templates Gallery** link.

Selecting Custom Templates

Once you are finished configuring your template, you can click the **Choose Custom Publishing Template** link to select your template.

You can also add your custom templates *(page 1901)* to the list of templates displayed in the **Templates** tab. To do this, store them in a directory, then click the **Configure Publishing Templates Gallery** link to open the **DITA > Publishing** preferences page *(page 226)* where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Save Template As Button

You can use the **Save template as** button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to create your own custom template *(page 1899)*. Clicking this button will open a template package configuration dialog box *(page 1673)* that contains some options and displays the parameters that will be exported to your template package.

Template Errors

When the **Templates** tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

If you click the **More details** link, a window will open with more information about the encountered error. For example, it might offer a hint for which element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠) will be displayed on the template's image (in the **Templates** tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to **Options > Preferences > DITA > Publishing** *(page 226)* and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

For more information about customizing publishing templates, watch our video demonstration:

Related Information:

Publishing Templates *(page 1849)*

Publishing Template Package Contents for PDF Customizations *(page 1971)*

Publishing Template Package Contents for WebHelp Responsive Customizations *(page 1852)*

Template Package Configuration Dialog Box

The **Save template as** button (at the bottom-left of the transformation dialog box for **WebHelp Responsive** or **PDF - based on HTML5 & CSS** transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to create your own custom template *(page 1899)*. The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

Name

Required field used to specify the name for the new template. This will become the text value of the `name` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

Description

Optional field used to specify a template description. This will become the text value of the `description` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

Parameter Table

This table displays the parameters that will be exported. Only relevant parameters are exported. The parameters and their values will be inserted in the `parameters` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

Note: Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

Include WebHelp Customization

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** *(page 1615)* or **DITA Map to PDF - based on HTML5 & CSS** *(page 1629)*). This option specifies that the custom template will include a WebHelp Responsive customization.

Include HTML Page Layout Files

For **WebHelp Responsive** customizations, select this option if you want to copy the default *HTML Page Layout Files (page 1857)* into your template package. They are helpful if you want to change the structure of the generated HTML pages.

Include PDF Customization

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** *(page 1615)* or **DITA Map to PDF - based on HTML5 & CSS** *(page 1629)*). This option specifies that the custom template will include a PDF customization.

Save as

Use this field to specify the name and path of the ZIP file where the template will be saved.

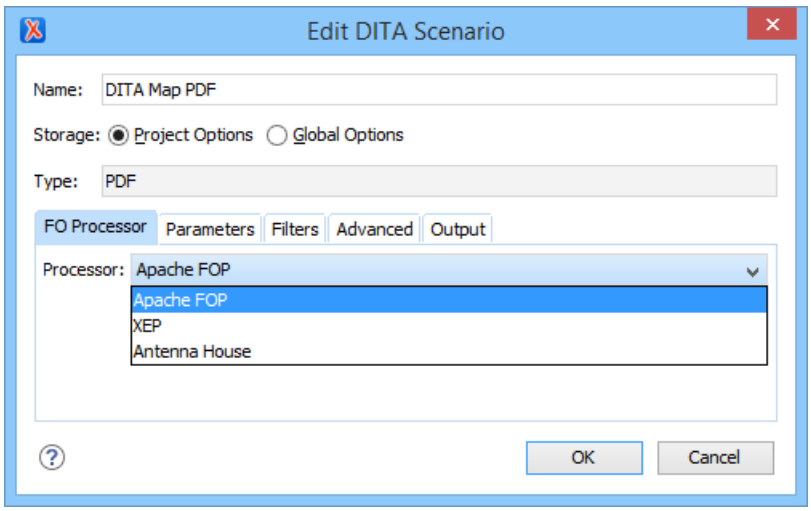
FO Processor Tab (DITA OT Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.

Figure: FO Processor Configuration Tab



You can choose one of the following processors:

Apache FOP

The default processor that comes bundled with Oxygen XML Editor.

XEP

The RenderX XEP processor. If XEP is already installed, Oxygen XML Editor displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the **FO Processors** option page *(page 212)*.
- The system property *com.oxygenxml.xep.location* was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the *`DITA-OT-DIR`*`/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Editor installation directory.

Antenna House

The Antenna House (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Editor preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters** tab *(page 3151)*.
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

Related Information:

FO Processors Preferences *(page 212)*

Generating PDF Output from XSL-FO (Apache FOP) *(page 2076)*

Parameters Tab (DITA OT Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the DITA OT Documentation. You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable *(page 275)* selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the *ask* editor variable *(page 276)* in the **Value** column.

Below the table, the following actions are available for managing parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the **Insert Editor Variables** *(page 275)* button or the **Browse** button.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

Parameters Contributed by an Oxygen Publishing Template

Transformation parameters that are defined in an *Oxygen Publishing Template (page 1849)* descriptor file are displayed in italics. After creating a publishing template *(page 1899)* and adding it to the templates gallery *(page 1901)*, when you select the template in the **Templates** tab *(page 3145)*, the **Parameters** tab will automatically be updated to include the parameters defined in the template descriptor file.

Related Information:

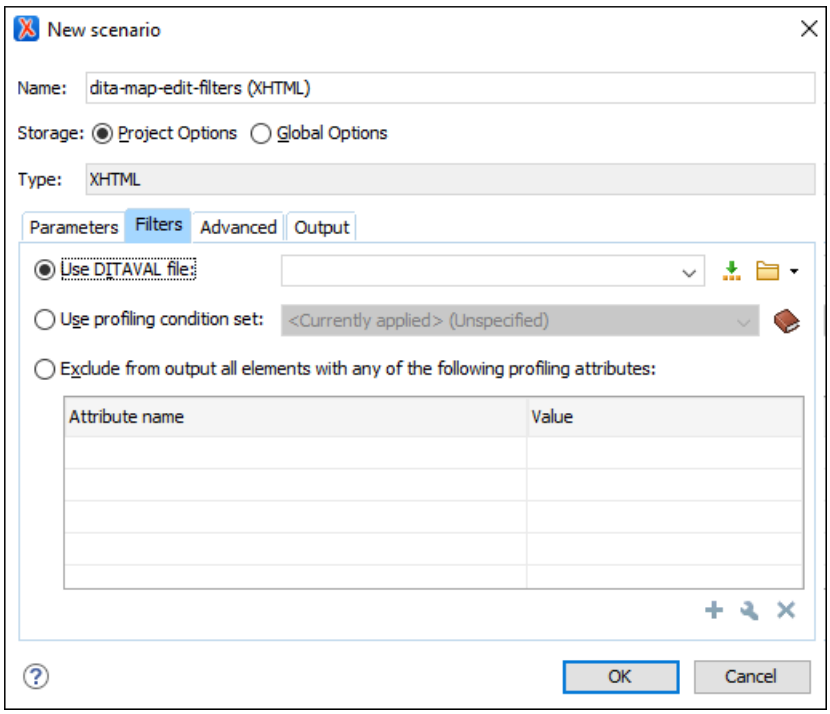
DITA Open Toolkit Documentation

Filters Tab (DITA Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.

Figure: Edit Filters Tab



You can choose one of the following options to define filters:

Use DITAVAL file

If you already have a *DITAVAL* file associated with the *DITA map (page 3228)*, you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list. You can find out more about constructing a *DITAVAL* file in the DITA Documentation.

Attention: If a filter file is specified in the `args.filter` parameter (in the **Parameters** tab *(page 3151)*), that file takes precedence over a *DITAVAL* file specified here.

Use profiling condition set

Sets the profiling condition set *(page 3170)* that will be applied to your transformation.

Exclude from output all elements with any of the following attributes

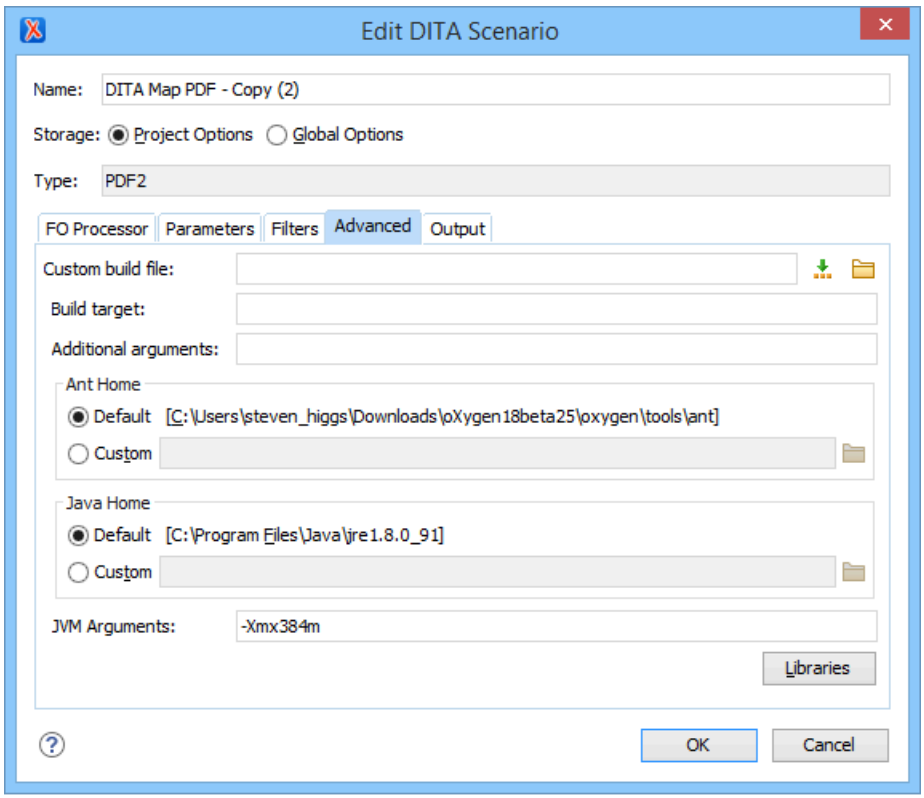
By using the **New**, **Edit**, or **Delete** buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

Advanced Tab (DITA OT Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Advanced** tab allows you to specify advanced options for the transformation scenario.

Figure: Advanced Settings Tab



You can specify the following parameters:

Custom build file

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the **Parameters** tab *(page 3151)* is used. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Build target

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

Additional arguments

You can specify additional command line arguments to be passed to the transformation (such as `-verbose`).

Ant Home

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the Ant preferences page *(page 219)*.

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor.

Note: It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. For example, DITA-OT 2.0 and newer requires Java 1.7 or newer. Thus, if you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA OT publishing engine and using it in the **Java Home** text field.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to **-Xmx384m**, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (**OutOfMemoryError**).

Libraries

By default, Oxygen XML Editor adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (*JAR (page 3230)* files or additional class paths) to be used by the Ant transformer.

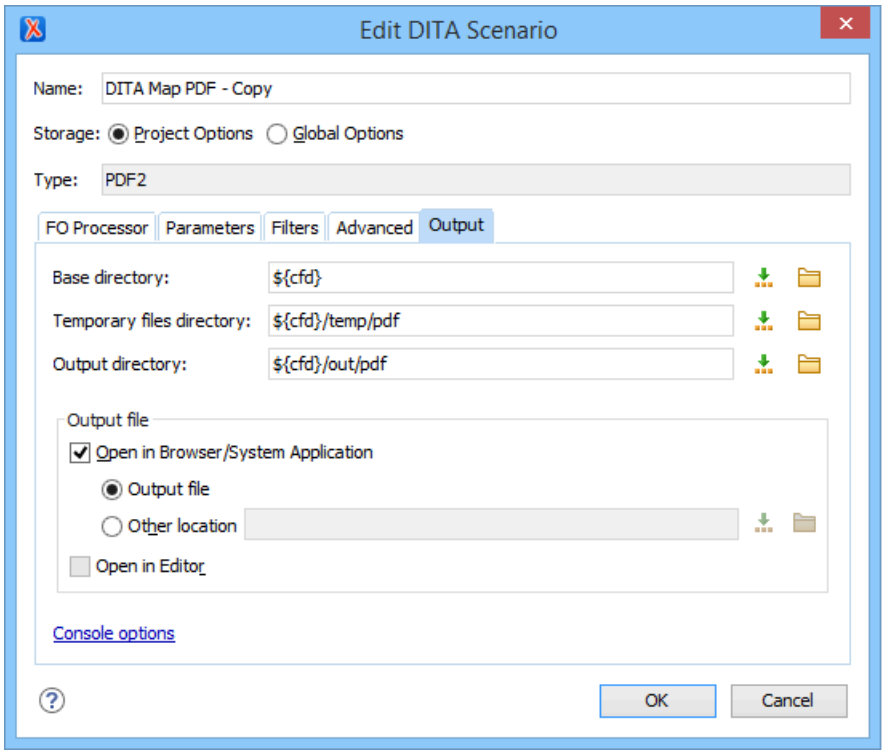
Tip: You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

Output Tab (DITA OT Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.

Figure: Output Settings Tab



You can specify the following parameters:

Base directory

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Temporary files directory

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Output directory

The folder where the content of the final output is stored. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Note: If the *DITA map (page 3228)* or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

Open in Browser/System Application

If selected, Oxygen XML Editor automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

At the bottom of the pane there is a link to the Console options *(page 226)* preferences page that contains options to control the display of the console output received from the publishing engine.

Troubleshooting DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. Validate the *DITA map (page 2988)* by using the **Validate and Check for Completeness** action that is available on the **DITA Maps Manager** *(page 2943)* toolbar and in the **DITA Maps** menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. Run the DITA transformation scenario *(page 1667)*.

4. If the transformation results in errors or warnings, they are displayed in the **Results** panel *(page 354)* at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
   - **Severity** - The first column displays the following icons that indicate the severity of the problem:
     # **Informational** - The transformation encountered a condition of which you should be aware.
     # **Warning** - The transformation encountered a problem that should be corrected.
     # **Error** - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
   - **Info** - You can click the **See More** icon to open a web page that contains details about DITA-OT error messages.
   - **Description** - A description of the problem.
   - **Resource** - The name of the transformation resource.
   - **System ID** - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
6. If you need to contact the *Oxygen* technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
   a. Go to the **Options > Preferences > DITA** preferences page and set the **Show console output** option to **Always**.
   b. Execute the transformation scenario again. The console output messages are displayed in the **DITA OT** view.
   c. Copy the entire log, save it in a text file, then send it to the *Oxygen* technical support team.
   d. After your issue has been solved, go back to the **Options > Preferences > DITA** preferences page and set the **Show console output** option to **When build fails**.

Ant Transformation

This type of transformation allows you to configure the options and parameters of an Ant build script.

An Ant transformation scenario is usually associated with an Ant build script. Oxygen XML Editor runs an Ant transformation scenario as an external process that executes the Ant build script with the built-in Ant distribution (*Apache Ant (page 3226)* version 1.9.8) that is included with the application, or optionally with a custom Ant distribution configured in the scenario.

To create an Ant transformation scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **ANT transformation**.

- Go to **Window > Show View** and select **Transformation Scenarios** to display this view *(page 1728)*. Click the **New Scenario** drop-down menu button and select **ANT transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** *(page 3233)* - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** *(page 3230)* - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Related Information:

Transforming Ant Build Files *(page 1223)*

Options Tab (Ant Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Options** tab allows you to specify the following options:

Working directory

The path of the current directory of the Ant external process. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Build file

The Ant script file that is the input of the Ant external process. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Build target

Optionally, you can specify a build target for the Ant script file. If no target is specified, the Ant target that is specified as the default in the Ant script file is used.

Additional arguments

You can specify additional command line arguments to be passed to the transformation (such as `-verbose`).

Ant Home

You can choose between the default or custom Ant installation to run the transformation. The default path can be configured in the Ant preferences page *(page 219)*.

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. For example, if it is set to **-Xmx384m**, the transformation process is allowed to use 384 megabytes of memory. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (**OutOfMemoryError**).

Libraries

By default, Oxygen XML Editor adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (*JAR (page 3230)* files or additional class paths) to be used by the Ant transformer.

Tip: You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

Parameters Tab (Ant Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters that are accessible as Ant properties in the Ant build script.

The table displays all the parameters that are available in the Ant build script, along with their description and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an editor variable *(page 275)* selector to simplify setting a file path as the value of a parameter.

Note: To input parameter values at runtime, use the *ask* editor variable *(page 276)* in the **Value** column.

Below the table, the following actions are available for managing parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the **Insert Editor Variables** *(page 275)* button or the **Browse** button.

Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

These parameters are also available for the built-in validation processor and the *Content Completion Assistant (page 3227)*.

Related Information:

Content Completion in Ant Build Files *(page 1225)*

Output Tab (Ant Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Open

Allows you to specify the file to open automatically when the transformation is finished. This is usually the output file of the Ant process. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

- **In System Application** - The file specified in the **Open** text box is opened in the system application that is set in the operating system as the default application for that type of file (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).
- **In Editor** - The file specified in the **Open** text box is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor).

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

XSLT Transformation

This type of transformation specifies the parameters and location of an XML document that the edited XSLT stylesheet is applied on. This scenario is useful when you develop an XSLT document and the XML document is in its final form.

To create an **XSLT transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (**Ctrl + Shift + C (Command + Shift + C on OS X)**) action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XSLT transformation**.
- Go to **Window > Show View** and select **Transformation Scenarios** to display this view *(page 1728)*. Click the **New Scenario** drop-down menu button and select **XSLT transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** *(page 3233)* - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** *(page 3230)* - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list. You can also use the **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page *(page 201)*, the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and the name of an initial template *(page 1646)* is specified in the scenario, the **XML URL** field can be empty. The **XML URL** field can also be empty if you use external XSLT processors *(page 1658)*. Otherwise, a value is mandatory in this field.

XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list. You can also use the **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xml-stylesheet" declaration

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the `xml-stylesheet` processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the **XSL URL** field.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page *(page 217)*. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine *(page 1649)* for the current transformation scenario. To configure the same options globally, go to the Saxon-HE/PE/EE preferences page *(page 199)*. For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens a **Configure parameters** dialog box *(page 1647)* that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for additional XSLT stylesheets *(page 1647)*. If the XSLT transformation engine is custom-defined, you can not use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a dialog box for configuring the XSLT extension *JARS* or classes *(page 1648)* that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a dialog box for adding XSLT stylesheets *(page 1648)* that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all additional stylesheets *(page 1648)*, along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or editor variables *(page 275)* (such as **${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable *(page 275)* can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable *(page 275)* can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

Editor Variables *(page 275)*

XSLT Extensions

The **Extensions** button opens a dialog box that allows you to specify the *JARS (page 3230)* and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

Tip: You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the **Move up** or **Move down** buttons.

Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an editor variable *(page 275)* in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

Open

Opens the selected stylesheet in a separate view.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the **Saxon HE/PE/EE** preferences page *(page 199)* but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options *(page 3230)* defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode ("-im")

A Saxon-specific option that sets the initial mode for the transformation.

Template ("-it")

A Saxon-specific option that sets the name of the initial XSLT template to be executed.

Use a configuration file ("-config")

Sets a Saxon 9.8.0.12 configuration file that is executed for XSLT transformation and validation processes.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the XSLT Debugger *(page 2218)* to *step into* XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

Note: Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Recoverable errors ("-warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces ("-strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-JS extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 9.8.0.12 processors.

Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the **xsl:assert** element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `xsl:assert` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The advanced options that are specific for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

XML Schema version

Use this option to change the default XML Schema version for this transformation.
To change the default XML Schema version globally, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **XML > XML Parser > XML Schema** and use the **Default XML Schema version** option *(page 190)*.

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.

- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable streaming mode

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the *net.sf.saxon.lib.Initializer* interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XSLT Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor *(page 212)*.

Output Tab (XSLT Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.

- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting *(page 171)*.
- **SVG** - If this is selected, Oxygen XML Editor displays the transformation result in an integrated SVG viewer in the **Results** panel *(page 1480)* at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

  Important: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

  # **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Attention: If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this **Output** tab. For more information, see: https://www.w3.org/TR/xslt-30/#element-result-document.

Generating Output Using an XSLT Processor

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Editor.

Supported XSLT Processors

Oxygen XML Editor includes the following XSLT processors:

- **Xalan 2.7.2** - Xalan-Java is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.
- **Saxon 6.5.5** - Saxon 6.5.5 is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.
- **Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE)** - Saxon-HE/PE implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term *basic XSLT 2.0 / 3.0 processor* is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.
- **Saxon 9.8.0.12 Enterprise Edition (EE)** - Saxon EE is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Editor. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

  The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be configured in Preferences *(page 190)*.

  Note: Oxygen XML Editor implements a Saxon *framework* that allows you to create Saxon configuration files. Two templates are available: **Saxon collection catalog** and **Saxon configuration**. Both of these templates support content completion, element annotation, and attribute annotation.

  Note: Saxon can use the *ICU-J localization library* (`saxon9-icu.jar`) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Editor installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

  1. Download Saxon 9.8.0.12 Professional Edition (PE) or Enterprise Edition (EE) from http://www.saxonica.com.
  2. Unpack the downloaded archive.

3. Create a new XSLT transformation scenario (or edit an existing one). In the **XSLT** tab, click the **Extensions** button to open the list of additional libraries used by the transformation process.
4. Click **Add** and browse to the folder where you unpacked the downloaded archive and choose the `saxon9-icu.jar` file.

Note that the `saxon9-icu.jar` should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Editor.

- **Saxon-CE (Client Edition)** is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Editor provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

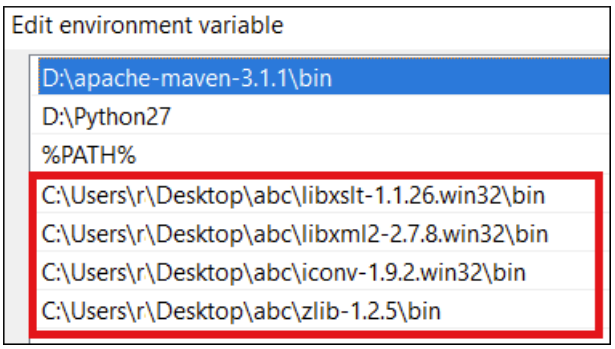
  Note: Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about executing such a stylesheet on Saxonica's website.

  Note: A specific template, named **Saxon-CE stylesheet**, is available in the **New** document wizard *(page 673)*.

- **Xsltproc (libxslt)** - Libxslt is the XSLT C library developed for the Gnome project. **Libxslt** is based on *libxml2*, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

  Oxygen XML Editor uses **Libxslt** through its command line tool (*Xsltproc*). Depending on your operating system, you must download the Libxslt libraries on your machine from http://xmlsoft.org/XSLT/downloads.html and place them in a local folder. Then you need to update the `PATH` environmental variable to contain the parent folder where the `xsltproc` executable is located.

  Tip: As an example, a Windows installation of the Xsltproc engine would follow these steps:
  1. Go to http://ftp.zlatkovic.com/libxml.en.html and download the following ZIP files: **iconv-1.9.2.win32.zip**, **libxml2-2.7.8.win32.zip**, **libxslt-1.1.26.win32.zip**, **zlib-1.2.5.win32.zip**.
  2. Unzip all of them into the same folder of your choice.
  3. Edit the `PATH` environment variable and add the `bin` folder for all four archives:



4. Restart Oxygen XML Editor.

   Result: You can now use the **xsltproc** processor as an XSLT engine in the XSLT transformation scenario.

Note: The Xsltproc processor can be configured from the **XSLTPROC** options page *(page 202)*.

CAUTION: There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in *XML Catalog (page 3235)* files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Editor is installed in the default location on Windows (C:\Program Files). This is because the built-in *XML catalog* files are stored in the `[OXYGEN_INSTALL_DIR]/frameworks` subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0** - MSXML 4.0 is available only on Windows platforms. It can be used for transformation *(page 1644)* and validation of XSLT stylesheets *(page 1172)*.

  Oxygen XML Editor uses the Microsoft XML parser through its command line tool *msxsl.exe*.

  Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.

- **MSXML .NET** - MSXML .NET is available only on Windows platforms. It can be used for transformation *(page 1644)* and validation of XSLT stylesheets *(page 1172)*.

  Oxygen XML Editor performs XSLT transformations and validations using the .NET *Framework* XSLT implementation (*System.Xml.Xsl.XslTransform* class) through the **nxslt** command line utility. The **nxslt** version included in Oxygen XML Editor is 1.6.

  You should have the .NET *Framework* version 1.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128`.

You can get the .NET *Framework* version 1.0 from the Microsoft website.

- **.NET 1.0** - A transformer based on the **System.Xml** 1.0 library available in the .NET 1.0 and .NET 1.1 *frameworks* from Microsoft (http://msdn.microsoft.com/xml/). It is available only on Windows.

  You should have the .NET *Framework* version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128`.

  You can get the .NET *Framework* version 1.0 from the Microsoft website.

- **.NET 2.0** - A transformer based on the **System.Xml** 2.0 library available in the .NET 2.0 *Framework* from Microsoft. It is available only on Windows.

  You should have the .NET *Framework* version 2.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128`.

  You can get the .NET *Framework* version 2.0 from the Microsoft website.

For information about configuring the XSLT preferences, see the XSLT options *(page 197)* section.

Configuring Custom XSLT Processors

Oxygen XML Editor allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **XML > XSLT-FO-XQuery > Custom Engines**.
2. Click the **New** button at the bottom of the dialog box.
3. Configure the parameters for the custom engine *(page 217)*.
4. Click **OK**.

Note: You can not use these custom engines in the Debugger *perspective (page 2199)*.

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows the format of an Oxygen XML Editor linked message *(page 1080)*, clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

Related Information:

Custom Engines Preferences *(page 217)*

Configuring the XSLT Processor Extensions Paths

The Xalan and Saxon processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- **Xalan** - http://xml.apache.org/xalan-j/extensions.html
- **Saxon 6.5.5** - http://saxon.sourceforge.net/saxon6.5.5/extensions.html
- **Saxon 9.8.0.12** - http://www.saxonica.com/documentation9.5/index.html#!extensibility

To set an XSLT processor extension (a directory or a `jar` file), use the **Extensions** button *(page 1646)* in the **Edit scenario** dialog box.

XProc Transformation

This type of transformation specifies the parameters and location of an XProc script.

A sequence of transformations described by an XProc script can be executed with an XProc transformation scenario. To create an **XProc transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XProc transformation**.
- Go to **Window > Show View** and select **Transformation Scenarios** to display this view *(page 1728)*. Click the **New Scenario** drop-down menu button and select **XProc transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** *(page 3233)* - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS,

SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** *(page 3230)* - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Related Information:

Integrating an External XProc Engine *(page 1707)*

Editing XProc Scripts *(page 1438)*

XProc Tab

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XProc** tab contains the following options:

XProc URL

Specify the source XSL file to be used by the transformation. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Processor

Allows you to select the XProc engine to be used for the transformation. You can select the *Add-on for Calabash XProc engine* or a custom engine that is configured in the **XProc Preferences** page *(page 196)*.

Inputs Tab (XProc Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Inputs** tab contains a list with the ports that the XProc script uses to read input data. Use the **Filter** text box to search for a specific term in the entire ports collection.

Each input port has an assigned name in the XProc script. The XProc engine reads data from the URL specified in the **URL** column.

The following actions are available for managing the input ports:

New

Opens an **Edit** dialog box that allows you to add a new port and its URL. The built-in editor variables *(page 275)* and custom editor variables *(page 283)* can be used to specify the URL.

Edit

Opens an **Edit** dialog box that allows you to modify the selected port and its URL. The built-in editor variables *(page 275)* and custom editor variables *(page 283)* can be used to specify the URL.

Delete

Removes the selected port from the list. It is available only for new ports that have been added to the list.

Parameters Tab (XProc Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Parameters** tab presents a list of ports and parameters collected from the XProc script. The tab is divided into three sections:

List of Ports

In this section, you can use the **New** and **Delete** buttons to add or remove ports.

List of Parameters

This section presents a list of parameters for each port and includes columns for the parameter name, namespace URI, and its value. Use the **Filter** text box to search for a specific term in the entire parameters collection. You can use the **New** and **Delete** buttons to add or remove parameters. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers.

Editor Variable Information

The built-in editor variables *(page 275)* and custom editor variables *(page 283)* can be used for specifying the URI. The message pane at the bottom of the dialog box provides more information about the editor variables that can be used.

Outputs Tab (XProc Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Outputs** tab displays a list of output ports (along with the URL) collected from the XProc script. Use the **Filter** text box to search for a specific term in the entire ports collection. You can also sort the columns by clicking the column headers.

The following actions are available for managing the output ports:

New

Opens an **Edit** dialog box that allows you to add a new output port and its URL. An editor variable *(page 275)* can be inserted for the URL by using the **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output **Results** view *(page 354)*.

Edit

Opens an **Edit** dialog box that allows you to edit an existing output port and its URL. An editor variable *(page 275)* can be inserted for the URL by using the **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output **Results** view *(page 354)*.

Delete

Removes the selected output port from the list. It is available only for new ports that have been added to the list.

Additional options that are available at the bottom of this tab include:

Open in Editor

If this option is selected, the XProc transformation result is automatically opened in an editor panel.

Open in Browser/System Application

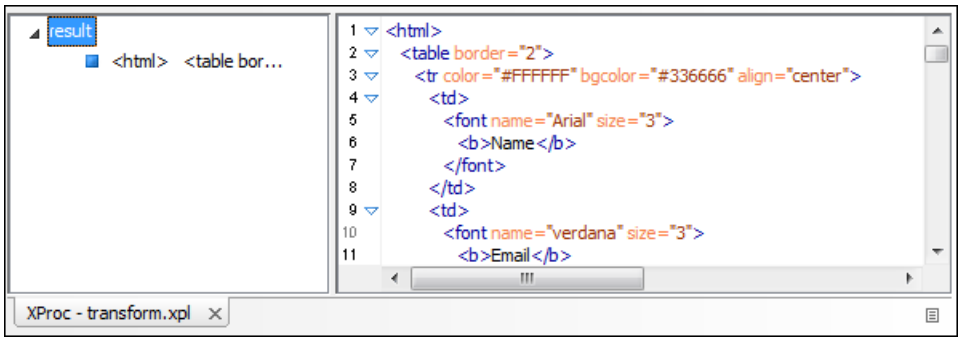
If this option is selected, you can specify a file to be opened at the end of the XProc transformation in the browser or system application that is associated with the file type. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list.

Results

The result of the XProc transformation can be displayed as a sequence in an output view with two sections:

- A list with the output ports on the left side.
- The content that correspond to the selected output port on the right side.

Figure: XProc Transformation Results View



Options Tab (XProc Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Options** tab displays a list of the options collected from the XProc script. The tab is divided into two sections:

List of Options

This section presents a list of options and includes columns for the option name, namespace URI, and its value. Use the **Filter** text box to search for a specific term in the entire options collection. You can use the **New** and **Delete** buttons to add or remove options. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers. The names of edited options are displayed in bold.

Editor Variable Information

The built-in editor variables *(page 275)* and custom editor variables *(page 283)* can be used for specifying the URI. This section provides more information about the editor variables that can be used.

Integrating an External XProc Engine

If you edit an XProc transformation scenario, there is a **Processor** drop-down menu where you can select the XProc engine to be used for the transformation. You can select the built-in *Calabash* engine

or a custom engine based on another XProc implementation. For example, there is a public project on GitHub that is an implementation for integrating Morgana XProc with Oxygen XML Editor: https://github.com/xml-project/support-for-xmleditor. Also, the Javadoc documentation of the XProc API is available for download from the application website as a zip file: *xprocAPI.zip*.

To create an XProc integration project, follow these steps:

1. Move the `oxygen.jar` file from *`[OXYGEN_INSTALL_DIR]/lib`* to the `lib` folder of your project.
2. Implement the *ro.sync.xml.transformer.xproc.api.XProcTransformerInterface* interface.
3. Create a *Java archive (JAR) (page 3230)* from the classes you created.
4. Create an `engine.xml` file according to the `engine.dtd` file. The attributes of the `engine` element are as follows:
   a. **name** - The name of the XProc engine.
   b. **description** - A short description of the XProc engine.
   c. **class** - The complete name of the class that implements *ro.sync.xml.transformer.xproc.api.XProcTransformerInterface*.
   d. **version** - The version of the integration.
   e. **engineVersion** - The version of the integrated engine.
   f. **vendor** - The name of the vendor / implementer.
   g. **supportsValidation** - **true** if the engine supports validation (otherwise, **false**).

   The `engine` element has only one child, `runtime`. The `runtime` element contains several `library` elements with the `name` attribute containing the relative or absolute location of the libraries necessary to run this integration.
5. Create a new folder (for example, named `MyXprocEngine`) and place the `engine.xml` and all the libraries necessary to run the new integration in that folder.
6. Place that new folder (i.e. `MyXprocEngine`) inside a new plugin folder. This new plugin folder should also contain a `plugin.xml` file that points to the new engine folder (i.e. `MyXprocEngine`).
   The `plugin.xml` file would look like this (it is based on the **AditionalXProcEngine** extension *(page 2540)*):

```
<plugin
 id="morgana.xproc.addon"
 name="Contribute Morgana XProc"
 description="Contribute Morgana XProc"
 version="1.0"
 vendor="SyncroSoft"
```

```
 class="ro.sync.exml.plugin.Plugin"
 classLoaderType="preferReferencedResources">
 <extension type="AdditionalXProcEngine" path="MyXprocEngine/"></extension>
</plugin>
```

Related Information:

Editing XProc Scripts *(page 1438)*

Creating an XProc Transformation Scenario *(page 1703)*

XQuery Transformation

This type of transformation specifies the parameters and location of an XML source that the edited XQuery file is applied on.

Note: When the XML source is a native XML database, the source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the input field of the scenario.

To create an **XQuery transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **XQuery transformation**.
- Go to **Window > Show View** and select **Transformation Scenarios** to display this view *(page 1728)*. Click the **New Scenario** drop-down menu button and select **XQuery transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario and the following **Storage** options:

- **Project Options** *(page 3233)* - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** *(page 3230)* - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list. You can also use the **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note: If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the advanced Saxon preferences page *(page 201)*, the XML input of the transformation is passed to that URI resolver.

XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list. You can also use the **Open in editor** button to open the specified file in the editor panel. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor for performing a transformation. These include the built-in engines and the external engines defined in the Custom Engines preferences page *(page 217)*. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the advanced options of the Saxon HE/PE/EE engine *(page 1663)* for the current transformation scenario. To configure the same options globally,

go to the Saxon-HE/PE/EE preferences page *(page 199)*. For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens the **Configure parameters** dialog box *(page 1661)* for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a dialog box for configuring the XQuery extension *JARS* or classes *(page 1663)* that define extension Java functions or extension XSLT elements used in the transformation.

XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or editor variables *(page 275)* (such as **${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An editor variable *(page 275)* can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An editor variable *(page 275)* can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

Editor Variables *(page 275)*

XQuery Extensions

The **Extensions** button is used to specify the *JAR (page 3230)* and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and press the **Move up** or **Move down** buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the **Saxon HE/PE/EE** preferences page *(page 207)* but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options *(page 3230)* defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 9.8.0.12 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 9.8.0.12 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Recoverable errors ("-warnings")

Allows you to choose how dynamic errors are handled. The following options can be selected:

- **Recover silently ("silent")** - Continues processing without reporting the error.
- **Recover with warnings ("recover")** - Issues a warning but continues processing.
- **Signal the error and do not attempt recovery ("fatal")** - Issues an error and stops processing.

Strip whitespaces ("-strip")

Allows you to choose how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document.

- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 9.8.0.12 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 9.8.0.12 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the *net.sf.saxon.lib.Initializer* interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XQuery Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an external processor *(page 212)*.

Output Tab (XQuery Transformations)

When you create a new transformation scenario *(page 1644)* or edit an existing one *(page 1718)*, a configuration dialog box allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Present as a sequence

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note: To set the web browser that is used for displaying HTML/XHTML pages, go to **Options > Preferences > Global**, and set it in the **Default Internet browser** field.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor displays the transformation result in an XML viewer panel at the bottom of the application window with syntax highlighting *(page 171)*.
- **SVG** - If this is selected, Oxygen XML Editor displays the transformation result in an integrated SVG viewer in the **Results** panel *(page 1480)* at the bottom of the application window and renders the result as an SVG image.
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

  Important: When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

  # **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

SQL Transformation

This type of transformation specifies a database connection for the database server that runs the SQL file associated with the scenario. The data processed by the SQL script is located in the database.

To create an **SQL transformation** scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu. Then click the **New** button and select **SQL transformation**.

- Go to **Window > Show View** and select **Transformation Scenarios** to display this view *(page 1728)*. Click the **New Scenario** drop-down menu button and select **SQL transformation**.

Both methods open the **New Scenario** dialog box. This dialog box allows you to configure the following options that control the transformation:

Name

The unique name of the SQL transformation scenario.

Storage

Allows you to select one of the following storage options:

- **Project Options** *(page 3233)* - The scenario is stored in the project file and can be shared with other users. For example, if your project is saved on a source versioning/sharing system (CVS, SVN, Source Safe, etc.) or a shared folder, your team can use the scenarios that you store in the project file.
- **Global Options** *(page 3230)* - The scenario is saved in the global options that are stored in the user home directory and is not accessible to other users.

SQL URL

Allows you to specify the URL of the SQL script. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** *(page 275)* button, or the browsing actions in the **Browse** drop-down list. You can also use the **Open in editor** button to open the specified file in the editor panel.

Connection

Allows you to select a connection from a drop-down list. To configure a connection, use the **Advanced options** button to open the **Data Source** preferences page *(page 227)*.

Parameters

Allows you to add or configure parameters for the transformation.

Editing a Transformation Scenario

Editing a transformation scenario is useful if you need to configure some of its parameters.

Note: Since transformation scenarios that are associated with built-in *frameworks (page 3229)* are read-only, to edit one of these scenarios you will need to duplicate it and edit the duplicated scenario *(page 1720)*.

To configure an existing transformation scenario, follow these steps:

1. Select the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.

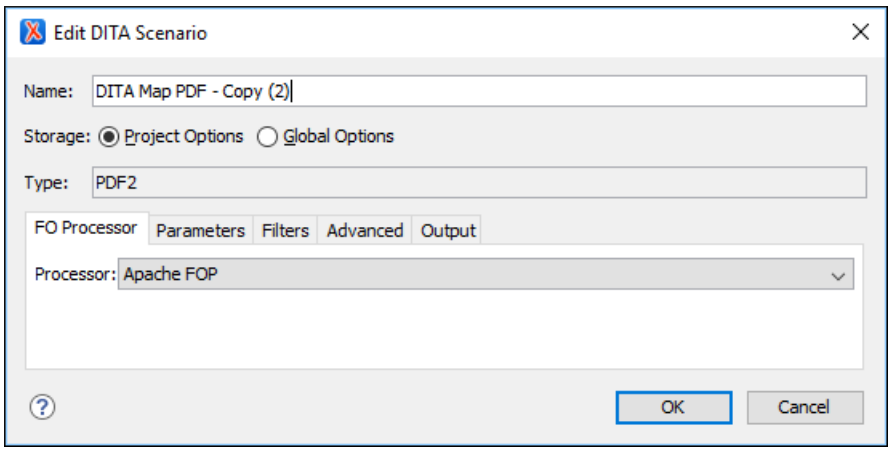
   Step Result: The **Configure Transformation Scenario(s)** dialog box *(page 1722)* is opened.

2. Select the particular transformation scenario and click the **Edit** button at the bottom of the dialog box or from the contextual menu.

   Tip: You could also select the scenario and the **Edit** button in the **Transformation Scenarios** view *(page 1728)* to achieve the same result.

Result: This will open an **Edit scenario** configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected.

Figure: Edit Scenarios Configuration Dialog Box



Transformation Types

The **Configure Transformation Scenario(s)** dialog box *(page 1722)* contains a **Type** column that shows you the transformation type for each of the listed scenarios. Each type of transformation contains includes some tabs with various configuration options.

The following is a list of the transformation types and their particular tabs (click the name of each tab below to see details about all the options that are available):

- **DITA OT** - This type of transformation includes configurable options in the following tabs:
  # Skins Tab *(page 3143)* (Available for **WebHelp Classic** and **WebHelp Classic with Feedback**)
  # Templates Tab *(page 3145)* (Available for **WebHelp Responsive** and **WebHelp Responsive with Feedback**)
  # FO Processor Tab *(page 3149)* (Available for PDF output)
  # Parameters Tab *(page 3151)*
  # Filters Tab *(page 3152)*

    # Advanced Tab *(page 3153)*
    # Output Tab *(page 3155)*
- **ANT** - This type of transformation includes configurable options in the following tabs:
    # Options Tab *(page 1685)*
    # Parameters Tab *(page 1686)*
    # Output Tab *(page 1687)*
- **XSLT** - This type of transformation includes configurable options in the following tabs:
    # XSLT Tab *(page 1645)*
    # FO Processor Tab *(page 1652)*
    # Output Tab *(page 1653)*
- **XProc** - This type of transformation includes configurable options in the following tabs:
    # XProc Tab *(page 1704)*
    # Inputs Tab *(page 1704)*
    # Parameters Tab *(page 1705)*
    # Outputs Tab *(page 1705)*
    # Options Tab *(page 1707)*
- **XQuery** - This type of transformation includes configurable options in the following tabs:
    # XQuery Tab *(page 1660)*
    # FO Processor Tab *(page 1665)*
    # Output Tab *(page 1666)*

Duplicating a Transformation Scenario *(page 1720)*

Configure Transformation Scenario(s) Dialog Box *(page 1722)*

Applying Associated Transformation Scenarios *(page 1721)*

Duplicating a Transformation Scenario

Duplicating a transformation scenario is useful for creating a scenario that is similar to an existing one or to edit a built-in transformation scenario.

To configure an existing transformation scenario, follow these steps:

1. Select the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.

Step Result: The **Configure Transformation Scenario(s)** dialog box *(page 1722)* is opened.

2. Select the particular transformation scenario and click the **Duplicate** button at the bottom of the dialog box or from the contextual menu.

Tip: You could also select the scenario and the **Duplicate** button in the **Transformation Scenarios** view *(page 1728)* to achieve the same result.

Result: This will open an **Edit scenario** configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the Transformation Types section *(page 1719)*.

Related Information:

Creating New Transformation Scenarios *(page 1644)*

Editing a Transformation Scenario *(page 1718)*

Applying Associated Transformation Scenarios

If you have associated transformation scenarios for the current document (in the **Configure Transformation Scenario(s)** dialog box *(page 1722)* or **Transformation Scenarios** view *(page 1728)*), Oxygen XML Editor included an **Apply Transformation Scenario(s)** action that allows you to quickly apply the associated transformation scenarios on the current document. Note that if an association is not detected, this action will open the **Configure Transformation Scenario(s)** dialog box *(page 1722)* where you can choose the scenarios you want to apply.

The **Apply Transformation Scenario(s)** action can be initiated from any of the following methods:

- Use the **Ctrl + Shift + T (Command + Shift + T on OS X))** keyboard shortcut.
- Click the **Apply Transformation Scenario(s)** button on the main toolbar.
- Click the **Apply Transformation Scenario(s)** button on the toolbar in the **Transformation Scenarios** view *(page 1728)*.
- Right-click a file in the **Project** view *(page 332)* and select **Transform > Apply Transformation Scenario(s)**.
- Use the **Apply Associated** button in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

Configure Transformation Scenario(s) Dialog Box *(page 1722)*

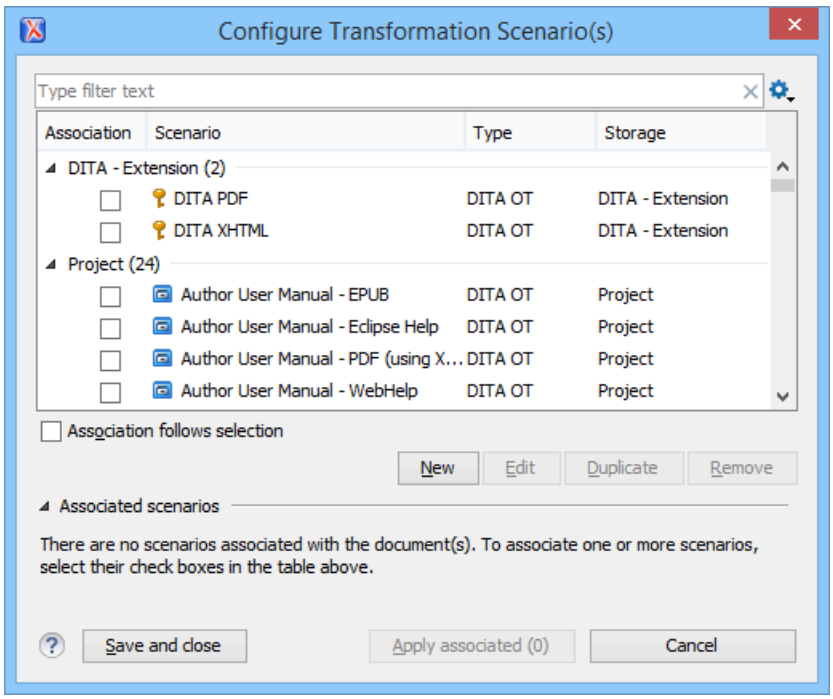
Transformation Scenarios View *(page 1728)*

Configure Transformation Scenario(s) Dialog Box

You can use the **Configure Transformation Scenarios(s)** dialog box for editing existing transformation scenarios *(page 1718)* or creating new ones *(page 1644)*.

To open this dialog box, use the **Configure Transformation Scenario(s) (Ctrl + Shift + C (Command + Shift + C on OS X))** action from the toolbar or the **Document > Transformation** menu.

Figure: Configure Transformation Scenario(s) Dialog Box



Top Section

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the **Settings** button allows you to configure the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Editor adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor creates a `scenarios` file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

Middle Section

The middle section of the dialog box displays the scenarios that you can apply to the current document. You can view both the scenarios associated with the current document type and the scenarios defined at project level *(page 3233)*. The following columns are used to display the transformation scenarios:

- **Association** - The checkboxes in this column mark whether or not a transformation scenario is associated with the current document.
- **Scenario** - This column presents the names of the transformation scenarios.
- **Type** - If the **Show Type** contextual menu option is selected, this column displays the type of the transformation scenario. For further details about the types of transformation scenarios that are available in Oxygen XML Editor, see the Transformation Types section *(page 1719)*.

- **Storage** - If the **Show Storage** contextual menu option is selected, this column displays where a transformation scenario is stored.

To sort each column you can left-click its header. The contextual menu of each header also includes the following actions:

Show Type

Use this option to display the transformation type of each scenario.

Show Storage

Use this option to display the storage location of the scenarios.

Group by Association

Select this option to group the scenarios depending on whether or not they are associated with the current document.

Group by Type

Select this option to group the scenarios by their type.

Group by Storage

Select this option to group the scenarios by their storage location.

Ungroup all

Select this option to ungroup all the scenarios.

Reset Layout

Select this option to restore the default settings of the layout.

Each transformation scenarios listed in the middle section of the dialog box also includes the following contextual menu actions:

Edit

This button opens the **Edit Scenario** configuration dialog box *(page 1718)* that allows you to configure the options of the transformations scenario.

Duplicate

Use this button to create a duplicate transformation scenario *(page 1720)*.

Remove

Use this button to remove custom transformation scenarios.

Change storage

Allows you to change the storage location of a transformation scenario to **Project Options** *(page 3233)* or **Global Options** *(page 3230)*. You are also able to keep the

original storage location and make a copy of the selected scenario in the new storage location.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Editor adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor creates a `scenarios` file that contains the scenarios that you export. This is useful if you want to share scenarios with others or export them to another computer.

Bottom Section

The bottom section of the dialog box contains the following actions and information:

Association follows selection

Select this checkbox to automatically associate selected transformation scenarios with the current document. This option can also be used for multiple selections.

Note: When this option is selected, the **Association** column is hidden.

New

This button allows you to create a new transformation scenario *(page 1644)*.

Edit

This button opens the **Edit Scenario** dialog box that allows you to configure the options of the transformations scenario. For information about all the specific options in the various tabs, see the Transformation Types section *(page 1719)*.

Note: If you try to edit a transformation scenario associated with a defined document type, Oxygen XML Editor displays a warning message to inform you that this

is not possible and gives you the option to create a duplicate transformation scenario *(page 1720)* to edit instead.

Duplicate

Use this button to create a duplicate transformation scenario *(page 1720)*.

Remove

Use this button to remove transformation scenarios.

Note: Removing scenarios associated with a defined document type is not allowed.

Associated scenarios section

Displays the scenarios that are associated with the current document. Selecting a checkbox in the **Association** column *(page 1723)* in the list of scenarios will add that scenario to this section. To remove a scenario from being associated with the current document, simply click the remove icon ( ) to the right of the scenario name.

Save and close

Saves the current configuration and closes the dialog box.

Apply associated

Use this button to apply the associated scenarios and run the transformation on the current document.

Cancel

Cancels any changes made in the dialog box and reverts to the previously saved association.

Your selections in the **Configure Transformation Scenarios(s)** dialog box are persistent so the configured associations for the current document will be remembered after the dialog box is closed.

Related Information:

Editing a Transformation Scenario *(page 1718)*

Duplicating a Transformation Scenario *(page 1720)*

Applying Associated Transformation Scenarios *(page 1721)*

Creating New Transformation Scenarios *(page 1644)*

Sharing Transformation Scenarios *(page 1728)*

Batch Transformations

A transformation action can be applied on a batch of selected files from the contextual menu of the **Project** view *(page 338)* without having to open the files involved in the transformation. You can apply the same scenario to a batch of files or multiple scenarios to a single file or batch of files.

1. (Optional, but recommended) Organize the files you want to transform in logical folders.

   a. Create a logical folder in the **Project** view *(page 332)* by using the **New > Logical Folder** action from the contextual menu of the root file.

   b. Add files you want to transform to the logical folder by using the **Add Files** or **Add Edited File** actions from the contextual menu of the logical folder.

   Note: You can skip this step if the files are already in a dedicated folder that does not include any additional files or folders. You can also manually select the individual files in the **Project** view *(page 332)* each time you want to transform them, but this can be tedious.

2. Select the files you want to transform (or the newly created logical folder) and from the contextual menu, select **Transform > Configure Transformation Scenario(s)** to choose one or more transformation scenarios to be applied on all the files in the logical folder.
3. Use Oxygen XML Editor editor variables *(page 275)* to specify the input and output files. This ensures that each file from the selected set of resources is processed and that the output is not overwritten by the subsequent processing.
   a. Edit the transformation scenario to make sure the appropriate editor variable *(page 275)* is assigned for the input file. For example, for a *DocBook PDF transformation* make sure the **XML URL** input box is set to the *${currentFileURL}* editor variable *(page 280)*. For a DITA PDF transformation make sure the `args.input` parameter is set to the *${cf}* editor variable *(page 279)*.
   b. Edit the transformation scenario to make sure the appropriate editor variable is assigned for the output file. For example, for an **XML transformation with XSLT**, switch to the **Output** tab and set the path of the output file using a construct of editor variables *(page 275)*, such as `${cfd}/${cfn}.html`.
4. Now that logical folder has been associated with one or more transformation scenarios, whenever you want to apply the same batch transformation you can select **Transform > Transform with** from the contextual menu and the same previously associated scenario(s) will be applied.
5. If you want a different type of transformation to be applied to each file inside the logical folder, associate individual scenarios for each file and select **Transform > Apply Transformation Scenario(s)** from the contextual menu of the logical folder.

Related Information:

Editor Variables *(page 275)*

Sharing Transformation Scenarios

The transformation scenarios and their settings can be shared with other users by saving them at project level *(page 3233)* or by exporting them to a specialized scenarios file *(page 275)* that can then be imported. When you create a new transformation scenario or edit an existing one, there is a **Storage** option to control whether the scenarios are stored in **Project Options** *(page 3233)* or **Global Options** *(page 3230)*.

Selecting **Project Options** *(page 3233)* stores the scenario in the project file and can be shared with other users that have access to the project. If your project is saved on a source versioning system (CVS, SVN, Source Safe, etc.) then your team will have access to the scenarios that you define. When you create a scenario at the project level, the URLs from the scenario become relative to the project URL.

Selecting **Global Options** *(page 3230)* stores the scenario in the global options that are stored in the user home directory.

You can also change the storage options on existing transformation scenarios by using the **Change storage** action *(page 1722)* from the contextual menu of the list of scenarios.

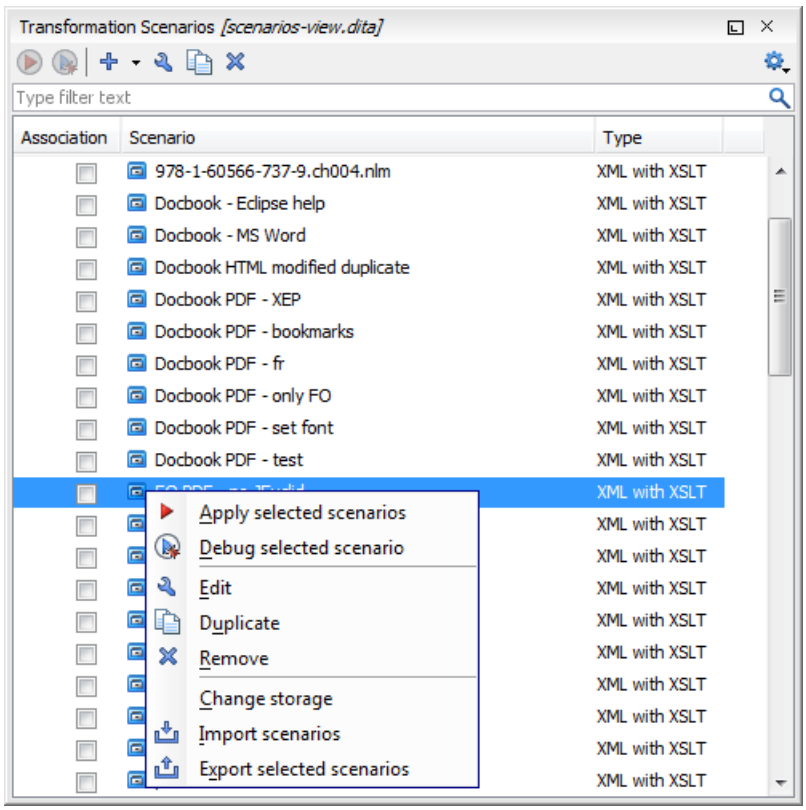
Related Information:

Sharing Application Settings *(page 265)*

Transformation Scenarios View

You can manage the transformation scenarios by using the **Transformation Scenarios** view. To open this view, select **Window > Show View > Transformation Scenarios**.

Figure: Transformation Scenarios view



Oxygen XML Editor supports multiple scenarios association. To associate multiple scenarios with a document, select the checkboxes in front of each scenario. You can also associate multiple scenarios with a document from the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

The **Transformation Scenarios** view presents both global and project-level *(page 3233)* scenarios. By default, Oxygen XML Editor presents the items in the following order:

1. Scenarios that match the current *framework (page 3229)*.
2. Scenarios that match the current project.
3. Scenarios that match other *frameworks*.

Toolbar/Contextual Menu Actions and Options

The following actions and options are available on the toolbar or in the contextual menu:

Apply selected scenarios

Select this option to run the current transformation scenario.

Debug selected scenario

Select this option to switch to the **Debugger** *perspective (page 3232)* and initialize it with the parameters from the scenario (the XML, XSLT, or XQuery input, the transformation engine, the XSLT parameters).

New

This drop-down menu contains a list of the scenarios that you can create *(page 1644)*. Oxygen XML Editor determines the most appropriate scenarios for the current type of file and displays them at the beginning of the list, followed by the rest of the scenarios.

Duplicate

Adds a new scenario to the list that is a duplicate of the current scenario. It is useful for creating a scenario that is similar to an existing one.

Edit

Opens the dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the Transformation Types section *(page 1719)*.

Remove

Removes the current scenario from the list. This action is also available by using the **Delete** key.

Change storage

Use this option to change the storage location of the selected scenario. You are also able to keep the original storage location and make a copy of the selected scenario in the target storage location.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Editor adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export transformation and validation scenarios individually. Oxygen XML Editor creates a `scenarios` file that contains the scenarios that you export.

Settings

This drop-down menu allows you to configure the following options (many of these options are also available if you right-click the name of a column):

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Change storage

Use this option to change the storage location of the selected scenario to **Project Options** *(page 3233)* or **Global Options** *(page 3230)*. You are also able to keep the original storage location and make a copy of the selected scenario in the new storage location.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the `scenarios` file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note: When you keep both scenarios, Oxygen XML Editor adds `imported` to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor creates a `scenarios` file that contains the scenarios that you

export. This is useful if you want to share scenarios with others or export them to another computer.

Show Type

Use this option to display the transformation type of each scenario.

Show Storage

Use this option to display the storage location of the scenarios.

Group by Association

Select this option to group the scenarios depending on whether or not they are associated with the current document.

Group by Type

Select this option to group the scenarios by their type.

Group by Storage

Select this option to group the scenarios by their storage location.

Ungroup all

Select this option to ungroup all the scenarios.

Reset Layout

Select this option to restore the default settings of the layout.

Your selections in the **Transformation Scenarios** view are persistent so the configured associations for the current document will be remembered whenever the document is opened.

Creating New Transformation Scenarios *(page 1644)*

WebHelp Output Customization

Oxygen XML WebHelp provides the ability to generate two different types of output, **WebHelp Responsive** and **WebHelp Classic**. Both types include a feedback-enabled variant and each has its own set of options and features. The **WebHelp Responsive** variants are available for DITA documents while the **WebHelp Classic** variants are available for both DITA and DocBook.

Table 70. WebHelp System Feature Matrix

Features	WebHelp System Variants			
	Responsive w/ Feedback	Responsive	Classic w/ Feedback	Classic
Desktop Systems	✓	✓	✓	✓
Mobile Devices	✓	✓		
Built-in Skins	✓	✓	✓	✓
Built-in Templates	✓	✓		
Search Capabilities	✓	✓	✓	✓
Modern Layout	✓	✓		
Adaptable to Any Screen Size	✓	✓		
Comments Section	✓		✓	
DITA Documents	✓	✓	✓	✓
DocBook Documents			✓	✓
Tri-Pane Frames or Frameless Version			✓	✓

WebHelp Classic Output

The **WebHelp Classic** variant is designed for desktop systems when feedback from users is not necessary and it is available for DocBook and DITA document types. The **WebHelp Classic with Feedback** variant also includes a feedback system that allows your users to make comments and allows you to manage and reply to them. This section contains information about configuring a WebHelp Classic system and customizing the output.

This type of WebHelp system can be generated by using one of the following transformation scenarios:

- **DITA Map WebHelp Classic** transformation scenario *(page 1624)*
- **DITA Map WebHelp Classic with Feedback** transformation scenario *(page 1625)*
- **DocBook WebHelp Classic** transformation scenario *(page 1638)*
- **DocBook WebHelp Classic with Feedback** transformation scenario *(page 1639)*

WebHelp Classic Output Layout and Features

Layout of the WebHelp Classic System Interface

The layout of the **WebHelp Classic** system is comprised of the following components:

Left Pane or Frame

This section on the left side of the help system includes the following tabs:

Content

A typical table of contents style presentation of your content. You can use the **Expand all/** **Collapse all** buttons to expand or collapse all the topics presented in the Table of Contents.

Note: You can enhance the appearance of items in the *Table of Contents*. See the Customizing WebHelp Classic Output chapter *(page 1766)* for more details.

Index

Presents the index terms for your content. If your content does not contain any `indexterm` elements, this tab is not generated.

Search Results

This tab is generated when the **Search** field is used. It presents the search results in the form of links to topics where the search terms are found, along with a rating scheme for each result. For more details, see the Search Feature section *(page 1737)*.

Upper Pane or Frame

The upper section of the help system includes the following features:

Search Field

Use this feature to perform searches in your content. When you enter search terms in this field, the results are displayed in the **Search Results** tab in the left section of the help system, along with a rating scheme for each result. For more details, see the Search Feature section *(page 1737)*.

Frames Option

Click on this option to display the output rendered in HTML frames.

Print Option

Opens a dialog box with various printing options and a print preview.

Navigation Links

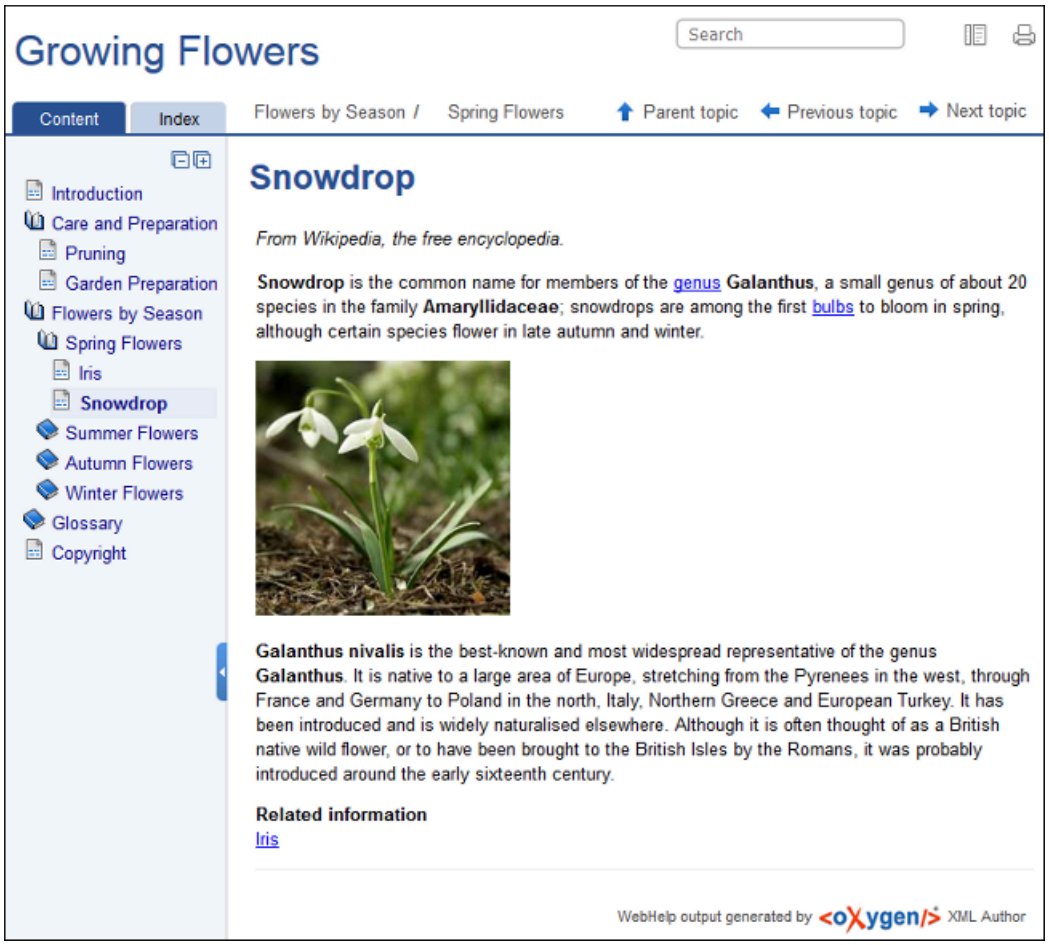
You can navigate through the content of your output using the navigation links or arrows in the upper-right part of the page. These arrows allow you to move to the **Parent topic**, **Previous topic**, or **Next topic**. Links to the parent topics of the currently opened topic are also presented at the top of the page. For DITA output, these navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference, navigation links will be generated in the output for that topic and all of its child topics.

Tip: To hide the **Parent**, **Next**, and **Previous** links, you can edit the transformation scenario and set the value of the `args.hide.parent.link` parameter to `yes`.

Main Pane or Frame

The content of the help pages are rendered and displayed in this main section.

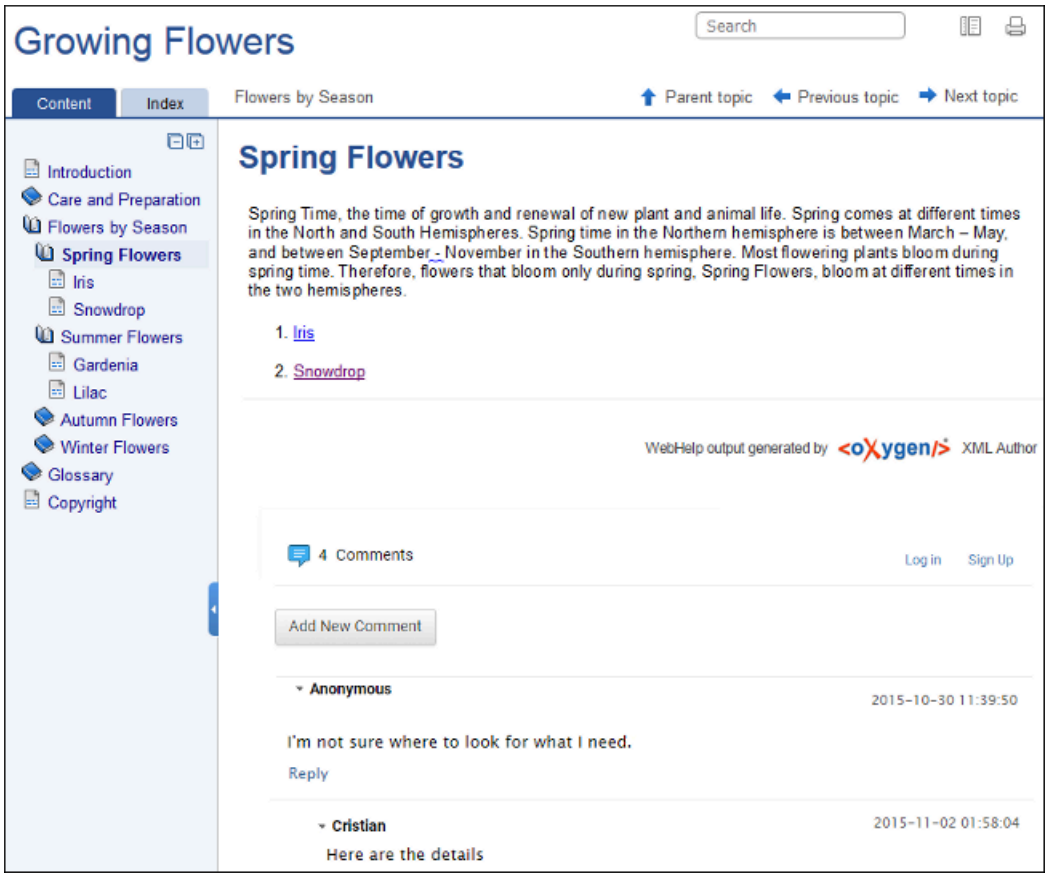
Figure: WebHelp Classic Output



WebHelp Classic with Feedback Enabled

The **WebHelp Classic with Feedback** variant also contains a **Comments** section at the bottom of each topic. This section is where you can interact with users through a comment system. For information about deploying a feedback-enabled system, see Deploying a Feedback-Enabled System *(page 1831)*.

Figure: WebHelp Classic with Feedback Comments Section



To add a new comment, click the **Add New Comment** button, or click **Reply** to add a comment to an existing thread. You can click on the **Log in** button on the right side of this bar to be authenticated as a user and your user name will be included in any comments that you add. If you do not have a user name, you can click on the **Sign Up** button to create a new user.

After you log in, your name and user name are displayed in the **Comments** bar, along with the **Log off** and **Edit** buttons. Click the **Edit** button to open the **User Profile** dialog box where you can customize the following options:

- **Your Name** - You can use this field to edit the initial name that you used to create your user profile.
- **Your email address** - You can use this field to edit the initial email address that you used to create your profile.
- You can choose to receive an email in the following situations:

When a comment is left on a page that you commented on.
When a comment is left on any topic in the WebHelp Classic system.
When a reply is left to one of my comments.

- **New Password** - Allows you to enter a new password for your user account.

Note: The **Current Password** field from the top of the **User Profile** is mandatory if you want to save the changes you make.

If you are an administrator, you can manage user information and comments. For more information, see Managing Users and Comments in a Feedback-Enabled System *(page 1835)*.

WebHelp Classic Search Engine

Search Rules

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, *"grow flowers"* will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a *phrase search*.
- *Boolean Search* is supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).
- `indexterm` and `keywords` DITA elements are an effective way to increase the ranking of a page (for example, content inside a *keywords* element weighs more than an *H1* HTML element).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot (".") characters count as a single word.
- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

5-Star Rating Mechanism and Sorting

The **Search** feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:

The search term is included in a meta keyword
The search term is in the title of the page
The search term is in bold text in a paragraph
The search term is in normal text in a paragraph

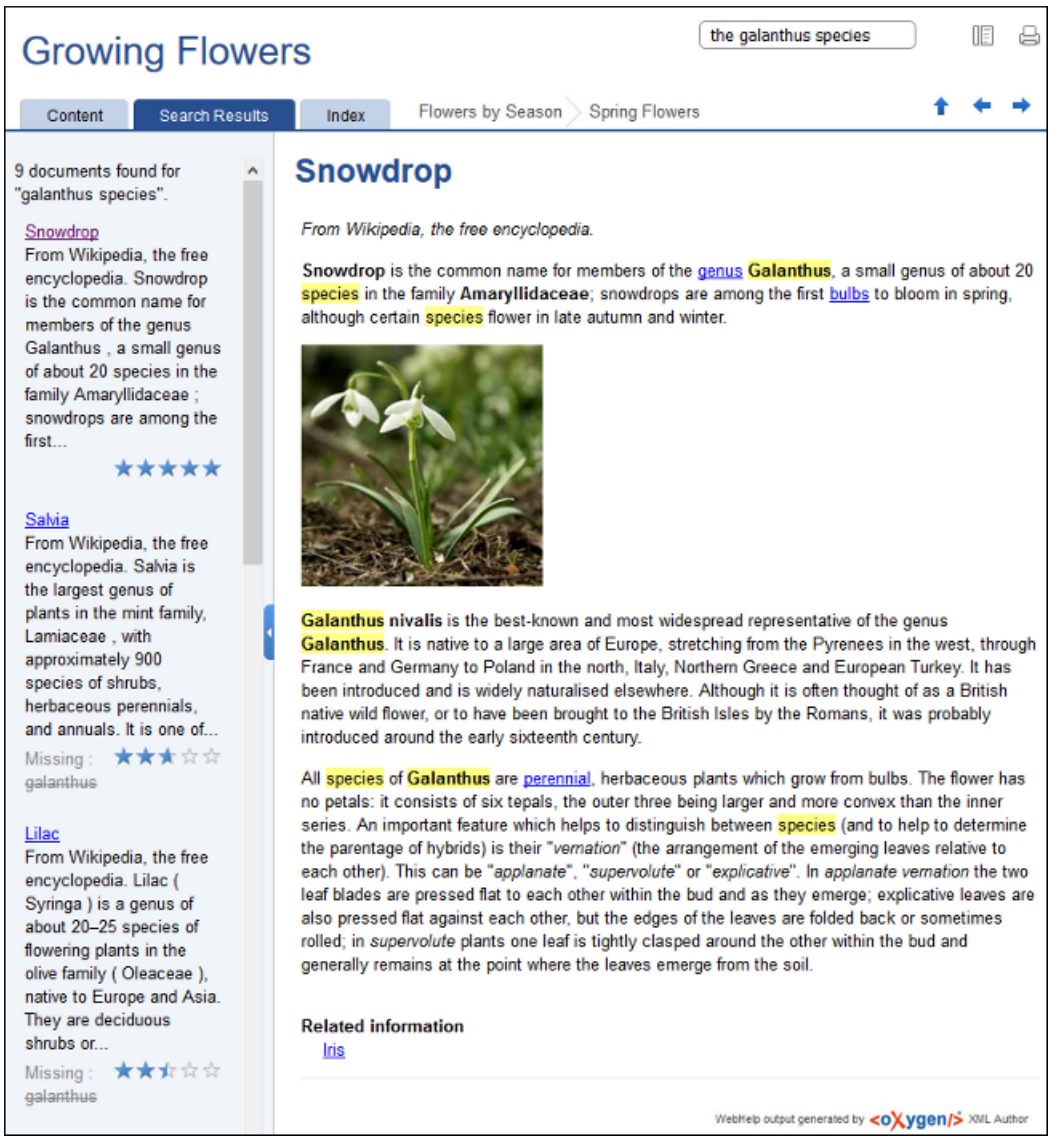
Excluded Terms

To improve performance, the **Search** feature excludes certain *stop words*. For example, the English version of such *stop words* include: *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*.

WebHelp Classic Search Results Tab

When you enter search terms in the **Search** field at the top of the help system, the results are displayed in the **Search Results** tab in the left section. When you click on a result in the **Search Results** tab, that result is displayed in the main pane with the search terms highlighted. If you press **Enter** with the **Search** field empty, the highlights are removed.

Figure: WebHelp Classic Search Results Tab



Missing Terms

If you enter multiple search terms (other than *stop words*), for any result that the search engine found at least one term but not one or more of the other terms, the **Missing** terms will be listed below each result.

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see Changing Element Scoring in Search Results *(page 1775)*.

Browser Compatibility

This output format is compatible with the most recent versions of the following common browsers:

- Edge
- Internet Explorer (IE 10 or newer)
- Chrome
- Firefox
- Safari
- Opera

⚠ **Important:** Due to some security restrictions in certain browsers (Google Chrome and Internet Explorer), WebHelp Classic pages loaded from the local system (through URLs of the `file:///...` format) may not work properly. We recommend that you load WebHelp Classic pages in Google Chrome or Internet Explorer only from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`).

❗ **Warning:** Due to some restrictions in web browsers in regards to JavaScript code, the *frameless* version (`index.html` start page) of the WebHelp Classic system should only be loaded from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`). When loading WebHelp Classic pages from the local file system, the *frameset* version (`index_frames.html` start page) of the WebHelp Classic system should be used instead (`file:///...`).

Deploying a Feedback-Enabled System

System Requirements

The feedback-enabled WebHelp system requires a standard server deployment. You can request this from your server administrator and it requires the following system components:

- A Web server (such as *Apache Web Server*)
- A *MySQL* or *MariaDB* database server
- A database admin tool (such as *phpMyAdmin*)
- PHP Version 5.1.6 or later

The WebHelp system supports most of the recent versions of the following browsers: Chrome, Firefox, Edge, Internet Explorer, Safari, Opera.

Create WebHelp with Feedback Database

The **WebHelp with Feedback** system needs a database to store user details and the actual feedback, and a user added to it with all privileges. After this is created, you should have the following information:

- Database name

- Username
- Password

Exactly how you create the database and user depends on your web host and your particular needs.

Example:

The following procedure uses *phpMyAdmin* to create a MySQL database for the feedback system and a MySQL user with privileges for that database. The feedback system uses these credentials to connect to the database.

Using *phpMyAdmin* to create a database:

1. Access the *phpMyAdmin* instance running on your server.
2. Click *Databases* (in the right frame) and then create a *database*. You can give it any name you want (for example *comments*).
3. Create a user with connection privileges for this database.
4. Under *localhost*, in the right frame, click *Privileges* and then at the bottom of the page click the **reload the privileges** link.

Deploying the WebHelp with Feedback Output

If you have a web server configured with PHP and MySQL, you can deploy the **WebHelp with Feedback** output by following these steps:

1. Connect to your server using an FTP client.
2. Locate the home directory (from now on, referred to as *DOCUMENT_ROOT*) of your server.
3. Copy the transformation output folder into the `DOCUMENT_ROOT` folder.
4. Rename it to something relevant (for example, `myProductWebHelp`).
5. Open the output folder (for example, `http://[YOUR_SERVER]/myProductWebHelp/`). You are redirected to the installation wizard. Proceed with the installation as follows:
   a. Verify that the prerequisites are met.
   b. Press **Start Installation**.
   c. Configure the **Deployment Settings** section. Default values are provided, but you should adjust them as needed.

      Tip: You can change some of the options later. The installation creates a `config.php` file in `[OXYGEN_WEBHELP_INSTALL_DIR]/feedback/resources/php/config/config.php` where all your configuration options are stored.

   d. Configure the **MySql Database Connection Settings** section. Use the information (database name, username, password) from the Create WebHelp with Feedback Database section *(page 1832)* to fill-in the appropriate text boxes.

Warning: Selecting the **Create new database structure** option will overwrite any existing data in the selected database, if it already exists. Therefore, it is useful the first time you install the **WebHelp with Feedback** system, but you do not want to select this option on subsequent deployments.

e. If you are using a domain (such as *OpenLDAP* or *Active Directory*) to manage users in your organization, select the **Enable LDAP Autehntication** option. This will allow you to configure the LDAP server, which will provide information and credentials for users who will access the WebHelp system. Also, this will allow you to choose which of the domain users will have administrator privileges.
f. If the **Create new database structure** option is selected, the **Create WebHelp Administrator Account** section becomes available. Here you can set the administrator account data. The administrator is able to moderate new posts and manage WebHelp users.

   The same database can be used to store comments for multiple **WebHelp with Feedback** deployments. If a topic is available in multiple deployments and there are comments associated with it, you can choose to display the comments in all deployments that share the database. To do this, select the **Display comments from other products** option. In the **Display comments from** section, a list with the deployments sharing the same database is displayed. Select the deployments allowed to share common feedback.

   Note: You can restrict the displayed comments of a product depending on its version. If you have two products that use the same database and you restrict one of them to display comments starting from a certain version, the comments of the other product are also displayed from the specified version onwards.

g. Press **Next Step**.
h. Remove the installation folder from your web server.

   Important: When you publish subsequent iterations of your **WebHelp with Feedback** system, you will not upload the `/install` folder in the output, as you only need it uploaded the first time you create the installation. On subsequent uploads, you will just upload the other output files.

i. In your Web browser, go to your **WebHelp with Feedback** system main page.

Testing Your WebHelp with Feedback System

To test your system, create a user and post a comment. Check to see if the notification emails are delivered to your email inbox.

Note: To read debug messages generated by the system:

1. Enable *JavaScript* logging by doing one of the following:
   - Open the `log.js` file, locate the `var log= new Log(Level.NONE);` line, and change the logging level to: `Level.INFO`, `Level.DEBUG`, `Level.WARN`, or `Level.ERROR`.
   - Append `?log=true` to the WebHelp URL.
2. Inspect the PHP and Apache server log files.

Documentation Product ID and Version

When you run a **WebHelp with Feedback** transformation scenario, by default you are prompted for a documentation product ID and version number. This is needed when multiple WebHelp systems are deployed on the same server. Think of your WebHelp output as a *product*. If you have three different WebHelp outputs, you have three different *products* (each with their own unique documentation product ID). This identifier is included in a configuration file so that comments are tied to a particular output (product ID and version number).

Note: The **WebHelp with Feedback** installation includes a configuration option (**Display comments from other products**) that allows you to choose to have comments visible in other specified *products*.

Related Information:

Managing Users and Comments in a Feedback-Enabled System *(page 1835)*

Refreshing the Content of a Feedback-Enabled System

It is common to update the content of an existing installation of a **WebHelp with Feedback** system on a regular basis. In this case, reinstalling the whole system is not a viable option since it might result in the loss of the comments associated with your topics. Also, reconfiguring the system every time you want to refresh it may be time consuming.

Fortunately, you can refresh just the content without losing the comments or the initial system configuration. To do so, follow these steps:

1. Execute the transformation scenario that produces the *WebHelp with Feedback* output directory.
2. Go to the output directory (specified in the **Output** tab of the transformation scenario), locate the `\feedback\resources\php\config\config.php` file, and delete it.
3. Locate the `\feedback\install` directory and delete it.
4. Copy the remaining structure of the output folder and paste it into your *WebHelp with Feedback* system installation directory, overwriting the existing content.

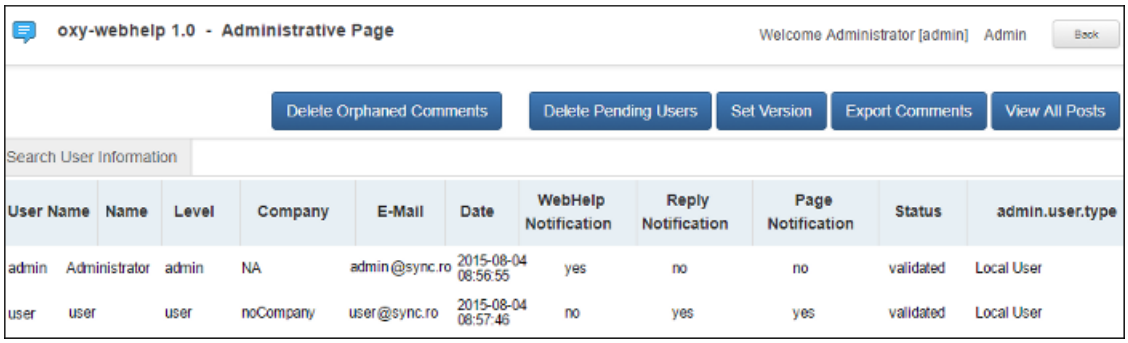
Managing Users and Comments in a Feedback-Enabled System

When you installed the **WebHelp with Feedback** system the first time (assuming the **Create new database structure** option *(page 1833)* was selected), you should have been prompted to create an administrator account (or a user named *administrator* was created by default). As an administrator, you have access to manage comments posted in your feedback-enabled WebHelp system. You can also manage the user information (such as role, status, or notification options).

To manage comments and user information, follow these steps:

1. At the bottom of each specific topic there is a **Comments** navigation bar and on the right side there is a **Log in** button. Click this button and log in with your administrator credentials. This gives you access to an **Admin Panel** button.
2. Click the **Admin Panel** button to display an administration page.

   Figure: Administrative Page

3. Use this page to manage the following options:

   Delete Orphaned Comments

   Allows you to delete comments that are no longer associated with a topic in your WebHelp system.

   Delete Pending Users

   Allows you to delete user accounts that you do not wish to activate.

   View All Posts

   Allows you to view all the comments that are associated with topics in your WebHelp system.

   Export Comments

   Allows you to export all posts associated with topics in your WebHelp system into an XML file.

   Set Version

   Use this action to display comments starting with a particular version.

Manage User Information

To edit the details for a user, click on the corresponding row. This opens a window that allows you to customize the following information associated with the user:

Name

The full name of the user.

Level

Use this field to modify the privilege level (role) for the selected user. You can choose from the following:

- **User** - Regular user, able to post comments and receive e-mail notifications.
- **Moderator** - In addition to the regular **User** rights, this type of user has access to the **Admin Panel** where a moderator can view, delete, export comments, and set the version of the feedback-enabled WebHelp system.
- **Admin** - Full administrative privileges. Can manage WebHelp-specific settings, users, and their comments.

Company

The name of the organization associated with the user.

E-Mail

The contact email address for the user. This is also the address where the WebHelp system sends notifications.

WebHelp Notification

When selected, the user receives notifications when comments are posted anywhere in your feedback-enabled WebHelp system.

Reply Notification

When selected, the user receives notifications when comments are posted as a reply to one of their comments.

Page Notification

When selected, the user receives notifications when comments are posted on a topic where they previously posted a comment.

Date

The date the user registered is displayed.

Status

Use this drop-down list to change the status of the user. You can choose from the following:

- **Created** - The user is created but does not yet have any rights for the feedback-enabled WebHelp system.
- **Validated** - The user is able to use the feedback-enabled WebHelp system.
- **Suspended** - The user has no rights for the feedback-enabled WebHelp system.

❗ **Warning:** The key used for identifying the page a comment is attached to is the relative file path to the output page. Since the output file and folder names mirror the source, any change to the file name (or its folder) in the source will affect the comments associated with that WebHelp page. If you change the file name or path, the comment history for that topic will become orphaned (a change to the topic ID does not affect the comment history).

Context-Sensitive WebHelp Classic System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

Generating Context-Sensitive Help

When WebHelp Classic output is generated, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `appContext` element, as in the following example:

```
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
  <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
    . . .
</map>
```

The possible attributes are as follows:

`helpID`

A Unique ID provided by a topic from two possible sources (`resourceid` element or the `id` attribute that is set on the topic root element):

`resourceid`

The `resourceid` element is mapped into the `appContext` element and can be specified in either the `topicref` within a *DITA map* or in a `prolog` within a DITA topic. The `resourceid` element accepts the following attributes:

- **`appname`** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty (`""`).
- **`appid`** - An ID used by an application to identify the topic.
- **`id`** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an **`appid`** attribute is used. Also, starting with DITA 1.3, the **`id`** attribute was deprecated in favor of the **`appid`** attribute.

Note: Multiple `appid` values can be associated with a single `appname` value (and multiple `appname` values can be associated with a single `appid` value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the `appid` and `appname` attributes should be unique within the context of a single *root map (page 3234)*. For example, suppose that you need two different functions of an application to both open the same WebHelp page.

Example: `resourceid` Specified in a DITA Map

The `resourceid` element can be specified in a `topicmeta` element within a `topicref`.

```
<map title="App Help">
  <topicref href="app-help1.dita" type="task">
     <topicmeta>
       <resourceid appname="myapp" appid="functionid1"/>
       <resourceid appname="myapp" appid="functionid2"/>
     </topicmeta>
  </topicref>
</map>
```

Example: `resourceid` Specified in a DITA Topic

The `resourceid` element can be specified in a `prolog` element within a DITA topic.

```
<task id="app-help1">
```

```
  <title>My App Help</title>
  <prolog>
    <resourceid appname="myapp" appid="functionid1"/>
    <resourceid appname="myapp" appid="functionid2"/>
  </prolog>
...
</task>
```

For more information about the `resourceid` element, see DITA Specifications: <resourceid>.

`id`

If a `resourceid` element is not declared in the *DITA map* or DITA topic (as described above), the `id` attribute that is set on the topic root element is mapped into the `appContext` element.

Important: You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

`path`

The path to a corresponding WebHelp page. This path is relative to the location of the `context-help-map.xml` mapping file.

`productID` **(Applicable only if you are using the WebHelp Classic with Feedback transformation scenario)**

The ID of the product for your documentation project.

`productVersion` **(Applicable only if you are using the WebHelp Classic with Feedback transformation scenario)**

The version of the product for your documentation project.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the `contextId` value and will look it up in the XML file.
- Invoke one of the WebHelp system files `index.html` or `index_frames.html` and pass the `contextId` parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the `contextId` parameter.

Note: The `contextId` parameter is not case sensitive.

The following example will open a *frameless* version of the WebHelp system showing the page associated with the ID `dialog1ID`:

```
index.html?contextId=dialog1ID
```

The following example will open a *frameset* version of the WebHelp system showing the page associated with the ID `view1ID`:

```
index_frames.html?contextId=view1ID
```

Tip: You can use an *anchor (page 3226)* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.

Context-Sensitive Queries

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

- **contextId** - The WebHelp JavaScript engine will look for this value in the `context-help-map.xml` mapping file and load the corresponding help page.

  Note: You can use an *anchor (page 3226)* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.

- **appname** - You can use this parameter in conjunction with `contextId` to search for this value in the corresponding *appname* attribute value *(page 1747)* in the mapping file.

  ```
  http://localhost/webhelp/index.html?contextId=topicID&appname=myApplication
  ```

Generating WebHelp Classic Output for DITA

The publishing process can be initiated from a transformation scenario within **Oxygen XML Editor/Author**, from a command line outside **Oxygen XML Editor/Author**, or from an integration server.

Running from **Oxygen XML Editor/Author**

To publish DITA content to WebHelp Classic output from a transformation scenario inside **Oxygen XML Editor/Author**, use one of the following procedures, depending on whether or not you want a feedback section in your output.

WebHelp Classic Output

To publish a *DITA map (page 3228)* as a **WebHelp Classic** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.

2. Select the **DITA Map WebHelp Classic** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:
   - **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
   - **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
   - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
   - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
   - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to process the transformation.

   When the **DITA Map WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

To further customize this transformation, you can edit various parameters, including the following most commonly used ones:

WebHelp Classic with Feedback Output

To publish a *DITA map (page 3228)* as a **WebHelp Classic with Feedback** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Classic with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:
   - **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
   - **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
   - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
   - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
   - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to begin the transformation.

5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

   When the **DITA Map WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment *(page 1831)*.

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

Running from Command Line

To publish to the **WebHelp Classic** output from a command line outside of **Oxygen XML Editor/Author**, you can use the `dita` startup script that comes bundled with distribution.

Required Arguments for the *dita* Command Startup Script:

`DITA-OT-DIR` *(page 3229)*`\bin\[executable] -i [path_to_input.ditamap] -f [transformation_type]`

executable

Windows - The `dita.bat` script located in: `DITA-OT-DIR` *(page 3229)*`\bin\`.

Linux/Mac OS X - The `dita` script file located in: `DITA-OT-DIR` *(page 3229)*`/bin/`.

-i / -input

Specifies the master file for your DITA documentation project. Typically this is a DITA map.

-f / -format

Specifies the transformation type. The **Oxygen XML WebHelp Plugin** contributes the following transformation types for DITA:

- **webhelp** - The transformation that produces **WebHelp Classic** output for desktop.
- **webhelp-feedback** - The transformation that produces feedback-enabled **WebHelp Classic with Feedback** for desktop.

Additional Options or Parameters:

You can also use DITA-OT options to modify the command behavior or additional configuration parameters that are contributed by the **Oxygen XML WebHelp Plugin** *(page 1752)*.

`DITA-OT-DIR` *(page 3229)*`\bin\[executable] -i [path_to_input.ditamap] -f [transformation_type] [option] -D[parameter=value]`

Command Line Examples:

- **Windows:** `dita.bat -i c:\mySample.ditamap -f webhelp-responsive -o c:\output -Dwebhelp.logo.image=C:\images\myLogo.jpg`
- **Linux/Mac OS X:** `dita -i C:/mySample.ditamap -f webhelp-responsive -o C:/output -Dwebhelp.logo.image=C:/images/myLogo.jpg`

Additional WebHelp Parameters for DITA

You can append the following parameters to the command line that runs the transformation:

`-Dwebhelp.copyright` **(not available for WebHelp Responsive systems)**

Adds a small copyright text that appears at the end of the **Table of Contents** pane.

`-Dwebhelp.custom.resources`

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

`-Dwebhelp.favicon`

The file path that points to an image to be used as a *favicon* in the WebHelp output.

`-Dwebhelp.footer.file` **(not available for WebHelp Responsive systems)**

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); }
       (document, 'script', 'facebook-jssdk')); -->
    </script>
    <div data-share="true" data-show-faces="true" data-action="like"
       data-layout="standard" class="fb-like"/>
```

```
</div>
```

`-Dwebhelp.footer.include` **(not available for WebHelp Responsive systems)**

Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, `no`. If set to `no`, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then a default **Oxygen** footer is inserted in each WebHelp page.

`-Dwebhelp.google.search.results`

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommend to set the `linkTarget` attribute to `frm` for frameless (*iframe*) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`

`-Dwebhelp.google.search.script`

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

`-Dwebhelp.logo.image.target.url`

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

`-Dwebhelp.logo.image`

Specifies a path to an image displayed as a logo in the left side of the output header.

`-Dwebhelp.product.id` **(available only for Feedback-enabled systems)**

This parameter specifies a short name for the documentation target, or product (for example, `mobile-phone-user-guide`, `hvac-installation-guide`).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

`-Dwebhelp.product.version` **(available only for Feedback-enabled systems)**

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

`-Dwebhelp.search.japanese.dictionary`

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages.

`-Dwebhelp.search.ranking`

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

`-Dwebhelp.show.changes.and.comments`

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

`-Dwebhelp.sitemap.base.url`

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the *DITA map*, appended to this base URL value. The `loc` element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

`-Dwebhelp.sitemap.change.frequency`

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

`-Dwebhelp.sitemap.priority`

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

`-Dwebhelp.skin.css` (available only for WebHelp Classic and WebHelp Classic with Feedback systems)

Path to a CSS file that sets the style theme in the WebHelp Classic output.
It can be one of the built-in skin CSS from the *`DITA-OT-DIR`*`/plugins/com.oxygenxml.webhelp.classic/predefined-skins` directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

Parameters Specific to WebHelp Responsive Output (available only for WebHelp Responsive and WebHelp Responsive with Feedback systems)

`-Dwebhelp.default.collection.type.sequence`

Specifies if the **sequence** value will be used by default when the `collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.

`-Dwebhelp.enable.search.autocomplete`

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is `yes`.

`-Dwebhelp.fragment.after.body`

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.after.logo_and_title`

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.after.main.page.search`

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.after.toc_or_tiles`

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.after.top_menu`

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.before.body`

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.before.logo_and_title`

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.before.main.page.search`

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.before.toc_or_tiles`

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.before.top_menu`

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.footer`

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.head`

In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.fragment.welcome`

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`-Dwebhelp.merge.nested.topics.related.links`

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is `yes`.

`-Dwebhelp.search.enable.pagination`

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

`-Dwebhelp.search.page.numberOfItems`

Specifies the number of search results items displayed on each page. This parameter is only used when the **webhelp.search.enable.pagination** parameter is enabled.

`-Dwebhelp.search.stop.words.exclude`

Specifies a list of words that will be excluded from the default list of *stop words* that are filtered out before the search processing. Use comma separators to specify more than one word (for example: `if,for,is`).

`-Dwebhelp.show.breadcrumb`

Specifies if the breadcrumb component will be presented in the output. The default value is `yes`.

`-Dwebhelp.show.child.links`

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is `no`.

`-Dwebhelp.show.indexterms.link`

Specifies if an icon that links to the index will be presented in the output. The default value is `yes`.

`-Dwebhelp.show.main.page.tiles`

Specifies if the tiles component will be presented in the main page of the output. For a *tree* style layout, this parameter should be set to `no`.

`-Dwebhelp.show.main.page.toc`

Specifies if the table of contents will be presented in the main page of the output. The default value is `yes`.

`-Dwebhelp.show.navigation.links`

Specifies if navigation links will be presented in the output. The default value is `yes`.

`-Dwebhelp.show.print.link`

Specifies if a print link or icon will be presented within each topic in the output. The default value is `yes`.

`-Dwebhelp.show.publication.toc`

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is `yes`.

`-Dwebhelp.show.topic.toc`

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. The default value is `yes`.

`-Dwebhelp.show.top.menu`

Specifies if a menu will be presented at the topic of the main page in the output. The default value is `yes`.

`-Dwebhelp.publication.toc.hide.chunked.topics`

Specifies if the table of contents will contain links for *chunked* topics. The default value is `yes`.

`-Dwebhelp.publication.toc.links`

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

`-Dwebhelp.publication.toc.tooltip.position`

By default, if a topic contains a `shortdesc` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left** (default)
- **right**
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

`-Dwebhelp.top.menu.depth`

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is `3`. A value of `0` means that the menu has unlimited depth.

`-Dwebhelp.topic.collapsible.elements.initial.state`

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are `collapsed` or `expanded` (default value).

Note: Note that the `fix.external.refs.com.oxygenxml` parameter is not supported. This parameter is normally used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.

Further Customization

If you need to further customize the transformation process, you can append other DITA-OT parameters as well. Any parameter that you want to append must follow the `-D` model of the above parameters. For example, to append the `args.csspath` parameter, use:

```
-Dargs.csspath=[CSS_FILE_PATH]
```

where `[CSS_FILE_PATH]` is the location of the directory that contains the CSS file.

Related Information:

DITA-OT Parameter Reference

Running from an Integration Server

Oxygen XML Editor can be processed from an automatic publishing system, such as *Jenkins* or *Travis*.

Automating DITA to WebHelp Output with Jenkins

To integrate WebHelp output with the Jenkins continuous integration tool, follow these steps:

1. Create a Maven project to incorporate the DITA-OT that already integrates Oxygen XML Editor.
2. Go to the root of your Maven project and edit the `pom.xml` file to include the following fragment:

```
<properties>
  <oxygen-webhelp>${basedir}/tools/DITA-OT2.5.2/
       plugins/com.oxygenxml.webhelp.responsive</oxygen-webhelp>
</properties>

<plugin>
  <artifactId>exec-maven-plugin</artifactId>
  <groupId>org.codehaus.mojo</groupId>
  <executions>
    <execution><!-- Run our version calculation script -->
      <id>Version Calculation</id>
      <phase>generate-sources</phase>
```

```
      <goals>
        <goal>exec</goal>
      </goals>
      <configuration>
        <executable>${oxygen-webhelp}/ditaWebhelp.bat</executable>
      </configuration>
    </execution>
  </executions>
</plugin>
```

Note: In the fragment above it is assumed that you are using DITA-OT version 2.5.4. If you are using another version, please adjust the path accordingly.

3. Go to the Jenkins top page and create a new Jenkins job. Configure this job to suit your particular requirements, such as the build frequency and location of the Maven project.

Automating DITA to WebHelp Output with Travis CI

This topic assumes you have a DITA project hosted on a GitHub public or private repository.

The goal of this tutorial is to help you setup a Travis continuous integration job that automatically publishes your DITA project to GitHub pages after every commit. The published website will contain a feedback link on each page that would allow a contributor to easily suggest changes to the documentation by creating a pull request on GitHub with just a few clicks.

Enable the Travis CI Build

1. Sign in to Travis CI with your GitHub account, accepting the GitHub access permissions confirmation.
2. Once you are signed in, and you have synchronized your GitHub repositories, go to your profile page and enable Travis CI for the repository you want to build.

Configure the Travis CI Build in your GitHub Project

1. Checkout your GitHub project locally.
2. Copy the `.travis` folder from here to the root directory of your project.
3. In the root of your GitHub project, add a file called `.travis.yml` with the following content:

```
language: dita
install:
  - echo "Installed"
script:
  - sh .travis/publish.sh
```

```
after_success:
  - sh .travis/deploy.sh
env:
  global:
    - DITAMAP=/path/to/your/ditamap/file
    - DITAVAL=/path/to/your/ditaval/file
    - ANT_OPTS=-Xmx1024M
```

Note: Replace `/path/to/your/ditamap/file` and `/path/to/your/ditaval/file` with the appropriate paths to your *DITA map* and `ditaval` files.

4. Create a GitHub personal access token by following this procedure.
5. Define an environment variable in the repository settings that has the name `GH_TOKEN` and the value equal with the GitHub personal access token created earlier.

Register Your License Key

1. Edit your `.gitignore` file (or create it if it does not already exist) and add the following line:

   ```
   licenseKey.txt
   ```

2. Copy your WebHelp license to the root of your GitHub project in a file called `licenseKey.txt`.

   Important: The `licenseKey.txt` file should not be committed to GitHub as it contains a license key that is issued only to you.

3. Encrypt the license key file and **add** it to the `.travis.yml` configuration file. This way only the Travis CI server will be able to decrypt it during the build process.

Commit to GitHub

1. Commit the following files and folders and push the commit to GitHub:

   ```
   git add .gitignore licenseKey.txt.enc .travis.yml .travis/
   git commit -m "Set up the Travis CI publishing system"
   git push
   ```

2. Create a `gh-pages` branch in your GitHub project where the WebHelp output will be published. You can follow the procedure here.

Generating WebHelp Classic Output for DocBook

The publishing process can be initiated from a transformation scenario within **Oxygen XML Editor/Author** or from a command line outside **Oxygen XML Editor/Author**.

Running from **Oxygen XML Editor/Author**

To publish DocBook content to WebHelp Classic output from a transformation scenario inside **Oxygen XML Editor/Author**, use one of the following procedures, depending on whether or not you want a feedback section in your output.

WebHelp Classic Output

To publish a DocBook document as a **WebHelp Classic** system, follow these steps:

1. Click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu.
2. Select the **DocBook WebHelp Classic** scenario from the **DocBook 4** or **DocBook 5** section.
3. Click **Apply associated**.

   When the **DocBook WebHelp Classic** transformation is complete, the output is automatically opened in your default browser.

WebHelp Classic with Feedback Output

To publish a DocBook document as a **WebHelp Classic with Feedback** system, follow these steps:

1. Click **Configure Transformation Scenarios**.
2. Select the **DocBook WebHelp Classic with Feedback** scenario from the **DocBook 4** or **DocBook 5** section.
3. Click **Apply associated**.
4. Enter the documentation product ID and the documentation version.

   When the **DocBook WebHelp Classic with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment. For more information, see Deploying a Feedback-Enabled System *(page 1831)*.

For more information about the feedback-enabled WebHelp system, watch our video demonstration:

Running from Command Line

To run a DocBook to WebHelp transformation outside of **Oxygen XML Editor/Author**, use the following script file:

- **Windows** - `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\docbook.bat`
- **Linux/Mac OS X** - `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/docbook.sh`

Before running the script to generate output, you must customize it to specify various paths and transformation type. To do this, open the script file and edit the following variables:

- **JVM_INSTALL_DIR** - Specifies the path to the Java Virtual Machine installation directory on your disk.
- **ANT_INSTALL_DIR** - Specifies the path to the installation directory of Ant.
- **SAXON_6_DIR** - Specifies the path to the installation directory of Saxon 6.5.5.
- **SAXON_9_DIR** - Specifies the path to the installation directory of Saxon 9.1.0.8.
- **DOCBOOK_XSL_DIR** - Specifies the path to the installation directory of the DocBook XSL distribution.
- **TRANSTYPE** - Specifies the type of the transformation you want to apply. The **Oxygen XML WebHelp Plugin** contributes the following transformation types for DocBook:
  # **webhelp** - The transformation that produces **WebHelp Classic** output for desktop.
  # **webhelp-feedback** - The transformation that produces feedback-enabled **WebHelp Classic with Feedback** for desktop.
- **INPUT_DIR** - Specifies the path to the input directory, containing the input XML file.
- **XML_INPUT_FILE** - Specifies the name of the input XML file.
- **OUTPUT_DIR** - Specifies the path to the output directory where the transformation output is generated.
- **DOCBOOK_XSL_DIR_URL** - Specifies the path to the directory of the DocBook XSL distribution in URL format.

You can also add additional configuration parameters that are contributed by the **Oxygen XML WebHelp Plugin** *(page 1763)*.

Additional WebHelp Parameters for DocBook

You can use various parameters in the command line to customize the transformation. Some of the most commonly used parameters include:

`-Ddefault.language`

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

`-Dclean.output`

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

`-Dl10n.gentext.default.language`

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

`-Duse.stemming`

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

`-Dwebhelp.copyright`

Adds a small copyright text that appears at the end of the **Table of Contents** pane.

`-Dwebhelp.custom.resources`

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

`-Dwebhelp.favicon`

The file path that points to an image to be used as a *favicon* in the WebHelp output.

`-Dwebhelp.footer.file`

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features (such as widgets for Facebook™, Twitter™, Google Analytics, or Google+™). The file must be well-formed, each widget must be in separate `div` or `span` element, and the code for each `script` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code exert is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); }
       (document, 'script', 'facebook-jssdk')); -->
    </script>
    <div data-share="true" data-show-faces="true" data-action="like"
       data-layout="standard" class="fb-like"/>
```

```
</div>
```

`-Dwebhelp.footer.include`

Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, `no`. If set to `no`, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then a default **Oxygen** footer is inserted in each WebHelp page.

`-Dwebhelp.logo.image.target.url`

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

`-Dwebhelp.logo.image`

Specifies a path to an image displayed as a logo in the left side of the output header.

`-Dwebhelp.product.id` **(available only for Feedback-enabled systems)**

This parameter specifies a short name for the documentation target, or product (for example, `mobile-phone-user-guide`, `hvac-installation-guide`).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

`-Dwebhelp.product.version` **(available only for Feedback-enabled systems)**

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

`-Dwebhelp.search.ranking`

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

`-Dwebhelp.skin.css`

Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the built-in skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\predefined-skins` directory, or it can be a custom skin CSS generated with the Oxygen Skin Builder web application.

If you need to further customize your transformation, other DocBook XSL parameters can be appended. Any parameter that you want to append must follow the `-D` model of the above parameters. For example, you can append the `html.stylesheet` parameter in the following form:

```
-Dhtml.stylesheet=/path/to/directory/of/stylesheet.css
```

Customizing WebHelp Classic Output

Oxygen XML WebHelp provides support for customizing the **WebHelp Classic** output to suit your specific needs. The **WebHelp Classic** type of output is designed for desktop systems and features a familiar *tri-pane* layout. You can use this system to publish DITA and DocBook document types. The **WebHelp Classic with Feedback** variant allows your users to add comments to your output.

To change the overall appearance of the **WebHelp Classic** output, you can use the visual WebHelp Skin Builder tool *(page 1816)*, which does not require knowledge of CSS language. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying option and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp system output, such as how to improve the appearance of the Table of Contents, add logo images in the title area, integrate with social media, add custom headers and footers, and much more.

Adding Custom HTML Content in WebHelp Classic Output

You can add custom HTML content in the WebHelp Classic output by inserting it in a well-formed XML file that will be referenced in the transformation. This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

Using Oxygen XML Editor/Author

To include custom HTML content in the WebHelp Classic output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:
   - **Well-Formedness** - If the file is not a *Well-formed XML* document *(page 1069)* (or fragments are not well-formed), the transformation will fail.

     A common use case is if you want to include several `script` or `link` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `html` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `head`, `body`, `html/head`, or `html/body` elements.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

```
<html>
  <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/
>
  <link rel="stylesheet" type="text/css"
        href="${oxygen-webhelp-output-dir}/css/test.css" />
</html>
```

  To copy the referenced resources to the output directory, follow the procedure in: Copying Additional Resources to Output Directory *(page)*.
- **Inline JavaScript or CSS Content** - If you want to include inline JavaScript or CSS content in the XML file, it is important to place this content inside an XML comment, as in the following examples:

  JavaScript:

```
<script type="text/javascript">
  <!--
    /* Include JavaScript code here. */

    function myFunction() {
      return true;
    }
  -->
</script>
```

  CSS:

```
<style>
  <!--
    /* Include CSS style rules here. */

    *{
      color:red
    }
  -->
</style>
```

2. Edit the WebHelp Classic transformation scenario.
3. Go to the **Parameters** tab.

4. Edit the value of the `webhelp.head.script` parameter and set it to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

   Note: If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.

5. Click **OK** to save the changes and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To include custom HTML content in the WebHelp Classic output using a script outside of **Oxygen XML Editor/Author** *(page 1749)*, follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:
   - **Well-Formedness** - If the file is not a *Well-formed XML* document *(page 1069)* (or fragments are not well-formed), the transformation will fail.

     A common use case is if you want to include several `script` or `link` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `html` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `head`, `body`, `html/head`, or `html/body` elements.
   - **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

     ```
     <html>
       <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/
     >
       <link rel="stylesheet" type="text/css"
             href="${oxygen-webhelp-output-dir}/css/test.css" />
     </html>
     ```

     To copy the referenced resources to the output directory, follow the procedure in: Copying Additional Resources to Output Directory *(page)*.

- **Inline JavaScript or CSS Content** - If you want to include inline JavaScript or CSS content in the XML file, it is important to place this content inside an XML comment, as in the following examples:

  JavaScript:

  ```
  <script type="text/javascript">
    <!--
      /* Include JavaScript code here. */

      function myFunction() {
        return true;
      }
    -->
  </script>
  ```

  CSS:

  ```
  <style>
    <!--
      /* Include CSS style rules here. */

      *{
        color:red
      }
    -->
  </style>
  ```

2. Use the `webhelp.head.script` parameter in your transformation script and set its value to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

   Note: If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.

3. Execute the transformation script.

For example, a DITA script might look like this::

- **Windows:**

  ```
  dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.head.script=c:\myFile.xml
  ```

- **Mac OS X/ Linux:**

```
dita -i C:/mySample.ditamap -f webhelp -Dwebhelp.head.script=C:/myFile.xml
```

Copying Additional Resources to Output Directory *(page)*

Adding a Favicon in WebHelp Systems

You can add a custom *favicon* to your WebHelp output by simply using a parameter in the transformation scenario to point to your *favicon* image. This is available for DITA and DocBook WebHelp output using **WebHelp Classic** or **WebHelp Classic with Feedback** transformations.

Using Oxygen XML Editor/Author

To add a *favicon* to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the WebHelp transformation scenario and open the **Parameters** tab.
2. Locate the `webhelp.favicon` parameter and enter the file path that points to the image that will be use as the *favicon*.
3. Run the transformation scenario.

   Result: Browsers that provide *favicon* support will display the *favicon* (typically in the browser's address bar, in the list of bookmarks, and in the history).

Using a Script Outside of Oxygen XML Editor/Author

⚠ **Important:** Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a *favicon* to your WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Specify the file path that points to the image that will be use as the *favicon* using the `webhelp.favicon` parameter.
2. Execute the transformation script.

Result: Browsers that provide *favicon* support will display the *favicon* (typically in the browser's address bar, in the list of bookmarks, and in the history).

For example:

- **Windows:**

```
dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.favicon=c:\myFavicon.jpg
```

- **Mac OS X/ Linux:**

```
dita -i C:/mySample.ditamap -f webhelp -Dwebhelp.favicon=C:/myFavicon.jpg
```

Adding a Logo Image in the Title Area

You can customize **WebHelp Classic** output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using a transformation scenario from within **Oxygen XML Editor/Author** or using a command line script outside of **Oxygen XML Editor/Author**.

Using Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit a **WebHelp Classic** transformation scenario, then open the **Parameters** tab.
2. Specify the path to your logo in the `webhelp.logo.image` parameter.
3. If you also want to add a link to your website when you click the logo image, set the URL in the `webhelp.logo.image.target.url` parameter.
4. Run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

⚠ **Important:** Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a logo in the title area of your WebHelp output using a script outside of **Oxygen XML Editor/ Author**, follow this procedure:

1. Specify the path to your logo using the `webhelp.logo.image` parameter.
2. If you also want to add a link to your website when you click the logo image, set the URL using the `webhelp.logo.image.target.url` parameter.
3. Execute the transformation script.

For example:

- **Windows:**

```
dita.bat -f webhelp -Dwebhelp.logo.image=c:\myLogo.jpg -
Dwebhelp.logo.image.target.url=http://sample-site.com
```

- **Mac OS X/ Linux:**

```
dita -f webhelp -Dwebhelp.logo.image=C:/myLogo.jpg -
Dwebhelp.logo.image.target.url=http://sample-site.com
```

Adding Video and Audio Objects in DITA WebHelp Classic

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

Adding Videos to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the video through one of the following methods:
   - Use the **Insert Media Object** toolbar action *(page 3017)*.
   - Drag (or copy) the video file from your system explorer or the **Project** view *(page 332)* and drop (or paste) it into your document.
   - Manually add an `object` element, as in one of the following examples:

     ```
     <object outputclass="video" type="video/mp4" data="MyVideo.mp4"/>
     ```

     or, instead of the `data` attribute, you can specify the video using a parameter like this:

     ```
     <object outputclass="video">
       <param name="src" value="videos/MyVideo.mp4"/>
     ```

```
</object>
```

2. Apply a **DITA to WebHelp** transformation to obtain the output.

   Result: The transformation converts the `object` element to an HTML5 `video` element.

```
<video controls="controls"><source type="video/mp4" src="MyVideo.mp4"></source>
</video>
```

Adding Audio Clips to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the audio clip through one of the following methods:
   - Use the **Insert Media Object** toolbar action *(page 3017)*.
   - Drag (or copy) the audio file from your system explorer or the **Project** view *(page 332)* and drop (or paste) it into your document.
   - Manually add an `object` element, as in one of the following examples:

```
<object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>
```

     or, instead of the `data` attribute, you can specify the video using a parameter like this:

```
<object outputclass="audio">
  <param name="src" value="audio/MyClip.mp3"/>
</object>
```

2. Apply a **DITA to WebHelp** transformation to obtain the output.

   Result: The transformation converts the `object` element to an HTML5 `audio` element.

```
<audio controls="controls"><source type="audio/mpeg" src="MyClip.mp3"></source>
</audio>
```

Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the **Insert Media Object** toolbar action *(page 3017)* or by manually adding an `object` element, as in one of the following examples:

```
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
```

   or, instead of the `data` attribute, you can specify the object using a parameter like this:

```
<object outputclass="iframe">
  <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4"/>
</object>
```

2. If you want the video to be allowed to play in full screen mode once the document is converted to XHTML output, also add an `allowfullscreen` parameter and set its value to **true**:

```
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
  <param name="allowfullscreen" value="true"/>
</object>
```

   Tip: If you copy the embed code from the source and paste it into the **Insert Media** dialog box (see the specific instructions: here *(page 3020)*), the `allowfullscreen` parameter will automatically be added and all you have to do is set the value to **true**.

3. Apply a **DITA to WebHelp** transformation to obtain the output.

   Result: The transformation converts the `object` element to an HTML5 `iframe` element.

```
<iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4">
</iframe>
```

For more information, see the following video demonstration:

Related Information:

Adding Video, Audio, and Embedded HTML Resources in DITA Topics *(page 3017)*

Adding Videos in DocBook WebHelp Classic Output

You can insert references to videos in your DocBook topics and then publish them to **WebHelp Classic** output. The videos can be played directly in all HTML5-based outputs, including WebHelp systems.

To add videos in the **WebHelp Classic** output generated from DocBook documents, follow these steps:

1. Edit the DocBook document and reference the video using an `mediaobject` element, as in the following example:

```
<mediaobject>
  <videoobject>
    <videodata fileref="http://www.youtube.com/watch/v/VideoName"/>
  </videoobject>
</mediaobject>
```

2. Apply a *WebHelp* or *WebHelp with Feedback* transformation scenario to obtain the output.

Changing Number Styles for Ordered Lists

Ordered lists (`ol`) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `outputclass` value and set it as an attribute of the ordered list, as in the following example:

```
<ol outputclass="number-alpha">
    <li>A</li>
    <li>B</li>
    <li>C</li>
</ol>
```

2. Add the following code snippet in a custom CSS file:

```
ol.number-alpha{
    list-style-type:lower-alpha;
}
```

3. Edit the WebHelp transformation scenario and open the **Parameters** tab.
   a. For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   b. For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
4. Run the transformation scenario.

Changing Element Scoring in Search Results

The WebHelp **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA or DocBook WebHelp systems. The properties file includes instructions and examples to help you with your customization.

a. For DITA WebHelp Classic systems, edit the following file: *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.classic\indexer\scoring.properties`.
b. For DocBook WebHelp system, edit the following file: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\indexer\scoring.properties`.

The values that can be edited in the `scoring.properties` file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i=3
u=3
div.toc=-10
title=20
div.ignore=ignored
meta_keywords = 20
meta_indexterms = 20
meta_description = 25
shortdesc=25
```

2. Save your changes to the file.
3. Re-run your WebHelp transformation.

Changing the Icons in a WebHelp Classic Table of Contents

You can change the icons that appear in a WebHelp Classic table of contents by assigning new image files in a custom CSS file. By default, these icons are defined with the following CSS codes (the first example is the icon that appears for a collapsed menu and the second for an expanded menu):

```
.hasSubMenuClosed{
    background: url('../img/book_closed16.png') no-repeat;
    padding-left: 16px;
    cursor: pointer;
}
```

```
.hasSubMenuOpened{
```

```
    background: url('../img/book_opened16.png') no-repeat;
    padding-left: 16px;
    cursor: pointer;
}
```

Using Oxygen XML Editor/Author

To assign other icons and use a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

   ```
   .hasSubMenuClosed{
       background: url('TOC-my-closed-button.png') no-repeat;
   }
   ```

   ```
   .hasSubMenuOpened{
       background: url('TOC-my-opened-button.png') no-repeat;
   }
   ```

2. It is recommended that you store the image files in the same directory as the default icons.
   - For DITA transformations: *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`.
   - For DocBook transformations: *[OXYGEN_INSTALL_DIR]*`\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`.
3. Edit the WebHelp transformation scenario and open the **Parameters** tab.
   - For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
4. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

⚠ **Important:** Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).

- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To assign other icons and use a script outside of **Oxygen XML Editor/Author** *(page 1749)*, follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

```
.hasSubMenuClosed{
    background: url('TOC-my-closed-button.png') no-repeat;
}
```

```
.hasSubMenuOpened{
    background: url('TOC-my-opened-button.png') no-repeat;
}
```

2. It is recommended that you store the image files in the same directory as the default icons.
   - For DITA transformations: *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`.
   - For DocBook transformations: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`.
3. Reference your custom CSS file:
   - For DITA transformations, use the `args.css` parameter in your transformation script and set its value to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For DocBook transformations, use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.
4. Execute the transformation script.

For example, a DITA script might look like this::

- **Windows:**

```
dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.css=c:\myFile.css -Dargs.copycss=yes
```

- **Mac OS X/ Linux:**

```
dita -i C:/mySample.ditamap -f webhelp -Dargs.css=C:/myFile.css -Dargs.copycss=yes
```

Copying Additional Resources to Output Directory

You can copy additional resources (such as JavaScript, CSS or other resources) to the output directory of a WebHelp system by using the `webhelp.custom.resources` parameter.

Using Oxygen XML Editor/Author

To copy additional resources to the output directory using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Place all your resources in the same directory.
2. Edit the WebHelp transformation scenario, then open the **Parameters** tab.
3. Edit the value for the `webhelp.custom.resources` parameter and set it to the absolute path of the directory in step 1.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

   Result: All files from the new directory will be copied to the root of the WebHelp output directory.

Using a Script Outside of Oxygen XML Editor/Author

⚠ **Important:** Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To copy additional resources to the output directory using a script outside of **Oxygen XML Editor/Author** *(page 1749)*, follow this procedure:

1. Place all your resources in the same directory.
2. Specify the absolute path to that directory using the `webhelp.custom.resources` parameter.
3. Execute the transformation script.

   Result: All files from the new directory will be copied to the root of the WebHelp output directory.

For example:

- **Windows:**

```
dita.bat -i c:\mySample.ditamap -f webhelp-responsive -Dwebhelp.custom.resources=c:\resources
```

- **Mac OS X/ Linux:**

```
dita -i C:/mySample.ditamap -f webhelp-responsive -Dwebhelp.custom.resources=C:/resources
```

Customizing the Appearance of Selected Items in the Table of Contents

The appearance of selected items in the table of contents of WebHelp Classic output can be enhanced.

For example, to highlight the background of the selected item, follow these steps:

1. Locate the `toc.css` file in the following directory:
   a. For DITA transformations: *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\css`.
   b. For DocBook transformations: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\css`.
2. Edit that CSS file, find the `menuItemSelected` class, and change the value of the `background` property.
3. Run the transformation.

Note: You can also overwrite the same value from your own custom CSS and then specify the path to your CSS in the transformation scenario by doing one of the following:

- For DITA transformations, use the `args.css` parameter and set its value to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
- For DocBook transformations, use the `html.stylesheet` parameter and set its value to the path of your custom CSS file.

Customizing WebHelp Output Through CSS Styling

The most common way to customize the look and style of your WebHelp output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario or script. This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using the CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using **F12** or by selecting **Inspect Element** (or simply **Inspect**) from the contextual menu.

Tip: When using Safari on Mac OS X, you must first enable the Develop menu by going to the Advanced settings and selecting **Show Develop menu in menu bar**. Then you can select **Show Web Inspector** from the Develop menu or click **Command + Option + I**.

Referencing the Custom CSS Using Oxygen XML Editor/Author

To use a custom CSS to style WebHelp output and use a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create your custom CSS file.
2. Edit the WebHelp transformation scenario and open the **Parameters** tab.
   - For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
3. Run the WebHelp transformation scenario to generate the output.

Referencing the Custom CSS Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To use a custom CSS to style WebHelp output and use a script outside of **Oxygen XML Editor/Author** *(page 1749)*, follow this procedure:

1. Create your custom CSS file.
2. Reference your custom CSS file:

- For DITA transformations, use the `args.css` parameter in your transformation script and set its value to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
- For DocBook transformations, use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.

3. Execute the transformation script.

For example, a DITA script might look like this::

- **Windows:**

```
dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.css=c:\myFile.css -
Dargs.copycss=yes
```

- **Mac OS X/ Linux:**

```
dita -i C:/mySample.ditamap -f webhelp -Dargs.css=C:/myFile.css -Dargs.copycss=yes
```

Disable Caching in WebHelp Classic Output

In cases where a set of WebHelp Classic pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a Web browser on the client side, rather than re-using an outdated *cached* version in the browser.

To disable caching in WebHelp Classic output, follow this procedure:

1. Edit the following XSL file for DITA or DocBook WebHelp systems:
   - For DITA WebHelp systems, edit the following file: *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\xsl\createMainFiles.xsl`.
   - For DocBook WebHelp system, edit the following file: *`[OXYGEN_INSTALL_DIR]`*`\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\xsl\createMainFiles.xsl`.
2. Locate the following template in the XSL file: `<xsl:template name-"create-toc-common-file">` and add the following code snippet:

```
<meta http-equiv="Pragma" content="no-cache" />
<meta http-equiv="Expires" content="-1" />
```

Note: The code should look like this:

```
<html>
  <head>
```

```
      <xsl:if test="$withFrames">
      <base target="contentwin"/>
      </xsl:if>
      <meta http-equiv="Content-Type" content="text/html; charset=utf-8"/>
           <!-- Disable caching of WebHelp pages in web browser. -->
      <meta http-equiv="Pragma" content="no-cache" />
      <meta http-equiv="Expires" content="-1" />
....
```

3. Save your changes to the file.
4. Re-run your WebHelp transformation scenario.

Excluding Certain DITA Topics from Search Results

There are several ways to exclude certain DITA resources from your WebHelp system's search results. This is useful if you have topics in your *DITA map (page 3228)* structure that you do not want to be included in search results for your WebHelp system. The first method involves setting a parameter in the WebHelp transformation scenario and the second involves setting an attribute for each DITA topic reference that you want to exclude.

Transformation Parameter Method

To exclude DITA topics from WebHelp search results using a transformation parameter, follow these steps:

1. Create a simple text file that will contain your excluded file patterns. Each pattern must be on a new line. The patterns are considered to be relative to the output directory and they accept wildcards such as `'*'` (matches zero or more characters) or `'?'` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

   Example: Suppose that in your project, you want to exclude all files located in the `resources` directory and all files located in the `topics` directory that have a `.bak` file extension. You could create a simple text file (for example, named `exclude.properties`), and add the following lines:

   ```
   resources/*
   topics/*.bak
   ```

2. Edit the WebHelp transformation scenario and open the **Parameters** tab.
3. Set the `webhelp.search.custom.excludes.file` parameter to specify the path to the file that contains the excluded file patterns (for example, `exclude.properties` in step 1).
4. Run the transformation scenario.

Search Attribute Method

The WebHelp **Search** engine does not index DITA topics that have the `@search` attribute set to `no`.

To exclude DITA topics from WebHelp search results using this attribute, follow these steps:

1. Edit the *DITA map* and for any `topicref` that you want to exclude from search results, set the `search` attribute to `no`. For example:

   ```
   <topicref href="../topics/internal-topic1.dita" search="no"/>
   ```

2. Save your changes to the *DITA map*.
3. Run your WebHelp system transformation scenario.

Flagging DITA Content in WebHelp Output

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for *block elements (page 3226)* (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in text.

Using Oxygen XML Editor/Author

To flag content in the DITA Map to WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as `audience-flag-build.ditaval`.
2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the `audience` attribute set to `programmer`, the content of the DITAVAL file should look like the following example:

   ```
   <?xml version="1.0" encoding="UTF-8"?>
   <val>
     <prop att="audience" val="programmer" action="flag"
    img="D:\resource\delta.gif" alt="sample alt text"/>
   </val>
   ```

   Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Edit a **DITA Map to WebHelp** transformation scenario.
4. Specify the DITAVAL file in the **Filters** tab of the transformation scenario.
5. Run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To flag content in the DITA Map to WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as `audience-flag-build.ditaval`.
2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the `audience` attribute set to `programmer`, the content of the DITAVAL file should look like the following example:

   ```
   <?xml version="1.0" encoding="UTF-8"?>
   <val>
     <prop att="audience" val="programmer" action="flag"
    img="D:\resource\delta.gif" alt="sample alt text"/>
   </val>
   ```

   Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.
3. Use the `args.filter` parameter in your transformation script and set its value to the path of the DITAVAL file.
4. Execute the transformation script.

For example:

- **Windows:**

  ```
  dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.filter=c:\myFile.ditaval
  ```

- **Mac OS X/ Linux:**

```
dita -i C:/mySample.ditamap -f webhelp -Dargs.filter=C:/myFile.ditaval
```

Generating or Hiding Navigation Links in WebHelp Classic Output

The WebHelp Classic output can contain navigation links (⬅ **Previous** / ➡ **Next** / ⬆ **Parent topic** arrows) that can be used to navigate to the previous, next, or parent topic.

How to Generate Navigation Links in WebHelp Classic Output

The navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference in your DITA map, navigation links will be generated in the output for that topic and all of its child topics (from parent to children, from children to parent, and from child to previous sibling and next sibling).

```
<map id="example_map" title="Example Map">
 <topicref href="../topics/ParentTopic.dita" collection-type="sequence">
  <topicref href="../topics/Childtopic.dita"/>
 </topicref>
```

How to Hide All Navigation Links in WebHelp Classic Output

To hide all navigation links, use the `args.hide.parent.link` parameter in the transformation and set its value to `no`.

Integrating Social Media and Google Tools in the WebHelp Classic Output

Oxygen XML Editor includes support for integrating some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Classic Output

It is possible to integrate Facebook™ into your **WebHelp Classic** output and the widget will appear in the footer sections of your WebHelp page.

Using Oxygen XML Editor/Author

To add a Facebook *Like* widget to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:

- The file must be well-formed.
- The code for each `script` element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="facebook">
    <div id="fb-root"/>
    <script>
        <!--
            (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
        }(document, 'script', 'facebook-jssdk'));
        -->
    </script>
    <div class="fb-like" data-layout="standard" data-action="like"
        data-show-faces="true" data-share="true"/>
</div>
```

4. In **Oxygen XML Editor/Author**, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu.
5. Select an existing WebHelp Classic transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `facebook-widget.xml` file that you created earlier.
7. Click **Ok** and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a Facebook *Like* widget to your WebHelp output using a script outside of **Oxygen XML Editor/Author** *(page 1749)*, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

```
<div id="facebook">
    <div id="fb-root"/>
    <script>
        <!--
            (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
        }(document, 'script', 'facebook-jssdk'));
        -->
    </script>
    <div class="fb-like" data-layout="standard" data-action="like"
        data-show-faces="true" data-share="true"/>
</div>
```

4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `facebook-widget.xml` file that you created earlier.
5. Execute the transformation script.

   For example:

   - **Windows:**

     ```
     dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\facebook-widget.xml
     ```

   - **Mac OS X/ Linux:**

     ```
     dita -i C:/mySample.ditamap -f webhelp -Dwebhelp.footer.file=C:/facebook-widget.xml
     ```

How to Add a Google+ Button in WebHelp Classic Output

It is possible to integrate *Google* into your **WebHelp Classic** output and the widget will appear in the footer section of your WebHelp page.

Using Oxygen XML Editor/Author

To add a *Google*+ widget to your WebHelp Classic output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Google Developers website.
2. Fill-in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

```
<div id="google-plus">
  <!-- Place this tag in your head or just before your close body tag. -->
  <script src="https://apis.google.com/js/platform.js" async defer></script>

  <!-- Place this tag where you want the +1 button to render. -->
  <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```

4. In **Oxygen XML Editor/Author**, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu.
5. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `google-plus-button.xml` file that you created earlier.
7. Click **Ok** and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).

- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a *Google+* widget to your WebHelp Classic output using a script outside of **Oxygen XML Editor/Author** *(page 1749)*, follow this procedure:

1. Go to the Google Developers website.
2. Fill-in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

```
<div id="google-plus">
  <!-- Place this tag in your head or just before your close body tag. -->
  <script src="https://apis.google.com/js/platform.js" async defer></script>

  <!-- Place this tag where you want the +1 button to render. -->
  <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```

4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `google-plus-button.xml` file that you created earlier.
5. Execute the transformation script.

   For example:

   - **Windows:**

     ```
     dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\google-plus-button.xml
     ```

   - **Mac OS X/ Linux:**

     ```
     dita -i C:/mySample.ditamap -f webhelp -Dwebhelp.footer.file=C:/google-plus-button.xml
     ```

How to Add Tweet Button in WebHelp Classic Output

It is possible to integrate *Twitter* into your **WebHelp Classic** output and the widget will appear in the footer section of your WebHelp page.

Using Oxygen XML Editor/Author

To add a Twitter *Tweet* widget to your WebHelp Classic output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill-in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `div` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
      !function (d, s, id) {
      var
      js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
 ? 'http': 'https';
      if (! d.getElementById(id)) {
      js = d.createElement(s);
      js.id = id;
      js.src = p + '://platform.twitter.com/widgets.js';
      fjs.parentNode.insertBefore(js, fjs);
      }
      }
      (document,
      'script', 'twitter-wjs');
     -->
  </script>
</div>
```

4. In **Oxygen XML Editor/Author**, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu.
5. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.

6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `tweet-button.xml` file that you created earlier.
7. Click **Ok** and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a Twitter *Tweet* widget to your WebHelp Classic output using a script outside of **Oxygen XML Editor/Author** *(page 1749)*, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill-in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `div` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
      !function (d, s, id) {
      var
      js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
 ? 'http': 'https';
      if (! d.getElementById(id)) {
      js = d.createElement(s);
      js.id = id;
      js.src = p + '://platform.twitter.com/widgets.js';
      fjs.parentNode.insertBefore(js, fjs);
      }
      }
      (document,
```

```
      'script', 'twitter-wjs');
    -->
  </script>
</div>
```

4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `tweet-button.xml` file that you created earlier.
5. Execute the transformation script.

   For example:

   - **Windows:**

     ```
     dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\tweet-button.xml
     ```

   - **Mac OS X/ Linux:**

     ```
     dita -i C:/mySample.ditamap -f webhelp -Dwebhelp.footer.file=C:/tweet-button.xml
     ```

How to Integrate Google Analytics in WebHelp Classic Output

You can use *Google Analytics* to track and report site data for your **WebHelp Classic** output.

Using Oxygen XML Editor/Author

To integrate *Google Analytics* into your WebHelp Classic output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your *Tracking ID*. A **Tracking Code** looks like this:

```
<script>
 (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
 (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
 m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

 ga('create', 'UA-XXXXXXXX-X', 'auto');
 ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. In **Oxygen XML Editor/Author**, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu.
6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `googleAnalytics.html` file that you created earlier.
8. Click **Ok** and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To integrate *Google Analytics* into your WebHelp Classic output using a script outside of **Oxygen XML Editor/Author** *(page 1749)*, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your *Tracking ID*. A **Tracking Code** looks like this:

```
<script>
 (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
 (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
 m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

 ga('create', 'UA-XXXXXXXX-X', 'auto');
 ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.

5. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `googleAnalytics.html` file that you created earlier.
6. Execute the transformation script.

   For example:

   - **Windows:**

     ```
     dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.footer.file=c:\googleAnalytics.xml
     ```

   - **Mac OS X/ Linux:**

     ```
     dita -i C:/mySample.ditamap -f webhelp -Dwebhelp.footer.file=C:/googleAnalytics.xml
     ```

How to Integrate Google Search in WebHelp Classic Output

It is possible to integrate the *Google Search Engine* into your **WebHelp Classic** output and you can specify where you want the results to appear in your WebHelp page.

Using Oxygen XML Editor/Author

To integrate the *Google Search Engine* into your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```
<script>
 (function()  {
  var cx =
    '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  gcse.src = (document.location.protocol == 'https:' ?
    'https:' : 'http:') +         '//www.google.com/cse/cse.js?cx=' + cx;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
 }
 )();
```

```
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.
5. In **Oxygen XML Editor/Author**, click the **Configure Transformation Scenario(s)** action from the toolbar (or the **Document > Transformation** menu.
6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.
8. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName-"searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.
9. Click **Ok** and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To integrate the *Google Search Engine* into your WebHelp Classic output using a script outside of **Oxygen XML Editor/Author** *(page 1749)*, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```
<script>
 (function()  {
```

```
  var cx =
    '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  gcse.src = (document.location.protocol == 'https:' ?
    'https:' : 'http:') +         '//www.google.com/cse/cse.js?cx=' + cx;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
 }
 )();
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.
5. Use the `webhelp.google.search.script` parameter in your transformation script and set its value to reference the `googlecse.html` file that you created earlier.
6. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName-"searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.
   b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.
7. Execute the transformation script.

   For example:

   - **Windows:**

     ```
     dita.bat -i c:\mySample.ditamap -f webhelp -Dwebhelp.google.search.script=c:\googlecse.html -Dwebhelp.google.search.results=c:\myFile.html
     ```

   - **Mac OS X/ Linux:**

     ```
     dita -i C:/mySample.ditamap -f webhelp -Dwebhelp.google.search.script=C:/googlecse.html -Dwebhelp.google.search.results=C:/myFile.html
     ```

Localization in WebHelp Classic Output

This section contains topics that explain the localization support for DITA or DocBook WebHelp Classic transformations.

Localizing Email Notifications of WebHelp Classic with Feedback Output

The feedback-enabled WebHelp systems use emails to notify users when comments are posted. These emails are based on templates stored in the WebHelp directory. The default messages are in English, French, German, and Japanese. These messages are copied into the WebHelp system deployment directory during the execution of the corresponding transformation scenario.

Using Oxygen XML Editor/Author

To change the language of the emails for WebHelp Classic with Feedback output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create the following directory, depending on your framework:
   - **DITA:** *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
   - **DocBook:** `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
2. Copy all English template files from the following directory (depending on your framework) and paste them into the directory you just created.
   - **DITA:** *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\en`
   - **DocBook:** `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\en`
3. Edit the HTML files from the following directory (depending on your framework) and translate the content into your language.
   - **DITA:** *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
   - **DocBook:** `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
4. Edit a **WebHelp Classic with Feedback** transformation scenario and open the **Parameters** tab.
5. In the **Parameters** tab, look for the `default.language` parameter and set its value to the appropriate language code (for example, `nl` for Dutch).

   Note: If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code.

6. Run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To change the language of the emails for WebHelp Classic with Feedback output using a script outside of **Oxygen XML Editor/Author** *(page 1749)*, follow this procedure:

1. Create the following directory, depending on your framework:
   - **DITA:** *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
   - **DocBook:** `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
2. Copy all English template files from the following directory (depending on your framework) and paste them into the directory you just created.
   - **DITA:** *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\en`
   - **DocBook:** `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\en`
3. Edit the HTML files from the following directory (depending on your framework) and translate the content into your language.
   - **DITA:** *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
   - **DocBook:** `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\php\templates\[Language code]` (where the *Language code* is the 2-digit code, such as *nl* for Dutch)
4. Use the `args.default.language` parameter in your transformation script and set its value to the appropriate language code (for example, `nl` for Dutch).

   Note: If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code.

5. Execute the transformation script.

For example, a DITA to WebHelp Classic with Feedback script might look like this:

- **Windows:**

```
dita.bat -i c:\mySample.ditamap -f webhelp-feedback -Dargs.default.language=nl
```

- **Mac OS X/ Linux:**

```
dita -i C:/mySample.ditamap -f webhelp-feedback -Dargs.default.language=nl
```

Localizing the Interface of DITA Map to WebHelp Classic Output

Static labels used in the WebHelp output are stored in translation files that have the *strings-lang1-lang2.xml* name format, where *lang1* and *lang2* are ISO language codes. For example, the US English labels are kept in the *strings-en-us.xml* file.

These translation files are collected from two locations:

- ***DITA-OT-DIR*/xsl/common folder** - DITA-OT's default translations (generated text for `note`, `fig`, and `table` elements).
- ***DITA-OT-DIR*/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization folder** - These translations are contributed by the WebHelp plugin and extend the default ones provided by DITA-OT. The labels defined in this folder take precedence over the DITA-OT defaults.

There are two major reasons you may want to use modify the translation files: to modify the existing strings or to translate to a new language.

Modifying the Existing Strings

To modify the generated text for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the *dita.xsl.messages* extension point. The following procedure is for changing English labels, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `/plugins/` location.
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

```
<plugin id="com.oxygenxml.webhelp.localization">
    <require plugin="com.oxygenxml.webhelp.classic"/>
    <require plugin="com.oxygenxml.webhelp.responsive"/>
```

```
    <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
</plugin>
```

3. Create a `webhelp-extension-strings.xml` file with the following content:

```
<langlist>
    <lang xml:lang="en"    filename="strings-en-us.xml"/>
    <lang xml:lang="en-us"    filename="strings-en-us.xml"/>
</langlist>
```

4. Copy the strings you want to change from the translation files *(page)* to the `strings-en-us.xml` file. Make sure you leave the name attribute unchanged because this is the key used to look up the string. A sample content might be:

```
<strings xml:lang="en-US">
  <str name="Figure">Fig</str>
  <str name="Draft comment">ADDRESS THIS DRAFT COMMENT</str>
</strings>
```

5. Use the **Run DITA-OT Integrator** transformation scenario *(page 1637)* found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

Adding a New Language

To add a new language for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the *dita.xsl.messages* extension point. The following sample procedure is for adding translation files for the Polish language, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `/plugins/` location.
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

```
<plugin id="com.oxygenxml.webhelp.localization">
    <require plugin="com.oxygenxml.webhelp.classic"/>
    <require plugin="com.oxygenxml.webhelp.responsive"/>

    <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
</plugin>
```

3. Create a `webhelp-extension-strings.xml` file with the following content:

```
<langlist>
    <lang xml:lang="pl"    filename="strings-pl-pl.xml"/>
    <lang xml:lang="pl-PL"    filename="strings-pl-pl.xml"/>
```

```
</langlist>
```

4. Copy the WebHelp strings file (*DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization/strings-en-us.xml`) to your plugin directory, and rename it as `strings-pl-pl.xml`.
5. In the `strings-pl-pl.xml` file, change the *@xml:lang* attribute on the root element that conforms with the new language.

```
<strings xml:lang="pl-PL">
  ...
</strings>
```

6. Translate the content of each `<str>` element (make sure to leave the *name* attribute unchanged).

   Result:

```
<strings xml:lang="pl-PL">
...
 <str name="webhelp.content" js="true" php="false">Polish translation for
 "Content".</str>
 <str name="webhelp.search" js="true" php="false">Polish translation for "Search"</
str>
...
</strings>
```

7. Copy the common DITA-OT strings defined in the *DITA-OT-DIR*`/xsl/common/strings-en-us.xml` file. It defines a set generated text available for HTML based transformations (such as `note`, `fig`, and `table` elements). Translate the content of each `<str>` element.

   Result:

```
<strings xml:lang="pl-PL">
...
 <str name="webhelp.content" js="true" php="false">Polish translation for
 "Content".</str>
 <str name="webhelp.search" js="true" php="false">Polish translation for "Search"</
str>
...
 <str name="Figure">Polish translation for "Figure"</str>
 <str name="Table">Polish translation for "Table"</str>
...
</strings>
```

8. Use the **Run DITA-OT Integrator** transformation scenario *(page 1637)* found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

Indexing Japanese Content in WebHelp Classic *(page 1803)*

Localizing the Interface of DocBook to WebHelp Classic Output

Static labels that are used in the WebHelp output are kept in translation files in the `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization` folder. Translation files have the *strings-lang1-lang2.xml* name format, where *lang1* and *lang2* are ISO language codes. For example, the US English text is kept in the *strings-en-us.xml* file.

To localize the interface of the WebHelp output for DocBook transformations, follow these steps:

1. Look for the *strings-[lang1]-[lang2].xml* file in `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization` directory (for example, the Canadian French file would be: *strings-fr-ca.xml*). If it does not exist, create one starting from the *strings-en-us.xml* file.
2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. Make sure that the new XML file that you created in the previous two steps is listed in the file `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization/strings.xml`. In our example for the Canadian French file, it should be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml"/>`.
4. Edit any of the DocBook to WebHelp transformation scenarios (with or without feedback) and set the **l10n.gentext.default.language** parameter to the code of the language you want to localize (for example, *fr-ca* for Canadian French).
5. Run the transformation scenario to produce the WebHelp output.

Indexing Japanese Content in WebHelp Classic *(page 1803)*

Indexing Japanese Content in WebHelp Classic

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the **Oxygen XML Editor/Author** installation kit.

Using Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Set the language for your content to Japanese (depending on your framework):
   - **DITA:** Edit a **DITA to WebHelp** transformation scenario and in the **Parameters** tab, set the value of the `default.language` parameter to `ja-jp`.

     Note: Alternatively, you could set the `xml:lang` attribute on the root of the *DITA map (page 3228)* and the referenced topics to `ja-jp`. Another alternative for DITA output is to use the `webhelp.search.japanese.dictionary` parameter to specify a path to a Japanese dictionary that will be used by the *Kuromoji* morphological engine.

   - **DocBook:** Edit a **DocBook to WebHelp** transformation scenario and in the **Parameters** tab, set the value of the `l10n.gentext.default.language` parameter to `ja`.
2. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To activate the Japanese indexing in your WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Set the language for your content to Japanese (depending on your framework):
   - **DITA:** Use the `args.default.language` parameter in your transformation script and set its value to `ja-jp`.

     Note: Alternatively, you could set the `xml:lang` attribute on the root of the *DITA map (page 3228)* and the referenced topics to `ja-jp`. Another alternative for DITA output is to use the `webhelp.search.japanese.dictionary` parameter to specify a path to a Japanese dictionary that will be used by the *Kuromoji* morphological engine.

   - **DocBook:** Use the `l10n.gentext.default.language` parameter in your transformation script and set its value to `ja`.

2. Execute the transformation script.

For example, a DITA script might look like this::

- **Windows:**

```
dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.default.language=ja-jp
```

- **Mac OS X/ Linux:**

```
dita -i C:/mySample.ditamap -f webhelp -Dargs.default.language=ja-jp
```

Activating Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, edit the *DITA map (page 3228)* and set the `xml:lang` attribute on its root element (`map`). The corresponding attribute value can be set for following RTL languages:

- `ar-eg` - Arabic
- `he-il` - Hebrew
- `ur-pk` - Urdu

Optimizing Search Results in WebHelp Classic

A **DITA Map WebHelp** transformation scenario can be configured to produce a `sitemap.xml` file that is used by search engines to aid crawling and indexing mechanisms. A *sitemap* lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the `sitemap.xml` file looks like this:

```
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
```

```
    <priority>0.5</priority>
  </url>
  <url>
    <loc>http://www.example.com/topics/care.html#care</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
   .  .  .
</urlset>
```

Each page has a `<url>` element structure containing additional information, such as:

- **loc** - the URL of the page. This URL must begin with the protocol (such as `http`), if required by your web server. It is constructed from the value of the `webhelp.sitemap.base.url` parameter from the transformation scenario and the relative path to the page (collected from the `href` attribute of a `topicref` element in the *DITA map*).

  Note: The value must have fewer than 2,048 characters.

- **lastmod** (optional) - the date when the page was last modified. The date format is `YYYY-MM-DD`.
- **changefreq** (optional) - indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

  Note: The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.

- **priority** (optional) - the priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. Open the **Parameters** tab and set a value for the following parameters:
   - **webhelp.sitemap.base.url** - the URL of the location where your WebHelp system is deployed

     Note: This parameter is required for Oxygen XML Editor to generate the `sitemap.xml` file.

   - **webhelp.sitemap.change.frequency** - how frequently the WebHelp pages are likely to change (accepted values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`)
   - **webhelp.sitemap.priority** - the priority of each page (value ranging from 0.0 to 1.0)
3. Run the transformation scenario.
4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

Overriding XSLT Processing Step of DITA WebHelp Classic Transformations

Since WebHelp output is primarily obtained by running XSLT transformations over the DITA input files (through the **DITA Map WebHelp Classic** transformation scenarios), one customization method would be to override the default XSLT templates that are used by the WebHelp transformations.

There are two methods available to override the XSLT stylesheets implied by the WebHelp transformation.

- The first method is to use one of the **WebHelp XSLT-import extension points** *(page 1807)* that allow you to import an XSLT stylesheet so that it becomes part of the normal build. This method uses the same mechanism as the DITA-OT XSLT-import extension points. Note that this method will affect all the outputs generated with the WebHelp system.
- The second method implies that you will create a DITA-OT extension plugin *(page 1809)* with a custom *transtype* and use an Ant build file to define the transformation process. The main difference from the first customization method is that you will not affect all WebHelp transformations. Only the transformations that use the declared plugin *transtype* will be affected.

WebHelp Classic XSLT-Import and XSLT-Parameter Extension Points

The WebHelp XSLT-Import extension points allows you to extend the XSLT stylesheets associated with some of the WebHelp transformation steps. The DITA-OT plug-in installer adds an XSLT import statement in the default WebHelp XSLT so that the XSLT stylesheet referenced by the extension point becomes part of the normal build.

Example:

```
<plugin id="com.oxygenxml.webhelp.classic.extension">
  <feature extension="com.oxygenxml.webhelp.classic.xsl.dita2webhelp"
           file="xsl/fixup.xsl"/>
</plugin>
```

Attention: The customizations you make by using this extension point will affect all WebHelp transformations. If you want to have a customization that is only available for a certain transformation, please use the Overriding a WebHelp XSLT Stylesheet from an Ant Build File *(page 1809)* method.

XSLT-Import Extension Points

The following extension points are available:

com.oxygenxml.webhelp.classic.xsl.dita2webhelp

Extension point to override the XSLT stylesheet (`dita2webhelpImpl.xsl`) that produces an HTML file for each DITA topic. The path to this stylesheet is: *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\xsl\dita\desktop\dita2webhelpImpl.xsl`

com.oxygenxml.webhelp.classic.xsl.createMainFiles

Extension point to override the XSLT stylesheet (`createMainFilesImpl.xsl`) that produces the WebHelp main HTML page (`index.html`). The path to this stylesheet is: *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\xsl\dita\desktop\createMainFilesImpl.xsl`

com.oxygenxml.webhelp.classic.xsl.createTocXML

Extension point to override the XSLT stylesheet (`tocDita.xsl`) that produces the `toc.xml` file. This file contains information extracted from the *DITA map (page 3228)* and it is mainly used to construct the WebHelp Table of Contents and navigational links. The path to this stylesheet is: *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.classic\xsl\dita\tocDita.xsl`.

XSLT-Parameter Extension Points

If your customization stylesheet declares one or more XSLT parameters and you want to control their values from the transformation scenario, you can use one of the following XSLT parameter extension points:

com.oxygenxml.webhelp.classic.xsl.dita2webhelp.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.classic.xsl.dita2webhelp** extension point *(page 1808)*.

com.oxygenxml.webhelp.classic.xsl.createMainFiles.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.classic.xsl.createMainFiles** extension point *(page 1808)*.

com.oxygenxml.webhelp.classic.xsl.createTocXML.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.classic.xsl.createTocXML** extension point *(page 1808)*.

[DITA-OT] XSLT-Import Extension Points

[DITA-OT] XSLT-Parameter Extension Points

Overriding a WebHelp Classic XSLT Stylesheet from an Ant Build File

To create a WebHelp XSLT customization that is only available for a certain DITA OT transformation, the extension plugin should declare a custom *transtype*. The WebHelp XSLT stylesheets can be overridden from an ANT file provided by the DITA-OT extension plugin. From the Ant target associated with the plugin, you will specify a custom XSLT stylesheet that imports the original WebHelp stylesheet and add some customization templates.

The following procedure explains how to create a DITA-OT extension plugin that uses this extension method:

1. In the *DITA-OT-DIR*`\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.classic.custom`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies a new DITA-OT `transtype` and the build file associated with the plugin. For example:

```
<plugin id="com.oxygenxml.webhelp.classic.custom">
    <feature extension="dita.conductor.target.relative" file="integrator.xml"/>
    <transtype name="webhelp-classic-custom" extends="webhelp"
      desc="WebHelp Classic Customization"/>
</plugin>
```

3. Create the **integrator.xml** file that will import the actual plugin Ant build file.

```
<project basedir="." name="Webhelp Classic Customization">
    <import file="build.xml"/>
</project>
```

4. Create the **build.xml** file that overrides the value of properties associated with the XSLT stylesheets used to produce HTML files *(page 1811)*. The following Ant properties can be overridden to specify your customization stylesheets:

   `args.wh.classic.topic.xsl`

   Specify this property if you want to customize the XSLT stylesheet used to produce an HTML file for each topic *(page 1811)*.

   `args.wh.classic.create.main.files.xsl`

   Specify this property if you want to customize the XSLT stylesheet used to produce the main HTML files *(page 1812)*.

   `args.wh.classic.createTocXML.xsl`

   Specify this property if you want to customize the XSLT stylesheet used to produce the *toc.xml* file *(page 1812)*. The toc.xml file contains information extracted from DITA map and it is mainly used to create the WebHelp TOC.

   For example, to customize a WebHelp Classic transformation type, the build file should look like:

```
<project basedir="." name="Webhelp Classic Customization">
 <target name="dita2webhelp-classic-custom">
   <!--
     Override this property if you want to customize the XSLT stylesheet
     used to produce an HTML file for each topic
   -->
   <property
     name="args.wh.classic.topic.xsl"
     value="${dita.plugin.com.oxygenxml.webhelp.classic.custom.dir}
                                              /xsl/dita2webhelpCustom.xsl"/>
   <!--
     Override this property if you want to customize the XSLT stylesheet
     used to produce the main HTML file.
   -->
   <property
     name="args.wh.classic.create.main.files.xsl"
     value="${dita.plugin.com.oxygenxml.webhelp.classic.custom.dir}
                                            /xsl/createMainFilesCustom.xsl"/>
   <!--
     Override this property if you want to customize the XSLT stylesheet
     used to produce the toc.xml file.
   -->
   <property
```

```
      name="args.wh.classic.createTocXML.xsl"
      value="${dita.plugin.com.oxygenxml.webhelp.classic.custom.dir}
                                              /xsl/createTocXMLCustom.xsl"/>
    <!--
      You need to delegate the build target:
      * dita2webhelp - for WebHelp Classic
    -->
    <antcall target="dita2webhelp"/>
  </target>
</project>
```

5. Create an **xsl** directory in the plugin customization directory (that you created in step 1) to store the customized XSLT stylesheets.
6. Now that the extension plugin is created, install it in the DITA Open Toolkit *(page 3185)*.

Referencing the WebHelp XSLT Stylesheets from Your Customizations

Note that your customization stylesheets should import the original stylesheets that they override. To reference the WebHelp stylesheets, you can use the **plugin:com.oxygenxml.dita-ot.plugin.webhelp** prefix. This prefix is rewritten by an XML catalog to the WebHelp root directory.

Customizing the `dita2webhelp.xsl` Stylesheet

The XSLT stylesheet that customizes the WebHelp **dita2webhelp.xsl** stylesheet should look like:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="2.0">
    <!--
      Import the original stylesheet used to produce an HTML file for each topic.
    -->
    <xsl:import href="plugin:com.oxygenxml.webhelp.classic:xsl/
                                            dita/classic/dita2webhelp.xsl"/>
    <!--
      Please add your customization templates here.
    -->
</xsl:stylesheet>
```

You need to import the following XSLT stylesheet:

```
<xsl:import href="plugin:com.oxygenxml.webhelp.classic:xsl/dita/desktop/
dita2webhelp.xsl"/>
```

Customizing the `createMainFiles.xsl` Stylesheet

The XSLT stylesheet that customizes the WebHelp **createMainFiles.xsl** stylesheet should look like:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="2.0">
    <!--
        Import the original stylesheet used to produce the main HTML file.
    -->
    <xsl:import href="plugin:com.oxygenxml.webhelp.classic:xsl/dita/
                                            desktop/createMainFiles.xsl"/>
    <!--
        Please add your customization templates here.
    -->

</xsl:stylesheet>
```

You need to import the following XSLT stylesheet:

```
<xsl:import href="plugin:com.oxygenxml.webhelp.classic:xsl/dita/desktop/
createMainFiles.xsl"/>
```

Customizing the `tocDita.xsl` File

The XSLT stylesheet that customizes the WebHelp **tocDita.xsl** stylesheet should look like:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:math="http://www.w3.org/2005/xpath-functions/math"
    exclude-result-prefixes="xs math"
    version="2.0">
    <!--
        Import the original stylesheet used to produce the toc.xml file.
    -->
    <xsl:import href="plugin:com.oxygenxml.webhelp.classic:xsl/dita/tocDita.xsl"/>
    <!--
```

```
        Please add your customization templates here.
    -->
</xsl:stylesheet>
```

How to Publish MathML Formulas when Generating WebHelp from a Command Line

The DITA-OT distribution that comes bundled with **Oxygen** includes some additional pre-installed DITA-OT plugins that add support for properly displaying MathML formulas in the WebHelp output. However, if you are generating your WebHelp output from a command line, MathML formulas will not be displayed properly unless you install these plugins manually.

These plugins can be downloaded and installed from DITA 1.3 Support for Open Toolkit (https://github.com/dita-community/dita13-dita-ot-1.x-support). This plugin package adds DITA 1.3 Support including MathML.

How to Add Support for MathML when Generating WebHelp from a Command Line

1. Download and unzip the **DITA 1.3 Support for Open Toolkit 1.x** distribution package. It includes 4 DITA-OT plugins.
2. Copy the four plugin directories to your `/plugins` directory.
3. In the home directory of your DITA-OT installation, run the `ant -f integrator.xml` command.

Publishing WebHelp Classic Output on a SharePoint Site

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to `.aspx`, as described in the steps below.

Using Oxygen XML Editor/Author

To publish WebHelp Classic output on a SharePoint site and use a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. Edit the WebHelp transformation scenario and open the **Parameters** tab.
   - For a DITA transformation, set the `args.outext` parameter to `.aspx`.
   - For a DocBook transformation, set the `html.ext` parameter to `.aspx`.
3. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To publish WebHelp Classic output on a SharePoint site and use a script outside of **Oxygen XML Editor/Author** *(page 1749)*, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. Use the following parameter to change your file extensions to `.aspx`:
   - For DITA transformations, use the `args.outext` parameter in your transformation script and set its value to `.aspx`.
   - For DocBook transformations, use the `html.ext` parameter in your transformation script and set its value to `.aspx`.
3. Execute the transformation script.

For example, a DITA script might look like this::

- **Windows:**

```
dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.outext=.aspx
```

- **Mac OS X/ Linux:**

```
dita -i C:/mySample.ditamap -f webhelp -Dargs.outext=.aspx
```

Removing the *Previous*/*Next* Links from WebHelp Classic Output

The **Previous** and **Next** links that are created at the top area of each WebHelp Classic page can be hidden with a CSS code.

Using Oxygen XML Editor/Author

To remove these links from WebHelp Classic output and use a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a custom CSS file and add the following CSS code:

```
.navparent, .navprev, .navnext {
    visibility:hidden;
}
```

2. Edit the WebHelp transformation scenario and open the **Parameters** tab.
   - For a DITA transformation, set the `args.css` parameter to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For a DocBook transformation, set the `html.stylesheet` parameter to the path of your custom CSS file.
3. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To remove these links from WebHelp Classic output and use a script outside of **Oxygen XML Editor/Author** *(page 1749)*, follow this procedure:

1. Create a custom CSS file and add the following CSS code:

```
.navparent, .navprev, .navnext {
    visibility:hidden;
}
```

2. Reference your custom CSS file:
   - For DITA transformations, use the `args.css` parameter in your transformation script and set its value to the path of your custom CSS file. Also, set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
   - For DocBook transformations, use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.
3. Execute the transformation script.

For example, a DITA script might look like this::

- **Windows:**

```
dita.bat -i c:\mySample.ditamap -f webhelp -Dargs.css=c:\myFile.css -
Dargs.copycss=yes
```

- **Mac OS X/ Linux:**

```
dita -i C:/mySample.ditamap -f webhelp -Dargs.css=C:/myFile.css -Dargs.copycss=yes
```

WebHelp Skin Builder

The **WebHelp Skin Builder** is a simple, easy-to-use tool, specially designed to assist users to visually customize the look and feel of the WebHelp output. It is implemented as an online tool hosted on the **Oxygen XML** website and allows you to experiment with various styles and colors over a documentation sample.

To be able to use the **Skin Builder**, you need:

- An Internet connection and unrestricted access to **Oxygen XML** website.
- A late version web browser.

To start the **Skin Builder**, do one of the following:

- For DocBook or DITA WebHelp systems, use a web browser to go to https://www.oxygenxml.com/webhelp-skin-builder.
- For DITA WebHelp systems, you can click the **Online preview** link in the **Skins tab** *(page 3143)* of a DITA OT transformation scenario. In the upper section of the preview, click the **Select Skin** button, then choose **Customize Skin**.

Skin Builder Layout

The left side panel of the **Skin Builder** is divided into 3 sections:

- **Actions** - Contains the following two buttons:
  - # **Import** - Opens an **Import CSS** dialog box that allows you to load a CSS stylesheet and apply it over the documentation sample.
  - # **Export** - Saves all properties as a CSS file.
- **Settings** - Includes a **Highlight selection** option that helps you identify the areas affected by a particular element customization.
  - # When hovering an item in the customizable elements menu, the affected sample area is highlighted with a dotted blue border.
  - # When an item in the customizable elements menu is selected, the affected sample area is highlighted with a solid red border.
- **Customize** - Provides a series of customizable elements organized under four main categories:

Header
TOC Area
Vertical Splitter
Content

For each customizable element, you can alter properties such as background color or font face. Any alteration made in the customizable elements menu is applied in real time over the sample area.

Creating a Customization Skin

1. You can start with one of the built-in skins or a CSS stylesheet applied over the sample using the **Import** button.
2. Use the elements in the **Customize** section to set properties that modify the look of the skin. By default, all customizable elements display a single property, but you can make more visible by clicking the + **Add** button and choosing from the available properties.

   Note: If you want to revert a particular property to its initial value, press the **Reset** button.

3. When you are happy with the skin customizations you have made, press the **Export** button. All settings will be saved in a CSS file.

Applying a Custom Skin to a DITA Map to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Editor.
2. Load the *DITA map (page 3228)* you want to produce as a WebHelp output.
3. Edit a **DITA Map to WebHelp** transformation scenario. Set the previously exported CSS file in the **Custom** section of the **Skins** tab.
4. Run the transformation to obtain the WebHelp output.

Apply a Customization Skin to a DocBook to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Editor.
2. Load the DocBook file you want to produce as a WebHelp output.
3. In the **Parameters** tab, set the `webhelp.skin.css` parameter to point to the previously exported CSS.
4. To customize the logo, use the following parameters: webhelp.logo.image and webhelp.logo.image.target.url.
5. Run the transformation to obtain the WebHelp output.

For more information about using the WebHelp Skin Builder, watch our video demonstration:

Related Information:

Skins Tab (DITA OT Transformations) *(page 3143)*

WebHelp Responsive Output

The **WebHelp Responsive** features a very flexible layout, is designed to adapt to any screen size to provide an optimal viewing and interaction experience. It is based upon the *Bootstrap* responsive front-end framework and is available for DITA document types.

The **WebHelp Responsive with Feedback** variant also includes a feedback system that allows your users to add comments and allows you to manage and reply to them.

WebHelp Responsive output can be generated by using the **DITA Map WebHelp Responsive** *(page 1615)* or **DITA Map WebHelp Responsive with Feedback** transformation scenario *(page 1616)*.

WebHelp Responsive Output Layout and Features

This section contains information about the layout and features of the WebHelp Responsive output.

HTML5 Responsive Pages

You can select from several different styles of layouts (for example, by default, you can select either a *tiles* or *tree* style of layout). Furthermore, each of these layouts include a collection of skins that you can choose from, or you can customize your own.

Figure: WebHelp Responsive Output on a Normal Screen

Figure: WebHelp Responsive Output on a Narrow Screen

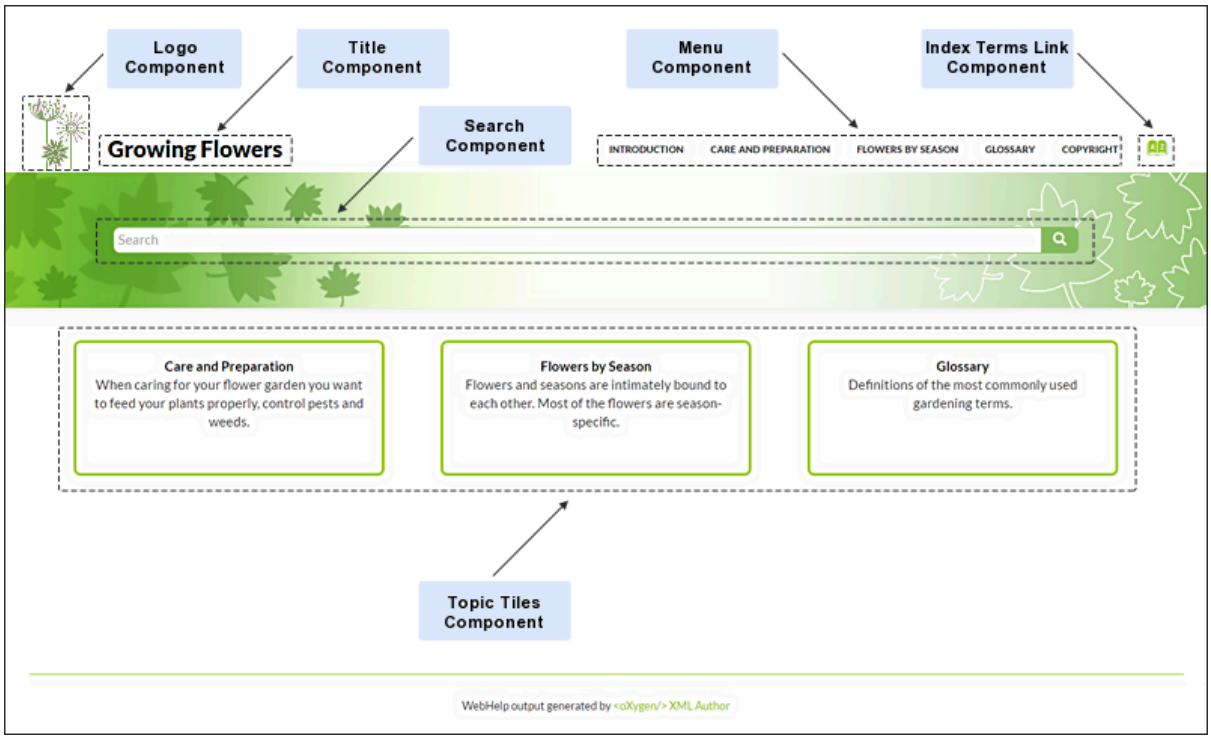
Main Page

The *Main Page* is the home page generated in the WebHelp Responsive output. The main function of the home page is to display top level information and provide links that help you easily navigate to any of the top level topics of the publication. These links can be rendered in either a *Tiles* or *Tree* style of layout. The main page also consists of various other components, such as a logo, title, menu, search field, or index link.

Main Page - Tiles Layout

In the *tiles* presentation mode, a tile component is created for each chapter (first level topic) in the publication. The tile presents a link to the topic and its short description.

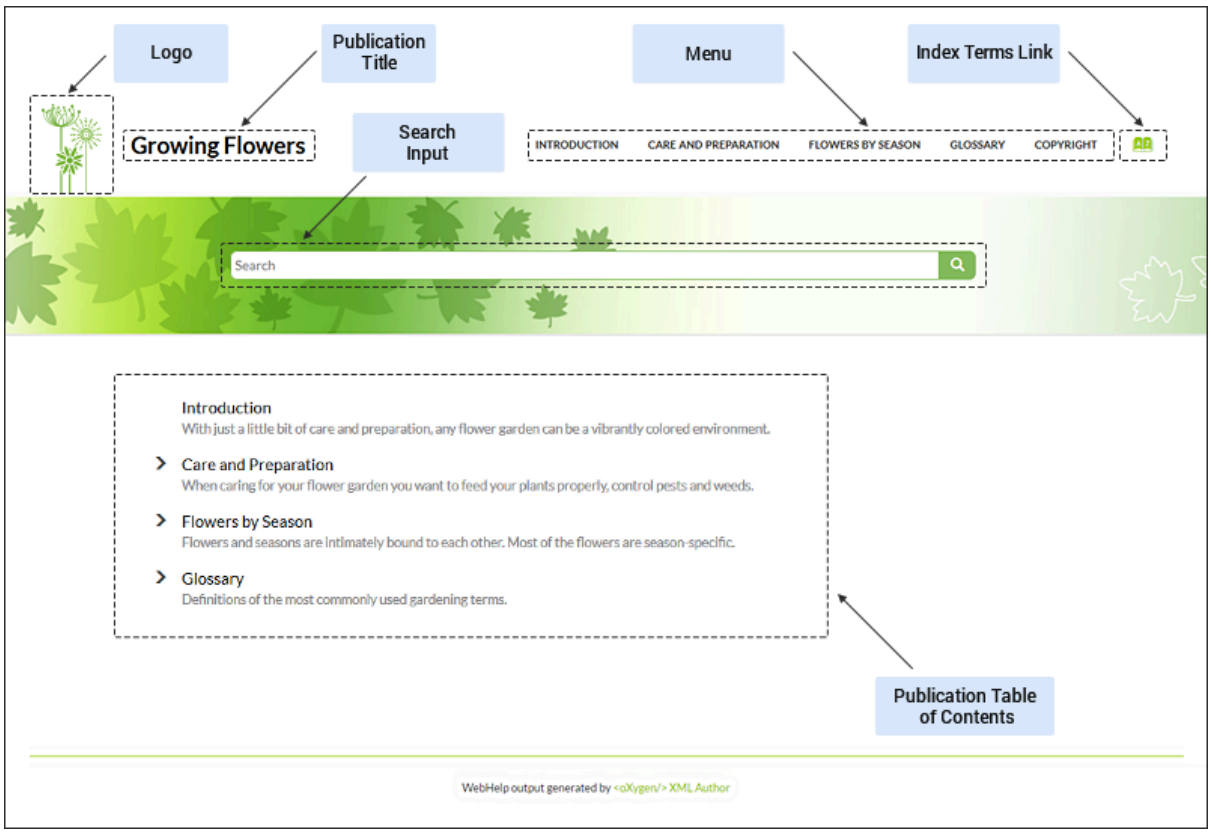
Figure: Main Page - Tiles Layout



Main Page - Tree Layout

In the *tree* presentation mode, links to the first and second level topics in the publication are displayed using a tree-like component.

Figure: Main Page - Tree Layout



Main Page Components

The layout components displayed in the main page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the webhelp.logo.image transformation parameter *(page 1890)*. For target URL use the webhelp.logo.image.target.url parameter *(page 1890)*.

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu *(page 1916)* topic.

Index terms link

Presents a link to the index terms page. You can control if this component is displayed by using the webhelp.show.indexterms.link parameter *(page 1892)*.

Search query input

Input text field allowing you to easily enter your search queries.

Tiles area

This section contains a tile for each root topic of the published documentation.

Topic Tile

A tile associated with a main topic. Each topic tile has three sections that corresponds to the topic title, short description, and image.

Topic Tile Title

Presents the navigation title of the associated topic.

Topic Tile Short Description

Presents the short description of the topic. It may be collected either from the topic or from the DITA map topic meta.

Topic Tile Image

Presents an image associated with the topic. The image association *(page 1916)* is done in the DITA map.

Tree area

An area containing topic titles from first and second level of your publication.

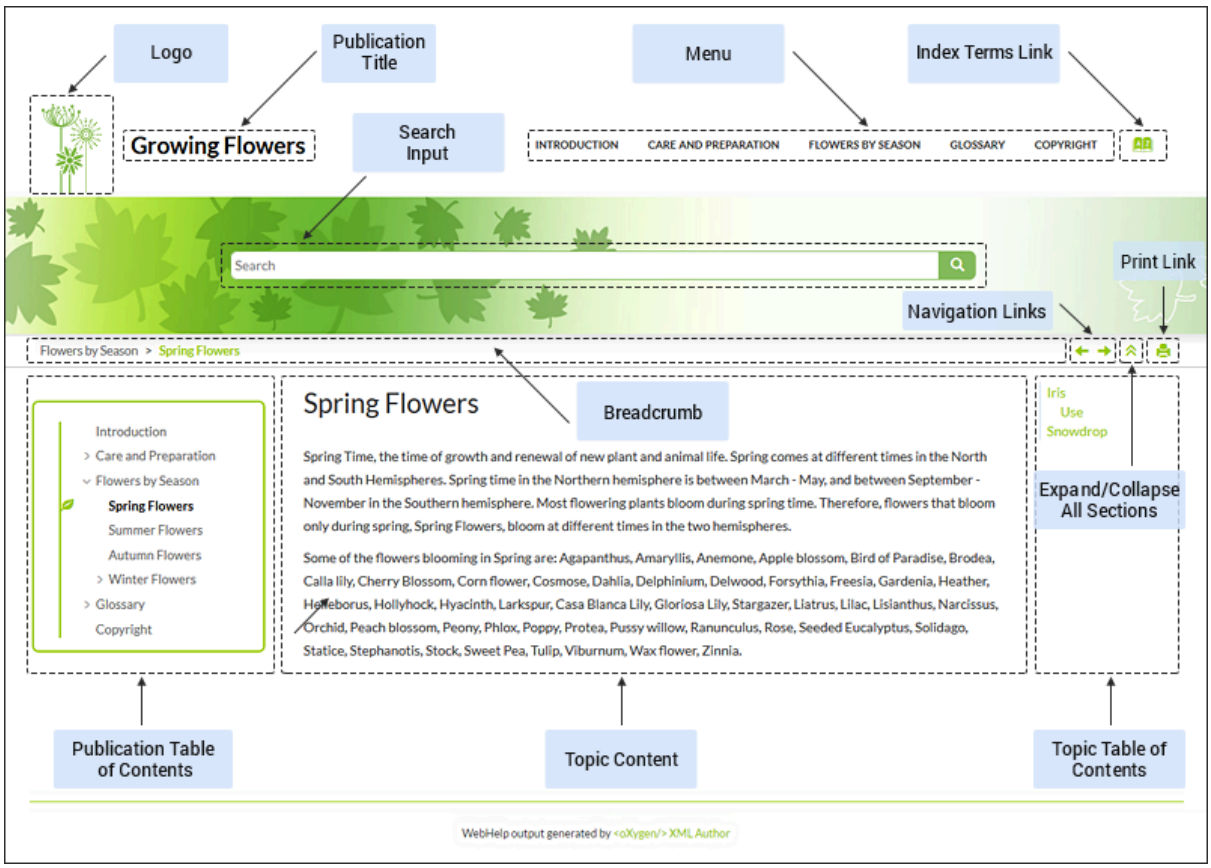
Page Footer

WebHelp Responsive output footer.

Topic Page

The *Topic Page* is the page generated for each DITA topic in the WebHelp Responsive output. The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

Figure: Topic Page



Topic Page Components

The layout components displayed in this page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the webhelp.logo.image transformation parameter *(page 1890)*. For target URL use the webhelp.logo.image.target.url parameter *(page 1890)*.

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu *(page 1916)* topic.

Index terms link

Presents a link to the index terms page. You can control if this component is displayed by using the webhelp.show.indexterms.link parameter *(page 1892)*.

Search query input

Input text field allowing you to easily enter your search queries.

Navigation Links

The navigation links (⬅ **Previous** / ➡ **Next** arrows) can be used to navigate to the previous or next topic. These navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference, navigation links will be generated in the output for that topic and all of its child topics. You can also use the `webhelp.default.collection.type.sequence` parameter and set its value to `yes` to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.

Tip: To hide the navigation links, you can edit the transformation scenario and set the value of the `webhelp.show.navigation.links` parameter to `no`.

Expand/Collapse Sections Icon

Icon that expands or collapses sections listed in the side table of contents within a topic.

Print Icon

A print icon that opens the print dialog box for your particular browser.

Breadcrumb

Presents the path of the current displayed DITA topic in documentation.

Topic Content

Presents the content of the associated DITA topic.

Publication Table of Contents

A Table of Content for the publication displayed in the left side.

Topic Table of Contents

A Table of Content for the topic displayed on the right side. This table of contents contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted.

Page Footer

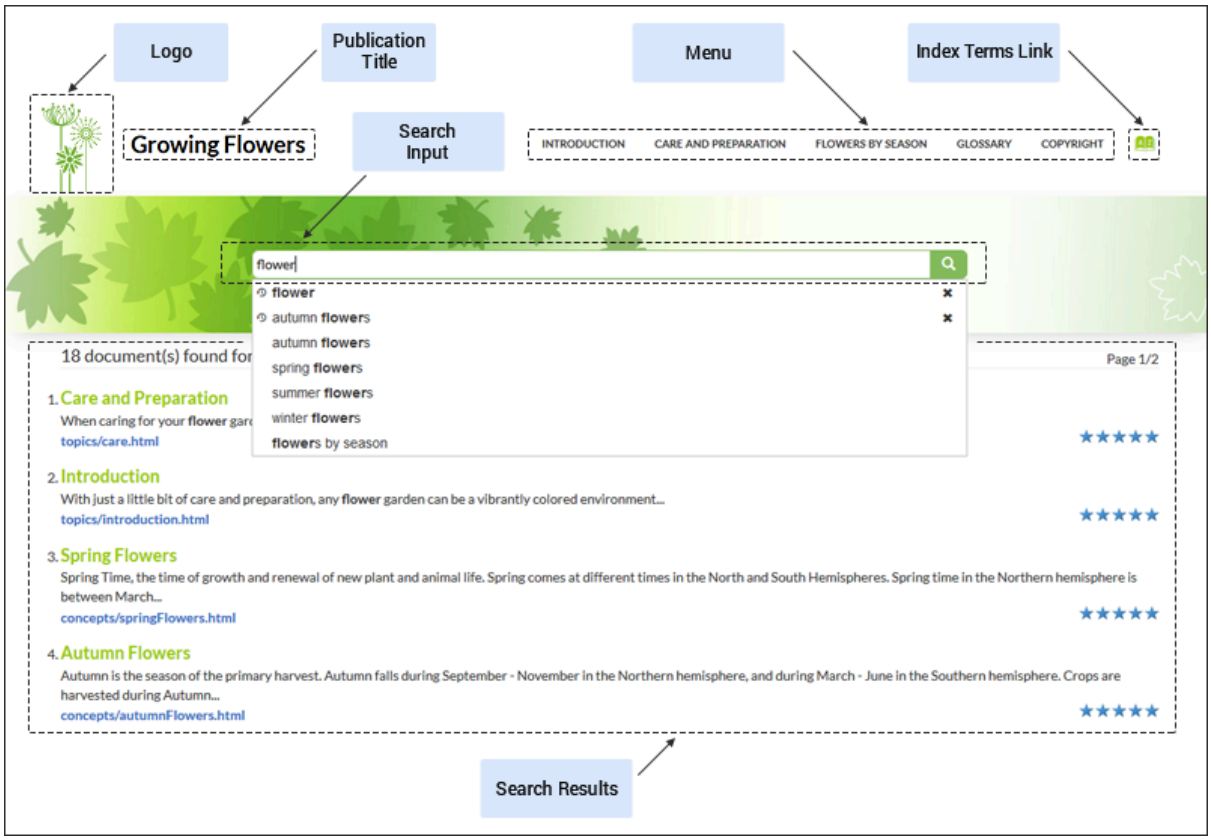
WebHelp Responsive output footer.

Search Page

The *Search Page* presents search results in the WebHelp Responsive output. The HTML page consists of a search results component along with various other additional components, such as a title, menu, or index link.

When you enter search terms in the **Search** field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the **Toggle Highlights** button at the top-right side of the page. The **Search** field also includes an *autocomplete* feature.

Figure: Search Results Page



Autocomplete Suggestions in the Search Text Field

When you are typing in the search text field, proposals are presented to help you to compute the search query. The information proposed when you are typing is collected from:

- The search queries from the history of the previous searches.
- The titles collected from your documentation.
- Documentation index terms and keywords. For example, in a DITA topic, the keywords and index terms are specified in the topic prolog section like this:

```
<prolog>
  <metadata>
 <keywords><indexterm>databases</indexterm></keywords>
 <keyword>installing</keyword>
 <keyword>uninstalling</keyword>
    <keyword>prerequisites</keyword>
  </metadata>
</prolog>
```

Missing Terms

If you enter multiple search terms (other than *stop words*), for any result that the search engine found at least one term but not one or more of the other terms, the **Missing** terms will be listed below each result.

Search Page Components

The layout components displayed in the search page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the webhelp.logo.image transformation parameter *(page 1890)*. For target URL use the webhelp.logo.image.target.url parameter *(page 1890)*.

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu *(page 1916)* topic.

Index terms link

Presents a link to the index terms page. You can control if this component is displayed by using the webhelp.show.indexterms.link parameter *(page 1892)*.

Search query input

Input text field allowing you to easily enter your search queries.

Search results area

This section is where the search results are displayed.

Page Footer

WebHelp Responsive output footer.

Related Information:

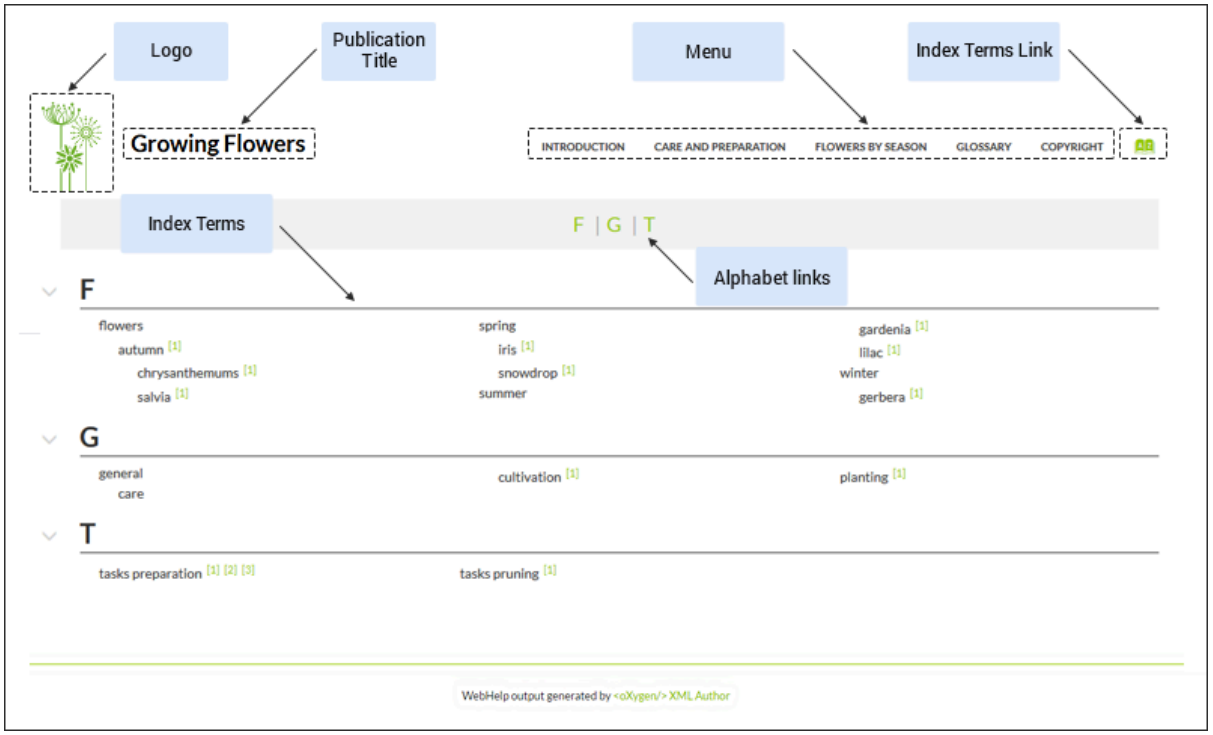
WebHelp Responsive Search Engine *(page 1828)*

Index Terms Page

The *Index Terms Page* page consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section. The indexes are presented in multiple columns to make it easier to read this page.

Figure: Index Terms Page



Index Terms Page Components

The layout components displayed in this page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the webhelp.logo.image transformation parameter *(page 1890)*. For target URL use the webhelp.logo.image.target.url parameter *(page 1890)*.

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see How to Customize the Menu *(page 1916)* topic.

Index terms link

Presents a link to the index terms page. You can control if this component is displayed by using the webhelp.show.indexterms.link parameter *(page 1892)*.

Index Terms Alphabet

An alphabet that contains the first letter of index terms. Each letter represents a link to a specific indices section.

Index Term First Letter

The first letter of the index.

Page Footer

WebHelp Responsive output footer.

Search Engine

Search engine has two main components:

Search indexer

It is also known as a **spider**. This component is active when you publish your documentation to WebHelp and it is responsible for creating the *search index*. This component traverses all HTML pages (for DITA topics) to gather information.

Search interface

This component is an interface between the user and the *search index*. It helps the user to search through the *search index* and displays results in the search page.

Search Rules

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, *"grow flowers"* will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a *phrase search*.
- *Boolean Search* is supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords: *grow* and *flowers*).
- `indexterm` and `keywords` DITA elements are an effective way to increase the ranking of a page (for example, content inside a *keywords* element weighs more than an *H1* HTML element).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot (".") characters count as a single word.
- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

5-Star Rating Mechanism and Sorting

The **Search** feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title scores better than a word found in unformatted text). The search ranking order, sorted by relevance is as follows:
  # The search term is included in a meta keyword
  # The search term is in the title of the page
  # The search term is in bold text in a paragraph
  # The search term is in normal text in a paragraph

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see How to Change Element Scoring in Search Results *(page 1927)*.

Excluded Terms

To improve performance, the **Search** feature excludes certain *stop words*. For example, the English version of such *stop words* include: *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*.

Search Field

When you enter search terms in the **Search** field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the **Toggle Highlights** button at the top-right side of the page. The **Search** field also includes an *autocomplete* feature.

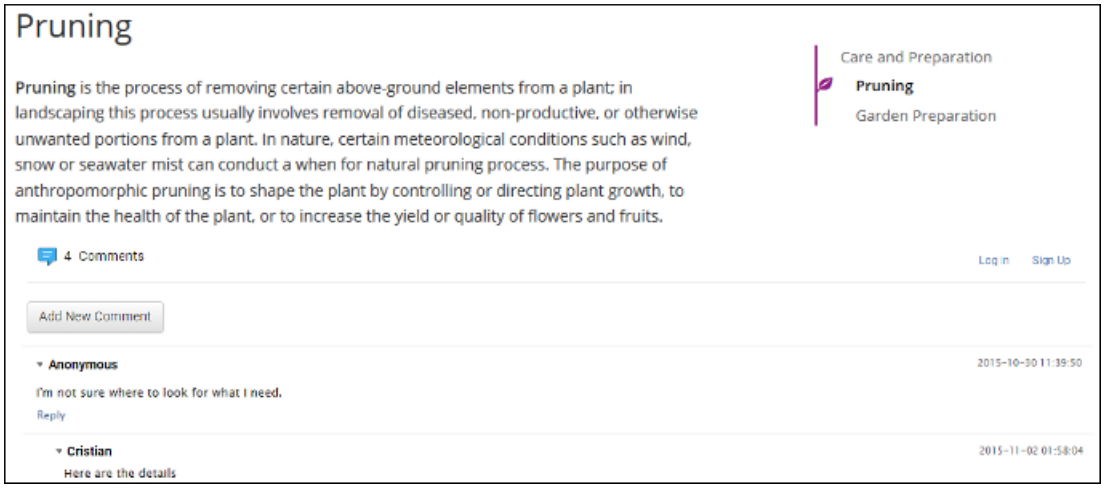
Related Information:

WebHelp Responsive HTML5 Pages: Search Page *(page 1824)*

Feedback System

The **WebHelp Responsive with Feedback** variant contains a **Comments** section at the bottom of each topic. This section is where you can interact with users through a comment system. For information about deploying a feedback-enabled system, see Deploying a Feedback-Enabled System *(page 1831)*.

Figure: WebHelp Responsive with Feedback Comments Section



To add a new comment, click the **Add New Comment** button, or click **Reply** to add a comment to an existing thread. You can click on the **Log in** button on the right side of this bar to be authenticated as a user and your user name will be included in any comments that you add. If you do not have a user name, you can click on the **Sign Up** button to create a new user.

After you log in, your name and user name are displayed in the **Comments** bar, along with the **Log off** and **Edit** buttons. Click the **Edit** button to open the **User Profile** dialog box where you can customize the following options:

- **Your Name** - You can use this field to edit the initial name that you used to create your user profile.
- **Your email address** - You can use this field to edit the initial email address that you used to create your profile.
- You can choose to receive an email in the following situations:
  # When a comment is left on a page that you commented on.
  # When a comment is left on any topic in the WebHelp Classic system.
  # When a reply is left to one of my comments.
- **New Password** - Allows you to enter a new password for your user account.

Note: The **Current Password** field from the top of the **User Profile** is mandatory if you want to save the changes you make.

If you are an administrator, you can manage user information and comments. For more information, see Managing Users and Comments in a Feedback-Enabled System *(page 1835)*.

Related Information:

Deploying a Feedback-Enabled System *(page 1831)*

Deploying a Feedback-Enabled System

System Requirements

The feedback-enabled WebHelp system requires a standard server deployment. You can request this from your server administrator and it requires the following system components:

- A Web server (such as *Apache Web Server*)
- A *MySQL* or *MariaDB* database server
- A database admin tool (such as *phpMyAdmin*)
- PHP Version 5.1.6 or later

The WebHelp system supports most of the recent versions of the following browsers: Chrome, Firefox, Edge, Internet Explorer, Safari, Opera.

Create WebHelp with Feedback Database

The **WebHelp with Feedback** system needs a database to store user details and the actual feedback, and a user added to it with all privileges. After this is created, you should have the following information:

- Database name
- Username
- Password

Exactly how you create the database and user depends on your web host and your particular needs.

Example:

The following procedure uses *phpMyAdmin* to create a MySQL database for the feedback system and a MySQL user with privileges for that database. The feedback system uses these credentials to connect to the database.

Using *phpMyAdmin* to create a database:

1. Access the *phpMyAdmin* instance running on your server.
2. Click *Databases* (in the right frame) and then create a *database*. You can give it any name you want (for example *comments*).
3. Create a user with connection privileges for this database.
4. Under *localhost*, in the right frame, click *Privileges* and then at the bottom of the page click the **reload the privileges** link.

Deploying the WebHelp with Feedback Output

If you have a web server configured with PHP and MySQL, you can deploy the **WebHelp with Feedback** output by following these steps:

1. Connect to your server using an FTP client.
2. Locate the home directory (from now on, referred to as *DOCUMENT_ROOT*) of your server.
3. Copy the transformation output folder into the `DOCUMENT_ROOT` folder.
4. Rename it to something relevant (for example, `myProductWebHelp`).
5. Open the output folder (for example, `http://[YOUR_SERVER]/myProductWebHelp/)`. You are redirected to the installation wizard. Proceed with the installation as follows:
   a. Verify that the prerequisites are met.
   b. Press **Start Installation**.
   c. Configure the **Deployment Settings** section. Default values are provided, but you should adjust them as needed.

Tip: You can change some of the options later. The installation creates a `config.php` file in `[OXYGEN_WEBHELP_INSTALL_DIR]/feedback/resources/php/config/config.php` where all your configuration options are stored.

d. Configure the **MySql Database Connection Settings** section. Use the information (database name, username, password) from the Create WebHelp with Feedback Database section *(page 1832)* to fill-in the appropriate text boxes.

Warning: Selecting the **Create new database structure** option will overwrite any existing data in the selected database, if it already exists. Therefore, it is useful the first time you install the **WebHelp with Feedback** system, but you do not want to select this option on subsequent deployments.

e. If you are using a domain (such as *OpenLDAP* or *Active Directory*) to manage users in your organization, select the **Enable LDAP Autehntication** option. This will allow you to configure the LDAP server, which will provide information and credentials for users who will access the WebHelp system. Also, this will allow you to choose which of the domain users will have administrator privileges.

f. If the **Create new database structure** option is selected, the **Create WebHelp Administrator Account** section becomes available. Here you can set the administrator account data. The administrator is able to moderate new posts and manage WebHelp users.

The same database can be used to store comments for multiple **WebHelp with Feedback** deployments. If a topic is available in multiple deployments and there are comments associated with it, you can choose to display the comments in all deployments that share the database. To do this, select the **Display comments from other products** option. In the **Display comments from** section, a list with the deployments sharing the same database is displayed. Select the deployments allowed to share common feedback.

Note: You can restrict the displayed comments of a product depending on its version. If you have two products that use the same database and you restrict one of them to display comments starting from a certain version, the comments of the other product are also displayed from the specified version onwards.

g. Press **Next Step**.

h. Remove the installation folder from your web server.

Important: When you publish subsequent iterations of your **WebHelp with Feedback** system, you will not upload the `/install` folder in the output, as you only need it uploaded the first time you create the installation. On subsequent uploads, you will just upload the other output files.

i. In your Web browser, go to your **WebHelp with Feedback** system main page.

Testing Your WebHelp with Feedback System

To test your system, create a user and post a comment. Check to see if the notification emails are delivered to your email inbox.

Note: To read debug messages generated by the system:

1. Enable *JavaScript* logging by doing one of the following:
   - Open the `log.js` file, locate the `var log= new Log(Level.NONE);` line, and change the logging level to: `Level.INFO`, `Level.DEBUG`, `Level.WARN`, or `Level.ERROR`.
   - Append `?log=true` to the WebHelp URL.
2. Inspect the PHP and Apache server log files.

Documentation Product ID and Version

When you run a **WebHelp with Feedback** transformation scenario, by default you are prompted for a documentation product ID and version number. This is needed when multiple WebHelp systems are deployed on the same server. Think of your WebHelp output as a *product*. If you have three different WebHelp outputs, you have three different *products* (each with their own unique documentation product ID). This identifier is included in a configuration file so that comments are tied to a particular output (product ID and version number).

Note: The **WebHelp with Feedback** installation includes a configuration option (**Display comments from other products**) that allows you to choose to have comments visible in other specified *products*.

Related Information:

Managing Users and Comments in a Feedback-Enabled System *(page 1835)*

Refreshing the Content of a Feedback-Enabled System

It is common to update the content of an existing installation of a **WebHelp with Feedback** system on a regular basis. In this case, reinstalling the whole system is not a viable option since it might result in the loss of the comments associated with your topics. Also, reconfiguring the system every time you want to refresh it may be time consuming.

Fortunately, you can refresh just the content without losing the comments or the initial system configuration. To do so, follow these steps:

1. Execute the transformation scenario that produces the *WebHelp with Feedback* output directory.

2. Go to the output directory (specified in the **Output** tab of the transformation scenario), locate the `\feedback\resources\php\config\config.php` file, and delete it.
3. Locate the `\feedback\install` directory and delete it.
4. Copy the remaining structure of the output folder and paste it into your *WebHelp with Feedback* system installation directory, overwriting the existing content.

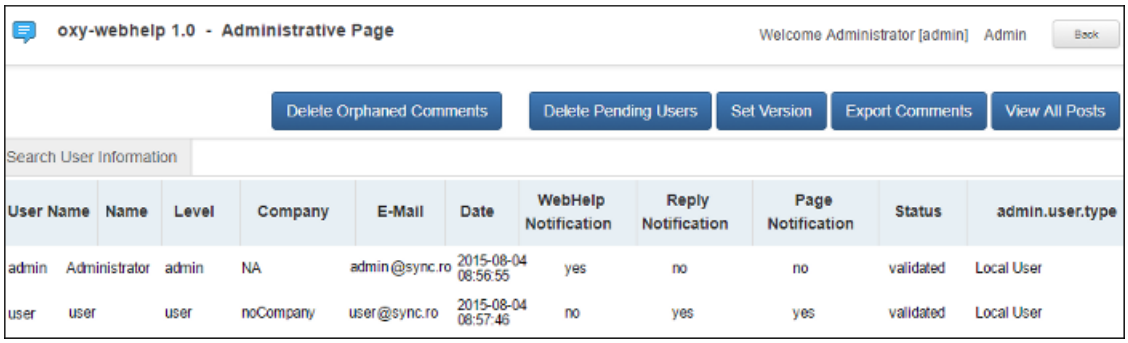
Managing Users and Comments in a Feedback-Enabled System

When you installed the **WebHelp with Feedback** system the first time (assuming the **Create new database structure** option *(page 1833)* was selected), you should have been prompted to create an administrator account (or a user named *administrator* was created by default). As an administrator, you have access to manage comments posted in your feedback-enabled WebHelp system. You can also manage the user information (such as role, status, or notification options).

To manage comments and user information, follow these steps:

1. At the bottom of each specific topic there is a **Comments** navigation bar and on the right side there is a **Log in** button. Click this button and log in with your administrator credentials. This gives you access to an **Admin Panel** button.
2. Click the **Admin Panel** button to display an administration page.

   Figure: Administrative Page



3. Use this page to manage the following options:

   Delete Orphaned Comments

   Allows you to delete comments that are no longer associated with a topic in your WebHelp system.

   Delete Pending Users

   Allows you to delete user accounts that you do not wish to activate.

   View All Posts

   Allows you to view all the comments that are associated with topics in your WebHelp system.

Export Comments

Allows you to export all posts associated with topics in your WebHelp system into an XML file.

Set Version

Use this action to display comments starting with a particular version.

Manage User Information

To edit the details for a user, click on the corresponding row. This opens a window that allows you to customize the following information associated with the user:

Name

The full name of the user.

Level

Use this field to modify the privilege level (role) for the selected user. You can choose from the following:

- **User** - Regular user, able to post comments and receive e-mail notifications.
- **Moderator** - In addition to the regular **User** rights, this type of user has access to the **Admin Panel** where a moderator can view, delete, export comments, and set the version of the feedback-enabled WebHelp system.
- **Admin** - Full administrative privileges. Can manage WebHelp-specific settings, users, and their comments.

Company

The name of the organization associated with the user.

E-Mail

The contact email address for the user. This is also the address where the WebHelp system sends notifications.

WebHelp Notification

When selected, the user receives notifications when comments are posted anywhere in your feedback-enabled WebHelp system.

Reply Notification

When selected, the user receives notifications when comments are posted as a reply to one of their comments.

Page Notification

When selected, the user receives notifications when comments are posted on a topic where they previously posted a comment.

Date

The date the user registered is displayed.

Status

Use this drop-down list to change the status of the user. You can choose from the following:

- **Created** - The user is created but does not yet have any rights for the feedback-enabled WebHelp system.
- **Validated** - The user is able to use the feedback-enabled WebHelp system.
- **Suspended** - The user has no rights for the feedback-enabled WebHelp system.

❗ **Warning:** The key used for identifying the page a comment is attached to is the relative file path to the output page. Since the output file and folder names mirror the source, any change to the file name (or its folder) in the source will affect the comments associated with that WebHelp page. If you change the file name or path, the comment history for that topic will become orphaned (a change to the topic ID does not affect the comment history).

Context-Sensitive WebHelp Responsive System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

Generating Context-Sensitive Help

When WebHelp Responsive output is generated, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it in the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `appContext` element, as in the following example:

```
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="myapp-functionid1" path="tasks/app-help1.html"/>
  <appContext helpID="myapp-functionid2" path="tasks/app-help1.html"/>
    . . .
</map>
```

The possible attributes are as follows:

`helpID`

A Unique ID provided by a topic from two possible sources (`resourceid` element or `id` attribute):

`resourceid`

The `resourceid` element is mapped into the `appContext` element and can be specified in either the `topicref` within a *DITA map* or in a `prolog` within a DITA topic. The `resourceid` element accepts the following attributes:

- **`appname`** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty (`""`).
- **`appid`** - An ID used by an application to identify the topic.
- **`id`** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an **`appid`** attribute is used.

Note: Multiple `appid` values can be associated with a single `appname` value (and multiple `appname` values can be associated with a single `appid` value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the `appid` and `appname` attributes should be unique within the context of a single *root map (page 3234)*. For example, suppose that you need two different functions of an application to both open the same WebHelp page.

Example: `resourceid` Specified in a DITA Map

The `resourceid` element can be specified in a `topicmeta` element within a `topicref`.

```
<map title="App Help">
  <topicref href="app-help1.dita" type="task">
     <topicmeta>
       <resourceid appname="myapp" appid="functionid1"/>
       <resourceid appname="myapp" appid="functionid2"/>
     </topicmeta>
  </topicref>
</map>
```

Example: `resourceid` Specified in a DITA Topic

The `resourceid` element can be specified in a `prolog` element within a DITA topic.

```
<task id="app-help1">
  <title>My App Help</title>
  <prolog>
    <resourceid appname="myapp" appid="functionid1"/>
    <resourceid appname="myapp" appid="functionid2"/>
  </prolog>
...
</task>
```

For more information about the `resourceid` element, see DITA Specifications: <resourceid>.

`id`

If a `resourceid` element is not declared in the *DITA map* or DITA topic (as described above), the `id` attribute that is set on the topic root element is mapped into the `appContext` element.

Important: You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

`path`

The path to a corresponding WebHelp page. This path is relative to the location of the `context-help-map.xml` mapping file.

`productID` (Applicable only if you are using the WebHelp Responsive with Feedback transformation scenario)

The ID of the product for your documentation project.

`productVersion` (Applicable only if you are using the WebHelp Responsive with Feedback transformation scenario)

The version of the product for your documentation project.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the `contextId` value and will look it up in the XML file.

- Invoke the `index.html` WebHelp system file and pass the `contextId` parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the `contextId` parameter.

  ```
  index.html?contextId=myDITATopic
  ```

  Note: The `contextId` parameter is not case sensitive.

Context-Sensitive Queries

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

- **contextId** - The WebHelp JavaScript engine will look for this value in the `context-help-map.xml` mapping file and load the corresponding help page.

  Note: You can use an *anchor (page 3226)* in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.

- **appname** - You can use this parameter in conjunction with `contextId` to search for this value in the corresponding *appname* attribute value in the mapping file.

  ```
  http://localhost/webhelp/index.html?contextId=topicID&appname=myApplication
  ```

Another parameter indicates the search query:

- **searchQuery** - You can use this parameter to perform a search operation when WebHelp is loaded. For example, if you want to open WebHelp showing all search results for *growing flowers*, the URL should look like this: `http://localhost/webhelp/index.html?searchQuery=growing%20flowers`.

Accessibility

Oxygen XML WebHelp Responsive output is compliant with the Section 508 accessibility standard, making the output accessible for people with visual impairment and other disabilities. Documentation and interface components are considered accessible when they have support in place that allows those with disabilities to use assistive technologies to understand the content.

Generally speaking, the WebHelp Responsive output has two major parts: topic content and WebHelp Responsive-related components (publication TOC, breadcrumb, menu). While the WebHelp Responsive components are designed to comply with the accessibility rules, it is important to adhere to some rules when you write DITA topics so that the content is also accessible.

DITA-OT Day 2017 Presentation: Accessibility in DITA-OT

Writing Guidelines for Accessible Documentation

To create accessible content, good authoring practices involve following guidelines, such as marking table headers, using semantic elements where are available, and using alternative text for images.

Accessible Images

Images must have text alternatives that describe the information or function represented by them.

Short Text Equivalents for Images

When using the `<image>` element, specify a short alternative text with the `<alt>` element.

```
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
</image>
```

Long Descriptions of Images

For complex images, when a short text equivalent does not suffice to adequately convey the function or role of an image, provide additional information in a file designated by the `<longdescref>` element.

```
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
  <longdescref href="http://www.example.org/birds/puffin.html"
               scope="external"
               format="html"/>
</image>
```

Related Information:

Darwin Information Typing Architecture (DITA) Specification `<image>` element

Web Accessibility Tutorials: Alt Decision Tree

Accessible Image Maps

For image maps, text alternatives are needed on both the `<image>` element itself (to describe the informative context) and on each of the `<area>` elements (to convey the link destination or the action

that will be initiated if the link is followed). The `<xref>` content within the `<area>` element contains the intended alternative text or hover text for that image map area.

```
<imagemap id="gear_pump_map">
  <image href="../images/Gear_pump_exploded.png" id="gear_pump_exploded">
    <alt>Gear Pump</alt>
  </image>
  <area>
    <shape>circle</shape>
      <coords>172, 265, 14</coords>
      <xref href="parts/bushings.dita#bushings_topic/bushings"
            format="dita">Bushings</xref>
  </area>
  <area>
      <shape>circle</shape>
      <coords>324, 210, 14</coords>
      <xref href="parts/ports.dita#ports_topic/sucction_port" format="dita"
        >Suction Port</xref>
   </area>
</imagemap>
```

Related Information:

Darwin Information Typing Architecture (DITA) Specification `<imagemap>` element

Accessible Tables

Accessible HTML tables need markup that indicates header cells and data cells and defines their relationship. Header cells must be marked with `<th>`, and data cells with `<td>`, to make tables accessible. For more complex tables, explicit associations may be needed using `@scope`, `@id`, and `@headers` attributes.

When you implement the table, it is best to use the `<table>` element (CALS table or OASIS Table Exchange Model). The `<table>` element includes all that you need to make a fully accessible table.

Related Information:

Darwin Information Typing Architecture (DITA) Specification `<table>` element

Table with Header Cells in the Top Row Only

For this type of table, you have to embed the table rows in the `<thead>` element.

Table 71. Example: Oxygen Events

Event	Date	Location
Evolution of TC 2018	May 31 - June 1, 2018	Sofia, Bulgaria
Markup UK	June 9 - 10, 2018	London, United Kingdom
Balisage 2018 - The Markup Conference	July 31 - August 3, 2018	Rockville, Maryland, USA

```
<table>
  <title>
    <b>Oxygen Events</b>
  </title>
  <tgroup cols="3">
    <colspec colname="COLSPEC0" colwidth="1*"/>
    <colspec colname="COLSPEC1" colwidth="1.1*"/>
    <colspec colname="newCol3" colwidth="1*"/>
    <thead>
      <row>
        <entry colname="COLSPEC0" valign="top">Event</entry>
        <entry colname="COLSPEC1" valign="top">Date</entry>
        <entry>Location</entry>
      </row>
    </thead>
    <tbody>
      <row>
        <entry>Evolution of TC 2018</entry>
        <entry>May 31 - June 1, 2018</entry>
        <entry>Sofia, Bulgaria</entry>
      </row>

WebHelp Responsive 508 VPAT

Oxygen XML Editor was designed to adhere to the U.S. Government Section 508 accessibility standards. This document describes the accessibility features that address the Section 508 Standards. This VPAT (Voluntary Product Accessibility Template) is an informational tool developed by industry and government to help facilitate the understanding of compatibility issues under Section 508.

Table 74. 1194.22 Web-based intranet and internet information and applications.

Criteria	Supporting Features	Remarks and Explanations
(a) A text equivalent for every non-text element shall be provided (*e.g.*, via "`alt`", "`longdesc`", or in element content).	Supported with exceptions	• The process that produces the WebHelp Responsive accessible output uses information extracted from the DITA topics. It is the technical writer's responsibility to write accessible-friendly DITA topics *(page 1841)*. • The developers who customize the WebHelp output are responsible for ensuring that the template they customize conforms to this criterion.
(b) Equivalent alternatives for any multimedia presentation shall be synchronized with the presentation.	Supported with exceptions	WebHelp Responsive plugin offers support to transfer multimedia objects (video, audio) from DITA topics to the generated HTML pages. Technical writers are responsible for ensuring that they use multimedia objects that conform to this criterion.
(c) Web pages shall be designed so that all information conveyed with color is also available without color, for example from context or markup.	Supported with exceptions	• The built-in *Cobalt* theme was specially designed to help visually impaired users. • The developers who customize the WebHelp output are responsible for ensuring that the template they customize conforms to this criterion.
(d) Documents shall be organized so they are readable without requiring an associated style sheet.	Supported	The WebHelp Responsive output is readable without requiring any stylesheet.

Criteria	Supporting Features	Remarks and Explanations
(e) Redundant text links shall be provided for each active region of a server-side image map.	Not applicable	The product contains no server-side image maps.
(f) Client-side image maps shall be provided instead of server-side image maps except where the regions cannot be defined with an available geometric shape.	Supported with exceptions	Technical writers can insert image maps in DITA topics. They are responsible for specifying the information required to generate accessible image maps *(page 1841)*.
(g) Row and column headers shall be identified for data tables.	Supported with exceptions	Technical writers can insert tables in DITA topics. They are responsible for inputting the information required to generate accessible tables *(page 1842)*.
(h) Markup shall be used to associate data cells and header cells for data tables that have two or more logical levels of row or column headers.	Supported with exceptions	Technical writers can insert tables in DITA topics. They are responsible for inputting the information required to generate accessible tables *(page 1842)*.
(i) Frames shall be titled with text that facilitates frame identification and navigation.	Not applicable	The WebHelp Responsive output does not use frames.
(j) Pages shall be designed to avoid causing the screen to flicker with a frequency greater than 2 Hz and lower than 55 Hz.	Not applicable	The screen does not flicker with frequencies greater then 2 Hz and lower than 55 Hz.
(k) A text-only page, with equivalent information or functionality, shall be provided to make a web site comply with the provisions of this part, when compliance cannot be accomplished in any other way. The content of the text-only page shall be updated whenever the primary page changes.	Not applicable	Accessibility provisions in WebHelp Responsive output can be provided without requiring a separate text-only version.
(l) When pages utilize scripting languages to display content, or to create interface elements, the information provided by the script shall be identified with functional text that can be read by assistive technology.	Supported with exceptions	The developers who customize the WebHelp output are responsible for ensuring that the template they customize conforms to this criterion.
(m) When a web page requires that an applet, plug-in or other application be present on the client system to interpret page content, the page must provide a link to a plug-in or applet that complies with 1194.21(a) through (l).	Not Applicable	This product does not use any plugins or applets.

Criteria	Supporting Features	Remarks and Explanations
(n) When electronic forms are designed to be completed on-line, the form shall allow people using assistive technology to access the information, field elements, and functionality required for completion and submission of the form, including all directions and cues.	Supported with exceptions	The developers who customize the WebHelp output are responsible for ensuring that the template they customize conforms to this criterion.
(o) A method shall be provided that permits users to skip repetitive navigation links.	Supported	
(p) When a timed response is required, the user shall be alerted and given sufficient time to indicate more time is required.	Not applicable	WebHelp Responsive output does not require a timed response as part of its core functionality.

Note: This VPAT pertains only to the HTML output generated by the WebHelp Responsive plugin as shipped and not to any customization. It specifically applies to version 20.1 or above and it does not apply to any versions prior to this.

Supported Platforms

All accessibility tests have been carried out in the following environment:

- NVDA (NonVisual Desktop Access) version 2018.1.1 with Firefox version 60.0.1 and Chrome version 66.0.3359.181.
- Windows 10 Narrator with Microsoft Edge browser.

However, this does not mean that WebHelp Responsive-generated output has any issue with other modern, standards-compliant browsers and alternative screen reader solutions. In any case, if you encounter any accessibility-related issue while using WebHelp Responsive generated output, contact the **Oxygen support team**. All accessibility issues are treated with utmost attention.

Section 508 Standards for Electronic and Information Technology

Publishing Templates

An *Oxygen Publishing Template* defines all aspects of the layout and styles for **WebHelp Responsive** or **PDF - based on HTML5 & CSS** output. It is a self-contained customization package stored as a ZIP

archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Important: The **DITA Map PDF - based on DITA & CSS (WYSIWYG)** transformation scenario does not supports publishing templates.

Some possible customizations include:

- Add additional template resources to customize the output (such as logos, favicons, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- For **WebHelp Responsive** output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structure for *Oxygen Publishing Template* packages:

Figure: Oxygen Publishing Template Package (WebHelp Responsive)

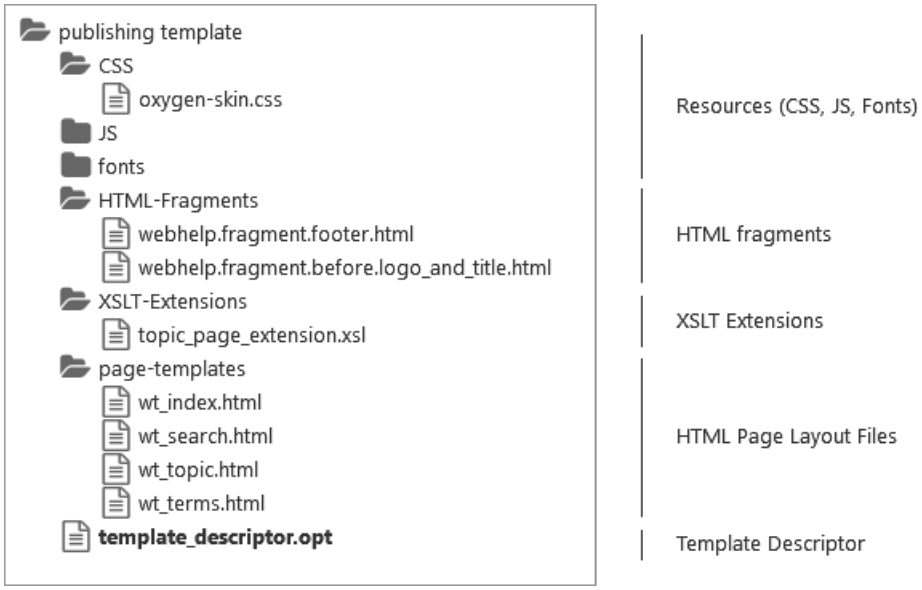

Figure: Oxygen Publishing Template Package (PDF)

For information about creating and customizing publishing templates, watch our video demonstration:

Related Information:

How to Create a Publishing Template *(page 1899)*

How to Edit a Publishing Template *(page 1900)*

How to Add a Publishing Template to the Publishing Templates Gallery *(page 1901)*

How to Share a Publishing Template *(page 1903)*

Publishing Templates Gallery

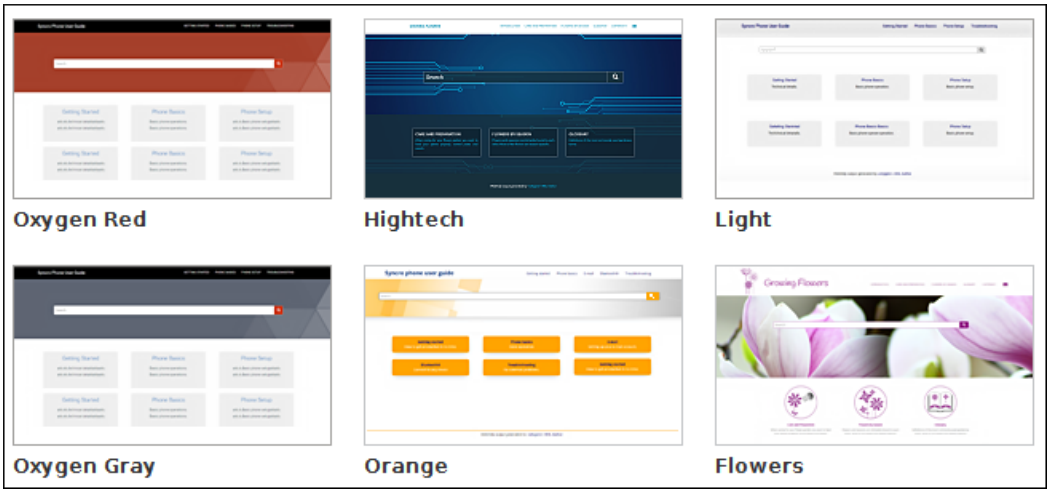
Oxygen XML Editor comes bundled with a variety of built-in templates. You can use one of them to publish your documentation or as a starting point for a new publishing template.

Built-in Templates

There are two categories of templates, *Tiles* and *Tree*. You can see the built-in templates in the **Templates** tab when editing a WebHelp Responsive transformation scenario in **Oxygen XML Editor/ Author**. Each one also includes an **Online preview** icon in the bottom-right corner that opens a webpage in your default browser that provides a sample of how the main page will look when that particular template is used to generate the output.

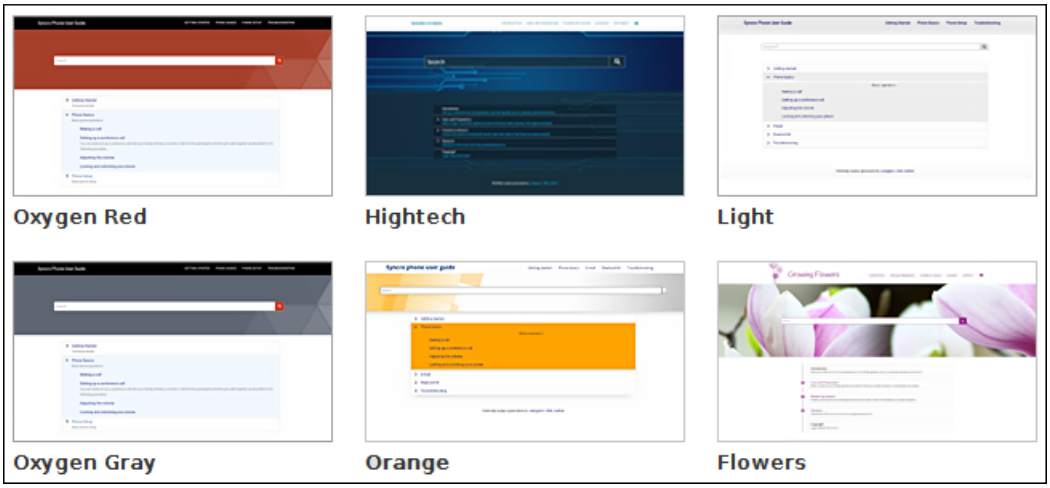
Tiles Templates

The main page in the WebHelp output presents a tile for each main topic (chapter) of the documentation.



Tree Templates

The main page in the WebHelp output presents a tree-like table of contents.



Built-in Templates Location

All built-in templates are stored in the following directory: `/plugins/com.oxygenxml.webhelp.responsive/templates`.

Custom Templates

You can use a built-in template as a starting point for creating your own custom template *(page 1899)*. You can store all of your custom templates in a particular directory. Then, go to **Options > Preferences > DITA > Publishing** and add your directory to the list, and all the templates stored in that directory will be displayed in the preview pane in the transformation scenario's **Template** tab along with all the built-in templates.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to **Options > Preferences > DITA > Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

Publishing Template Package Contents for WebHelp Responsive Customizations

An *Oxygen Publishing Template* package must contain a template descriptor file and some other resources (such as CSS files). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.

Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with template. It is an XML file that defines all the resources included in a template (such as HTML page layout files, CSS, JS, fonts, and transformation parameters).

The template descriptor file must have the `.opt` file extension and must be located in the templates' root folder.

A template descriptor might look like this:

```
<publishing-template>
    <name>Flowers</name>

    <webhelp>
        <tags>
            <tag>tree</tag>
            <tag>light</tag>
        </tags>
        <preview-image file="flowers-tree.png"/>

        <!-- Resources (CSS, favicon, logo and others) -->
        <resources>
            <!-- Main CSS file -->
            <css file="flowers.css"/>

             <!-- Resources to copy to the output folder -->
            <fileset>
                <include name="resources/**/*"/>
                <exclude name="resources/**/.svn"/>
                <exclude name="resources/**/.git"/>
            </fileset>
        </resources>

        <parameters>
            <parameter name="webhelp.show.main.page.tiles" value="no"/>
            <parameter name="webhelp.show.main.page.toc" value="yes"/>
            <parameter name="webhelp.top.menu.depth" value="3"/>
        </parameters>
    </webhelp>
</publishing-template>
```

Tip: It is recommended to edit the template descriptor in **Oxygen XML Editor/Author** because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a **name** element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a **description** and it displayed when the user hovers over the template in the transformation scenario dialog box.

```
<publishing-template>
    <name>Lorem Ipsum</name>
    <description>Lorem ipsum dolor sit amet, consectetur adipiscing elit</description>
    ...
```

Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the **author** element, a **name** is required and optionally you can include **email**, **organization**, and **organizationUrl** information.

```
<publishing-template>
    ...
    <author>
      <name>John Doe</name>
      <email>jdoe@example.com</email>
      <organization>ACME</organization>
      <organizationUrl>http://www.example.com/jdoe</organizationUrl>
    </author>
    ...
```

Webhelp Element

The **webhelp** element contains various details that define the WebHelp Responsive output. The elements that are allowed in this **webhelp** section specify the template tags *(page 1855)*, template preview image *(page 1855)*, resources *(page 1856)* (such as CSS, JS, fonts, logos), HTML page layout files *(page 1857)*, transformation parameters *(page 1880)*, HTML fragment extensions *(page 1877)* (used to add fragments to placeholders), or XSLT extensions *(page 1880)*.

```
    <webhelp>
        <tags>
          ...
        </tags>
        <preview-image file="MyPreview.png"/>

        <resources>
          ...
        </resources>

        <html-page-layouts>
          ...
        </html-page-layouts>

        <parameters>
          ...
        </parameters>
    </webhelp>
```

Template Tags

The **tags** section provides meta information about the template (such as layout type or color theme). Each **tag** is displayed at the top of the **Templates** tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```
<publishing-template>
    ...
    <webhelp>
      <tags>
        <tag>tree</tag>
        <tag>dark</tag>
      </tags>
```

Template Preview Image

The **preview-image** element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be `200 x 115` pixels and the supported image formats are: `JPEG`, `PNG`, or `GIF`.

You can also include an **online-preview-url** element to specify the URL of a published sample of your template. This will display an **Online preview** icon in the bottom-right corner the image in the transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

```
<publishing-template>
    ...
    <webhelp>
      ...
      <preview-image file="ashes/ashes-tree.png"/>
      <online-preview-url=https://www.example.com/samples/tiles/ashes</online-preview-
url>
```

Template Resources

The **resources** section of the descriptor file specifies a set of resources (CSS, JS, fonts, logos, etc.) that are used to customize various components in generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included, while the other types of resources are optional.

The types of resources that can be specified include:

- **CSS files** - One or more CSS files that will define the styles of all generated HTML pages.
- **Favicon** - You can specify the path to an image for the *favicon* associated with your website.
- **Logo** - You can specify the path to a logo image that will be displayed in the left side of the output header. Optionally, you can also specify:
  - # **target-url** - will redirect the user to the specified URL if they click the logo in the output.
  - # **alt** - provides an alternate text for the logo image.
- **JavaScript AMD module** - The path to a JavaScript module that uses the AMD (Asynchronous Module Definition) format. This module will be loaded in the output HTML pages using the *RequireJS* library. For more information, see How to Insert JavaScript AMD Modules in WebHelp Responsive Output *(page 1911)*.
- **Additional Resources (JS, Fonts)** - You can specify one or more sets of additional resources that will be copied to the output folder during the transformation process. These resources are specified with the **fileset** element and you can use one or more **include** and **exclude** elements. This semantic is similar to the ANT FileSet.

```
<publishing-template>
    ...
    <webhelp>
      ...
```

```
<resources>
    <css file="css/custom_styles.css"/>
    <css file="css/custom_fonts.css"/>

    <favicon file="images/favicon.png"/>

    <logo
     file="images/logo.png"
     target-url="http://www.example.com"
     alt="Alternate text for the logo image"/>

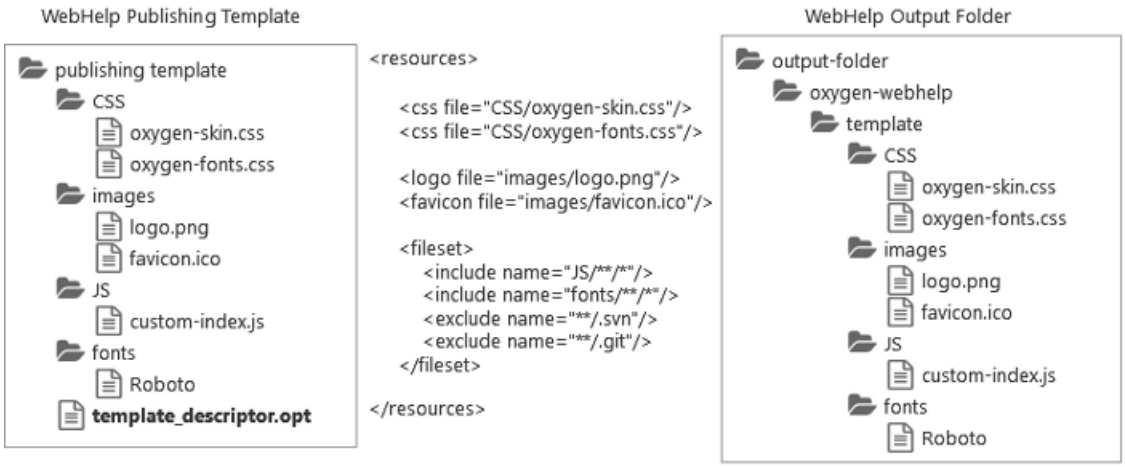
    <js-amd-module file="js/template-main.js"/>

    <fileset>
        <include name="common/**/*"/>
        <include name="JS/**/*"/>
        <exclude name="**/*.svn"/>
        <exclude name="**/*.git"/>
    </fileset>
</resources>
```

Note: All relative paths specified in the descriptor file are relative to the template root folder.

The resources specified in the template descriptor are copied to the following output folder: *[WebHelp_OUTPUT_DIR]/oxygen-webhelp/template*. The following graphic illustrates the mapping between the template resources and the location where they will be copied to the output folder:

Figure: Template Resources Mapping



HTML Page Layout Files

The HTML page layout files define the layout of the generated pages in the output. There are four types of pages (*main*, *search*, *topic*, *index*) and each type of page is a simple HTML file. Each type of page is defined inside an **html-page-layout-files** element in the descriptor file.

```
<publishing-template>
      ...
      <webhelp>
      ...
      <!-- HTML page layout files -->
      <html-page-layout-files>
        <page-layout-file page="main" file="page-templates/wt_index.html"/>
        <page-layout-file page="search" file="page-templates/wt_search.html"/>
        <page-layout-file page="topic" file="page-templates/wt_topic.html"/>
        <page-layout-file page="index-terms" file="page-templates/wt_terms.html"/>
      </html-page-layout-files>
```

These HTML files are not required in the descriptor file, but if you do use the **html-page-layout-files** element, you must specify all four types of pages (*main*, *search*, *topic*, *index*). If you do not specify these HTML page layout files, the files from the `/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates` folder will be used to define the layout of each type of page.

HTML Page Components

Each type of page contains various components that control the layout of that page. The rendering of each component depends on the context where it is placed and its content depends on the transformed *DITA map (page 3228)*.

Some of the components can be used in all four types of pages, while some are only available for certain pages. For instance, the *Publication Title* component can be used in all pages, but the *Navigation Breadcrumb* component can only be used in the **Topic Page**.

To include a component in the output of a particular type of page, you have to reference a specific element in that particular HTML file. All the elements associated with a component should belong to the `http://www.oxygenxml.com/webhelp/components` namespace.

Every component can contain custom content or reference another component. To specify where the component content will be located in the output, you can use the `whc:component_content` element as a descendant of the component element. It can specify the location as before, after, or it can wrap the component content. The following snippet contains an example of each:

```
<whc:webhelp_search_input class="navbar-form wh_main_page_search"
       role="form" >
       <div class="custom-content-before">Enter search terms here:</div>
 <div class="custom-wrapper">
        <whc:component_content/>
 </div>
       <div class="custom-content-after">Results will be displayed in a new window.</
div>
</whc:webhelp_search_input>
```

Main Page

The *Main Page* is the home page generated in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_index.html` and it is located in the following directory: `/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The main function of the home page is to display top level information and provide links that help you easily navigate to any of the top level topics of the publication. These links can be rendered in either a *Tiles* or *Tree* style of layout. The HTML page produced for the home page also consists of various other components, such as a logo, title, menu, search field, or index link.

Figure: Examples of Main Page Components for a Tiles Style of Layout

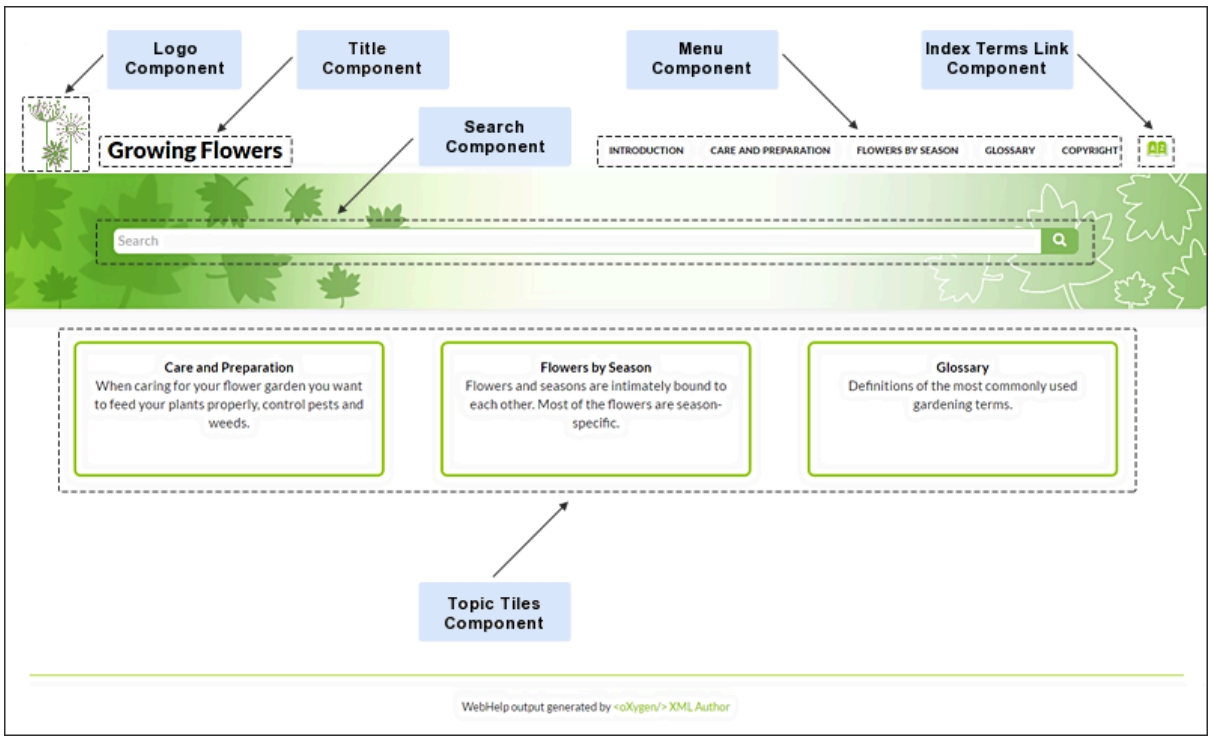


Figure: Examples of Main Page Components for a Tree Style of Layout

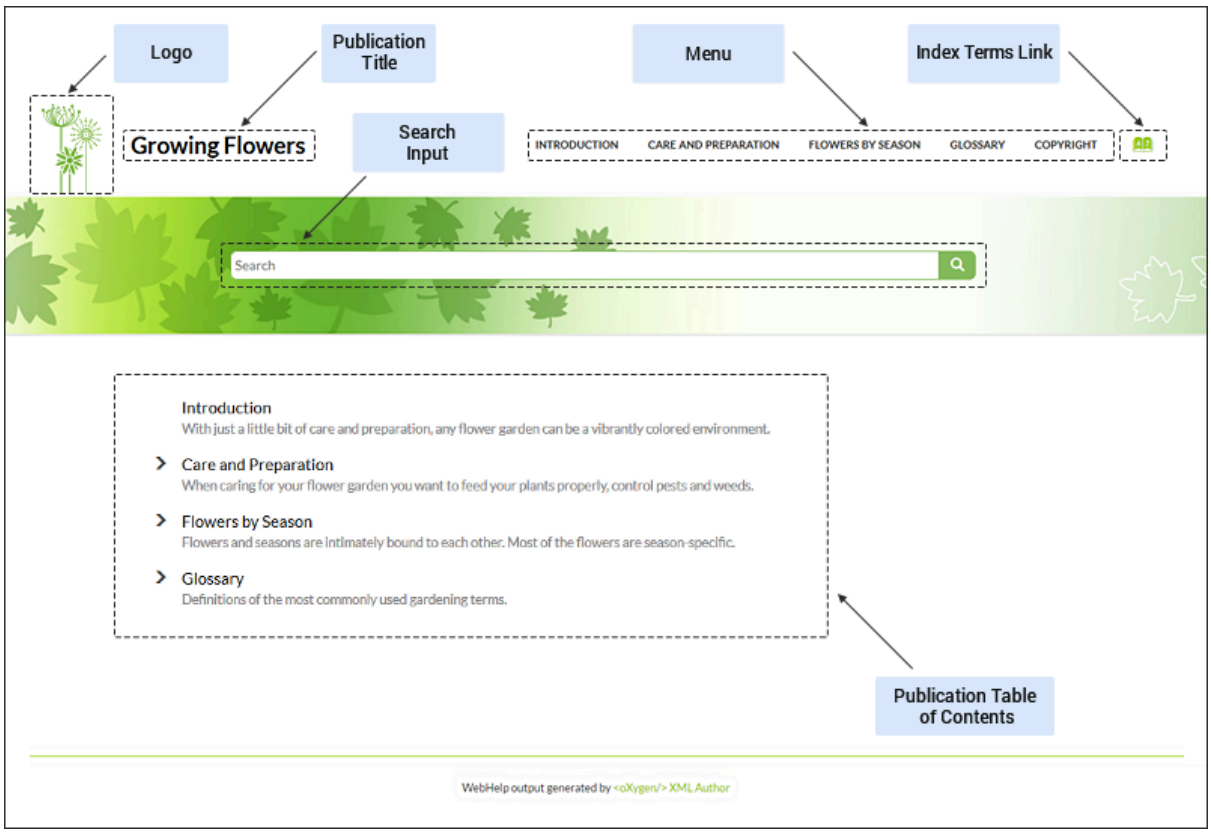


The following components can be referenced in the *Main Page* (`wt_index.html`) file:

Publication Title (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
    xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
    xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the

transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_input`.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `webhelp_print_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_print_link`.

Main Page Menu (`webhelp_topics_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `webhelp_topics_menu` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topics_menu
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_topics_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu *(page 1916)*.

Main Page Topic Tiles (`webhelp_tiles`)

This component generates the tiles section in the main page. This section will contain a tile for each root topic of the published documentation. Each topic tile has three

sections that corresponds to the topic title, short description, and image. To generate this component, the `webhelp_tiles` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_tiles
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_tiles`.

If you want to control the HTML structure that is generated for a WebHelp tile you can also specify the template for a tile by using the `whc:webhelp_tile` component, as in the following example:

```
<whc:webhelp_tile class="col-md-4">
  <!-- Place holder for tile's image -->
  <whc:webhelp_tile_image/>

  <div class="wh_tile_text">
    <!-- Place holder for tile's title -->
     <whc:webhelp_tile_title/>

     <!-- Place holder for tile's shordesc -->
     <whc:webhelp_tile_shortdesc/>
  </div>
</whc:webhelp_tile>
```

For information about customizing the tiles, see How to Configure the Tiles on the WebHelp Responsive Main Page *(page 1919)*.

Main Page Table of Contents (`webhelp_main_page_toc`)

This component generates a simplified Table of Contents. It is simplified because it contains only two levels from the documentation hierarchy. To generate this component, the `webhelp_main_page_toc` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_main_page_toc
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_main_page_toc`.

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contains any

index terms, then the link will not be generated. To generate this component, the `webhelp_indexterms_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `webhelp_skin_resources` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

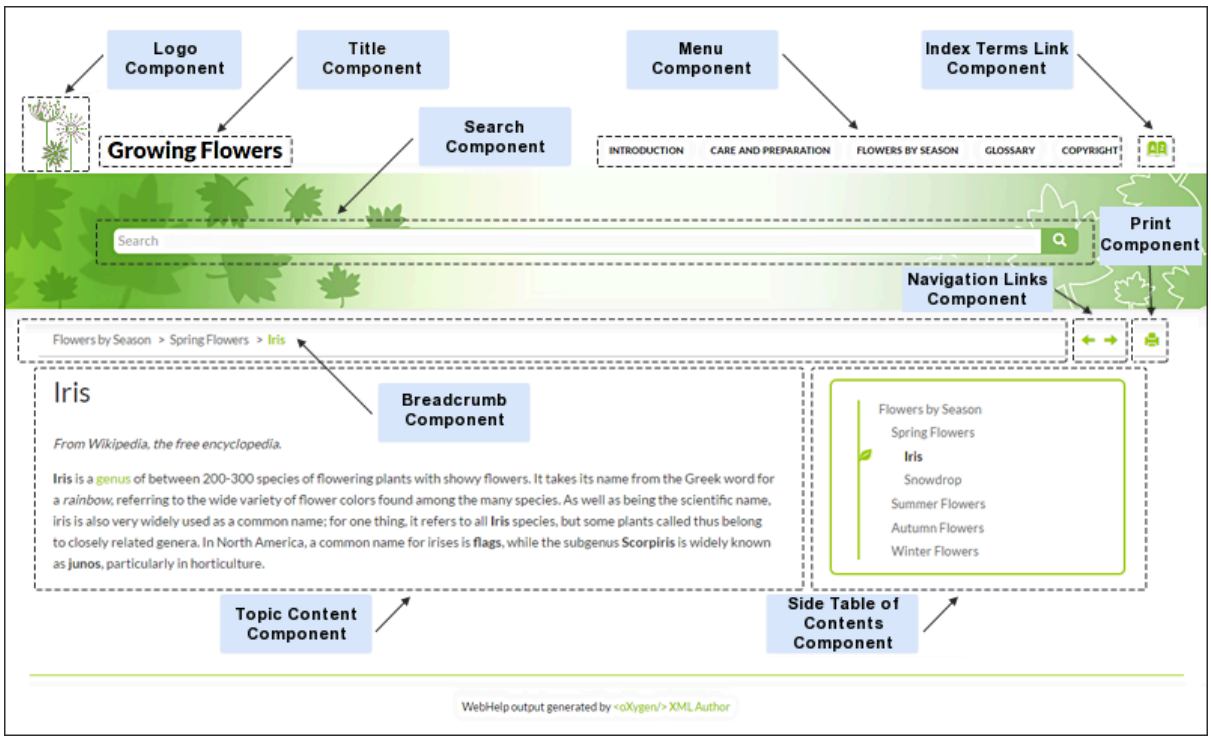
In the output, you will find a link to the skin resources.

Topic Page

The *Topic Page* is the page generated for each DITA topic in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_topic.html` and it is located in the following directory: `/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

Figure: Examples of Topic Page Components



The following components can be referenced in the *Topic Page* (`wt_topic.html`) file:

Publication Title (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_input`.

Topic Breadcrumb (`webhelp_breadcrumb`)

This component generates a breadcrumb that displays the path of the current topic. To generate this component, the `webhelp_breadcrumb` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_breadcrumb
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_breadcrumb`. This element will contain a list with items that correspond to the topics in the path. The first item in the list has a link to the main page with the `home` class. The last item in the list corresponds to the current topic and has the `active` class set.

Navigation Links (`webhelp_navigation_links`)

This component generates navigation links to the next and previous topics. To generate this component, the `webhelp_navigation_links` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_navigation_links
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_navigation_links`. This element will contain the links to the next and previous topics.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `webhelp_print_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_print_link`.

Topic Content (`webhelp_topic_content`)

This component generates the content of a topic and it represent the content of the HTML files as they are produced by the DITA-OT processor. To generate this component, the `webhelp_topic_content` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topic_content
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_topic_content`.

Publication TOC (`webhelp_publication_toc`)

This component generates a mini table of contents for the current topic (on the left side). It will contain links to the children of current topic, its siblings, and all of its ancestors. To generate this component, the `webhelp_publication_toc` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_toc
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_toc`. This element will contain links to the topics that are close to the current topic.

Topic TOC (`webhelp_topic_toc`)

This component generates a topic table of contents for the current topic (on the right side). This table of contents contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. To generate this component, the `webhelp_topic_toc` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topic_toc
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_topic_toc`. This element will contain links to the topics that are close to the current topic.

Expand/Collapse Sections (`webhelp_expand_collapse_sections`)

This component is used to generate an icon that expands or collapses sections listed in the side table of contents within a topic. To generate this component, the `webhelp_expand_collapse_sections` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_expand_collapse_sections
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `webhelp_expand_collapse_sections`.

Topic Feedback (`webhelp_feedback`)

This component generates a placeholder for where the comments section will be presented. To generate this component, the `webhelp_feedback` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_feedback
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

Main Page Menu (`webhelp_topics_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `webhelp_topics_menu` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topics_menu
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_topics_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu *(page 1916)*.

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contains any index terms, then the link will not be generated. To generate this component, the `webhelp_indexterms_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

Child Links (`webhelp_child_links`)

For all topics with subtopics (child topics), this component generates a list of links to each child topic. To generate this component, the `webhelp_child_links` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_child_links
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

Related Links (`webhelp_related_links`)

For all topics that contain related links, this component generates a list of related links that will appear in the output. To generate this component, the `webhelp_related_links` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_related_links
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `webhelp_skin_resources` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

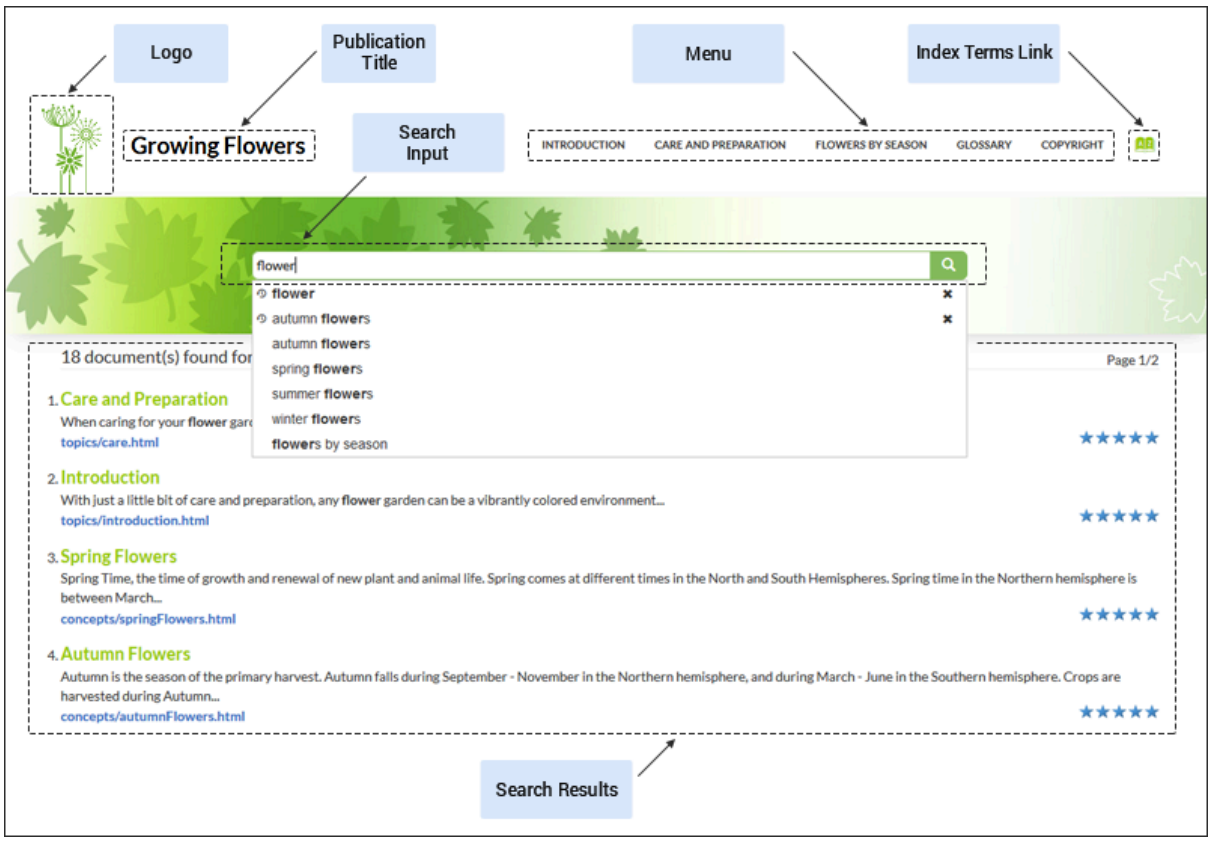
In the output, you will find a link to the skin resources.

Search Results Page

The *Search Results Page* is the page generated that present search results in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_search.html` and it is located in the following directory: `/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of a search results component along with various other additional components, such as a title, menu, or index link.

Figure: Examples of Search Results Page Components



The following components can be referenced in the *Search Results Page* (`wt_search.html`) file:

Publication Title (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
      xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
      xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the

transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_input`.

Search Results (`webhelp_search_results`)

This component is used to generate a placeholder to signal where the search results will be presented in the output. To generate this component, the `webhelp_search_results` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_results
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_results`.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `webhelp_print_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_print_link`.

Main Page Menu (`webhelp_topics_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `webhelp_topics_menu` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topics_menu
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_topics_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu *(page 1916)*.

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contains any index terms, then the link will not be generated. To generate this component, the `webhelp_indexterms_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_indexterms_link` . This element will contain a link to the `indexterms.html` page.

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `webhelp_skin_resources` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

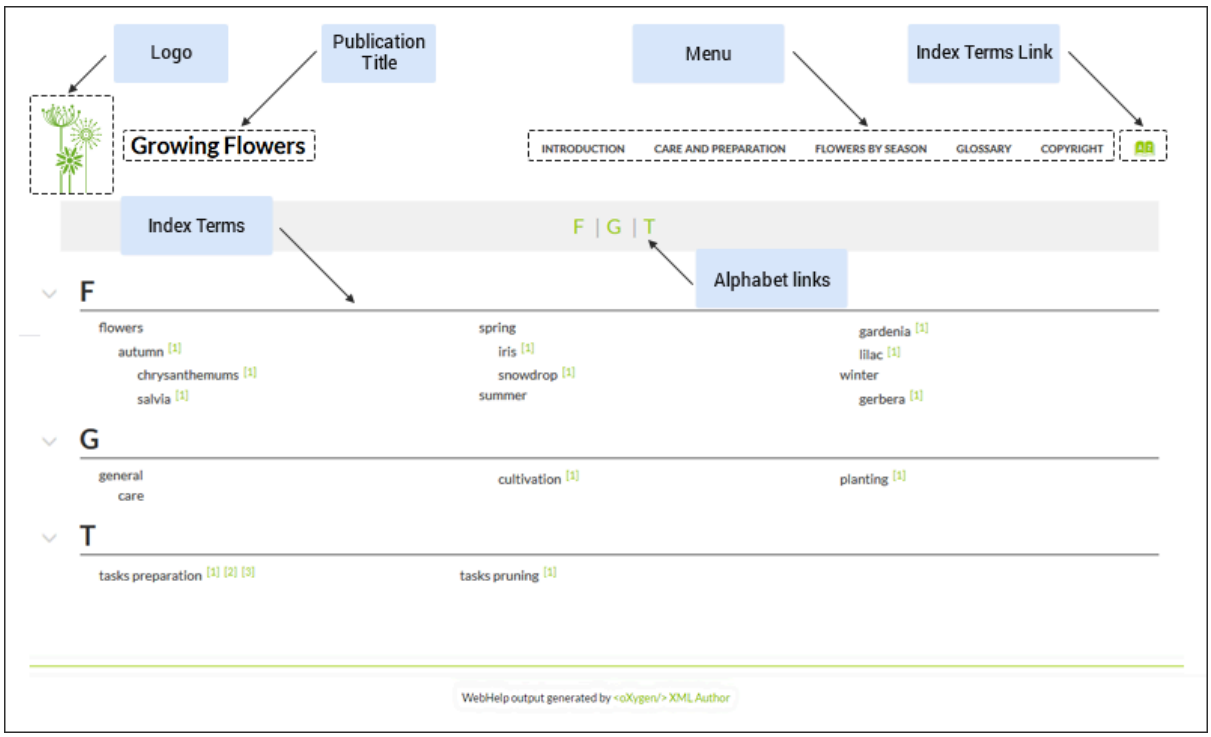
Index Terms Page

The *Index Terms Page* is the page generated that presents index terms in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_terms.html` and it is located in the following directory: `/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section.

Figure: Examples of Index Terms Page Components



The following components can be referenced in the *Index Terms Page* (`wt_terms.html`) file:

Publication Title (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `webhelp_publication_title` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `webhelp_logo` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `webhelp_search_input` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_search_input`.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `webhelp_print_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_print_link`.

Main Page Menu (`webhelp_topics_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `webhelp_topics_menu` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topics_menu
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_topics_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see How to Customize the Menu *(page 1916)*.

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contains any index terms, then the link will not be generated. To generate this component, the

`webhelp_indexterms_link` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
     xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_indexterms_link`. This element will contain a link to the `indexterms.html` page.

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `webhelp_skin_resources` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

WebHelp Responsive Macros

You can use the `whc:macro` layout component to specify a macro value (a variable that will be expanded when the output files are generated).

A macro has the following syntax:

```
${macro-name}
```

or

```
${macro-name(macro-parameter)}
```

A macro name can accept any alphanumeric characters, as well as the following characters: `-` (minus), `_` (underscore), `.` (dot), `:` (colon). The value of a parameter may contain any character except the `}` (close curly bracket) character.

Implementations

The following *macros* are supported:

`i18n`

For localizing a string.

```
${i18n(string.id)}
```

`param`

Returns the value of a transformation parameter.

```
${param(webhelp.show.main.page.tiles)}
```

`env`

Returns the value of an environment variable.

```
${env(JAVA_HOME)}
```

`system-property`

Returns the value of a system property.

```
${system-property(os.name)}
```

`timestamp`

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or *picture string* as it is known in the XSLT specification). The format string must comply with the rules of the XSLT `format-dateTime` function specification.

```
${timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001])}
```

`path`

Returns the path associated with the specified path ID. The following paths IDs are supported:

- `oxygen-webhelp-output-dir` - The path to the output directory. The path is relative to the current HTML file.
- `oxygen-webhelp-assets-dir` - The path to the `oxygen-webhelp` subdirectory from the output directory. The path is relative to the current HTML file.
- `oxygen-webhelp-template-dir` - The path to the template directory. The path is relative to the current HTML file.

  ```
  ${path(oxygen-webhelp-template-dir)}
  ```

Note: New paths IDs can be added by overriding the `wh-macro-custom-path` template from `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl`:

```
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
    <xsl:param name="pathId"/>
    <xsl:value-of select="$pathId"/>
```

```
</xsl:template>
```

`map-xpath`

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

Tip: Available in all template layout HTML pages.

```
${map-xpath(/map/title)}
```

`topic-xpath`

Can be used to execute an XPath expression over the current topic.

Tip: Available only in the topic HTML page template (`wt_topic.html`).

```
${topic-xpath(string-join(//shortdesc//text(), ' '))}
```

`oxygen-webhelp-build-number`

Returns the current WebHelp distribution ID (build number).

```
${oxygen-webhelp-build-number}
```

Extensibility

To add new *macros*, you can add an XSLT extension to overwrite the `wh-macro-extension` template from the `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl` file.

```
<!-- Extension template for expanding custom macro constructs -->
<xsl:template name="wh-macro-extension">
    <xsl:param name="name"/>
    <xsl:param name="params"/>
    <xsl:param name="contextNode"/>
    <xsl:param name="matchedString"/>

    <xsl:choose>
        <xsl:when test="$contextNode instance of attribute()">
            <xsl:value-of select="$matchedString"/>
        </xsl:when>
        <xsl:otherwise>
            <xsl:message>Cannot expand macro:
                [<xsl:value-of select="$matchedString"/>]</xsl:message>
            <xsl:copy-of select="$contextNode"/>
        </xsl:otherwise>
```

```
    </xsl:choose>
</xsl:template>
```

The `wh-macro-extension` template has the following parameters:

- `name` - The name of the current *macro*.
- `params` - List of parameters of the current *macro* as `string` sequence. The current *macros* parsing mechanism only allows *macros* with a maximum of one parameter. Consequently, this list will contain at most one element.
- `contextNode` - The current element or attribute where the *macro* was declared.
- `matchedString` - The entire value of the matched *macro* as specified in the HTML template page.

HTML Fragment Extension Points

The HTML pages contain component placeholders that can be used to insert custom HTML fragments.

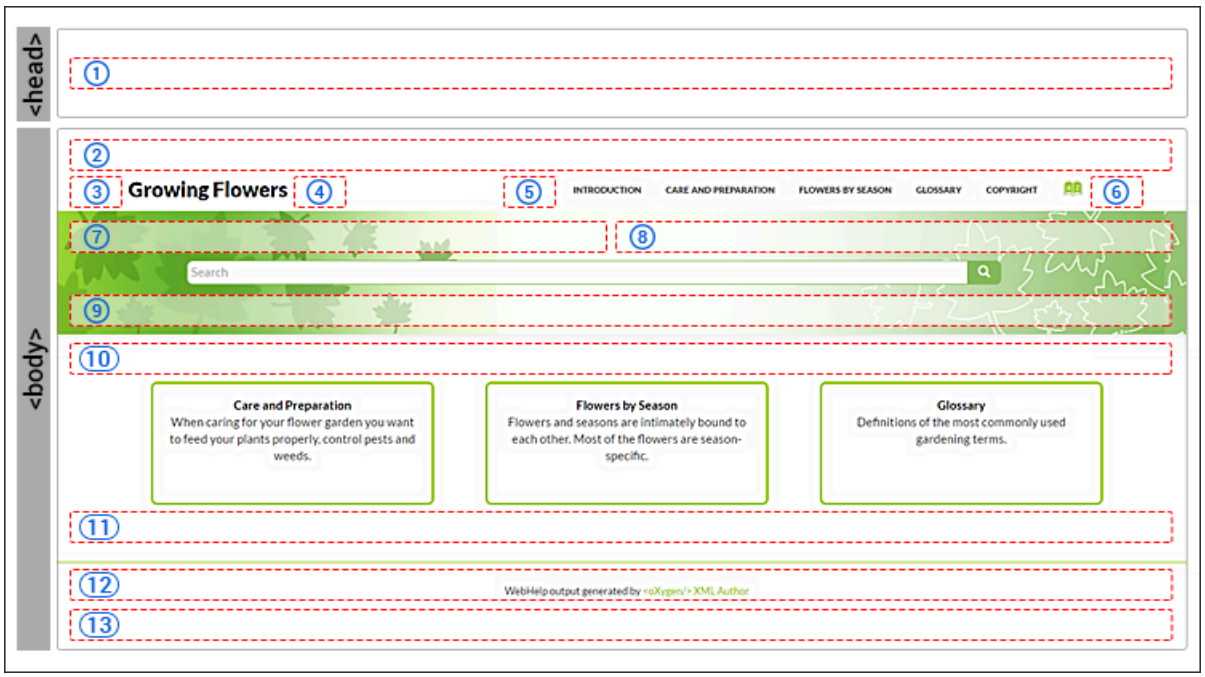
You can specify one or more HTML fragment extension points in the descriptor file using the following structure:

```
<publishing-template>
    ...
    <webhelp>
      ...
      <html-fragments>
        <fragment
          file="html-fragments/webhelp.fragment.welcome"
          placeholder="webhelp.fragment.welcome"/>
        <fragment
          file="html-fragments/webhelp.fragment.footer.html"
          placeholder="webhelp.fragment.footer"/>
      </html-fragments>
```

Some of these placeholders are left empty in the default output configurations, but you can use them to insert custom content.

Each placeholder has an associated parameter in the transformation. These predefined empty placeholder parameters are illustrated and described below.

Figure: Predefined Placeholders Diagram



Each of these parameters can hold either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment:

1- webhelp.fragment.head

In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

2- webhelp.fragment.before.body

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

3- webhelp.fragment.before.logo_and_title

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

4- webhelp.fragment.after.logo_and_title

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

5- webhelp.fragment.before.top_menu

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

6- webhelp.fragment.after.top_menu

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

7- webhelp.fragment.before.main.page.search

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

8- webhelp.fragment.welcome

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

9- webhelp.fragment.after.main.page.search

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

10- webhelp.fragment.before.toc_or_tiles

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

11- webhelp.fragment.after.toc_or_tiles

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

12- webhelp.fragment.footer

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

13- webhelp.fragment.after.body

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

How to Insert HTML Content in WebHelp Responsive Output *(page 1906)*

XSLT Extension Points

The publishing template allows supports one or more XSLT extension points. They are helpful when you want to change the structure of the HTML pages that are primarily generated from XSLT processing. They can be specified in the descriptor file using the following structure:

```
<publishing-template>
    ...
    <webhelp>
        ...
        <xslt>
            <extension
              id="com.oxygenxml.webhelp.xsl.dita2webhelp"
              file="xsl/customDita2webhelp.xsl"/>
            <extension
              id="com.oxygenxml.webhelp.xsl.createMainPage"
              file="xsl/customMainPage.xsl"/>
        </xslt>
```

For more information, and a full list of the available extension points, see: XSLT-Import and XSLT-Parameter Extension Points *(page 1896)*.

Note: You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.

Transformation Parameters

You can also set one or more WebHelp transformation parameters in the descriptor file.

```
<publishing-template>
    ...
    <webhelp>
      ...
      <parameters>
        <parameter
          name="webhelp.show.main.page.toc"
```

```
        value="yes"/>
      <parameter
        name="webhelp.top.menu.depth"
        value="3"/>
      <parameter
        name="webhelp.fragment.welcome"
        value="html-fragment/webhelp.fragment.welcome.html"
        type="filePath"/>
    </parameters>
  </webhelp>
```

The following information can be specified in the `parameter` element:

Parameter name

The name of the parameter. It may be one of the WebHelp Responsive transformation parameters *(page 1889)* or a DITA-OT HTML-based output parameter.

Note: It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

Attention: JVM arguments like *-Xmx* cannot be specified as a transformation parameter.

Parameter Value

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

Parameter Type

The type of the parameter: `string` or `filepath`. The `string` value is default.

After creating a publishing template *(page 1899)* and adding it to the templates gallery *(page 1901)*, when you select the template in the transformation scenario dialog box, the **Parameters** tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

Combining WebHelp Responsive and PDF Customizations in a Template Package

An *Oxygen Publishing Template* package can contain both a WebHelp Responsive and PDF customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `webhelp` and `pdf` element and some of the resources can be reused.

</publishing-template>
```

Generating WebHelp Responsive Output

The publishing process can be initiated from a transformation scenario within **Oxygen XML Editor/Author**, from a command line outside **Oxygen XML Editor/Author**, or from an integration server.

Running from Oxygen XML Editor/Author

To publish to the WebHelp Responsive output from a transformation scenario inside **Oxygen XML Editor/Author**, use one of the following procedures, depending on whether or not you want a feedback section in your output.

WebHelp Responsive Output

To publish a *DITA map (page 3228)* as **WebHelp Responsive** output, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:
   - **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
   - **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
   - **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
   - **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
   - **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.
4. Click **Apply associated** to process the transformation.

   When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

WebHelp Responsive with Feedback Output

To publish a *DITA map (page 3228)* as a **WebHelp Responsive with Feedback** system, follow these steps:

1. Select the **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive with Feedback** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

   Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:
   - **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.

- **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to begin the transformation.
5. Enter the documentation product ID (value for the `webhelp.product.id` parameter) and the documentation version (value for the `webhelp.product.version` parameter).

   When the **DITA Map WebHelp Responsive with Feedback** transformation is complete, your default browser opens the `installation.html` file. This file contains information about the output location, system requirements, installation instructions, and deployment of the output. Follow the instructions to complete the system deployment *(page 1831)*.

Running from Command Line

To publish to the WebHelp Responsive output from a command line outside of **Oxygen XML Editor/ Author**, you can use the `dita` startup script that comes bundled with distribution.

`dita` Command Format

`dita` command has the following format:

```
/bin/dita --format=webhelp-responsive --input=input-file options
```

where the arguments are as follows:

`dita`

Windows - The `dita.bat` script located in: `DITA-OT-DIR` *(page 3229)*`\bin\`.

Linux/Mac OS X - The `dita` script file located in: `DITA-OT-DIR` *(page 3229)*`/bin/`.

`--format` = `webhelp-responsive`

Specifies the output format (transformation type) for WebHelp Responsive transformation.

`--input` = `input-file`

The `input-file` represents the path to the DITA map that you want to process.

`options`

`options` include the following optional build parameters:

`--output` **=dir**

`-o` **dir**

Specifies the path of the output directory; the path can be absolute or relative to the current directory. By default, the output is written to the `out` subdirectory of the current directory.

`--filter` **=file**

Specifies filter file(s) used to include, exclude, or flag content.

Relative paths are resolved against the current directory and internally converted to absolute paths.

`--temp` **=dir**

`-t` **dir**

Specifies the location of the temporary directory.

`--verbose`

`-v`

Verbose logging.

`--debug`

`-d`

Debug logging.

`--logfile` **=file**

`-l` **file**

Write logging messages to a file.

`--parameter` **=value**

`-D` **parameter=value**

Specify a value for a DITA-OT or Ant build parameter.

`--propertyfile` **=file**

Use build parameters defined in the referenced `.properties` file.

Build parameters specified on the command line override those set in the `.properties` file.

WebHelp and DITA-OT parameters

In addition to the transformation parameters that are specific to WebHelp Responsive *(page 1889)*, you can use to the common DITA-OT transformation parameters and the Modifying or adding generated text.

Command Line Example

- Windows:

```
dita.bat
   --format=webhelp-responsive
   --input=c:\mySample.ditamap
   --output=c:\output
   -Dwebhelp.logo.image=C:\images\myLogo.jpg
```

- Linux/Mac OS X:

```
dita
   --format=webhelp-responsive
   --input=c:\mySample.ditamap
   --output=c:\output
   -Dwebhelp.logo.image=C:\images\myLogo.jpg
```

DITA-OT Documentation: HTML-based output parameters

WebHelp Responsive Output Parameters *(page 1889)*

Running from an Integration Server

Oxygen XML Editor can be processed from an automatic publishing system, such as *Jenkins* or *Travis*.

Automating DITA to WebHelp Output with Jenkins

To integrate WebHelp output with the Jenkins continuous integration tool, follow these steps:

1. Create a Maven project to incorporate the DITA-OT that already integrates Oxygen XML Editor.
2. Go to the root of your Maven project and edit the `pom.xml` file to include the following fragment:

```
<properties>
  <oxygen-webhelp>${basedir}/tools/DITA-OT2.5.2/
       plugins/com.oxygenxml.webhelp.responsive</oxygen-webhelp>
</properties>

<plugin>
  <artifactId>exec-maven-plugin</artifactId>
  <groupId>org.codehaus.mojo</groupId>
  <executions>
    <execution><!-- Run our version calculation script -->
      <id>Version Calculation</id>
      <phase>generate-sources</phase>
      <goals>
        <goal>exec</goal>
      </goals>
      <configuration>
        <executable>${oxygen-webhelp}/ditaWebhelp.bat</executable>
      </configuration>
    </execution>
  </executions>
</plugin>
```

Note: In the fragment above it is assumed that you are using DITA-OT version 2.5.4. If you are using another version, please adjust the path accordingly.

3. Go to the Jenkins top page and create a new Jenkins job. Configure this job to suit your particular requirements, such as the build frequency and location of the Maven project.

Automating DITA to WebHelp Output with Travis CI

This topic assumes you have a DITA project hosted on a GitHub public or private repository.

The goal of this tutorial is to help you setup a Travis continuous integration job that automatically publishes your DITA project to GitHub pages after every commit. The published website will contain a feedback link on each page that would allow a contributor to easily suggest changes to the documentation by creating a pull request on GitHub with just a few clicks.

Enable the Travis CI Build

1. Sign in to Travis CI with your GitHub account, accepting the GitHub access permissions confirmation.
2. Once you are signed in, and you have synchronized your GitHub repositories, go to your profile page and enable Travis CI for the repository you want to build.

Configure the Travis CI Build in your GitHub Project

1. Checkout your GitHub project locally.
2. Copy the `.travis` folder from here to the root directory of your project.
3. In the root of your GitHub project, add a file called `.travis.yml` with the following content:

```
language: dita
install:
  - echo "Installed"
script:
  - sh .travis/publish.sh
after_success:
  - sh .travis/deploy.sh
env:
  global:
    - DITAMAP=/path/to/your/ditamap/file
    - DITAVAL=/path/to/your/ditaval/file
    - ANT_OPTS=-Xmx1024M
```

Note: Replace `/path/to/your/ditamap/file` and `/path/to/your/ditaval/file` with the appropriate paths to your *DITA map* and `ditaval` files.

4. Create a GitHub personal access token by following this procedure.
5. Define an environment variable in the repository settings that has the name `GH_TOKEN` and the value equal with the GitHub personal access token created earlier.

Register Your License Key

1. Edit your `.gitignore` file (or create it if it does not already exist) and add the following line:

```
licenseKey.txt
```

2. Copy your WebHelp license to the root of your GitHub project in a file called `licenseKey.txt`.

Important: The `licenseKey.txt` file should not be committed to GitHub as it contains a license key that is issued only to you.

3. Encrypt the license key file and **add** it to the `.travis.yml` configuration file. This way only the Travis CI server will be able to decrypt it during the build process.

Commit to GitHub

1. Commit the following files and folders and push the commit to GitHub:

```
git add .gitignore licenseKey.txt.enc .travis.yml .travis/
git commit -m "Set up the Travis CI publishing system"
git push
```

2. Create a `gh-pages` branch in your GitHub project where the WebHelp output will be published. You can follow the procedure here.

WebHelp Responsive Transformation Parameters

In addition to the common DITA-OT transformation parameters and the Modifying or adding generated text, there are numerous other supported parameters that are specific to the WebHelp Responsive output.

Publishing Template Parameters

`webhelp.publishing.template`

Specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

Note: The built-in templates are stored in the *`DITA-OT-DIR`*`/plugins/com.oxygenxml.webhelp.responsive/templates` folder.

Note: Relative paths are resolved based on the current working directory.

`webhelp.publishing.template.descriptor`

Specifies the name of the descriptor to be loaded from the WebHelp Responsive template package. If it is not specified, the first encountered descriptor will be automatically loaded.

Custom Resource Parameters

`webhelp.custom.resources`

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

`webhelp.favicon`

The file path that points to an image to be used as a *favicon* in the WebHelp output.

`webhelp.logo.image.target.url`

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

`webhelp.logo.image`

Specifies a path to an image displayed as a logo in the left side of the output header.

`webhelp.logo.image.alt`

Specifies a value that will be set in the `alt` attribute of the logo image. If the parameter is not specified, the `alt` attribute will contain the publication title. Note that this parameter makes sense only in conjunction with the `webhelp.logo.image` parameter.

Feedback-Enabled Parameters

`webhelp.product.id` **(available only for Feedback-enabled systems)**

This parameter specifies a short name for the documentation target, or product (for example, `mobile-phone-user-guide`, `hvac-installation-guide`).

Note: You can deploy documentation for multiple products on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

`webhelp.product.version` **(available only for Feedback-enabled systems)**

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

Note: Multiple documentation versions can be deployed on the same server.

Restriction: The following characters are not allowed in the value of this parameter: `< > / \ ' ( ) { } = ; * % + &`.

HTML Fragment Extension Parameters

`webhelp.fragment.after.body`

In the generated output it displays a given XHTML fragment after the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.logo_and_title`

In the generated output it displays a given XHTML fragment after the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.main.page.search`

In the generated output it displays a given XHTML fragment after the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.toc_or_tiles`

In the generated output it displays a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.after.top_menu`

In the generated output it displays a given XHTML fragment after the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.before.body`

In the generated output it displays a given XHTML fragment before the page body. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.before.logo_and_title`

In the generated output it displays a given XHTML fragment before the logo and title. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.before.main.page.search`

In the generated output it displays a given XHTML fragment before the search field. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.before.toc_or_tiles`

In the generated output it displays a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.before.top_menu`

In the generated output it displays a given XHTML fragment before the top menu. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.footer`

In the generated output it displays a given XHTML fragment as the page footer. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.head`

In the generated output it inserts a given XHTML fragment in the `<head>` element. The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

`webhelp.fragment.welcome`

In the generated output it displays a given XHTML fragment as a welcome message (or title). The value of the parameter can be either an XHTML fragment or a path to a file that contains a well-formed XHTML fragment.

Output Component Parameters

`webhelp.default.collection.type.sequence`

Specifies if the **sequence** value will be used by default when the `collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.

`webhelp.merge.nested.topics.related.links`

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is `yes`.

`webhelp.show.breadcrumb`

Specifies if the breadcrumb component will be presented in the output. The default value is `yes`.

`webhelp.show.changes.and.comments`

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

`webhelp.show.child.links`

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is `no`.

`webhelp.show.indexterms.link`

Specifies if an icon that links to the index will be presented in the output. The default value is `yes`.

`webhelp.show.main.page.tiles`

Specifies if the tiles component will be presented in the main page of the output. For a *tree* style layout, this parameter should be set to `no`.

`webhelp.show.main.page.toc`

Specifies if the table of contents will be presented in the main page of the output. The default value is `yes`.

`webhelp.show.navigation.links`

Specifies if navigation links will be presented in the output. The default value is `yes`.

`webhelp.show.print.link`

Specifies if a print link or icon will be presented within each topic in the output. The default value is `yes`.

`webhelp.show.publication.toc`

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is `yes`.

`webhelp.show.topic.toc`

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. The default value is `yes`.

`webhelp.show.top.menu`

Specifies if a menu will be presented at the topic of the main page in the output. The default value is `yes`.

`webhelp.publication.toc.hide.chunked.topics`

Specifies if the table of contents will contain links for *chunked* topics. The default value is `yes`.

`webhelp.publication.toc.links`

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.

- **all** - The TOC will include all links.

`webhelp.publication.toc.tooltip.position`

By default, if a topic contains a `shortdesc` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left** (default)
- **right**
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

`webhelp.top.menu.depth`

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is `3`. A value of `0` means that the menu has unlimited depth.

`webhelp.topic.collapsible.elements.initial.state`

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are `collapsed` or `expanded` (default value).

Search-Related Parameters

`webhelp.search.japanese.dictionary`

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages.

`webhelp.search.ranking`

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

`webhelp.search.stop.words.exclude`

Specifies a list of words that will be excluded from the default list of *stop words* that are filtered out before the search processing. Use comma separators to specify more than one word (for example: `if,for,is`).

`webhelp.sitemap.base.url`

Base URL for all the `loc` elements in the generated `sitemap.xml` file. The value of a `loc` element is computed as the relative file path from the `href` attribute of a `topicref` element from the *DITA map*, appended to this base URL value. The `loc`

element is mandatory in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `sitemap.xml` file is not generated.

`webhelp.enable.search.autocomplete`

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is `yes`.

`webhelp.search.enable.pagination`

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

`webhelp.search.page.numberOfItems`

Specifies the number of search results items displayed on each page. This parameter is only used when the **webhelp.search.enable.pagination** parameter is enabled.

`webhelp.sitemap.change.frequency`

The value of the `changefreq` element in the generated `sitemap.xml` file. The `changefreq` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `changefreq` element is not added in `sitemap.xml`. Allowed values: <empty string> (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

`webhelp.sitemap.priority`

The value of the `priority` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `priority` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `priority` element is not added in `sitemap.xml`.

`webhelp.google.search.results`

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommend to set the `linkTarget` attribute to `frm` for frameless (*iframe*) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`

`webhelp.google.search.script`

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

Note: The `fix.external.refs.com.oxygenxml` parameter is not supported when running the transformation from a command line. This parameter is normally used to specify whether or not the

application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.

Generating WebHelp Responsive Output *(page 1882)*

DITA-OT Parameter Reference

WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points

XSLT extension points can be used from either from an *Oxygen Publishing Template* or from a DITA-OT extension plug-in.

Extension Points from an Oxygen Publishing Template

The publishing template allows you to specify one or more XSLT extension points. These extension points will affect only the transformations that use the particular template.

For an example of how to use these extension in a publishing template, see: How to Use a XSLT Extension Point from a Publishing Template *(page 1948)* topic.

Example:

```
<publishing-template>
    ...
    <webhelp>
        ...
        <xslt>
            <extension
              id="com.oxygenxml.webhelp.xsl.createMainPage"
              file="xsl/customMainPage.xsl"/>
        </xslt>
```

Extension Points from a DITA-OT Extension Plug-in

The DITA-OT plug-in installer adds an XSLT import statement in the default WebHelp XSLT so that the XSLT stylesheet referenced by the extension point becomes part of the normal build. You can use these extension points to override XSLT processing steps.

Example:

```
<plugin id="com.oxygenxml.webhelp.responsive.extension">
  <feature extension="com.oxygenxml.webhelp.responsive.xsl.dita2webhelp"
```

```
            file="xsl/fixup.xsl"/>
</plugin>
```

XSLT-Import Extension Points

The following extension points are available:

com.oxygenxml.webhelp.xsl.dita2webhelp

Extension point to override the XSLT stylesheet (`dita2webhelp.xsl`) that produces an HTML file for each DITA topic. The location of this file is *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.responsive\xsl\dita2webhelp\dita2webhelp.xsl`

com.oxygenxml.webhelp.xsl.createMainPage

Extension point to override the XSLT stylesheet (`createMainPage.xsl`) that produces the WebHelp Responsive main HTML page (`index.html`). The location of this file is *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`

com.oxygenxml.webhelp.xsl.createNavLinks

Extension point to override the XSLT stylesheets that are used to generate navigation links in the WebHelp Responsive pages. These stylesheets can be found in the `navLinks` folder: *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.responsive\xsl\navLinks\`

com.oxygenxml.webhelp.xsl.createSearchPage

Extension point to override the XSLT stylesheet (`createSearchPage.xsl`) that produces the WebHelp Responsive search HTML page (`search.html`). The location of this file is *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createSearchPage.xsl`

com.oxygenxml.webhelp.xsl.createIndexTermsPage

Extension point to override the XSLT stylesheet (`createIndextermsPage.xsl`) that produces the WebHelp Responsive index terms HTML page (`indexterms.html`). The location of this file is *`DITA-OT-DIR`*`\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createIndextermsPage.xsl`

com.oxygenxml.webhelp.xsl.createTocXML

Extension point to override the XSLT stylesheet (`tocDita.xsl`) that produces the `toc.xml` file. This file contains information extracted from the *DITA map* *(page 3228)* and it is mainly used to construct the WebHelp Table of Contents

and navigational links. The path to this stylesheet is: *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.responsive\xsl\toc\tocDita.xsl`.

XSLT-Parameter Extension Points

If your customization stylesheet declares one or more XSLT parameters and you want to control their values from the transformation scenario, you can use one of the following XSLT parameter extension points:

com.oxygenxml.webhelp.xsl.dita2webhelp.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.dita2webhelp** extension point *(page 1897)*.

com.oxygenxml.webhelp.xsl.createMainPage.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.createMainPage** extension point *(page 1897)*.

com.oxygenxml.webhelp.xsl.createNavLinks.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.createNavLinks** extension point *(page 1897)*.

com.oxygenxml.webhelp.xsl.createSearchPage.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.createSearchPage** extension point *(page 1897)*.

com.oxygenxml.webhelp.xsl.createIndextermsPage.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.createIndexTermsPage** extension point *(page 1897)*.

com.oxygenxml.webhelp.xsl.createTocXML.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.createTocXML** extension point *(page 1897)*.

[DITA-OT] XSLT-Parameter Extension Points

Customizing the WebHelp Responsive Output

Oxygen XML Editor provides support for customizing the **WebHelp Responsive** output to suit your specific needs. The **WebHelp Responsive** output is based upon the *Bootstrap* responsive front-end framework and is available for DITA document types. The **WebHelp Responsive with Feedback** variant allows your users to add comments to your output.

To change the overall appearance of your **WebHelp Responsive** output, you can use several different customization methods or a combination of methods. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying existing templates, create your own layout pages, or by configuring certain options and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp Responsive system output, such as how to configure the tiles on the main page, add logos in the title area, integrate with social media, localizing the interface, and much more.

Working with Publishing Templates

An *Oxygen Publishing Template* defines all aspects of the layout and styles of the **WebHelp Responsive** output. It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output. The recommended method for customizing the *WebHelp Responsive* output is to use a custom publishing template.

This section contains topics about how to create, edit, publish, and share publishing templates.

Related Information:

Publishing Template Package Contents for WebHelp Responsive Customizations *(page 1852)*

How to Create a Publishing Template

The easiest way to create a new *Oxygen Publishing Template* is to select an existing template in the transformation scenario dialog box and use the **Save template as** button to save that template into a new template package that can be used as a starting point.

To create a new *Oxygen Publishing Template*, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.

2. **Optional:** You can set one or more transformation parameters from the **Parameters** tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.
3. Click the **Save template as** button.
   This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.
4. Specify a name for the new template.
5. **Optional:** Specify a template description.
6. **Optional:** The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** or **DITA Map to PDF - based on HTML5 & CSS**). You can use the **Include WebHelp customization** and **Include PDF customization** options to specify whether your custom template will include both types of customizations.
7. **Optional:** For **WebHelp Responsive** customizations, you can select the **Include HTML Page Layout Files** option if you want to copy the default *HTML Page Layout Files (page 1857)* in your template package. They are helpful if you want to change the structure of the generated HTML pages.
8. In the **Save as** field, specify the name and path of the ZIP file where the template will be saved.

A new ZIP archive will be created on disk in the specified location with the specified name.

For more information about creating and customizing publishing templates, watch our video demonstration:

How to Edit a Publishing Template

To edit an existing *Oxygen Publishing Template* package, follow these steps:

1. Unzip the ZIP archive associated with the *Oxygen Publishing Template* in a separate folder.
2. Link the folder associated with the template in the **Project** view.

3. Using the **Project** view, you can modify the resources (CSS, JS, fonts) within the *Oxygen Publishing Template* folder to fit your needs.
4. Open the publishing template descriptor file (`.opt` extension) in the editor and modify to suit your needs.
5. **Optional:** Once you finish your customization, you can archive the folder as a ZIP file.

Related Information:

Publishing Template Package Contents for PDF Customizations *(page 1971)*

Publishing Template Package Contents for WebHelp Responsive Customizations *(page 1852)*

How to Add a Publishing Template to the Publishing Templates Gallery

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box.
2. In the **Templates** tab, click the **Configure Publishing Templates Gallery** link to.
   This will open the preferences page.
3. Click the **Add** button and specify the location of your template directory.
   Your template directory is now added to the **Additional Publishing Templates Galleries** list.
4. Click **OK** to return to the transformation scenario dialog box.
   All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

How to Use a Publishing Template from Command Line

Before you run the transformation, you need to know if the publishing template has a single or multiple template descriptor files *(page 1852)*. If you don't know, open the ZIP archive or folder and check for files with the `.opt` extension.

Publishing Template with a Single Descriptor

A template with a single descriptor is used for a single customization.

To run from a command line, you need to use the webhelp.publishing.template parameter *(page 1889)*. This parameter specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

Command line example:

- **Windows**:

```
dita.bat
   --format=webhelp-responsive
   --input=c:\mySample.ditamap
   --output=c:\output
   -Dwebhelp.publishing.template=path/to/custom-template
```

- **Linux/Mac OS X**:

```
dita
   --format=webhelp-responsive
   --input=c:\mySample.ditamap
   --output=c:\output
   -Dwebhelp.publishing.template=path/to/custom-template
```

Using a Publishing Template with Multiple Descriptors

A template with multiple descriptors contains multiple customizations.

Because the publishing template is self-contained, it is used to reuse resources that are common to multiple publications.

To run from a command line, you need to use the webhelp.publishing.template *(page 1889)* and webhelp.publishing.template.descriptor *(page 1889)* parameters.

The webhelp.publishing.template *(page 1889)* parameter specifies the path to the ZIP archive (or root folder) while the webhelp.publishing.template.descriptor *(page 1889)* parameter specifies the name of the descriptor you want to use.

Command line example:

- **Windows**:

```
dita.bat
   --format=webhelp-responsive
   --input=c:\mySample.ditamap
   --output=c:\output
   -Dwebhelp.publishing.template=path/to/custom-template
   -Dwebhelp.publishing.template.descriptor=flowers.opt
```

- **Linux/Mac OS X**:

```
dita
   --format=webhelp-responsive
```

```
--input=c:\mySample.ditamap
--output=c:\output
-Dwebhelp.publishing.template=path/to/custom-template
-Dwebhelp.publishing.template.descriptor=flowers.opt
```

How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to **Options > Preferences > DITA > Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

How to Convert Old Templates to Version 20.0 and Newer

With the introduction of the Publishing Template concept in Oxygen XML Editor version 20.0, the old WebHelp output template formats are no longer supported. However, they can be easily converted to the new format by following this procedure:

1. Set Oxygen XML Editor to point to the DITA-OT distribution that contains your old template:
   a. Go to **Options > Preferences > DITA**.
   b. Select **Custom** in the **DITA Open Toolkit** section and specify the DITA-OT directory that contains your old template.
2. Edit a **WebHelp Responsive** transformation scenario.
3. Select your old custom template in the **Templates** tab.
4. Click on the **Save Template as** button, complete the required fields, and save the template.
5. Go back to **Options > Preferences > DITA** and select **Built-in DITA-OT 2.x** in the **DITA Open Toolkit** section.
6. Edit the **WebHelp Responsive** transformation scenario again.
7. This time use the **Choose custom template** button to select your old template.
8. Save the scenario and use it to generate the WebHelp Responsive output.

Troubleshooting: Errors Encountered when Loading Templates

When the **Templates** tab of a **WebHelp Responsive** transformation scenario dialog box is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file *(page 1852)* are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

If you click the **More details** link, a window will open with more information about the encountered error. For example, it might offer a hint for which element is missing from the expected descriptor file structure *(page 1852)*.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file *(page 1852)*, a warning icon (⚠) will be displayed on the template's image (in the **Templates** tab of the transformation dialog box). For example, this happens if a valid preview-image element *(page 1855)* cannot be found.

Changing the Layout and Styles

This section contains topics that explain how to customize the output using CSS, inserting HTML fragments, changing the layout of the main page, and more.

How to Customize the Output Using a CSS

The most common way to customize WebHelp Responsive output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario (using a *Oxygen Publising Templater* or a transformation parameter). This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using **F12** or by selecting **Inspect Element** (or simply **Inspect**) from the contextual menu.

Tip: When using Safari on Mac OS X, you must first enable the Develop menu by going to the Advanced settings and selecting **Show Develop menu in menu bar**. Then you can select **Show Web Inspector** from the Develop menu or click **Command + Option + I**.

Create the Custom CSS

As a practical example, the following procedure would change the background color of the footer bar in the WebHelp output:

1. Use the browser's CSS inspector to identify the current CSS code that styles the footer bar. In this particular case, the pertinent code that would be identified is:

```
.wh_footer {
  font-size: 15px;
  line-height: 1.7em;
  background-color: #000;
}
```

2. If you want to test the color you want to apply as the background of this particular element, use the browser's CSS inspector to change the value of the `background-color` attribute. After you find a suitable color, copy that new code.
3. Create a custom CSS file and paste or enter the copied code. For example:

```
.wh_footer {
  background-color: #255890;
}
```

4. Save the custom CSS file at a location of your convenience.
5. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template (page 1905)* or the `args.css` parameter *(page 1906)*.

Referencing the CSS Using a Publishing Template

1. If you haven't already created a Publishing Template, see Working with Publishing Templates *(page 1899)*.
2. Using the **Project** view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the `custom_footer_template/resources` folder).
3. Open the template descriptor file *(page 1852)* associated with your publishing template and add your custom CSS in the *resources* section.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <resources>
            ...
            <css file="resources/MyCustom.css"/>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.

7. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the *args.css* Parameter

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
2. Set the `args.css` parameter to the path of your custom CSS file.
3. Set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

How to Insert HTML Content in WebHelp Responsive Output

You can add custom HTML content in the WebHelp Responsive output by inserting it in a well-formed XML file that will be referenced in the transformation (either from a *Oxygen Publishing Template* or using one of the HTML fragment parameters *(page 1890)*). This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

The XML File

There are several things to consider in regards to this XML file:

- **Well-Formedness** - If the file is not a *Well-formed XML* document *(page 1069)* (or fragments are not well-formed), the transformation will fail.

  A common use case is if you want to include several `script` or `link` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `html` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `head`, `body`, `html/head`, or `html/body` elements.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

```
<html>
  <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
```

```
  <link rel="stylesheet" type="text/css"
        href="${oxygen-webhelp-output-dir}/css/test.css" />
</html>
```

If you want that the path of your resource to be relative to the templates directory *(page 1849)*, you can use the `${oxygen-webhelp-template-dir}` macro.

To copy the referenced resources to the output directory, follow the procedure in: How to Copy Additional Resources to Output Directory *(page 1921)*.

- **Inline JavaScript or CSS Content** - If you want to include inline JavaScript or CSS content in the XML file, it is important to place this content inside an XML comment, as in the following examples:

  JavaScript:

```
<script type="text/javascript">
  <!--
    /* Include JavaScript code here. */

    function myFunction() {
      return true;
    }
  -->
</script>
```

  CSS:

```
<style>
  <!--
    /* Include CSS style rules here. */

    *{
      color:red
    }
  -->
</style>
```

Using WebHelp Macros Inside an HTML Fragment File

The XML file can use WebHelp macros, which are variables that will be expanded when the content of the HTML fragment file will be copied in the final output.

The following *macros* are supported:

`i18n`

For localizing a string.

```
${i18n(string.id)}
```

`param`

Returns the value of a transformation parameter.

```
${param(webhelp.show.main.page.tiles)}
```

`env`

Returns the value of an environment variable.

```
${env(JAVA_HOME)}
```

`system-property`

Returns the value of a system property.

```
${system-property(os.name)}
```

`timestamp`

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or *picture string* as it is known in the XSLT specification). The format string must comply with the rules of the XSLT `format-dateTime` function specification.

```
${timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001])}
```

`path`

Returns the path associated with the specified path ID. The following paths IDs are supported:

- `oxygen-webhelp-output-dir` - The path to the output directory. The path is relative to the current HTML file.
- `oxygen-webhelp-assets-dir` - The path to the `oxygen-webhelp` subdirectory from the output directory. The path is relative to the current HTML file.
- `oxygen-webhelp-template-dir` - The path to the template directory. The path is relative to the current HTML file.

```
${path(oxygen-webhelp-template-dir)}
```

Note: New paths IDs can be added by overriding the `wh-macro-custom-path` template from `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl`:

```
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
    <xsl:param name="pathId"/>
    <xsl:value-of select="$pathId"/>
</xsl:template>
```

`map-xpath`

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

Tip: Available in all template layout HTML pages.

```
${map-xpath(/map/title)}
```

`topic-xpath`

Can be used to execute an XPath expression over the current topic.

Tip: Available only in the topic HTML page template (`wt_topic.html`).

```
${topic-xpath(string-join(//shortdesc//text(), ' '))}
```

`oxygen-webhelp-build-number`

Returns the current WebHelp distribution ID (build number).

```
${oxygen-webhelp-build-number}
```

Referencing the HTML fragment using a Publishing Template

1. If you haven't already created a Publishing Template, see Working with Publishing Templates *(page 1899)*.
2. Insert the HTML content in a well-formed XML file (for example, `custom-html.html`).
3. Using the **Project** view, copy your custom HTML fragment in a folder inside publishing the template root folder (for example, in the `custom_footer_template/html-fragments` folder).
4. Open the template descriptor file *(page 1852)* associated with your publishing template and add a reference to the custom HTML fragment in the *html-fragments* section.

```
<publishing-template>
    ...
```

```
<webhelp>
  ...
  <html-fragments>
    <fragment
      file="html-fragments/custom-html.html"
      placeholder="webhelp.fragment.head"/>
```

Note: If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points *(page 1877)*.

5. Open the *DITA Map WebHelp Responsive* transformation scenario.
6. Click the **Choose Custom Publishing Template** link and select your template.
7. Click **OK** to save the changes to the transformation scenario.
8. Run the transformation scenario.

Results: Your additional content will be included at the end of the `head` element of your output document.

Referencing the HTML Fragment using a Transformation Parameter

1. Insert the HTML content in a well-formed XML file.
2. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
3. Edit the value of the `webhelp.fragment.head` parameter and set it to the absolute path of your XML file.

   Note: If you want to insert the content in another location within the output document, you can reference the XML file from any other HTML Fragment extension points *(page 1877)*.

4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Results: Your additional content will be included at the end of the `head` element of your output document.

Publishing Template Package Contents for WebHelp Responsive Customizations *(page 1852)*

How to Insert JavaScript AMD Modules in WebHelp Responsive Output

In the WebHelp Responsive output, you may want to include a JavaScript module that uses the Asynchronous Module Definition (AMD) format. Unlike the traditional JavaScript resources that are loaded using `<script>` tags, these modules are loaded using the *RequireJS* library. For the traditional JavaScript libraries, the standard procedure to contribute your script to the output would be to use an HTML fragment file as described here *(page 1906)*.

Although following the procedure that uses HTML fragments *(page 1906)* would result in having your JS file included in the output, loading the JS code in the browser will result in an error. Since your JS module uses the AMD API, it cannot be loaded using a `<script>` element. For example, because many jQuery plugins use the AMD format, it will be difficult for you to use those libraries in your custom WebHelp output.

Normally, a JavaScript AMD module can be loaded in one of the following ways:

- **As a top-level script**, using the `data-main` attribute of the `<script>` element used to load the *RequireJS* library.

  ```
  <script data-main="js/template-main.js" src="js/require.js"></script>
  ```

  However, since WebHelp already loads its internal JS modules using *RequireJS*, a top level script is already specified and you cannot specify another top level script in the same page. Therefore, this approach can not be used to load your custom JS module in **Oxygen XML WebHelp**, leaving you with only the following option.

- **As a dependency module**, using a `require()` call from the top level (main) script or from one of its dependency modules. This means that you would have to alter one of the WebHelp core JS libraries and inject a `require()` call to load your custom module:

  ```
  require(['js/template-main.js']);
  ```

  Note: Altering the WebHelp core libraries is not recommended because when you will upgrade the WebHelp plugin to a newer version, those modifications will be lost.

Contributing JavaScript AMD Modules Using a Publishing Template

Oxygen XML WebHelp provides the ability to contribute a custom JavaScript Asynchronous Module Definition (AMD) resource in the output by referencing it in the Publishing Template descriptor file *(page 1852)*. This module is automatically copied to the output directory and it is automatically loaded in the output HTML pages using a `require()` call. Thus, you can include your scripts in the output without altering WebHelp's core JavaScript libraries.

This module may contain all of your custom functionality or can be used to load other AMD JavaScript modules. The additional sub-modules can be stored either locally in your custom Publishing Template or on a remote web server.

Important: To enable loading of a JS module you should set the `webhelp.enable.template.js.module.loading` parameter to `yes` (the default value is `no`) in the Publishing Template descriptor file or in the transformation scenario.

The JavaScript Modules

The **JS Modules** sample template contains a main JavaScript module (`template-main.js`) that loads other modules stored in the template package or in a remote location on the Internet.

```
define(['require'], function (require) {
    require(['./red', './italic', './tables']);
});
```

Besides the main JavaScript example, the template contains 3 other sub-modules:

- **`red.js`** - Changes the font color of the publication title.

  ```
  define(["jquery"], function ($) {
      $(document).ready(function () {
          // Make the title red
          $('.wh_publication_title a').attr('style', 'color:red');
      });
  });
  ```

- **`italic.js`** - Changes the font style of your publication title.

  ```
  define(["jquery"], function ($) {
      $(document).ready(function () {
          // Make the title italic
          $('.wh_publication_title a').wrapInner('<i></i>');
      });
  });
  ```

- **`tables.js`** - Loads the DataTables jQuery plugin from a CDN.

  ```
  define(["jquery",
      "https://cdn.datatables.net/1.10.16/js/jquery.dataTables.min.js"], function ($)
   {

      $(document).ready(function () {
  ```

```
        $('.table').DataTable();
    });
});
```

The JavaScript modules are stored in the Publishing Template package as follows:

```
[template-dir]
    [js]
        template-main.js
        italic.js
        red.js
        tables.js
```

Note:

- The main module should be referenced in the Publishing Template descriptor file *(page 1852)* by specifying its path relative to the base directory of the template.

  ```
  <js-amd-module file="js/template-main.js"/>
  ```

- The main JS module is copied automatically to the output directory, but the sub-modules are not. To instruct the Publishing Template engine to copy those modules to the output directory you should include a `<fileset>` section in the Publishing Template descriptor file *(page 1852)*.

  ```
  <fileset>
      <include name="js/*.js"/>
  </fileset>
  ```

- The main module can reference other modules bundled in the publishing template package as follows:
  # **Relative to template directory** - Prefix their paths with the ID of the template directory: `template-base-dir` (for example: `template-base-dir/js/italic`).
  # **Relative to the name of the current JS module** - Use `./` to prefix the paths of the referenced modules.
  # The `.js` extension **should be omitted** for local modules, because the *RequireJS* library will add it automatically.

How to Insert HTML Content in WebHelp Responsive Output *(page 1906)*

How to Change Numbering Styles for Ordered Lists

Ordered lists (`ol`) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `outputclass` value and set it as an attribute of the ordered list, as in the following example:

```
<ol outputclass="number-alpha">
    <li>A</li>
    <li>B</li>
    <li>C</li>
</ol>
```

2. Add the following code snippet in a custom CSS file:

```
ol.number-alpha{
    list-style-type:lower-alpha;
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template (page 1914)* or the `args.css` parameter *(page 1915)*.

Referencing the Custom CSS from a Publishing Template

1. If you haven't already created a Publishing Template, see Working with Publishing Templates *(page 1899)*.
2. Using the **Project** view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the `custom_footer_template/resources` folder).
3. Open the template descriptor file *(page 1852)* associated with your publishing template and add your custom CSS in the *resources* section.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <resources>
            ...
            <css file="resources/MyCustom.css"/>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.

7. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the *args.css* Parameter

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
2. Set the `args.css` parameter to the path of your custom CSS file.
3. Set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

How to Show or Hide Navigation Links in Topic Pages

The topic pages *(page 1822)* in WebHelp Responsive output can contain navigation links (⬅ **Previous** / ➡ **Next** arrows) that can be used to navigate to the previous or next topic.

How to Control Which Topic Pages Include Navigation Links

The navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference in your DITA map, navigation links will be generated in the output for that topic and all of its child topics.

```
<map id="example_map" title="Example Map">
 <topicref href="../topics/ParentTopic.dita" collection-type="sequence">
  <topicref href="../topics/Childtopic.dita"/>
 </topicref>
```

How to Generate Navigation Links for All Topics (Ignoring the Collection Type Attribute)

You can use the `webhelp.default.collection.type.sequence` parameter in the transformation and set its value to `yes` to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.

How to Hide All Navigation Links

To hide all navigation links, use the `webhelp.show.navigation.links` parameter in the transformation and set its value to `no`.

How to Change the Main Page Layout

This section contains topics that explain how to customize the layout of the main page in the WebHelp Responsive output.

How to Customize the Menu

By default, the menu component is displayed in all WebHelp Responsive pages. However, you might want to hide it completely, or only display some of its menu entries.

How to Hide Some of the Menu Entries

There are two methods for doing this. One of them involves editing the *DITA map (page 3228)* and marking the topics that do not need to be included in the menu, and another one that uses a small CSS customization.

Editing the DITA Map

To edit the metadata in the *DITA map* to control which topics will not be displayed in the menu, follow these steps:

1. Open the *DITA map* in the **Text** editing mode of Oxygen XML Editor.
2. Add the following metadata information in the `topicref` element (or any of its specializations) for each topic you do not want to be displayed in the menu:

```
<topicmeta>
  <data name="wh-menu">
    <data name="hide" value="yes"/>
  </data>
</topicmeta>
```

Customizing the CSS

To customize the CSS to control which topics will not be displayed in the menu, follow these steps:

1. Make sure you set an ID on the topic that you do not want to include in the menu.
2. Create a new CSS file that contains a rule that hides the menu entry generated for the topic (identified by the topic ID `growing-flowers` in the following example). The CSS file should have content that is similar to this:

```
.wh_top_menu *[data-id='growing-flowers'] {
  display:none;
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template (page 1905)* or the `args.css` parameter *(page 1906)*.

How to Hide the Entire Menu

If you do not want to include a main menu in the pages of the WebHelp Responsive output, you can instruct the transformation scenario to skip the menu generation completely.

Using a Publishing Template

To hide the menu using an *Oxygen Publishing Template (page 1849)*, follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates *(page 1899)*.
2. Open the template descriptor file *(page 1852)* associated with your publishing template and add the `webhelp.show.top.menu` parameter in the *parameters* section with its value set to `no`.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter name="webhelp.show.top.menu" value="no"/>
        </parameters>
    </webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To hide the menu using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.show.top.menu` parameter to `no`.
3. Click **OK** to save the changes to the transformation scenario.

4. Run the transformation scenario.

How to Add a Welcome Message in the WebHelp Responsive Main Page

The main page of the WebHelp Responsive output contains a set of empty placeholders *(page 1877)* that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the `webhelp.fragment.welcome` parameter displays text content above the search box in the main page.

Using a Publishing Template

To add a customized welcome message in the main page of the WebHelp Responsive output using an *Oxygen Publishing Template (page 1849)*, follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates *(page 1899)*.
2. Open the template descriptor file *(page 1852)* associated with your publishing template and add the `webhelp.fragment.welcome` parameter in the *parameters* section with its value set to one of the following:
   - A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
   - A path to a file that contains well-formed XHTML content.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter name="webhelp.fragment.welcome" value="c:\myMessage.xhtml"/>
        </parameters>
    </webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

   Result: In the WebHelp output, your custom message will be displayed above the search box in the main page.

Using a Transformation Scenario in Oxygen XML Editor/Author

Important: Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated for the DITA Open Toolkit or a DocBook XSL Distribution.

To add a customized welcome message in the main page of the WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.fragment.welcome` parameter with its value set to one of the following:
   - A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
   - A path to a file that contains well-formed XHTML content.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

   Result: In the WebHelp output, your custom message will be displayed above the search box in the main page.

How to Configure the Tiles on the WebHelp Responsive Main Page

The *tiles* version of the main page of the WebHelp Responsive output displays a tile for each topic found on the first level of the *DITA map (page 3228)*. However, you might want to customize the way they look or even to hide some of them.

Depending on your particular setup, you can choose to customize the these tiles either by setting metadata information in the *DITA map* or by customizing the CSS that is associated with the *DITA map*.

How to Hide Some of the Tiles

If your documentation is very large or there is a large number of topics on the first level, you might want to hide some of the tiles. Also, this might be useful if you only want to display the topics in the first page that are most relevant to your intended audience.

There are two methods for doing this. One of them involves editing the *DITA map* and marking the topics that do not need to be displayed as tiles, and another one that uses a small CSS customization level to hide some tiles identified by the ID of the topic.

Editing the DITA Map

To edit the metadata in the *DITA map* to control which topics on the first level of the *DITA map* will not be displayed as a tile, follow these steps:

1. Open the *DITA map* in the **Text** editing mode of Oxygen XML Editor.
2. Add the following metadata information in the `topicref` element (or any of its specializations) for each first-level topic that you do not want to be displayed as a tile:

```
<topicmeta>
  <data name="wh-tile">
    <data name="hide" value="yes"/>
  </data>
</topicmeta>
```

Customizing the CSS

To customize the CSS to control which topics on the first level of the *DITA map* will not be displayed as a tile, follow these steps:

1. Make sure you set an ID on the topic you want to hide.
2. Create a new CSS file that contains a rule that hides the tile generated for the topic (identified in the following example by the topic ID `growing-flowers`). The CSS file should have content that is similar to this:

```
.wh_tile [data-id='growing-flowers'] {
  display:none;
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template (page 1905)* or the `args.css` parameter *(page 1906)*.

How to Add an Image to the Tiles

There are two methods that you can use to add an image to a tile. One of them involves editing the *DITA map*, and the other uses a CSS customization.

Editing the DITA Map

To edit the metadata in the *DITA map* to set an image to be displayed in a tile, follow these steps:

1. Open the *DITA map* in the **Text** editing mode of Oxygen XML Editor.
2. Add the following metadata information in the `topicref` element (or any of its specializations) for each first-level topic that will have an image displayed in the corresponding tile:

```
<topicmeta>
  <data name="wh-tile">
    <data name="image" href="img/tile-image.png" format="png">
     <data name="attr-width" value="64"/>
     <data name="attr-height" value="64"/>
    </data>
  </data>
</topicmeta>
```

Note: The `attr-width` and `attr-height` attributes can be used to control the size of the image, but they are optional.

Customizing the CSS

To customize the CSS to set an image to be displayed in a tile, follow these steps:

1. Make sure you set an ID on the topic that you want the tile include an image.
2. Create a new CSS file that contains a rule that associates an image with a specific tile. The CSS file should have content that is similar to this:

```
.wh_tile[data-id='growing-flowers']> div {
    background-image:url('resources/flower.png');
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template (page 1905)* or the `args.css` parameter *(page 1906)*.

Adding Media Resources

This section contains topics that explain how to add media resources to the published output or the output directory.

How to Copy Additional Resources to Output Directory

You can copy additional resources (such as JavaScript, CSS, or other resources) to the output directory either by using an *Oxygen Publishing Template* or the `webhelp.custom.resources` parameter.

Copying Additional Resources to the Output Directory using a Publishing Template

1. If you haven't already created a Publishing Template, see Working with Publishing Templates *(page 1899)*.
2. Add a new `<fileset>` element in the resources section of the template descriptor file *(page 1856)*.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <resources>
            <fileset>
                <include name="custom-resources/**/*"/>
                <exclude name="**/*.git"/>
            </fileset>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Results: All files from the custom resources directory will be copied to the `/oxygen-webhelp/template` folder.

Copying Additional Resources to the Output Directory using a Transformation Parameter

1. Place all your resources in the same directory.
2. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
3. Edit the value of the `webhelp.custom.resources` parameter and set it to the absolute path of the directory in step 1.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Results: All files from the new directory will be copied to the root of the WebHelp output directory.

How to Add a Logo Image in the Title Area

You can customize **WebHelp Responsive** output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using an *Oxygen Publishing Template* or using a transformation scenario from within **Oxygen XML Editor/Author**.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an *Oxygen Publishing Template (page 1849)*, follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates *(page 1899)*.
2. Open the template descriptor file *(page 1852)* associated with your publishing template and add the `webhelp.logo.image` parameter in the *parameters* section with its value set to path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `webhelp.logo.image.target.url` parameter.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter name="webhelp.logo.image" value="c:\myLogo.jpg"/>
            <parameter name="webhelp.logo.image.target.url" value="http://
sample.com"/>
        </parameters>
    </webhelp>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.logo.image` parameter to the path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `webhelp.logo.image.target.url` parameter.
4. Click **OK** to save the changes to the transformation scenario.

5. Run the transformation scenario.

How to Add a Favicon in WebHelp Systems

You can add a custom *favicon* to your WebHelp output by simply using a parameter in the transformation scenario to point to your *favicon* image.

This customization can be done using an *Oxygen Publishing Template* or using a transformation scenario from within **Oxygen XML Editor/Author**.

Using a Publishing Template

To add a *favicon* to your WebHelp output using an *Oxygen Publishing Template (page 1849)*, follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates *(page 1899)*.
2. Open the template descriptor file *(page 1852)* associated with your publishing template and add the `webhelp.favicon` parameter in the *parameters* section with its value set to path of your image.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter name="webhelp.favicon" value="c:\myFavicon.jpg"/>
        </parameters>
    </webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

   Result: Browsers that provide *favicon* support will display the *favicon* (typically in the browser's address bar, in the list of bookmarks, and in the history).

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a *favicon* to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.

2. Open the **Parameters** tab and set the `webhelp.favicon` parameter to the path of your image.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

How to Add Video and Audio Objects in DITA WebHelp Output

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

Adding Videos to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the video through one of the following methods:
   - Use the **Insert Media Object** toolbar action *(page 3017)*.
   - Drag (or copy) the video file from your system explorer or the **Project** view *(page 332)* and drop (or paste) it into your document.
   - Manually add an `object` element, as in one of the following examples:

     ```
     <object outputclass="video" type="video/mp4" data="MyVideo.mp4"/>
     ```

     or, instead of the `data` attribute, you can specify the video using a parameter like this:

     ```
     <object outputclass="video">
       <param name="src" value="videos/MyVideo.mp4"/>
     </object>
     ```
2. Apply a **DITA to WebHelp** transformation to obtain the output.

   Result: The transformation converts the `object` element to an HTML5 `video` element.

   ```
   <video controls="controls"><source type="video/mp4" src="MyVideo.mp4"></source>
   </video>
   ```

Adding Audio Clips to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the audio clip through one of the following methods:
   - Use the **Insert Media Object** toolbar action *(page 3017)*.
   - Drag (or copy) the audio file from your system explorer or the **Project** view *(page 332)* and drop (or paste) it into your document.
   - Manually add an `object` element, as in one of the following examples:

```
<object outputclass="audio" type="audio/mpeg" data="MyClip.mp3"/>
```

or, instead of the `data` attribute, you can specify the video using a parameter like this:

```
<object outputclass="audio">
  <param name="src" value="audio/MyClip.mp3"/>
</object>
```

2. Apply a **DITA to WebHelp** transformation to obtain the output.

Result: The transformation converts the `object` element to an HTML5 `audio` element.

```
<audio controls="controls"><source type="audio/mpeg" src="MyClip.mp3"></source>
</audio>
```

Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the **Insert Media Object** toolbar action *(page 3017)* or by manually adding an `object` element, as in one of the following examples:

```
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
```

or, instead of the `data` attribute, you can specify the object using a parameter like this:

```
<object outputclass="iframe">
  <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4"/>
</object>
```

2. If you want the video to be allowed to play in full screen mode once the document is converted to XHTML output, also add an `allowfullscreen` parameter and set its value to **true**:

```
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4"/>
  <param name="allowfullscreen" value="true"/>
</object>
```

Tip: If you copy the embed code from the source and paste it into the **Insert Media** dialog box (see the specific instructions: here *(page 3020)*), the `allowfullscreen` parameter will automatically be added and all you have to do is set the value to **true**.

3. Apply a **DITA to WebHelp** transformation to obtain the output.

Result: The transformation converts the `object` element to an HTML5 `iframe` element.

```
<iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4">
```

```
</iframe>
```

For more information, see the following video demonstration:

Adding Video, Audio, and Embedded HTML Resources in DITA Topics *(page 3017)*

How to Publish MathML Formulas when Generating WebHelp from a Command Line

The DITA-OT distribution that comes bundled with **Oxygen** includes some additional pre-installed DITA-OT plugins that add support for properly displaying MathML formulas in the WebHelp output. However, if you are generating your WebHelp output from a command line, MathML formulas will not be displayed properly unless you install these plugins manually.

These plugins can be downloaded and installed from DITA 1.3 Support for Open Toolkit (https://github.com/dita-community/dita13-dita-ot-1.x-support). This plugin package adds DITA 1.3 Support including MathML.

How to Add Support for MathML when Generating WebHelp from a Command Line

1. Download and unzip the **DITA 1.3 Support for Open Toolkit 1.x** distribution package. It includes 4 DITA-OT plugins.
2. Copy the four plugin directories to your `/plugins` directory.
3. In the home directory of your DITA-OT installation, run the `ant -f integrator.xml` command.

Searching the Output

This section contains topics that explain how to use some of the search features in WebHelp Responsive output.

How to Change Element Scoring in Search Results

The WebHelp **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA. The properties file includes instructions and examples to help you with your customization. The file is located in: *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.responsive\indexer\scoring.properties`.
   The values that can be edited in the `scoring.properties` file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i=3
u=3
div.toc=-10
title=20
div.ignore=ignored
meta_keywords = 20
meta_indexterms = 20
meta_description = 25
shortdesc=25
```

2. Save your changes to the file.
3. Re-run your WebHelp transformation.

How to Exclude Certain DITA Topics from Search Results

There are several ways to exclude certain DITA resources from your WebHelp system's search results. This is useful if you have topics in your *DITA map (page 3228)* structure that you do not want to be included in search results for your WebHelp system. The first method involves setting a parameter in the WebHelp transformation scenario and the second involves setting an attribute for each DITA topic reference that you want to exclude.

Transformation Parameter Method

To exclude DITA topics from WebHelp search results using a transformation parameter, follow these steps:

1. Create a simple text file that will contain your excluded file patterns. Each pattern must be on a new line. The patterns are considered to be relative to the output directory and they accept wildcards such as `'*'` (matches zero or more characters) or `'?'` (matches one character). For more information about the patterns, see https://ant.apache.org/manual/dirtasks.html#patterns.

   Example: Suppose that in your project, you want to exclude all files located in the `resources` directory and all files located in the `topics` directory that have a `.bak` file extension. You could create a simple text file (for example, named `exclude.properties`), and add the following lines:

   ```
   resources/*
   topics/*.bak
   ```

2. Set the `webhelp.search.custom.excludes.file` parameter to specify the path to the file that contains the excluded file patterns (for example, `exclude.properties` in step 1). The parameter can be specified in the *parameters* section of the template descriptor file *(page 1880)* associated with your publishing template or in the **Parameters** tab of the transformation scenario dialog box in **Oxygen XML Editor/Author**.
3. Run the transformation.

Search Attribute Method

The WebHelp **Search** engine does not index DITA topics that have the `@search` attribute set to `no`.

To exclude DITA topics from WebHelp search results using this attribute, follow these steps:

1. Edit the *DITA map* and for any `topicref` that you want to exclude from search results, set the `search` attribute to `no`. For example:

   ```
   <topicref href="../topics/internal-topic1.dita" search="no"/>
   ```

2. Save your changes to the *DITA map*.
3. Run your WebHelp system transformation.

How to Optimize Search Results

A **DITA Map WebHelp** transformation scenario can be configured to produce a `sitemap.xml` file that is used by search engines to aid crawling and indexing mechanisms. A *sitemap* lists all pages of a WebHelp system and allows webmasters to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

The structure of the `sitemap.xml` file looks like this:

```
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
  <url>
    <loc>http://www.example.com/topics/care.html#care</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
    <priority>0.5</priority>
  </url>
   .  .  .
</urlset>
```

Each page has a `<url>` element structure containing additional information, such as:

- **loc** - the URL of the page. This URL must begin with the protocol (such as `http`), if required by your web server. It is constructed from the value of the `webhelp.sitemap.base.url` parameter from the transformation scenario and the relative path to the page (collected from the `href` attribute of a `topicref` element in the *DITA map*).

  Note: The value must have fewer than 2,048 characters.

- **lastmod** (optional) - the date when the page was last modified. The date format is `YYYY-MM-DD`.
- **changefreq** (optional) - indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

  Note: The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.

- **priority** (optional) - the priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the

`webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. Open the **Parameters** tab and set a value for the following parameters:
   - **webhelp.sitemap.base.url** - the URL of the location where your WebHelp system is deployed

     Note: This parameter is required for Oxygen XML Editor to generate the `sitemap.xml` file.

   - **webhelp.sitemap.change.frequency** - how frequently the WebHelp pages are likely to change (accepted values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`)
   - **webhelp.sitemap.priority** - the priority of each page (value ranging from 0.0 to 1.0)
3. Run the transformation scenario.
4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

How to Index Japanese Content

To optimize the indexing of Japanese content in WebHelp pages, the Lucene Kuromoji Japanese analyzer can be used. This analyzer is included in the **Oxygen XML Editor/Author** installation kit.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an *Oxygen Publishing Template (page 1849)*, follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates *(page 1899)*.
2. Open the template descriptor file *(page 1852)* associated with your publishing template and add the `default.language` parameter in the *parameters* section with its value set to `ja-jp`.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
```

```
            <parameter name="default.language" value="ja-jp"/>
        </parameters>
    </webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit a **DITA to WebHelp** transformation scenario and in the **Parameters** tab, set the value of the `default.language` parameter to `ja-jp`.

   Note: Alternatively, you could set the `xml:lang` attribute on the root of the *DITA map (page 3228)* and the referenced topics to `ja-jp`. Another alternative for DITA output is to use the `webhelp.search.japanese.dictionary` parameter to specify a path to a Japanese dictionary that will be used by the *Kuromoji* morphological engine.

2. Run the WebHelp transformation scenario to generate the output.

Localization

This section contains topics that explain how to use the localization support in WebHelp Responsive output.

How to Localize Email Notifications of Feedback System

The feedback-enabled WebHelp Responsive systems use emails to notify users when comments are posted. These emails are based on templates stored in the WebHelp directory. The default messages are in English, French, German, and Japanese. These messages are copied into the WebHelp system deployment directory during the execution of the corresponding transformation scenario.

Using a Publishing Template

To change the language of the emails for DITA Map WebHelp Responsive with Feedback output using an *Oxygen Publishing Template (page 1849)*, follow this procedure:

1. Create the following directory:

   ```
   DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp
   \resources\php\templates\nl
   ```

2. Copy all English template files from *DITA-OT-DIR*\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\en and paste them into the directory you just created.
3. Edit the HTML files from the *DITA-OT-DIR*\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\nl directory and translate the content into your language.
4. Open the template descriptor file *(page 1852)* associated with your publishing template and add the `default.language` parameter in the *parameters* section with its value set to the appropriate language code (for example, `nl` for Dutch).

   Note: If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code.

   ```
   <publishing-template>
       ...
       <webhelp>
           ...
           <parameters>
               <parameter name="default.language" value="nl"/>
           </parameters>
       </webhelp>
   ```

5. Open the *DITA Map WebHelp Responsive* transformation scenario.
6. Click the **Choose Custom Publishing Template** link and select your template.
7. Click **OK** to save the changes to the transformation scenario.
8. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To change the language of the emails for DITA Map WebHelp Responsive with Feedback output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create the following directory:

   DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\nl

2. Copy all English template files from *DITA-OT-DIR*\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\en and paste them into the directory you just created.
3. Edit the HTML files from the *DITA-OT-DIR*\plugins\com.oxygenxml.webhelp.responsive\oxygen-webhelp\resources\php\templates\nl directory and translate the content into your language.

4. Edit a **DITA Map WebHelp Responsive** transformation scenario and open the **Parameters** tab.
5. In the **Parameters** tab, look for the `default.language` parameter and set its value to the appropriate language code (for example, `nl` for Dutch).

   Note: If you set the parameter to a value such as `LanguageCode-CountryCode` (for example, `en-us`), the transformation scenario will only use the language code.

6. Run the transformation scenario.

How to Localize the Interface of WebHelp Responsive Output

Static labels used in the WebHelp output are stored in translation files that have the *strings-lang1-lang2.xml* name format, where *lang1* and *lang2* are ISO language codes. For example, the US English labels are kept in the *strings-en-us.xml* file.

These translation files are collected from two locations:

- ***DITA-OT-DIR*`/xsl/common` folder** - DITA-OT's default translations (generated text for `note`, `fig`, and `table` elements).
- ***DITA-OT-DIR*`/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization` folder** - These translations are contributed by the WebHelp plugin and extend the default ones provided by DITA-OT. The labels defined in this folder take precedence over the DITA-OT defaults.

There are two major reasons you may want to use modify the translation files: to modify the existing strings or to translate to a new language.

DITA to XHTML

Modifying the Existing Strings

To modify the generated text for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the *dita.xsl.messages* extension point. The following procedure is for changing English labels, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `/plugins/` location.
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

```
<plugin id="com.oxygenxml.webhelp.localization">
    <require plugin="com.oxygenxml.webhelp.classic"/>
    <require plugin="com.oxygenxml.webhelp.responsive"/>

    <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
</plugin>
```

3. Create a `webhelp-extension-strings.xml` file with the following content:

```
<langlist>
    <lang xml:lang="en"    filename="strings-en-us.xml"/>
    <lang xml:lang="en-us"    filename="strings-en-us.xml"/>
</langlist>
```

4. Copy the strings you want to change from the translation files *(page 1934)* to the `strings-en-us.xml` file. Make sure you leave the name attribute unchanged because this is the key used to look up the string. A sample content might be:

```
<strings xml:lang="en-US">
  <str name="Figure">Fig</str>
  <str name="Draft comment">ADDRESS THIS DRAFT COMMENT</str>
</strings>
```

5. Use the **Run DITA-OT Integrator** transformation scenario *(page 1637)* found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

Adding a New Language

To add a new language for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the *dita.xsl.messages* extension point. The following sample procedure is for adding translation files for the Polish language, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `/plugins/` location.
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

```
<plugin id="com.oxygenxml.webhelp.localization">
    <require plugin="com.oxygenxml.webhelp.classic"/>
```

```
    <require plugin="com.oxygenxml.webhelp.responsive"/>

    <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
</plugin>
```

3. Create a `webhelp-extension-strings.xml` file with the following content:

```
<langlist>
    <lang xml:lang="pl"    filename="strings-pl-pl.xml"/>
    <lang xml:lang="pl-PL"    filename="strings-pl-pl.xml"/>
</langlist>
```

4. Copy the WebHelp strings file (*`DITA-OT-DIR`*`/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization/strings-en-us.xml`) to your plugin directory, and rename it as `strings-pl-pl.xml`.
5. In the `strings-pl-pl.xml` file, change the *@xml:lang* attribute on the root element that conforms with the new language.

```
<strings xml:lang="pl-PL">
  ...
</strings>
```

6. Translate the content of each `<str>` element (make sure to leave the *name* attribute unchanged).

```
<strings xml:lang="pl-PL">
...
 <str name="webhelp.content" js="true" php="false">Polish translation for
 "Content".</str>
 <str name="webhelp.search" js="true" php="false">Polish translation for "Search"</
str>
...
</strings>
```

7. Copy the common DITA-OT strings defined in the *`DITA-OT-DIR`*`/xsl/common/strings-en-us.xml` file. It defines a set generated text available for HTML based transformations (such as `note`, `fig`, and `table` elements). Translate the content of each `<str>` element.

```
<strings xml:lang="pl-PL">
...
 <str name="webhelp.content" js="true" php="false">Polish translation for
 "Content".</str>
 <str name="webhelp.search" js="true" php="false">Polish translation for "Search"</
str>
```

```
...
 <str name="Figure">Polish translation for "Figure"</str>
 <str name="Table">Polish translation for "Table"</str>
...
</strings>
```

8. Use the **Run DITA-OT Integrator** transformation scenario *(page 1637)* found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.

How to Activate Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, edit the *DITA map (page 3228)* and set the `xml:lang` attribute on its root element (`map`). The corresponding attribute value can be set for following RTL languages:

- `ar-eg` - Arabic
- `he-il` - Hebrew
- `ur-pk` - Urdu

Integrating Social Media and Google Tools in the WebHelp Output

This section contains topics that explain how to integrate some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Responsive Output

It is possible to integrate Facebook into your **WebHelp Responsive** output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Facebook *Like* widget to your WebHelp output using an *Oxygen Publishing Template (page 1849)*, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

```
<div id="facebook">
    <div id="fb-root"/>
    <script>
        <!--
            (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
        }(document, 'script', 'facebook-jssdk'));
        -->
    </script>
    <div class="fb-like" data-layout="standard" data-action="like"
        data-show-faces="true" data-share="true"/>
</div>
```

4. Open the template descriptor file *(page 1852)* associated with your publishing template.
5. Use one of the parameters that begin with *webhelp.fragment (page 1877)* in the *html-fragments* section of the descriptor file. Set the value of that parameter to reference the `facebook-widget.xml` file that you created earlier.

```
<publishing-template>
    ...
    <webhelp>
        ...
      <html-fragments>
        <fragment
          file="HTML-fragments/facebook-widget.xml"
          placeholder="webhelp.fragment.after.toc_or_tiles"/>
      </html-fragments>
    </webhelp>
```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a Facebook *Like* widget to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Facebook Developers website.
2. Fill-in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

```
<div id="facebook">
    <div id="fb-root"/>
    <script>
        <!--
            (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
        }(document, 'script', 'facebook-jssdk'));
        -->
    </script>
    <div class="fb-like" data-layout="standard" data-action="like"
        data-show-faces="true" data-share="true"/>
</div>
```

4. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit one of the parameters that begin with *webhelp.fragment (page 1877)*. Set that parameter to reference the `facebook-widget.xml` file that you created earlier.
6. Click **Ok** and run the transformation scenario.

How to Add a Google+ Button in WebHelp Responsive Output

It is possible to integrate *Google* into your **WebHelp Responsive** output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a *Google+* widget to your WebHelp Responsive output using an *Oxygen Publishing Template (page 1849)*, follow this procedure:

1. Go to the Google Developers website.
2. Fill-in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

```
<div id="google-plus">
  <!-- Place this tag in your head or just before your close body tag. -->
  <script src="https://apis.google.com/js/platform.js" async defer></script>

  <!-- Place this tag where you want the +1 button to render. -->
  <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```

4. Open the template descriptor file *(page 1852)* associated with your publishing template.
5. Use one of the parameters that begin with *webhelp.fragment (page 1877)* in the *html-fragments* section of the descriptor file. Set the value of that parameter to reference the `google-plus-button.xml` file that you created earlier.

```
<publishing-template>
    ...
    <webhelp>
        ...
      <html-fragments>
        <fragment
          file="HTML-fragments/google-plus-button.xml"
          placeholder="webhelp.fragment.after.toc_or_tiles"/>
      </html-fragments>
    </webhelp>
```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a *Google+* widget to your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Google Developers website.

2. Fill-in the displayed form. The preview area on the right side displays the code and a preview of the widget.
3. Copy the code snippet displayed in the preview area and paste it into a `div` element inside an XML file called `google-plus-button.xml`. Make sure that the content of the file is well-formed. The content of the XML file should look like this:

```
<div id="google-plus">
  <!-- Place this tag in your head or just before your close body tag. -->
  <script src="https://apis.google.com/js/platform.js" async defer></script>

  <!-- Place this tag where you want the +1 button to render. -->
  <div class="g-plusone" data-annotation="inline" data-width="300"></div>
</div>
```

4. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit one of the parameters that begin with *webhelp.fragment (page 1877)*. Set that parameter to reference the `google-plus-button.xml` file that you created earlier.
6. Click **Ok** and run the transformation scenario.

How to Add Tweet Button in WebHelp Responsive Output

It is possible to integrate *Twitter* into your **WebHelp Responsive** output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Twitter *Tweet* widget to your WebHelp Responsive output using an *Oxygen Publishing Template (page 1849)*, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill-in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `div` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
```

```
      !function (d, s, id) {
      var
      js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
 ? 'http': 'https';
      if (! d.getElementById(id)) {
      js = d.createElement(s);
      js.id = id;
      js.src = p + '://platform.twitter.com/widgets.js';
      fjs.parentNode.insertBefore(js, fjs);
      }
      }
      (document,
      'script', 'twitter-wjs');
     -->
  </script>
</div>
```

4. Open the template descriptor file *(page 1852)* associated with your publishing template.
5. Use one of the parameters that begin with *webhelp.fragment (page 1877)* in the *html-fragments* section of the descriptor file. Set the value of that parameter to reference the `tweet-button.xml` file that you created earlier.

```
<publishing-template>
    ...
    <webhelp>
        ...
      <html-fragments>
        <fragment
          file="HTML-fragments/tweet-button.xml"
          placeholder="webhelp.fragment.after.toc_or_tiles"/>
      </html-fragments>
    </webhelp>
```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a Twitter *Tweet* widget to your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Tweet button generator page.
2. Fill-in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `div` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
   - The file must be well-formed.
   - The code for each `script` element must be included in an XML comment.
   - The start and end tags for the XML comment must be on a separate line.

   The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
      !function (d, s, id) {
      var
      js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
 ? 'http': 'https';
      if (! d.getElementById(id)) {
      js = d.createElement(s);
      js.id = id;
      js.src = p + '://platform.twitter.com/widgets.js';
      fjs.parentNode.insertBefore(js, fjs);
      }
      }
      (document,
      'script', 'twitter-wjs');
     -->
  </script>
</div>
```

4. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit one of the parameters that begin with *webhelp.fragment (page 1877)*. Set that parameter to reference the `tweet-button.xml` file that you created earlier.
6. Click **Ok** and run the transformation scenario.

How to Integrate Google Analytics in WebHelp Responsive Output

You can use *Google Analytics* to track and report site data for your **WebHelp Responsive** output.

Using a Publishing Template

To integrate *Google Analytics* into your WebHelp Responsive output using an *Oxygen Publishing Template (page 1849)*, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your *Tracking ID*. A **Tracking Code** looks like this:

```
<script>
 (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
 (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
 m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

 ga('create', 'UA-XXXXXXXX-X', 'auto');
 ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. Open the template descriptor file *(page 1852)* associated with your publishing template.
6. Use the webhelp.fragment.after.body parameter *(page 1890)* in the *html-fragments* section of the descriptor file. Set the value of that parameter to reference the `googleAnalytics.xml` file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.

```
<publishing-template>
    ...
    <webhelp>
        ...
      <html-fragments>
        <fragment
          file="HTML-fragments/googleAnalytics.xml"
          placeholder="webhelp.fragment.after.body"/>
      </html-fragments>
    </webhelp>
```

7. Open the *DITA Map WebHelp Responsive* transformation scenario.
8. Click the **Choose Custom Publishing Template** link and select your template.

9. Click **OK** to save the changes to the transformation scenario.
10. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate *Google Analytics* into your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a new Google Analytics account (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your *Tracking ID*. A **Tracking Code** looks like this:

```
<script>
 (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
 (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
 m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
 })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

 ga('create', 'UA-XXXXXXXX-X', 'auto');
 ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
6. Switch to the **Parameters** tab. Edit the webhelp.fragment.after.body parameter *(page 1890)* and set it to reference the `googleAnalytics.xml` file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.
7. Click **Ok** and run the transformation scenario.

How to Integrate Google Search in WebHelp Responsive Output

It is possible to integrate the *Google Search Engine* into your **WebHelp Responsive** output and you can specify where you want the results to appear in your WebHelp page.

Using a Publishing Template

To integrate the *Google Search Engine* into your WebHelp Responsive output using an *Oxygen Publishing Template (page 1849)*, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```
<script>
 (function()  {
  var cx =
    '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  gcse.src = (document.location.protocol == 'https:' ?
    'https:' : 'http:') +         '//www.google.com/cse/cse.js?cx=' + cx;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
 }
 )();
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.
5. Open the template descriptor file *(page 1852)* associated with your publishing template and add the `webhelp.google.search.script` parameter in the *parameters* section with its value set to reference the `googlecse.html` file that you created earlier.

```
<publishing-template>
  ...
  <webhelp>
     ...
     <parameters>
         <parameter name="webhelp.google.search.script" value="resources/
googlecse.html"/>
     </parameters>
  </webhelp>
```

6. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName-"searchQuery"></div>` (you must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.

b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.

7. Open the *DITA Map WebHelp Responsive* transformation scenario.
8. Click the **Choose Custom Publishing Template** link and select your template.
9. Click **OK** to save the changes to the transformation scenario.
10. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate the *Google Search Engine* into your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the Google Custom Search Engine page using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```
<script>
 (function()  {
  var cx =
    '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  gcse.src = (document.location.protocol == 'https:' ?
    'https:' : 'http:') +         '//www.google.com/cse/cse.js?cx=' + cx;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
 }
 )();
</script>
```

4. Save the script into a well-formed HTML file called `googlecse.html`.
5. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
6. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.
7. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
   a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName-"searchQuery"></div>` (you

must use the HTML5 version for the GCSE). For more information about other supported attributes, see Google Custom Search: Supported Attributes.

b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.

8. Click **Ok** and run the transformation scenario.

XSLT Extensions for WebHelp Responsive Transformations

Since WebHelp Responsive output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the WebHelp Responsive transformations.

There are two methods available to override the XSLT stylesheets implied by the WebHelp Responsive transformation.

- Use *XSLT-import extension points* from an *Oxygen Publishing Template*.

  Note: Use this method if you want to affect only the transformations that use this *publishing template*.

- Use *XSLT-import extension points* from a DITA-OT extension plugin.

  Note: This method will affect all the outputs generated with the WebHelp system.

Related Information:

WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points *(page 1896)*

How to Use XSLT Extension Points from a Publishing Template

This example demonstrates how to use WebHelp XSLT-import Extension Points from an *Oxygen Publishing Template (page 1849)*.

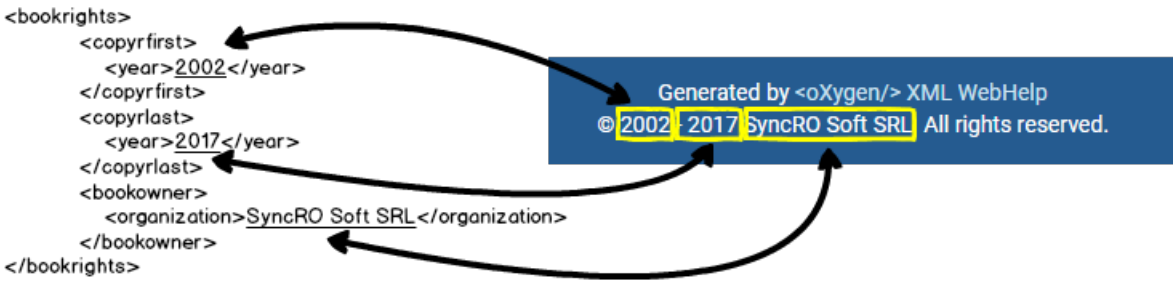
Use Case 1: Add Copyright Information Extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```
<bookrights>
  <copyrfirst>
```

```
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
  <bookowner>
    <organization>SyncRO Soft SRL</organization>
  </bookowner>
</bookrights>
```

Figure: Example: Copyright information added in the WebHelp footer



The XSLT stylesheet that generates the main page is located in: *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`. This XSLT stylesheet declares the `copy_template` mode that processes the main page template *(page 1859)* to expand its components. The main page template declares a component for the footer section that looks like this:

```
<div class=" footer-container text-center ">
  <whc:include_html href="${webhelp.fragment.footer}"/>
</div>
```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
      <xsl:choose>
          <!-- Adds the start-end years if they are defined -->
          <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
                          exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
```

```
            <span class="copyright_years">
               &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/
*:copyrfirst"/>
                     -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/
*:copyrlast"/>
            </span>
         </xsl:when>

         <!-- Adds only the first year if last is not defined. -->
         <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
            <span class="copyright_years">
               &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/
*:copyrfirst"/>
            </span>
         </xsl:when>
      </xsl:choose>

      <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
         <span class="organization">
            <xsl:text> </xsl:text><xsl:value-of
               select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>
            <xsl:text>. All rights reserved.</xsl:text>
         </span>
      </xsl:if>
   </div>
</xsl:template>
```

To add this functionality using a , follow these steps:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates *(page 1899)*.
2. Link the folder associated with the publishing template to your current project in the **Project** view. You should have the `custom_footer_template` folder linked in your project.
3. Using the **Project** view, create an `xslt` folder inside the project root folder.
   You should have the `custom_footer_template/xsl` folder in your project.
4. Create your customization stylesheet (for example, **custom_mainpage.xsl**) in the `custom_footer_template/xsl` folder. Edit it to override the template that produces the footer section:

```
<xsl:template match="*:div[contains(@class, 'footer-
container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
      <xsl:choose>
          <!-- Adds the start-end years if they are defined -->
          <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
                       exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
              <span class="copyright_years">
                 &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/
*:copyrfirst"/>
                      -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/
*:copyrlast"/>
              </span>
          </xsl:when>

          <!-- Adds only the first year if last is not defined. -->
          <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
              <span class="copyright_years">
                 &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/
*:copyrfirst"/>
              </span>
          </xsl:when>
      </xsl:choose>

      <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/
*:organization)">
          <span class="organization">
              <xsl:text> </xsl:text><xsl:value-of
                   select="$toc/*:topicmeta/*:bookrights/*:bookowner/
*:organization"/>
              <xsl:text>. All rights reserved.</xsl:text>
          </span>
      </xsl:if>
  </div>
```

```
</xsl:template>
```

5. Open the template descriptor file *(page 1852)* associated with your publishing template and set the XSLT stylesheet created in previous step with the *com.oxygenxml.webhelp.xsl.createMainPage* XSLT extension point.

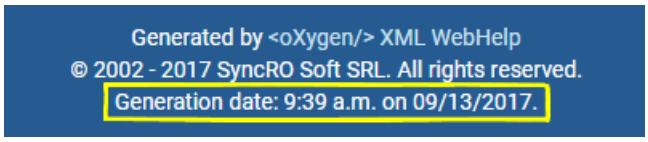
```
<publishing-template>
    ...
    <webhelp>
        ...
        <xslt>
            <extension
            file="xslt/customMainPage.xsl"
            id="com.oxygenxml.webhelp.xsl.createMainPage"/>
```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Use Case 2: Add generation time in the output footer

Another possible customization for the main page is to add the generation time in its footer. We will use a transformation parameter to control if this customization is active or not.

Figure: Generation time added in the WebHelp footer



To add this functionality, follow these steps:

1. In the customization stylesheet that you just created (for example, **custom_mainpage.xsl**), modify the template by adding the following XSLT code at the end.

```
<xsl:if test="oxyf:getParameter('webhelp.footer.add.generation.time') = 'yes'">
  <div class="generation_time">
    Generation date: <xsl:value-of
    select="format-dateTime(
                  current-dateTime(),
```

```
                    '[h1]:[m01] [P] on [M01]/[D01]/[Y0001].')"/>
  </div>
</xsl:if>
```

Note: You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.

2. Open the template descriptor file *(page 1852)* associated with your publishing template and set the `webhelp.footer.add.generation.time` parameter to the default value.

```
<publishing-template>
    ...
    <webhelp>
      ...
      <parameters>
        <parameter
          name="webhelp.footer.add.generation.time"
          value="yes"/>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. In the **Parameters** tab, you can change the value of the `webhelp.footer.add.generation.time` parameter.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

How to Use XSLT Extension Points from a DITA-OT Plugin

In this example, the main page footer is modified by adding copyright information extracted from the DITA bookmap or by adding the output generation time. The first use-case uses an XSLT-Import extension point while the second uses an XSLT-Parameter extension point.

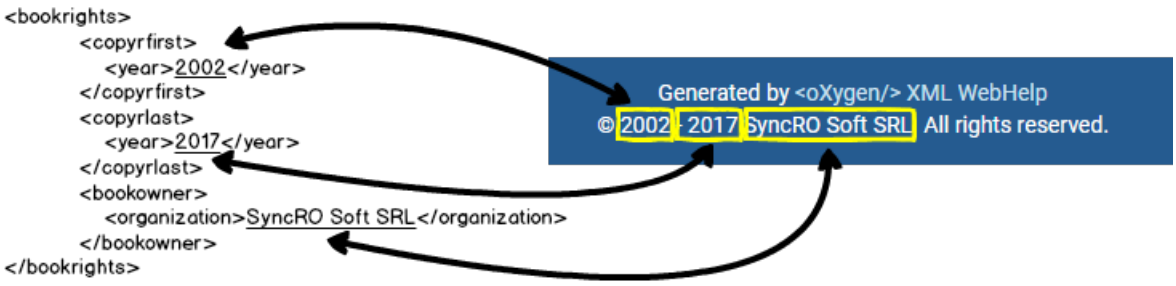
Note: This customization is available as a GitHub project at: https://github.com/oxygenxml/com.oxygenxml.webhelp.responsive.custom.footer.

Use Case 1: WebHelp XSLT-Import extension point to add copyright information extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
  <bookowner>
    <organization>SyncRO Soft SRL</organization>
  </bookowner>
</bookrights>
```

Figure: Example: Copyright information added in the WebHelp footer



The XSLT stylesheet that generates the main page is located in: *DITA-OT-DIR*`\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`. This XSLT stylesheet declares the `copy_template` mode that processes the main page template to expand its components. The main page template *(page 1859)* declares a component for the footer section that looks like this:

```
<div class=" footer-container text-center ">
  <whc:include_html href="${webhelp.fragment.footer}"/>
</div>
```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
```

```
  <!-- Apply the default processing -->
  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
      <xsl:choose>
          <!-- Adds the start-end years if they are defined -->
          <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
                          exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
              <span class="copyright_years">
                 &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/
*:copyrfirst"/>
                       -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/
*:copyrlast"/>
              </span>
          </xsl:when>

          <!-- Adds only the first year if last is not defined. -->
          <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
              <span class="copyright_years">
                 &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/
*:copyrfirst"/>
              </span>
          </xsl:when>
      </xsl:choose>

      <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
          <span class="organization">
              <xsl:text> </xsl:text><xsl:value-of
                   select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>
              <xsl:text>. All rights reserved.</xsl:text>
          </span>
      </xsl:if>
  </div>
</xsl:template>
```

You can implement this functionality with a WebHelp extension plugin that uses the **com.oxygenxml.webhelp.xsl.createMainPage** extension point *(page 1897)*. This extension point allows you to specify a customization stylesheet that will override the template described above.

To add this functionality as a DITA-OT plugin, follow these steps:

1. In the *DITA-OT-DIR*\plugins\ folder, create a folder for this plugin (for example, com.oxygenxml.webhelp.responsive.custom.footer).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

```
<plugin id="com.oxygenxml.webhelp.responsive.custom.footer">
  <feature extension="com.oxygenxml.webhelp.xsl.createMainPage"
             file="custom_mainpage.xsl"/>
</plugin>
```

3. Create your customization stylesheet (for example, **custom_mainpage.xsl**), and edit it to override the template that produces the footer section:

```
<xsl:template match="*:div[contains(@class, 'footer-
container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
      <xsl:choose>
          <!-- Adds the start-end years if they are defined -->
          <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
                        exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
              <span class="copyright_years">
                 &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/
*:copyrfirst"/>
                       -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/
*:copyrlast"/>
              </span>
          </xsl:when>

          <!-- Adds only the first year if last is not defined. -->
          <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
              <span class="copyright_years">
                 &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/
*:copyrfirst"/>
              </span>
          </xsl:when>
```

```
      </xsl:choose>

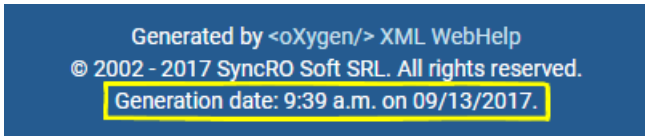
      <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/
*:organization)">
          <span class="organization">
              <xsl:text> </xsl:text><xsl:value-of
                   select="$toc/*:topicmeta/*:bookrights/*:bookowner/
*:organization"/>
              <xsl:text>. All rights reserved.</xsl:text>
          </span>
      </xsl:if>
  </div>
</xsl:template>
```

4. Use the **Run DITA-OT Integrator** transformation scenario *(page 1637)* found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.
5. Run a **DITA Map WebHelp Responsive** transformation scenario to obtain the customized side TOC.

Use-Case 2: WebHelp XSLT-Parameter extension point to control if generation time is displayed in the output

Another possible customization for the main page is to add the generation time in its footer. You can use an XSLT-Parameter extension point to control if this customization is active or not. In this case, you can use the **com.oxygenxml.webhelp.xsl.createMainPage.param** extension point *(page 1898)*.

Figure: Generation time added in the WebHelp footer



To add this functionality, follow these steps:

1. Create a DITA-OT plugin structure by following the first 3 steps in the procedure above *(page 1953)*.
2. In the customization stylesheet that you just created (for example, **custom_mainpage.xsl**), declare `webhelp.footer.add.generation.time` as a global parameter and modify the template by adding the following XSLT code at the end.

```
<xsl:if test="$webhelp.footer.add.generation.time = 'yes'">
    <div class="generation_time">
```

```
        Generation date: <xsl:value-of select="format-dateTime(
              current-dateTime(), '[h1]:[m01] [P] on [M01]/[D01]/[Y0001].')"/>
    </div>
</xsl:if>
```

3. Edit the **plugin.xml** file to specify the **com.oxygenxml.webhelp.xsl.createMainPage.param** extension point and a custom parameter file by adding the following line:

```
<feature extension="com.oxygenxml.webhelp.xsl.createMainPage.param" file="params.xml"/
>
```

4. Create a custom parameter file (for example, **params.xml**). It should look like this:

```
<dummy>
    <param name="webhelp.footer.add.generation.time"
        expression="${webhelp.footer.add.generation.time}"
        if="webhelp.footer.add.generation.time"/>
</dummy>
```

5. Use the **Run DITA-OT Integrator** transformation scenario *(page 1637)* found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box *(page 1722)*.
6. Edit a **DITA Map WebHelp Responsive** transformation scenario and in the **Parameters** tab *(page 3151)*, specify the desired value (*yes* or *no*) for your custom parameter (`webhelp.footer.add.generation.time`).
7. Run the transformation scenario.

Miscellaneous Customization Topics

This section contains miscellaneous topics about how to customize the WebHelp Responsive output.

How to Add an Edit Link to Launch Oxygen XML Web Author

You can embed *Edit* links in the DITA WebHelp Responsive output that will automatically launch a particular document in Oxygen XML Web Author. A reviewer can then simply click the link and they will be redirected to the Oxygen XML Web Author editing page with that particular file open and editable.

Using a Publishing Template

To embed an *Edit* link in the DITA Map WebHelp Responsive output using an *Oxygen Publishing Template (page 1849)*, follow this procedure:

1. If you haven't already created a Publishing Template, see Working with Publishing Templates *(page 1899)*.
2. Open the template descriptor file *(page 1852)* associated with your publishing template and add the following parameters with their values set to the URLs:
   - **editlink.remote.ditamap.url** - The URL of the DITA Map suitable for opening in Oxygen XML Web Author.
   - **editlink.web.author.url** - The URL of the Oxygen XML Web Author installation.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter name="editlink.remote.ditamap.url"
                       value="webdav-https://dav.box.com/dav/my.ditamap"/>
            <parameter name="editlink.web.author.url"
                       value="https://www.oxygenxml.com/webauthor.html"/>
        </parameters>
    </webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

   Result: In the WebHelp output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

For example:

- **Windows:**

```
dita.bat -i c:\mySample.ditamap -f webhelp-responsive -
Deditlink.remote.ditamap.url=webdav-https://dav.box.com/dav/my.ditamap -
Deditlink.web.author.url=https://www.oxygenxml.com/webauthor.html
```

- **Mac OS X/ Linux:**

```
dita -i C:/mySample.ditamap -f webhelp-responsive -
Deditlink.remote.ditamap.url=webdav-https://dav.box.com/dav/my.ditamap -
Deditlink.web.author.url=https://www.oxygenxml.com/webauthor.html
```

Using a Transformation Scenario in Oxygen XML Editor/Author

To embed an *Edit* link in the DITA Map WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit a **DITA Map WebHelp Responsive** transformation scenario and open the **Parameters** tab.
2. Set values for the following parameters:
   - **editlink.remote.ditamap.url** - The URL of the DITA Map suitable for opening in Oxygen XML Web Author.
   - **editlink.web.author.url** - The URL of the Oxygen XML Web Author installation.
3. Run the transformation scenario.

   Result: In the WebHelp output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

For more information, see https://www.oxygenxml.com/doc/ug-waCustom/topics/webauthor-integrate-embedded-launch.html.

How to Flag DITA Content in WebHelp Output

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for *block elements (page 3226)* (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in text.

Using a Publishing Template

To flag content in the DITA Map to WebHelp output using an *Oxygen Publishing Template (page 1849)*, follow this procedure:

1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as `audience-flag-build.ditaval`.
2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the `audience` attribute set to `programmer`, the content of the DITAVAL file should look like the following example:

```
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
 img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

   Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Open the template descriptor file *(page 1852)* associated with your publishing template and add the `args.filter` parameter in the *parameters* section with its value set to the path of the DITAVAL file.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter name="args.filter" value="resources/myFile.ditaval"/>
        </parameters>
    </webhelp>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To flag content in the DITA Map to WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a DITA filter file in the directory where you want to add the file. Give the file a descriptive name, such as `audience-flag-build.ditaval`.
2. Define the property of the element you want to be flagged. For example, if you want to flag elements that have the `audience` attribute set to `programmer`, the content of the DITAVAL file should look like the following example:

```
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
 img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

Note that for an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Edit a **DITA Map to WebHelp** transformation scenario.
4. Specify the DITAVAL file in the **Filters** tab of the transformation scenario.
5. Run the transformation scenario.

Filtering Profiling Values with a DITAVAL File *(page 3181)*

How to Deploy the Output on a SharePoint Site

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to `.aspx`, as described in the steps below.

Using a Script Outside of Oxygen XML Editor/Author

To publish WebHelp Responsive output on a SharePoint site using an *Oxygen Publishing Template (page 1849)*, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. To allow browsers to open your published files (rather than downloading them), you need to change the file extensions from `.html` to `.aspx`.
3. Open the template descriptor file *(page 1852)* associated with your publishing template and add the `args.outext` parameter in the *parameters* section with its value set to `.aspx`.

```
<publishing-template>
    ...
    <webhelp>
        ...
        <parameters>
            <parameter name="args.outext" value=".aspx"/>
        </parameters>
```

```
    </webhelp>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To publish WebHelp Responsive output on a SharePoint site using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: https://support.microsoft.com/en-us/kb/2616712.
2. To allow browsers to open your published files (rather than downloading them), you need to change the file extensions from `.html` to `.aspx`. Fortunately, this can be done in the transformation.
   a. Edit the WebHelp transformation scenario and open the **Parameters** tab.
   b. Set the `args.outext` parameter to `.aspx`.
   c. Run the transformation scenario.

PDF Output Customization

Oxygen XML Editor provides support for generating PDF output using transformation scenarios for certain types of documents (for example, DITA, DocBook, TEI, and JATS) and Oxygen XML Editor supports several different types of processors. There are numerous ways to customize the published output to fit your specific needs.

DITA Map to PDF - based on HTML5 and CSS Customization

Oxygen XML Editor comes bundled with the DITA Open Toolkit that provides a mechanism for converting *DITA maps (page 3228)* to PDF output.

This transformation type uses a CSS based processing engine and HTML5 as an intermediate format. The complete customization documentation can be found here: DITA Map to PDF CSS-based Customization *(page 1964)*. For this transformation, the `pdf-css-html5` transtype is used.

Because the structure of the HTML5 intermediate format resembles the one used in WebHelp output, it is possible to reuse parts of your CSS file you developed for a WebHelp customization.

Related Information:

Oxygen DITA-OT CSS-based PDF Publishing Plugin *(page 1629)*

DITA Map to PDF CSS-based Customization *(page 1964)*

DITA Map to PDF - based on DITA and CSS (WYSIWYG) Customization

Oxygen XML Editor comes bundled with the DITA Open Toolkit that provides a mechanism for converting *DITA maps (page 3228)* to PDF output.

This transformation type converts DITA maps to PDF using a CSS-based processing engine and a merged DITA map (one with all topics expanded inline) as an intermediate format. The complete customization documentation can be found here: DITA Map to PDF CSS-based Customization *(page 1964)*. For this transformation, the `pdf-css` transtype is used.

Related Information:

DITA Map to PDF - based on DITA and CSS (WYSIWYG) Transformation *(page 1631)*

DITA Map to PDF CSS-based Customization *(page 1964)*

DITA Map to PDF CSS-based Customization

Oxygen XML Editor comes bundled with a **DITA-OT CSS-based PDF Publishing Plugin** that combines all the topics from a map or bookmap and styles the resulting document using CSS. It is the base of the **DITA Map PDF - based on HTML5 & CSS** and **DITA Map PDF - based on DITA & CSS (WYSIWYG)** transformation scenarios.

Overview

This section contains topics that provide a basic overview of the **DITA-OT CSS-based PDF Publishing Plugin**, technical details, and some additional resources to help you with your customizations.

Resources

Customizing the PDF output requires knowledge of CSS, Paged Media, and DITA. The following list provides some resources to help you:

- **CSS** - You can find a good tutorial here: https://developer.mozilla.org/en-US/docs/Learn/CSS/Introduction_to_CSS. Also, the specification is available on the W3C website: https://www.w3.org/Style/CSS/Overview.en.html.
- **CSS Paged Media** - This is a part of the CSS specification that shows how to organize your publication in pages, how to use headers/footers, page breaks, and other page-related issues. The specification is available here: https://www.w3.org/TR/CSS2/page.html. Also, there is a set of hands-on examples in the **Oxygen PDF Chemistry** user guide: https://www.oxygenxml.com/doc/ug-chemistry/.
- **DITA** - You will need a basic understanding of DITA elements, attributes, and structure. A good resource is *The DITA Style Guide - Best Practices for Authors* by Tony Self. It is available at: www.ditastyle.com and: https://www.oxygenxml.com/dita/styleguide/webhelp-feedback/Artefact/c_DITA_Authoring_Concepts.html.
- **HTML5** - For the **DITA Map PDF - based on HTML5 & CSS** transformation type, you will need a good knowledge of HTML5. You can find resources here: https://developer.mozilla.org/en-US/docs/Web/Guide/HTML/HTML5

Related Information:

DITA-OT DAY 2017: Using CSS to Style PDF Output

Supported Processors

The Oxygen XML Editor supports the following CSS processors:

- **Oxygen PDF Chemistry** - This is recommended processor because the built-in CSS files were fine-tuned for this processor. For example, metadata extraction *(page 1990)* only functions with this processor. If the plugin is started from an **Oxygen XML Editor/Author** distribution, a Chemistry installation is not needed.
- **Prince XML** - A commercial product, available at: https://www.princexml.com/.
- **Antenna House** - A commercial product, available at: https://www.antennahouse.com/antenna1/formatter/.

Technical Details

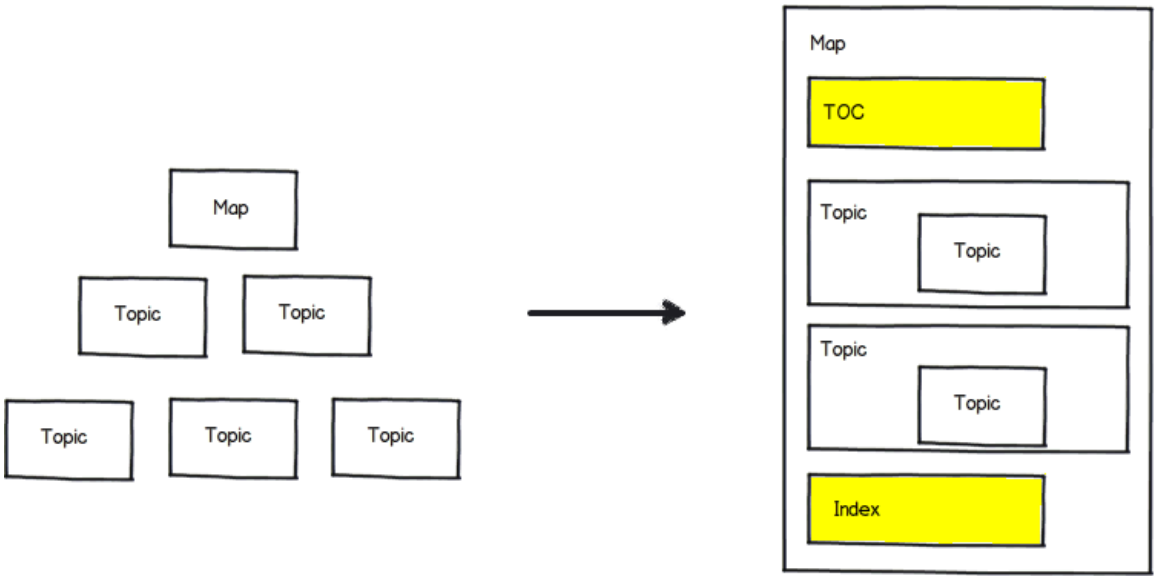
The Oxygen XML Editor comes bundled in the **Oxygen XML Editor/Author** distributions. The plugin id is: **com.oxygenxml.pdf.css**. It is installed in the `[OXYGEN-INSTALL-DIR]frameworks/dita/DITA-OT2.x/plugins/com.oxygenxml.pdf.css` folder.

It has two transformation types:

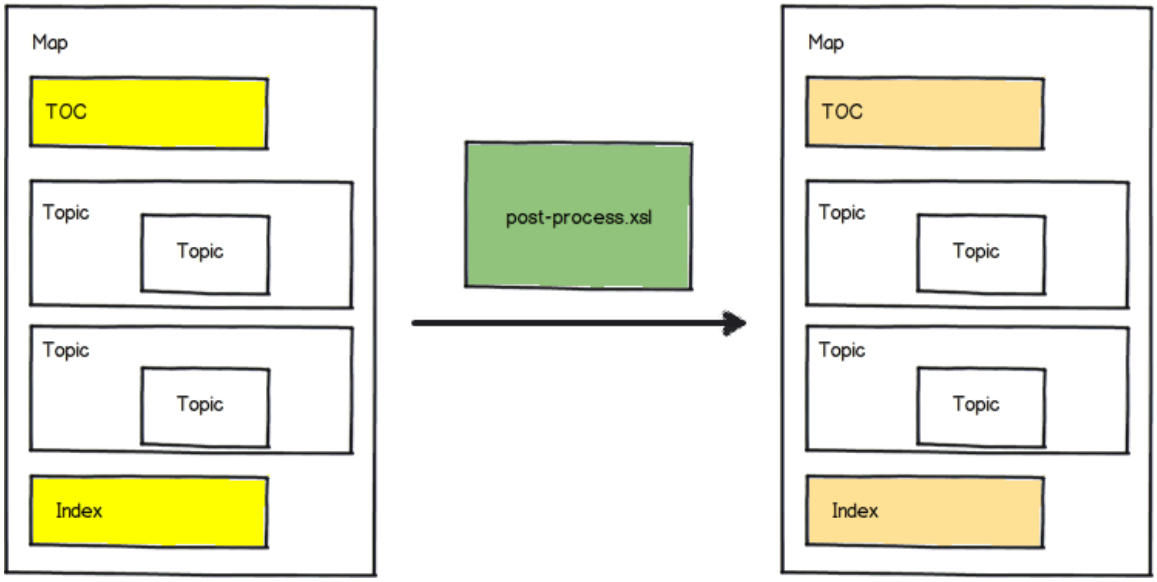
- `pdf-css` - CSS styling applied directly over a merged DITA document.
- `pdf-css-html5` - CSS styling applied over a merged HTML5 document (the merged DITA converted to HTML5).

This is how it works:

1. It expands all the topic references into a temporary clone of the map, resolving keys and reused content. This is the standard DITA-OT pre-processing procedure.
2. It generates a structure for the table of contents and index. The result is a merged map with all the references resolved. This is a standard DITA-OT processing procedure, based on the PDF2 plugin.



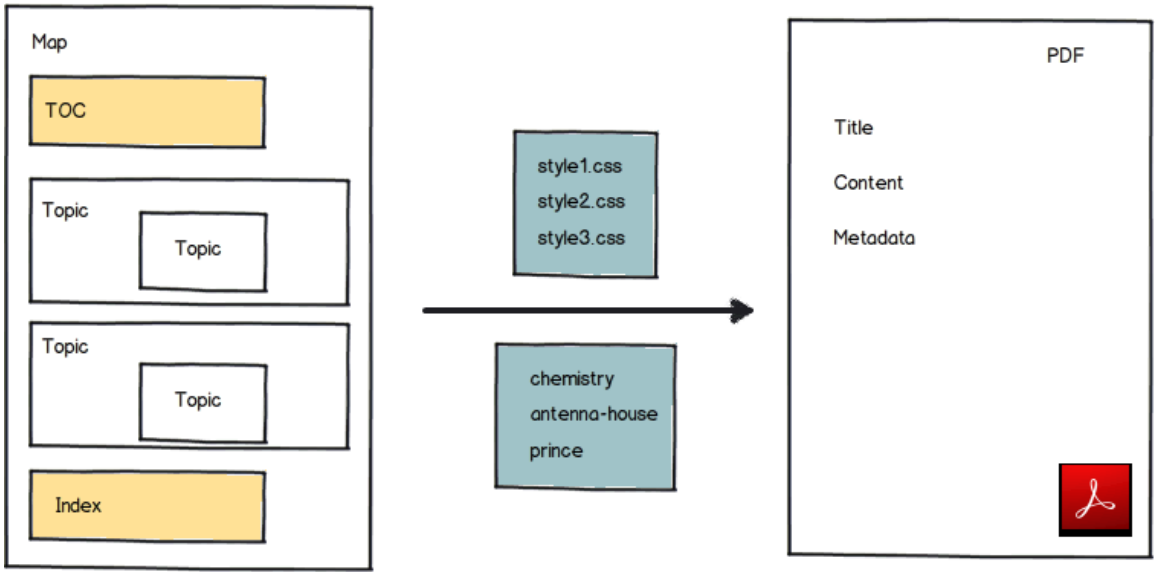
3. Then it post-processes the merged map. It fixes some of the structure in the TOC and index, moves the *frontmatter* and *backmatter* to the correct places, transforms any change tracking and review processing instructions to elements that can be styled later, etc. The result is another merged map.



4. When using the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged DITA map is transformed to a single HTML5 file. The generated HTML elements copy the class attributes from the original DITA elements. In this way you can either use selectors that were designed for DITA structure, or ones for the HTML structure - see: Reusing the Styling for WebHelp and PDF Output *(page 2052)*. This step can apply customization XSLT extension points *(page 1979)* that change the default processing.
5. In the last phase, it uses a collection of CSS files to style the merged map (or for the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map in the HTML5 format with the help of the CSS processor).

Note: For the **DITA Map PDF - based on DITA & CSS (WYSIWYG)** transformation type,, the used CSS files are those selected in the **Styles** drop-down menu from the toolbar in **Oxygen XML Editor/Author**, and they are processed along with the CSS files specified with the `args.css` parameter set in the transformation scenario.

Note: For the **DITA Map PDF - based on HTML5 & CSS** transformation type, references to the CSS files are collected from the publishing template *(page 1971)*.



Increasing Memory Allocation for Java

If you are working with a large project with extensive metadata or key references, you may need to increase the amount of memory that is allocated for the Java process. You can do this by changing the value of the `ANT_OPTS` environment variable from a command line for a specific session.

Example: To increase the JVM memory allocation to 1024 MB for a specific session, issue the following command from a command prompt (depending on your operating system):

- **Windows**

```
set ANT_OPTS=%ANT_OPTS% -Xmx1024M
```

- **Linux/Mac OS X**

```
export ANT_OPTS=$ANT_OPTS -Xmx1024M
```

Tip: To persistently change the memory allocation, change the value allocated to the `ANT_OPTS` environment variable on your system.

Transformation Parameters

This list includes the most common customization parameters that are available in the **DITA Map PDF - based on HTML5 & CSS** or **DITA Map PDF -based on DITA & CSS (WYSIWYG)** transformation scenarios. Other standard DITA-OT parameters were omitted for clarity, but they are still supported.

args.css	You can use this to specify a list of CSS URLs to be used in addition to those specified in the **dita.css.list** parameter or publishing template (for the **DITA Map PDF - based on HTML5 & CSS** transformation). The files must have URL syntax and be separated using semicolons.
args.input	Specifies the master DITA map file for your documentation project.
clean.temp	Specifies whether the DITA-OT deletes the files in the temporary directory after it finishes a build. Allowed values: **yes** (default) / **no**
css.processor.type	Specifies the processor to use for the transformation. Allowed values: **chemistry** (default) / **antenna-house** / **prince**.
css.processor.path.chemistry	Path to the **Oxygen PDF Chemistry** executable file that needs to be run to generate the PDF (for example, `C:\path\to\chemistry.bat` on Windows). If this parameter is not set, the plugin will use the system's PATH environment variable to locate and start **Oxygen PDF Chemistry**.
css.processor.path.antenna-house	Path to the Antenna House executable file that needs to be run to generate the PDF (for example, `C:\path\to\AHFCmd.exe` on Windows).
css.processor.path.prince	Path to the Prince executable file that needs to be run to generate the PDF (for example, `C:\path\to\prince.exe` on Windows).
show.changes.and.comments	When set on **yes**, the user comments, colored highlights and track-changes are shown in the output.
figure.title.placement	Controls the title placement of the figures, relative to the image. Possible values include **top** (default) and **bottom**.

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the following parameters can be used to specify a publishing template:

pdf.publishing.template	Specifies the path to the folder containing the custom PDF template.
pdf.publishing.template.descriptor	Specifies the name of the descriptor to be loaded from the PDF template folder or package. If it is not specified, the first encountered descriptor will be loaded.

Publishing Templates

An *Oxygen Publishing Template* defines all aspects of the layout and styles for **WebHelp Responsive** or **PDF - based on HTML5 & CSS** output. It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Important: The **DITA Map PDF - based on DITA & CSS (WYSIWYG)** transformation scenario does not supports publishing templates.

Some possible customizations include:

- Add additional template resources to customize the output (such as logos, favicons, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- For **WebHelp Responsive** output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structure for *Oxygen Publishing Template* packages:

Figure: Oxygen Publishing Template Package (WebHelp Responsive)

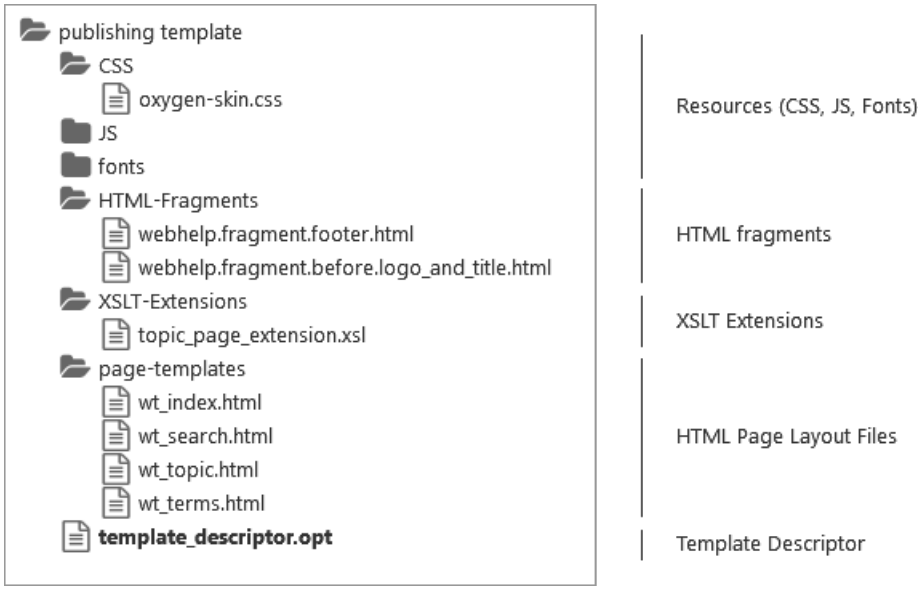


Figure: Oxygen Publishing Template Package (PDF)

For information about creating and customizing publishing templates, watch our video demonstration:

Related Information:

How to Create a Publishing Template *(page 1899)*

How to Edit a Publishing Template *(page 1900)*

How to Add a Publishing Template to the Publishing Templates Gallery *(page 1901)*

How to Share a Publishing Template *(page 1903)*

Publishing Template Package Contents for PDF Customizations

An *Oxygen Publishing Template* package must contain a template descriptor file and some other resources (such as CSS files). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive when you need it to share with others.

Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with template. It is an XML file that defines all the resources included in a template (such as CSS files and transformation parameters).

The template descriptor file must have the `.opt` file extension and must be located in the templates' root folder.

A PDF template descriptor might look like this:

```
<publishing-template>
    <name>Flowers</name>

    <pdf>
        <tags>
            <tag>purple</tag>
            <tag>light</tag>
        </tags>
        <preview-image file="flowers-preview.png"/>

        <resources>
            <css file="flowers.css"/>
        </resources>

        <parameters>
            <parameter name="figure.title.placement" value="top"/>
```

```
        </parameters>
    </pdf>
</publishing-template>
```

Tip: It is recommended to edit the template descriptor in **Oxygen XML Editor/Author** because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a **name** element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a **description** and it displayed when the user hovers over the template in the transformation scenario dialog box.

```
<publishing-template>
    <name>Flowers</name>
    <description>Flowers themed light colored template</description>
    ...
```

Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the **author** element, a **name** is required and optionally you can include **email**, **organization**, and **organizationUrl** information.

```
<publishing-template>
    ...
    <author>
      <name>John Doe</name>
      <email>jdoe@example.com</email>
      <organization>ACME</organization>
      <organizationUrl>http://www.example.com/jdoe</organizationUrl>
    </author>
    ...
```

PDF Element

The **pdf** element contains various details about the template and its resources that define the output. The elements that are allowed in this **pdf** section specify the template tags *(page 1973)*, template

preview image *(page 1973)*, resources *(page 1974)* (such as CSS files), transformation parameters *(page 1975)*, or XSLT extensions *(page 1974)*.

```
<pdf>
    <tags>
      ...
    </tags>
    <preview-image file="MyPreview.png"/>

    <resources>
      ...
    </resources>

    <parameters>
      ...
    </parameters>
</pdf>
```

Template Tags

The **tags** section provides meta information about the template (such as color theme). Each **tag** is displayed at the top of the **Templates** tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```
<publishing-template>
    ...
    <pdf>
      <tags>
        <tag>purple</tag>
        <tag>light</tag>
      </tags>
```

Template Preview Image

The **preview-image** element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be `200 x 115` pixels and the supported image formats are: `JPEG`, `PNG`, or `GIF`.

You can also include an **online-preview-url** element to specify the URL of a published sample of your template. This will display an **Online preview** icon in the bottom-right corner of the image in the

transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

```
<publishing-template>
    ...
    <pdf>
      ...
      <preview-image file="ashes/ashes-tree.png"/>
      <online-preview-url=https://www.example.com/samples/tiles/ashes</online-preview-
url>
```

Template Resources

The **resources** section of the descriptor file specifies a set of resources (CSS files) that are used to customize various components in generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included, while the other types of resources are optional.

```
<publishing-template>
    ...
    <pdf>
      ...
      <resources>
          <css file="css/custom_styles.css"/>
          <css file="css/custom_fonts.css"/>
      </resources>
```

Note: All relative paths specified in the descriptor file are relative to the template root folder.

XSLT Extension Points

The publishing template allows supports one or more XSLT extension points. They can be specified in the descriptor file using the following structure:

```
<publishing-template>
    ...
    <pdf>
        ...
        <xslt>
            <extension
              id="com.oxygenxml.pdf.css.xsl.merged2html5"
              file="xslt/merged2html5Extension.xsl"/>
            <extension
```

```
            id="com.oxygenxml.pdf.css.xsl.merged2merged"
            file="xslt/merged2mergedExtension.xsl"/>
        </xslt>
```

For more information about the available extension points, see: XSLT Extensions for PDF Transformations *(page 1979)*.

Transformation Parameters

You can also set one or more transformation parameters in the descriptor file.

```
<publishing-template>
    ...
    <pdf>
      ...
      <parameters>
        <parameter name="show.changes.and.comments" value="yes"/>
      </parameters>
    </pdf>
```

The following information can be specified in the `parameter` element:

Parameter name

The name of the parameter. It may be one of the transformation parameters listed in the **Parameters** tab of the **DITA Map to PDF - based on HTML5 & CSS** transformation scenario or a DITA-OT PDF-based output parameter.

Note: It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

Attention: JVM arguments like *-Xmx* cannot be specified as a transformation parameter.

Parameter Value

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

Parameter Type

The type of the parameter: `string` or `filepath`. The `string` value is default.

After creating a publishing template *(page 1899)* and adding it to the templates gallery *(page 1901)*, when you select the template in the transformation scenario dialog box, the **Parameters** tab will

automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

Combining PDF and WebHelp Responsive Customizations in a Template Package

An *Oxygen Publishing Template* package can contain both a PDF and WebHelp Responsive customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `webhelp` and `pdf` element and some of the resources can be reused.

```
<publishing-template>
    <name>Flowers</name>
    <description>Flowers themed light colored template</description>

    <webhelp>
        <tags>
            <tag>purple</tag>
            <tag>light</tag>
        </tags>
        <preview-image file="flowers-preview.png"/>
        <resources>
            <css file="flowers-wh.css"/>
            <css file="flowers-page-styling.css"/>
        </resources>
        <parameters>
            <parameter name="webhelp.show.main.page.tiles" value="no"/>
            <parameter name="webhelp.show.main.page.toc" value="yes"/>
        </parameters>
    </webhelp>
    <pdf>
        <tags>
            <tag>purple</tag>
            <tag>light</tag>
        </tags>
        <preview-image file="flowers-preview.png"/>
        <resources>
            <css file="flowers-pdf.css"/>
            <css file="flowers-page-styling.css"/>
        </resources>
        <parameters>
            <parameter name="show.changes.and.comments" value="yes"/>"/>
        </parameters>
```

```
    <pdf>
</publishing-template>
```

How to Create a Publishing Template

The easiest way to create a new *Oxygen Publishing Template* is to select an existing template in the transformation scenario dialog box and use the **Save template as** button to save that template into a new template package that can be used as a starting point.

To create a new *Oxygen Publishing Template*, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.
2. **Optional:** You can set one or more transformation parameters from the **Parameters** tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.
3. Click the **Save template as** button.
   This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.
4. Specify a name for the new template.
5. **Optional:** Specify a template description.
6. **Optional:** The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** or **DITA Map to PDF - based on HTML5 & CSS**). You can use the **Include WebHelp customization** and **Include PDF customization** options to specify whether your custom template will include both types of customizations.
7. **Optional:** For **WebHelp Responsive** customizations, you can select the **Include HTML Page Layout Files** option if you want to copy the default *HTML Page Layout Files (page 1857)* in your template package. They are helpful if you want to change the structure of the generated HTML pages.
8. In the **Save as** field, specify the name and path of the ZIP file where the template will be saved.

A new ZIP archive will be created on disk in the specified location with the specified name.

For more information about creating and customizing publishing templates, watch our video demonstration:

Related Information:

Publishing Template Package Contents for PDF Customizations *(page 1971)*

Publishing Template Package Contents for WebHelp Responsive Customizations *(page 1852)*

How to Edit a Publishing Template

To edit an existing *Oxygen Publishing Template* package, follow these steps:

1. Unzip the ZIP archive associated with the *Oxygen Publishing Template* in a separate folder.
2. Link the folder associated with the template in the **Project** view.
3. Using the **Project** view, you can modify the resources (CSS, JS, fonts) within the *Oxygen Publishing Template* folder to fit your needs.
4. Open the publishing template descriptor file (`.opt` extension) in the editor and modify to suit your needs.
5. **Optional:** Once you finish your customization, you can archive the folder as a ZIP file.

Related Information:

Publishing Template Package Contents for PDF Customizations *(page 1971)*

Publishing Template Package Contents for WebHelp Responsive Customizations *(page 1852)*

How to Add a Publishing Template to the Publishing Templates Gallery

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box.
2. In the **Templates** tab, click the **Configure Publishing Templates Gallery** link to.
   This will open the preferences page.
3. Click the **Add** button and specify the location of your template directory.
   Your template directory is now added to the **Additional Publishing Templates Galleries** list.
4. Click **OK** to return to the transformation scenario dialog box.
   All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to **Options > Preferences > DITA > Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

XSLT Extensions for PDF Transformations

Since PDF output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the PDF transformation.

The `pdf-css-html5` transformation type uses two stages to transform the merged DITA map (the one that aggregates all the topics) to HTML5:

1. **Stage 1**: Makes some changes on the merged map and the result is a modified merged map. This stage can be altered by implementing the **com.oxygenxml.pdf.css.xsl.merged2merged** XSLT extension point. This extension overrides the stylesheets found in the following folder: *DITA-OT-DIR*`\plugins\com.oxygenxml.pdf.css\xsl\merged2merged`.

   Note: Use this when you need to filter DITA content.

2. **Stage 2**: Transforms the merged map to HTML5 and the result is a single HTML document. This stage can be altered by implementing the **com.oxygenxml.pdf.css.xsl.merged2html5** XSLT extension point. This extension overrides the stylesheets found in the following folder: *DITA-OT-DIR*`\plugins\com.oxygenxml.pdf.css\xsl\merged2html5`.

   Note: Use this when you need to change the HTML structures generated for a specific DITA element.

These extension points can be used either from a *Publishing Template* or a DITA-OT extension plugin.

How to Use XSLT Extension Points for PDF Output from a Publishing Template

These examples demonstrate how to use XSLT extension points from an *Oxygen Publishing Template (page 1849)*.

Use Case 1: Styling Codeblocks with a Zebra Effect

Suppose you want your *codeblocks* to have a particular background color for one line, and another color for the next line. One advantage of this coloring technique is that you can clearly see when text from the codeblock is wrapped.

This effect can be done by altering the HTML5 output, creating a `div` for each line from the code block, then styling them.

To add this functionality using an *Oxygen Publishing Template*, follow these steps:

1. If you haven't already created a Publishing Template, see How to Create a Publishing Template *(page 1899)*.
2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an `xslt` folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, ' pr-d/codeblock ')]">
       <div class='zebra'>
          <xsl:analyze-string regex="\n" select=".">
            <xsl:matching-substring/>
            <xsl:non-matching-substring>
               <div><xsl:value-of select="."/></div>
            </xsl:non-matching-substring>
          </xsl:analyze-string>
       </div>
    </xsl:template>
</xsl:stylesheet>
```

5. Open the *template descriptor file (page 1971)* associated with your *publishing template* (the .opt file) and set the XSLT stylesheet created in previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```
<publishing-template>
    ...
    <pdf>
```

```
        ...
        <xslt>
            <extension
              id="com.oxygenxml.pdf.css.xsl.merged2html5"
              file="xslt/merged2html5Extension.xsl"/>
        </xslt>
```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the *codeblock* structure. For example:

```
div.zebra {
  font-family:courier, fixed, monospace;
  white-space:pre-wrap;
}

div.zebra > *:nth-of-type(odd){
  background-color: silver;
}
```

7. Open the *template descriptor file (page 1971)* associated with your *publishing template* (the .opt file) and reference your custom CSS file in the `resources` element:

```
<publishing-template>
    ...
    <pdf>
      ...
      <resources>
          <css file="css/custom.css"/>
      </resources>
```

8. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
9. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
10. Click **OK** to save the changes to the transformation scenario.
11. Run the transformation scenario.

Use Case 2: Removing the Related Links Section

Suppose you want the *related links* sections to be removed from the PDF output.

To add this functionality using an *Oxygen Publishing Template*, follow these steps:

1. If you haven't already created a Publishing Template, see How to Create a Publishing Template *(page 1899)*.

2. Link the folder associated with the publishing template to your current project in the **Project** view.
3. Using the **Project** view, create an `xslt` folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2mergedExtension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

   <xsl:template match="*[contains(@class, ' topic/related-links ')]">
      <!-- Remove. -->
   </xsl:template>
</xsl:stylesheet>
```

5. Open the *template descriptor file (page 1971)* associated with your *publishing template* (the .opt file) and set the XSLT stylesheet created in previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```
<publishing-template>
    ...
    <pdf>
        ...
        <xslt>
            <extension
              id="com.oxygenxml.pdf.css.xsl.merged2merged"
              file="xslt/merged2mergedExtension.xsl"/>
        </xslt>
```

6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin

These examples demonstrate how to use XSLT extension points from a DITA-OT plugin.

Use Case 1: Styling Codeblocks with a Zebra Effect

Suppose you want your *codeblocks* to have a particular background color for one line, and another color for the next line. One advantage of this coloring technique is that you can clearly see when text from the codeblock is wrapped.

This effect can be done by altering the HTML5 output, creating a `div` for each line from the code block, then styling them.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the *DITA-OT-DIR*`\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.custom.codeblocks`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

```
<plugin id="com.oxygenxml.pdf.custom.codeblocks">
  <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5"
             file="custom_codeblocks.xsl"/>
</plugin>
```

3. Create your customization stylesheet (for example, **custom_codeblocks.xsl**) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, ' pr-d/codeblock ')]">
       <div class='zebra'>
          <xsl:analyze-string regex="\n" select=".">
            <xsl:matching-substring/>
            <xsl:non-matching-substring>
               <div><xsl:value-of select="."/></div>
            </xsl:non-matching-substring>
          </xsl:analyze-string>
       </div>
    </xsl:template>
</xsl:stylesheet>
```

4. Use the **Run DITA-OT Integrator** transformation scenario *(page 1637)* found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.
5. Create a custom CSS file with rules that style the *codeblock* structure. For example:

```
div.zebra {
  font-family:courier, fixed, monospace;
  white-space:pre-wrap;
}

div.zebra > *:nth-of-type(odd){
  background-color: silver;
}
```

6. Edit a **DITA Map PDF - based on HTML5 & CSS** transformation scenario and reference your custom CSS file (using the `args.css` parameter).
7. Run the transformation scenario.

Use Case 2: Removing the Related Links Section

Suppose you want the *related links* sections to be removed from the PDF output.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the *DITA-OT-DIR*`\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.custom.codeblocks`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

```
<plugin id="com.oxygenxml.pdf.custom.related.links">
  <feature extension="com.oxygenxml.pdf.css.xsl.merged2merged"
             file="custom_related_links.xsl"/>
</plugin>
```

3. Create your customization stylesheet (for example, **custom_related_links.xsl**) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

   <xsl:template match="*[contains(@class, ' topic/related-links ')]">
      <!-- Remove. -->
```

```
    </xsl:template>
</xsl:stylesheet>
```

4. Use the **Run DITA-OT Integrator** transformation scenario *(page 1637)* found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.
5. Run the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

Customization CSS

The publishing process is driven by a customization CSS.

DITA Map PDF - based on HTML5 and CSS Transformation Type

To change the styling of the output for the **DITA Map PDF - based on HTML5 & CSS** transformation scenario:

1. Create the CSS file that will contain all your customizations. It is recommended to create this file in your project directory so you can edit it easily.
2. Add the custom CSS rules. See the various topics in this section for assistance with specific types of customizations.
3. For linking the CSS file, you have two options:
   a. Create a publishing template, create the customization CSS file inside the template folder and link it into the publishing template descriptor. See Publishing Templates *(page 1849)*.
   b. Choose an existing publishing template, then edit the scenario and set the full path to the custom CSS file as the value of the `args.css` parameter. The rules from custom CSS will override the rules from the template CSS files.
4. Run the transformation scenario.

DITA Map PDF - based on DITA and CSS (WYSIWYG) Transformation Type

To change the styling of the output for the **DITA Map PDF - based on DITA & CSS** transformation scenario:

1. Create the CSS file that will contain all your customizations. It is recommended to create this file in your project directory so you can edit it easily.

   ⚠ **Important:** Always use CSS rules that match the DITA class attribute values. Avoid using CSS selectors containing element names, because they have a weaker specificity and will not override the styles defined in the built-in CSS files. For instance, to match the `p` element, use its class attribute:

   ```
   *[class ~= "topic/p"] {
     color: gray;
   ```

```
}
```

Instead of:

```
p {
  color: gray;
}
```

Tip: You can organize the CSS rules in separate files, but they all need to be imported from a single master CSS file. For simplicity, this manual provides instructions based upon a single CSS file.

Note: LESS files are supported (LESS is a CSS pre-processor with a CSS-like syntax, but has a lot of features designed to speed up development).

2. Add the custom CSS rules. See the various topics in this section for assistance with specific types of customizations.
3. Set the full path to the custom CSS file as the value of the `args.css` parameter.
4. Run the transformation scenario.

Debugging the CSS

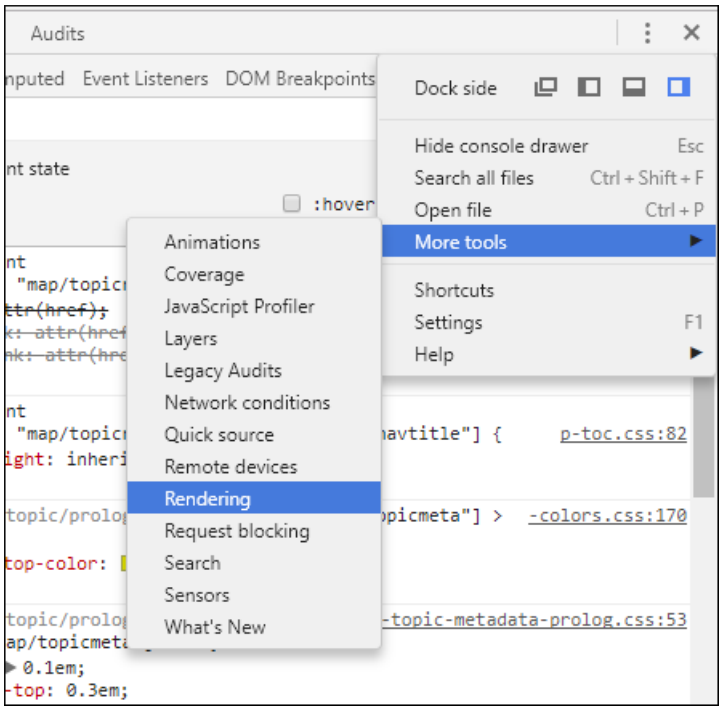
If you notice that some of the CSS properties were not applied, some typical debugging steps might include the following:

1. The first thing you should try is to check the file structure of the **merged map**. This can be found in the `out/pdf-css` directory and it has the `.merged.xml` file extension. For the **DITA Map PDF - based on HTML5 & CSS** transformation type, in addition to that you will find a `.merged.html` file. You can open this file in **Oxygen XML Editor/Author** to examine its structure. Optionally, you can pretty print it (**Format and Indent**) to make the structure easier to read.
2. Check that the CSS selector is written correctly against the document structure.
3. If you still cannot identify the problem, then inspect how the styles are applied (you can try one of the methods listed below).

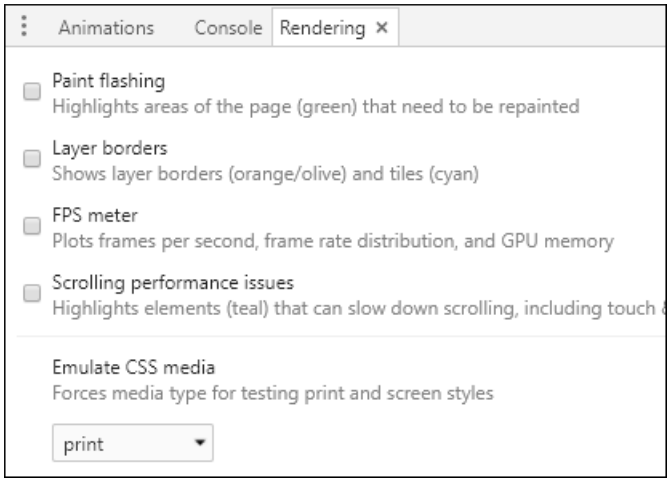
Inspecting the Applied Styles Using the Chrome Browser

To inspect the applied CSS styles using Chrome:

1. In Chrome, open the file ending in `.merged.xml` or `.merged.html` (for the **DITA Map PDF - based on HTML5 & CSS** transformation type).
2. Click on the element you want to inspect.
3. Activate the **Chrome Developer Tools** by using **> More Tools > Developer Tools**, or press **CTRL+SHIFT+I**.
4. Activate the **Rendering** pane by using **> More Tools > Rendering**:



5. In the **Rendering** pane, select **print** from the **Emulate CSS media** section. This will activate the CSS selectors enclosed in `@media print {..}`.



Note: This allows you to the debug styling of elements, table of contents, and index, but not the styles of the page margin boxes (headers, footers) or page breaks.

Tip: In the left pane of the **Developer Tools** interface, you can inspect elements and their styles in the **Elements** tab. You can click on any of the links to display the applied CSS files in the **Styles** tab in the right pane. Editing the styles in that pane results in a live preview of how the change will affect the output.

CAUTION: Do not modify the built-in rules directly in the CSS files from the **Oxygen XML Editor/ Author** installation. Instead, copy the rules to your own customization CSS.

Inspecting the Applied Styles Using Oxygen XML Editor/Author

To inspect styles:

1. In **Oxygen XML Editor/Author**, open the file ending in `.merged.xml` or `.merged.html` (for the **DITA Map PDF - based on HTML5 & CSS** transformation type).
2. From the **Styles** toolbar, choose the **+ Print Ready** entry. This will activate the CSS selectors enclosed in `@media print {..}`.
3. Click on the element you want to style. Use the **Inspect Styles** action from the Contextual Menu. A specialized view will show the built-in CSS rules.

Note: This allows you to debug styling of elements, but not of the page margin boxes (headers, footers) or page breaks.

CAUTION: Do not modify the built-in rules directly in the CSS files from the **Oxygen XML Editor/Author** installation. Instead, copy the rules to your own customization CSS.

Other techniques

These are some other techniques you may find useful:

- Add background and borders properties to the specific CSS rule. If they do not appear in the output then there is a problem with the rule selector.
- Try to use the `!important` notation to the property that is not applied, or make the selector more specific (you can add more parent selectors).
- To figure out how the elements are mapped into PDF, you can use this fragment in the customization CSS:

```
* {
   border: 1pt solid blue !important;
}

*:before(1000) {
   content:  oxy_name() !important;
   color: orange;
}

*:before(999) {
   content: "[ class= '" attr(class) "'] " !important;
   color: orange;
}
```

This will show the element name, its class attribute, and will paint a blue border around each of the elements in the output. It will not show the page margin boxes or some content elements that were hidden.

Page Size

This is where you can find information on how the page sizes are defined.

Page Size - Built-in CSS rules

The `[PLUGIN_DIR]/css/p-page-size.css` file contains the default page rules. It uses the US-LETTER size (8.5in by 11in). The content of this file is:

```
@page {
    padding-top:0.2em;
    padding-bottom:0.2em;
    size: us-letter;
    margin: 1in;
}
```

Note: This is listed solely for illustration purposes, as the plugin might use something different.

How to Change the Page Size

Suppose you want to publish using the standard A4 page size, with a margin of 2cm.

In your customization CSS *(page 1985)*, use:

```
@page {
    size: A4;
    margin: 2cm;
}
```

If you need different margins depending on the page side:

```
@page {
    size: A4;
    margin: 2cm;
}
@page :left{
    margin-right:4cm;
}
@page :right{
```

```
    margin-left:4cm;
}
```

This would only increase the gutter margins or the inside margins needed for binding of the final book. The other margins would remain 2cm.

How to Change the Page Orientation

Suppose you want to publish on a landscape page. The default is portrait, so you need to change it by using the size property. This will contain both the physical measurements and the orientation. In your customization CSS *(page 1985)*, use:

```
@page {
    size: us-letter landscape;
}
```

How to Change the Page Settings for a Specific Element

Suppose your publication is mainly using a portrait page orientation, but there are some topics that have wide images. To avoid having the images bleeding outside of the page, you could use a wider page setting (landscape).

1. Mark the topic with an `@outputclass` attribute and give it a distinct value (for example, **wide**). You can set the attribute on the root element of the topic, or on the `<topicref>` element from the map.

   Note: The outputclass values from the topicref automatically propagate to the root of the topic from the merged map.

2. In your customization CSS *(page 1985)*, match the output class and associate it with a named page. This page has landscape orientation and small margins. This technique works for any element (consider a table or a list) not necessarily a topic.

   ```
   *[outputclass = 'wide'] {
       page: wide-page;
   }

   @page wide-page {
       size: letter landscape;
       margin: 0.5in;
   }
   ```

Metadata

DITA has a solid vocabulary for specifying metadata. There are `<prolog>` elements in the topics, and `<topicmeta>`, `<bookmeta>` elements in the bookmaps. They can be used to define authors, dates, audiences, organizations, etc. See: https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/metadata-in-maps-and-topics.html

It is up to you to decide where this information should be presented, in the PDF content or in the PDF document properties.

Metadata - Input XML fragment

In the merged map, the metadata section is placed inside the `<oxy:front-page>` element. This is different from the original placement in the map or bookmap - after the title, but allows usage of information from it in the title page.

Bookmaps

This is an example of a section taken from a merged bookmap. It only contains some of the possible metadata elements. The `bookmeta` metadata section is inherited from `topicmeta`:

```
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
  xmlns:opentopic-index="http://www.idiominc.com/opentopic/index" cascade="merge"
    class="- map/map bookmap/bookmap "
  ditaarch:DITAArchVersion="1.3" >

  <oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">

   <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
     class="- map/topicmeta bookmap/bookmeta ">
     <author class="- topic/author ">Howe Tuduit</author>
     <bookid class="- topic/data bookmap/bookid ">
       <isbn class="- topic/data bookmap/isbn ">071271271X</isbn>
       <booknumber class="- topic/data bookmap/booknumber ">SG99-9999-00</booknumber>
        <maintainer class="- topic/data bookmap/maintainer ">
        <organization class="- topic/data bookmap/organization ">ACME Tools</
organization>
        <person class="- topic/data bookmap/person "/>
       </maintainer>
     </bookid>
     <bookrights class="- topic/data bookmap/bookrights ">
        ...
```

```
        <bookowner class="- topic/data bookmap/bookowner ">
  <organization class="- topic/data bookmap/organization ">ACME Tools, Inc.</
organization>
        </bookowner>
     </bookrights>
        </bookmeta>

        <oxy:front-page-title>
            ...
...
```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<div
    class="- map/map bookmap/bookmap bookmap" ... >

   <div class=" front-page/front-page front-page">

   <div
     class="- map/topicmeta bookmap/bookmeta boometa">
     <div class="- topic/author author">Howe Tuduit</div>
     <div class="- topic/data bookmap/bookid bookid">
       <div class="- topic/data bookmap/isbn isbn">071271271X</div>
       <div class="- topic/data bookmap/booknumber booknumber">SG99-9999-00</div>
       <div class="- topic/data bookmap/maintainer maintainer">
          <div class="- topic/data bookmap/organization organization">ACME Tools</div>
          <div class="- topic/data bookmap/person person"/>
        </div>
      </div>
      <div class="- topic/data bookmap/bookrights bookrights">
        ...
         <div class="- topic/data bookmap/bookowner bookowner">
              <div class="- topic/data bookmap/organization organization">
                                      ACME Tools, Inc.
              </div>
         </div>
       </div>
     </div>
```

```
     <div class=" front-page/front-page-title front-page-title">
           ...
...
```

Maps

The maps have a more simple structure, they use the `<topicmeta>` element for metadata sections. This is also a simplified example, as there may be many more elements in the metadata section:

```
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
    xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
          cascade="merge" class="- map/map "
    ditaarch:DITAArchVersion="1.3">
    ...

<oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">

  <topicmeta class="- map/topicmeta ">
      <author class="- topic/author ">Dan C</author>
      <metadata class="- topic/metadata ">
         <prodinfo class="- topic/prodinfo ">
             <prodname class="- topic/prodname ">oXygen PDF CSS DITA Plugin</prodname>
         </prodinfo>
      </metadata>
      <audience class="- topic/audience "/>
  </topicmeta>
...
```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements:

```
<div xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
    xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
          cascade="merge" class="- map/map "
    ditaarch:DITAArchVersion="1.3">
    ...

<div class=" front-page/front-page front-page">

  <div class="- map/topicmeta topicmeta">
      <div class="- topic/author author">Dan C</div>
      <div class="- topic/metadata metadata">
```

```
        <div class="- topic/prodinfo prodinfo">
            <div class="- topic/prodname prodname">oXygen PDF CSS DITA Plugin</div>
        </div>
      </div>
      <div class="- topic/audience audience"/>
  </topicmeta>
...
```

Metadata - Built-in CSS rules

The `[PLUGIN_DIR]/css/p-meta.css` file contains the rules that extract metadata.

How to Add the Publication Audience to the Custom PDF Metadata

The audience element indicates the users the publication is addressing. This can be placed inside a `<topicmeta>` element in a `<map>` as in the following example:

```
<map>
    ...
    <topicmeta>
        ...
        <audience type="programmer" job="programming" experiencelevel="expert"/>
```

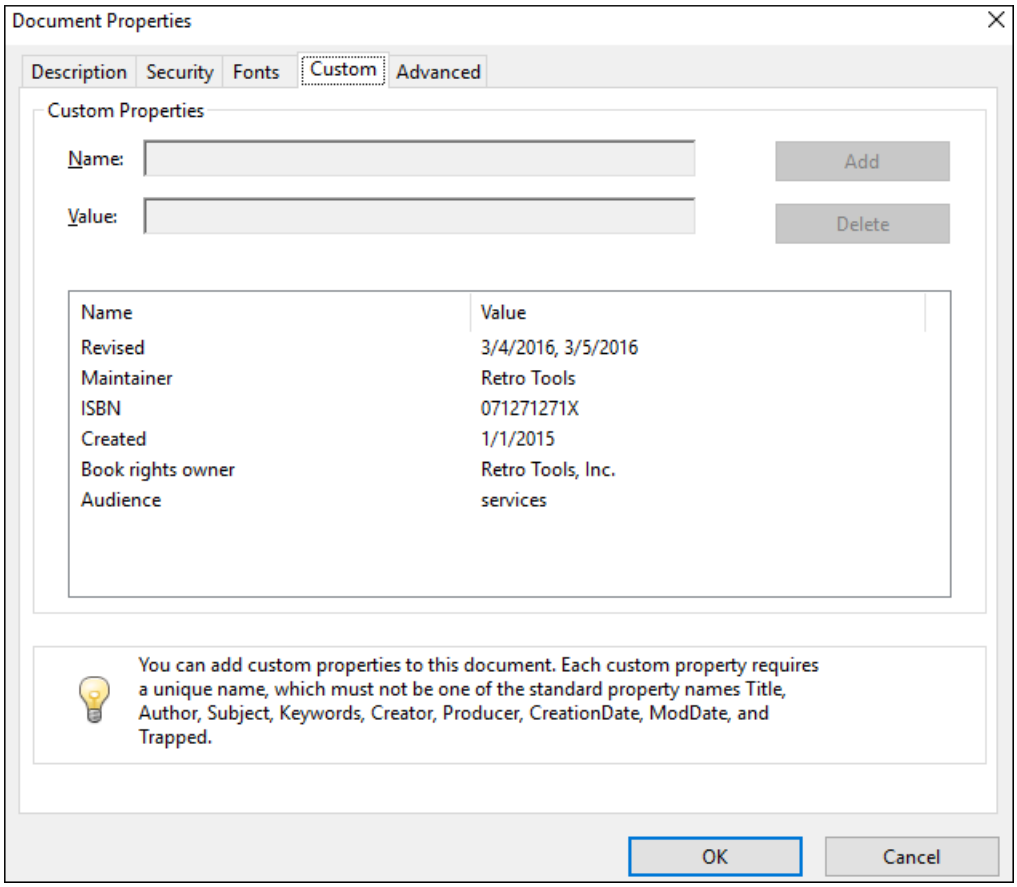
To collect the `@type` attribute, add the following in your customization CSS *(page 1985)*:

```
*[class ~= "map/map"] > *[class ~= "map/topicmeta"] > *[class ~= "topic/audience"] {
    -oxy-pdf-meta-custom: "Audience" attr(type);
}
```

Note: It is best to use the class selector (such as `*[class ~= "map/topicmeta"]`) instead of `topicmeta` to cover cases where the elements are specialized (for instance, in a bookmap the `bookmeta` is a `topicmeta`, so your selector will also function for bookmaps, not only simple maps.

Note: The selector begins with `map >` to choose the `<topicmeta>` that is a direct child of the map, not other `<topicmeta>` elements from other `<topicref>` elements.

The metadata is displayed in the **Custom** tab of the **Document Properties** dialog box from Acrobat Reader:



How to Show Metadata in the Cover Page

Suppose you need to present the **author** and the **ISBN** just under the publication title. Your bookmap contains:

```
<bookmap id="taskbook">
    <booktitle>
        <booklibrary>Retro Tools</booklibrary>
        <mainbooktitle>Product tasks</mainbooktitle>
        <booktitlealt>Tasks and what they can do</booktitlealt>
    </booktitle>
    <bookmeta>
        <author>Howe Tuduit</author>
        <critdates>
            <created date="1/1/2015"/>
            <revised modified="3/4/2016"/>
            <revised modified="3/5/2016"/>
        </critdates>
        <bookid>
            <isbn>071271271X</isbn>
            <booknumber>SG99-9999-00</booknumber>
```

```
...
```

The entire `<booktitle>` element content is displayed on the first page of the PDF, so suppose you need to add the information after it.

In your customization CSS *(page 1985)*, add the following CSS rules:

```
*[class ~= "bookmap/booktitle"]:after {
    display:block;
    content: "by " oxy_xpath('//*[contains(@class, " bookmap/bookmeta ")]/
*[contains(@class, " topic/author ")]/text()');
    margin-top: 4em;
    text-align: center;
    color: gray;
}
*[class ~= "bookmap/booktitle"]:after(2) {
    display:block;
    content: "ISBN "oxy_xpath('//*[contains(@class, " bookmap/isbn ")]/text()');
    text-align: center;
    color: gray;
}
```

The following CSS extensions were used in this example:

- **oxy_xpath** - Executes an XPath expression and returns a string content.
- `:after(N)` - Creates more than one *after* pseudo element. The argument value represents how far the generated content is from the real content. In the example above, the content of the `:after` is closer to the title (upper) than the content of the `:after(2)`.

Generating Synthetic Pages for Metadata.

Suppose you need to show this information on a page that follows the title page, instead of on the title page. In this case, you need to prepare a named page and place the content on it. In your customization CSS *(page 1985)*, add the following CSS rules:

```
@page page-for-meta {
    background-color: yellow; /* Just to see it better*/
    @top-left-corner {
        content:""; /* Remove the default header */
    }
    @top-right-corner {
        content:""; /* Remove the default header */
    }
```

```
}

*[class ~= "bookmap/booktitle"]:after {
    page: page-for-meta;
}
*[class ~= "bookmap/booktitle"]:after(2) {
    page: page-for-meta;
}
```

How to Show Metadata in the Header or Footer

If you need to add some of the map metadata to the header of the front page (for example, the **creation date**), add the following CSS rules in your customization CSS *(page 1985)*:

```
*[class ~= "front-page/front-page"] >
  *[class ~= "map/topicmeta"] >
    *[class ~= "topic/critdates"] >
      *[class ~= "topic/created"]{
    string-set: mapcreated attr(date);
}

@page front-page {
     @top-center {
          content: "Created: " string(mapcreated);
     }
}
```

Note: The *front-page* is the name of a page that used to present the element with the class "front-page/front-page". The above page rule is combined with the default styles.

How to Show Arbitrary/Computed Data in the Header or Footer

The header and footer are compose of page margin boxes that can be populated with static text, by using *string-sets*.

You can extract and process data from any location in your document by executing XPath expressions. You can bind the evaluation result to a CSS *string-set* and then use it in the page margin boxes.

The following example counts the words from the publication and shows it in the front page footer.

In your customization CSS *(page 1985)*, add the following CSS rules:

```
*[class ~= "map/map"]{
    string-set: number-of-words oxy_xpath("string-length(normalize-space(.)) - string-length(translate(normalize-space(.),' ','')) +1");
}

@page front-page {
     @bottom-center {
          content: "Number of words: " string(number-of-words);
     }
}
```

Note: This example counts all the words, including the ones from the TOC, but does not take into account the static labels.

Note: Preferably define the string set directly on the root element if you intend to use it in the front page.

Note: The context node for the XPath execution is(are) the one(s) matched by the CSS selector.

Cover (Title) Page

Customizing the cover page is one of the most requested customization requests.

Cover Page - Input XML fragment

The merged map contains a `<oxy:front-page>` element, child of the root element. This contains the metadata and an `<oxy:front-page-title>` element with the title structure.

```
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
  <oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">
   <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
            ...
   </bookmeta>
```

```
   <oxy:front-page-title>
    <booktitle xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
       class="- topic/title bookmap/booktitle ">
       <booklibrary class="- topic/ph bookmap/booklibrary ">Retro Tools</booklibrary>
       <mainbooktitle class="- topic/ph bookmap/mainbooktitle ">Tasks</mainbooktitle>
       <booktitlealt class="- topic/ph bookmap/booktitlealt ">Product tasks</
booktitlealt>
    </booktitle>
   </oxy:front-page-title>
</oxy:front-page>
```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<div class="- map/map bookmap/bookmap bookmap" ... >
   <div class=" front-page/front-page front-page">
      <div class="- map/topicmeta bookmap/bookmeta boometa">
        ...
      </div>
     <div class=" front-page/front-page-title front-page-title">
       <div class="- topic/title bookmap/booktitle booktitle">
         <div class="- topic/ph bookmap/booklibrary booklibrary">Retro Tools</div>
         <div class="- topic/ph bookmap/mainbooktitle mainbooktitle">Tasks</div>
         <div class="- topic/ph bookmap/booktitlealt booktitlealt">Product tasks</div>
      </div>
...
```

Cover Page - Built-in CSS rules

The element with the class "frontpage/frontpage" is associated with a page named *front-page* with no headers or footers. The front page titile is styled with a bigger font. The built-in CSS rules are in `[PLUGIN_DIR]/css/p-front-page.css`.

```
@media print {

    *[class~="front-page/front-page"] {
        page: front-page;
    }

    *[class~="front-page/front-page-title"] {
        display:block;
```

```
        text-align:center;
        margin-top:3in;
        font-size:2em;
        font-family:arial, helvetica, sans-serif;
        font-weight:bold;
    }

    @page front-page {
        @top-left-corner    {          content:none }
        @top-left           {          content:none }
        @top-center         {          content:none }
        @top-right          {          content:none }
        @top-right-corner   {          content:none }
        @bottom-left-corner {          content:none }
        @bottom-left        {          content:none }
        @bottom-center      {          content:none }
        @bottom-right       {          content:none }
        @bottom-right-corner{          content:none }
    }
}
```

Note: This is listed solely for illustration purposes, as the plugin might use something different.

How to Add a Background Image for the Cover

The simplest way is to create an SVG image as large as the entire physical page and set it as the background for the *front-page*.

Consider the following SVG document.

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE svg PUBLIC "-//W3C//DTD SVG 1.1//EN"
       "http://www.w3.org/Graphics/SVG/1.1/DTD/svg11.dtd">
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in">
    <desc>A gradient as big as a page.</desc>
    <defs>
        <linearGradient id="lc"
            x1="0%" y1="0%"
            x2="0%" y2="100%"
            spreadMethod="pad">
            <stop offset="0%"   stop-color="#00DD00" stop-opacity="1"/>
```

```
            <stop offset="100%" stop-color="#00AA00" stop-opacity="1"/>
        </linearGradient>
    </defs>
    <rect x="0" y="0" width="100%" height="100%" rx="10" ry="10"
        style="fill:url(#lc);
        stroke: #005000;
        stroke-width: 3;"/>
    <text x="45%" y="95%"  color="#FFFFAA" font-size="0.7cm"> Sample </text>
</svg>
```

It shows a gradient (but it can be anything, created with any tool) and the "Sample" text. It is as large as a US-LETTER page and can be used in a publication using this page size.

Note: You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

In your customization CSS *(page 1985)*, add the following:

```
@page front-page {
    background-image: url("us-letter.svg");
    background-position:center;
}
```

Note: For smaller artworks, you can use `background-position` with percentage values to position and center the artwork (for example, a company logo):

```
@page front-page {
    background-image:url("company-logo.svg");
    background-position:50% 5%; /* The first is the alignement on the X axis, the
 second on the Y axis.*/
    background-repeat:no-repeat;
}
```

Note: The text from the SVG or PDF background images are searchable in the PDF reader.

How to Change Styling of the Cover Page Title

Match the front page title element in your customization CSS *(page 1985)* based on its class attribute:

```
*[class ~= "front-page/front-page-title" {
  margin-top: 1in;
  font-size: 3em;
}
```

How to Add Text to the Cover Page

If you need to add arbitrary text to the cover page, you can use the front page title element as an anchor and add as many blocks of text as you need after it, and style them differently.

In your customization CSS *(page 1985)*, add the following:

```
*[class ~= "front-page/front-page-title"]:after(1) {
    display:block;
    content: "DRAFT VERSION";
    font-size: large;
    color: red;
    text-align:center;
}

*[class ~= "front-page/front-page-title"]:after(2) {
    display:block;
    content: "DO NOT DISTRIBUTE WITHOUT PERMISSION";
    font-size: large;
    color: red;
    text-align:center;
    font-style: italic;
}
```

The result is:

To use content from the document, you can use the `oxy_xpath` function in the `content` property. For a more complex example, including the generation of a new page for the synthetic `:after` elements, see: How to Show Metadata in the Cover Page *(page 1995)*.

Related Information:

How to Show Metadata in the Cover Page *(page 1995)*

How to Place Cover on the Right or Left Side

In your customization CSS *(page 1985)*, add the following CSS rules:

```
*[class ~= "front-page/front-page"]{
    page-break-before:left;
}
```

Note: This will create an empty page at the beginning of the publication, moving the cover content on the needed side.

For more information, see: Oxygen PDF Chemistry: Controlling Page Breaks.

Related Information:

Double Side Pagination *(page 2021)*

How to Add a Specific Number of Empty Pages After the Cover Page

In your customization CSS *(page 1985)*, add the following CSS rules:

```
@page my-blank-page {
    /* Hide the page numbers */
    @top-left {content: none};
```

```
    @top-right {content: none};
}

*[class ~= 'front-page/front-page']:after(1){
    page:my-blank-page;
    display:block;
    content: '\2002';
    color:transparent;
    page-break-after:always;
}

*[class ~= 'front-page/front-page']:after(2){
    page:my-blank-page;
    display:block;
    content: '\2002';
    page-break-after:always;
}

*[class ~= 'front-page/front-page']:after(3){
    page:my-blank-page;
    display:block;
    content: '\2002';
    page-break-after:always;
}
```

Note: The *\2002* character is a space that is not shown on the pages, but gives a value for the content property.

How to Remove the Cover Page and TOC

If you need to hide or remove the cover page, the table of contents or other structures, match the elements with a "front-page/front-page" and "toc/toc" classes in your customization CSS *(page 1985)*:

```
*[class ~= 'map/map'] > *[class ~= 'toc/toc'] {
    display:none !important;
}
```

```
*[class ~= 'map/map'] > *[class ~= 'front-page/front-page']{
    display:none !important;
}
```

Front Matter and Back Matter

The *front matter* is a series of topics that are usually placed after the cover page and before the TOC or the content.

The *back matter* is a series of topics that are usually placed after the content of the book.

Front Matter and Back Matter - Input XML fragment

The frontmatter topics are wrapped in an `<oxy:front-matter>` element, that has the class `bookmap/frontmatter` (it is a clone of the original `<frontmatter>` element from the map):

```
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
    <oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author"
                    class=" front-page/front-page ">
       ...
    </oxy:front-page>
    <oxy:front-matter xmlns:oxy="http://www.oxygenxml.com/extensions/author"
                  class="- map/topicref bookmap/frontmatter ">
        <concept xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
                  class="- topic/topic concept/concept "
            id="unique_1" oid="concept-1">
          ...
    </oxy:front-matter>
```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<div xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
    <div class=" front-page/front-page front-page">
       ...
    </div>
    <div class="- map/topicref bookmap/frontmatter frontmatter">
        <div class="- topic/topic concept/concept " id="unique_1" oid="concept-1">
        ...
    </div>
```

Front Matter and Back Matter - Built-in CSS

The built-in CSS rules are in `[PLUGIN_DIR]/css/p-bookmap-frontmatter-backmatter.css`. By default, it associates the `<oxy:front-matter>` and `<oxy:back-matter>` elements (or for the **DITA Map PDF - based on HTML5 & CSS** transformation type, the corresponding HTML div elements with the *matter* page), that have no headers or other page margin boxes. Each of the child topics start on a new page.

The content of this file is:

```
@media print {
    *[class ~= "bookmap/frontmatter"],
    *[class ~= "bookmap/backmatter"] {
        page: matter-page;
    }

    /* Put the sections on a separate page. */
    *[class ~= "bookmap/frontmatter"] > *[class ~= "topic/topic"],
    *[class ~= "bookmap/backmatter"] > *[class ~= "topic/topic"]{
      page-break-before: always;
    }
}
```

Note: This is listed solely for illustration purposes, as the plugin might use something different.

Related Information:

Page Headers and Footers *(page 2029)*

How to Remove Page Breaks Between Front Matter Child Topics

If you do not like the fact that all the topics that enter a bookmap frontmatter start on a new page, you can disable this by using the following rules in your customization CSS *(page 1985)*:

```
*[class ~= "bookmap/frontmatter"] > *[class ~= "topic/topic"],
*[class ~= "bookmap/backmatter"] > *[class ~= "topic/topic"]{
      page-break-before: auto;
}
```

How to Style the Front Matter and Back Matter Topics

Suppose you want the topics from the *front matter* and *back matter* to start at the middle of the page and use a smaller fine print.

In your customization CSS *(page 1985)*, add the following:

```
*[class ~= "bookmap/frontmatter"] > *[class ~= "topic/topic"],
*[class ~= "bookmap/backmatter"] > *[class ~= "topic/topic"] {
    margin-top: 50%;
    border-top: 5pt solid silver;
    font-size: 0.5em;
}
```

Numbering

The default numbering system is to only number the chapters in the TOC and in the content (shallow numbering).

Note: For a plain DITA map, the chapters are the `<topicref>` elements that are placed on the first level. For bookmaps, the chapters are the topics referenced by a `<chapter>` element.

Numbering - Input XML Fragments

The numbering affects three parts of your publication, the table of contents, headers/footers, and chapter titles:

The Table of Contents

The table of contents is a tree of `<topicref>` elements.

```
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
  <oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author"
        class=" front-page/front-page ">
        ...
  </oxy:front-page>
  <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic" class=" toc/toc ">
    <title class="- topic/title ">Publication Title</title>

    <topicref is-chapter="true" class="- map/topicref " ... >
      <topicmeta class="- map/topicmeta " ... >
        <navtitle href="#unique_1" class="- topic/navtitle ">Overview</navtitle>
            ...
      </topicmeta>
```

```
      <topicref class="- map/topicref " ...>
        <topicmeta class="- map/topicmeta " data-topic-id="dcpp_resources">
          <navtitle href="#unique_2" class="- topic/navtitle ">Resources</navtitle>
            ...
        </topicmeta>
      </topicref>
        ...
  </opentopic:map>
...
</map>
```

Note: The `<opentopic:map>` element contains the effective table of contents structure.

Note: The TOC items are the elements with the class: `- map/topicref`.

Note: The ones identified as chapters have the `@is-chapter` attribute set.

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<div class="- map/map map" ...>
  <div
        class=" front-page/front-page front-page">
        ...
  </div>
  <div class=" toc/toc toc">
    <div class="- topic/title title">Publication Title</title>

    <div is-chapter="true" class="- map/topicref topicref" ... >
      <div class="- map/topicmeta topicmeta" ... >
        <div href="#unique_1" class="- topic/navtitle navtitle">Overview</div>
            ...
      </div>
      <div class="- map/topicref " ...>
        <div class="- map/topicmeta " data-topic-id="dcpp_resources">
          <div href="#unique_2" class="- topic/navtitle ">Resources</div>
            ...
        </div>
      </div>
        ...
  </div>
```

```
...
</div>
```

The Header and Footers

These are based on string sets generated for the titles. The complete set of strings is defined in: `[INSTALLATION_DIR]/css/print/p-pages-and-headers.css`.

The CSS rules that build the string sets are matching the map title from the front page and the titles from the content.

```
<oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">
        <oxy:front-page-title>
            <title class="- topic/title ">Publication Title</title>
        </oxy:front-page-title>
</oxy:front-page>
```

For the **DITA Map PDF - based on HTML5 & CSS** transformations:

```
<div class=" front-page/front-page front-page">
        <div class=" front-page-title/front-page-title front-page-title">
            <div class="- topic/title title ">Publication Title</div>
        </div>
</div>
```

The main content is organized as follows:

```
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
    ...
    <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">
      ...
    </opentopic:map>

    <topic is-chapter="true" oid="dcpp_overview">
        <title class="- topic/title ">Overview</title>
        <body class="- topic/body ">
            ...
        </body>
        <topic class="- topic/topic " id="unique_2" oid="dcpp_resources">
            <title class="- topic/title ">Resources</title>
            ...
        </topic>
        <topic class="- topic/topic " id="unique_2" oid="dcpp_parameters">
```

```
            <title class="- topic/title ">Parameters</title>
            ...
        </topic>
    </topic>
```

For the **DITA Map PDF - based on HTML5 & CSS** transformations:

```
<div class=" map/map map" ...>
    ...
   <div class=" toc/toc toc">
      ...
    </div>

    <div is-chapter="true" oid="dcpp_overview" class="- topic/topic topic">
        <div class="- topic/title title">Overview</title>
        <div class="- topic/body body">
            ...
        </div>
        <div class="- topic/topic topic" id="unique_2" oid="dcpp_resources">
            <div class="- topic/title title">Resources</div>
            ...
        </div>
        <div class="- topic/topic topic" id="unique_2" oid="dcpp_parameters">
            <div class="- topic/title title">Parameters</div>
            ...
        </div>
    </div>
```

Note: The topic content comes after the `<opentopic:map>` element.

Note: The child topics are the elements that have the class `- topic/topic` included in the parents.

Note: The ones identified as chapters have the `@is-chapter` attribute set.

The Titles of Chapters

The titles from the content are children of the topics:

```
<topic class="- topic/topic " id="unique_2" oid="dcpp_parameters">
        <title class="- topic/title ">Parameters</title>
            ...
</topic>
```

For the **DITA Map PDF - based on HTML5 & CSS** transformations:

```
<div class="- topic/topic topic" id="unique_2" oid="dcpp_parameters">
        <div class="- topic/title title ">Parameters</div>
            ...
</div>
```

Note: The title elements have the class: `- topic/title`. The actual element name can be different.

Numbering - Built-in CSS rules

This section contains information about how to deal with shallow or deep chapter numbering.

CSS for Shallow Numbering

There is a file located in `[PLUGIN_DIR]/css/print/p-numbering-shallow`. The following examples are from this file.

Note: This is listed solely for illustration purposes, as the plugin might use something different.

The counters should be reset on the root element. This is the element that has the class `map/map`. Note that bookmaps derive from maps and the following selector will also match them:

```
*[class ~= "map/map"] {
    counter-reset: page 1
                   toc-chapter 0
                   chapter 0
                   figcount 0
                   tablecount 0;
}
```

Table of Contents

There is only one counter for the chapters, named `toc-chapter`. This is reset on the book parts (for bookmaps) and is incremented on each chapter that is not a part.

Note: The parts are also marked as chapters.

```
*[class ~= "map/topicref"][is-chapter]:not([is-part]) {
    counter-increment:toc-chapter;
}
*[class ~= "map/topicref"][is-part] {
   counter-reset:toc-chapter !important;
   counter-increment:toc-part;
```

```
}

/* All other topicrefs that follow a part should not have a number (i.e appendices)  */
*[class ~= "map/topicref"][is-part] ~ *[class ~= "map/topicref"]:not([is-part]) >
 *[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before{
   content: none !important;
   counter-increment:none;
}
```

To display the numbers in the TOC, a `:before` pseudo element is used on the navigation titles from the `<topicref>` elements:

```
*[class ~= "map/topicref"][is-part] > *[class ~= "map/topicmeta"] > *[class ~= "topic/
navtitle"]:before{
   content:"Part " counter(toc-part, upper-roman) ". " !important;
   color:inherit;
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicmeta"] >
 *[class ~= "topic/navtitle"]:before{
    content:"Chapter " counter(toc-chapter) ". " !important;
    color:inherit;
}
```

The Titles of Chapters in the Main Content

The `part` and `chapter` counters are incremented on the elements that have the class `topic/topic`:

```
*[class ~= "topic/topic"][is-part]{
    counter-increment:part;
    counter-reset:chapter;
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]){
    counter-increment:chapter;
}
```

Except for `<frontmatter>`, `<backmatter>`, and other topics following the last book part (for bookmaps).

```
*[class ~= "bookmap/frontmatter"],
*[class ~= "bookmap/frontmatter"] *[class ~= "topic/topic"],
*[class ~= "bookmap/backmatter"],
*[class ~= "bookmap/backmatter"] *[class ~= "topic/topic"],
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) {
```

```
   counter-increment:none !important;
   counter-reset: chapter part;
}
```

These counters are used in the content, before the titles:

```
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"]:before {
    content: "Part " counter(part, upper-roman) ". ";
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"]:before
 {
    content: "Chapter " counter(chapter) ". ";
}
```

Except for `<frontmatter>`, `<backmatter>`, and other topics following the last book part (for bookmaps).

```
*[class ~= "bookmap/frontmatter"] > *[class ~= "topic/title"]:before,
*[class ~= "bookmap/frontmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/
title"]:before,
*[class ~= "bookmap/backmatter"] > *[class ~= "topic/title"]:before,
*[class ~= "bookmap/backmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/
title"]:before,
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) > *[class
 ~= "topic/title"]:before,
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) *[class
 ~= "topic/topic"] > *[class ~= "topic/title"]:before{
    content:none !important;
}
```

Headers

Define the string-sets used in the header, using the `part` and `chapter` counters:

```
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"] {
    string-set: parttitle " | " counter(part, upper-roman) " - " content(),
 chaptertitle  ""; /* Avoid propagating a past chapter title on a new part */
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"] {
    string-set: chaptertitle " | " counter(chapter) " - " content();
}
```

Except for front matter, backmatter and other topics following the last book part (for bookmaps).

```
*[class ~= "bookmap/frontmatter"] > *[class ~= "topic/title"],
*[class ~= "bookmap/frontmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/
title"],
*[class ~= "bookmap/backmatter"] > *[class ~= "topic/title"],
*[class ~= "bookmap/backmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/title"],
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) > *[class
 ~= "topic/title"],
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) *[class
 ~= "topic/topic"] > *[class ~= "topic/title"]{
   string-set: parttitle "", chaptertitle "";
}
```

CSS for Deep Numbering

The CSS file responsible for deep numbering is `[PLUGIN_DIR]/css/print/p-optional-numbering-deep.css`. The following examples are taken from this file.

Note: This CSS file is not used by default. To use it, you should copy it and then import it from your customization CSS *(page 1985)*.

Note: This is listed solely for illustration purposes, as the plugin might use something different.

For implementing the deep numbering, first the counters for the root element should be reset. In our example, the root is the element that has the class attribute set to `map/map`. Note that the following selector will also match bookmaps, as they are derived from maps:

```
*[class ~= "map/map"] {
    counter-reset: page 1
                   toc-chapter 0
                   toc-section1 0
                   toc-section2 0
                   toc-section3 0
                   toc-section4 0
                   chapter 0
                   section1 0
                   section2 0
                   section3 0
                   section4 0
                   figcount 0
                   tablecount 0;
}
```

Table of Contents

There are counters for parts (`toc-part`), chapters (`toc-chapter`) and sections (`toc-section1` , `toc-section2` , `toc-section3`).

Note: The parts are also marked as chapters.

```
*[class ~= "map/topicref"][is-chapter]:not([is-part]) {
 counter-increment:toc-chapter;
 counter-reset: toc-section1;
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicref"]{
 counter-increment:toc-section1;
 counter-reset: toc-section2;
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicref"] >
 *[class ~= "map/topicref"]{
 counter-increment:toc-section2;
 counter-reset: toc-section3;
}

/*
  All the parts get a part number.
  Each chapter gets a chapter number.
  All other topicrefs following a part do not have a number.
*/
*[class ~= "map/topicref"][is-part] {
   counter-reset:toc-chapter !important;
   counter-increment:toc-part;
}

/* All other topicrefs that follow a part should not have a number (i.e appendices)  */
*[class ~= "map/topicref"][is-part] ~ *[class ~= "map/topicref"]:not([is-part]) >
 *[class ~= "map/topicmeta"]:before{
   content: none !important;
   counter-increment:none;
}

*[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before {
 display:none !important; /* In case this CSS is used in cascade with the shallow
 numbering. */
```

```
}
```

To display the numbers in the table of contents, a pseudo `:before` element is used on `<topicmeta>` (this contains the TOC label and the header and page number).

To avoid wrapping the text under the chapter/section number, these pseudo elements are moved to the left of the `<topicmeta>` using position **absolute**:

```
*[class ~= "map/topicref"] {
    position:relative;
}

*[class ~= "map/topicref"] > *[class ~= "map/topicmeta"]:before {
    display:block;
    position:absolute; /* If the TOC item is wrapping, it won't wrap under the
 numbering. */
    top:0.4em; /* This aligns the before with the TOC item text. */
}

*[class ~= "map/topicref"][is-part] > *[class ~= "map/topicmeta"]:before {
    left: -1.5em; /* Increase the value of width and left as the depth increases. */
    width:1em;
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/
topicmeta"]:before {
    left: -1.5em;
    width:1em;
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicref"] >
 *[class ~= "map/topicmeta"]:before {
    left: -2em;
    width:2em;
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicref"] >
 *[class ~= "map/topicref"] > *[class ~= "map/topicmeta"]:before {
    left: -2.5em;
    width:2.5em;
}
```

And now the content for each pseudo element (depending on its depth) is set:

```

```

```
*[class ~= "map/topicref"][is-part] > *[class ~= "map/topicmeta"]:before {
    content: counter(toc-part, upper-roman) ".";
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/
topicmeta"]:before {
    content: counter(toc-chapter) ".";
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicref"] >
 *[class ~= "map/topicmeta"]:before {
    content: counter(toc-chapter) "." counter(toc-section1);
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicref"] >
 *[class ~= "map/topicref"] > *[class ~= "map/topicmeta"]:before {
    content: counter(toc-chapter) "." counter(toc-section1) "." counter(toc-section2);
}
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicref"]
 > *[class ~= "map/topicref"] > *[class ~= "map/topicref"] > *[class ~= "map/
topicmeta"]:before {
    content: counter(toc-chapter) "." counter(toc-section1) "." counter(toc-
section2) "." counter(toc-section3);
}
```

Tip: When using deep numbering rules, to avoid double numbering in the TOC, override the default labeling behavior defined in the `p-numbering-shallow.css` file by adding something like the following rule in your customization CSS *(page 1985)*:

```
/* To hide the "Chapter NN." labels */
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicmeta"] >
 *[class ~= "topic/navtitle"]:before{
    content:none !important;
}
```

The Titles of Chapters in the Main Content

The `part`, `chapter` and `section1` / `section2` / `section3` counters are incremented on the elements that have the class `topic/topic`:

```
*[class ~= "topic/topic"][is-part]{
    counter-increment:part;
    counter-reset:chapter;
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) {
```

```
    counter-increment: chapter;
    counter-reset:section1;
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] {
    counter-increment:section1;
    counter-reset:section2;
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] >
 *[class ~= "topic/topic"] {
    counter-increment:section2;
    counter-reset:section3;
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] >
 *[class ~= "topic/topic"]  > *[class ~= "topic/topic"] {
    counter-increment:section3;
    counter-reset:section4;
}
```

Now avoid incrementing the counters for `<frontmatter>`, `<backmatter>`, and other topics following the last book part (for bookmaps).

```
*[class ~= "bookmap/frontmatter"],
*[class ~= "bookmap/frontmatter"] *[class ~= "topic/topic"],
*[class ~= "bookmap/backmatter"],
*[class ~= "bookmap/backmatter"] *[class ~= "topic/topic"],
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) {
   counter-increment:none !important;
   counter-reset: part chapter section1 section2 section3 section4 !important;
}
```

The following counters are used in the content, before the titles:

```
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"]:before{
        content: counter(part, upper-roman) ". ";
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/
title"]:before{
        content: counter(chapter) ". ";
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] >
 *[class ~= "topic/title"]:before{
        content: counter(chapter) "." counter(section1) ". ";
```

```
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] >
 *[class ~= "topic/topic"] > *[class ~= "topic/title"]:before{
        content: counter(chapter) "." counter(section1) "." counter(section2) ". ";
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"]
 > *[class ~= "topic/topic"] > *[class ~= "topic/topic"] > *[class ~= "topic/
title"]:before{
        content: counter(chapter) "." counter(section1) "." counter(section2) "."
 counter(section3) ". ";
}
```

Avoid however setting content for `<frontamatter>`, `<backmatter>`, and other topics following the last book part (for bookmaps).

```
*[class ~= "bookmap/frontmatter"] > *[class ~= "topic/title"]:before,
*[class ~= "bookmap/frontmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/
title"]:before,
*[class ~= "bookmap/backmatter"] > *[class ~= "topic/title"]:before,
*[class ~= "bookmap/backmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/
title"]:before,
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) > *[class
 ~= "topic/title"]:before,
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) *[class
 ~= "topic/topic"] > *[class ~= "topic/title"]:before{
  content:none !important;
}
```

Headers

Define the string-sets used in the header and make use of counters:

```
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"] {
    string-set: parttitle " | " counter(part, upper-roman) " - " content(),
 chaptertitle  ""; /* Avoid propagating a past chapter title on a new part */
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"] {
    string-set: chaptertitle " | " counter(chapter) " - " content(), sectiontitle "";
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] >
 *[class ~= "topic/title"] {
```

```
    string-set: sectiontitle " | " counter(chapter) "." counter(section1) " -
 " content();
}
```

Avoid using counters for `<frontamatter>`, `<backmatter>`, and other topics following the last book part (for bookmaps).

```
*[class ~= "bookmap/frontmatter"] > *[class ~= "topic/title"],
*[class ~= "bookmap/frontmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/
title"],
*[class ~= "bookmap/backmatter"] > *[class ~= "topic/title"],
*[class ~= "bookmap/backmatter"] *[class ~= "topic/topic"] > *[class ~= "topic/title"],
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) > *[class
 ~= "topic/title"],
*[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part]) *[class
 ~= "topic/topic"] > *[class ~= "topic/title"]{
   string-set: parttitle "", chaptertitle "", sectiontitle "";
}
```

How to Reset the Page Numbers after the TOC

In your customization CSS *(page 1985)*, use the following rule:

```
*[class ~= "map/map"] > *[class ~= "toc/toc"] + *[class ~= "topic/topic"]{
    counter-reset: page 1;
}
```

The effect is to reset the page number at the beginning of the first topic following the TOC.

How to Remove the 'chapter NN' Prefix from Table of Contents and Content.

If you are using the shallow numbering CSS (this is the default), and you want to hide the "Chapter" prefix, use the following rules in your customization CSS *(page 1985)*:

For the TOC:

```
*[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before {
 display:none !important;
}
```

For the titles in the content, change the content of the title `:before` (this example just uses the chapter number):

```
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"]:before
 {
    content: counter(chapter) ". ";
}
```

How to Use a Deeper Numbering for Sections

If you need a deeper numbering, that goes to the sections and subsections, import the rules defined in the `[INSTALLATION_DIRECTORY]/css/print/p-optional-double-side-pagination.css` from your customization CSS *(page 1985)*.

Related Information:

CSS for Deep Numbering *(page 2014)*

Double Side Pagination

By default, the processor generates pages that are mirror images (the right page has the header on the right side, the left pages have the header on the left side). The chapters follow one another with no constraint on the page side.

Note: For a plain DITA map, the chapters are the `<topicref>` elements that are placed on the first level. For bookmaps, the chapters are the topics referenced by a `<chapter>` element.

This section contains information about how to position the start of the chapters on an odd folio number. Some of the CSS rules given here as examples are already listed in: `[INSTALLATION_DIRECTORY]/css/print/p-optional-double-side-pagination.css`. You may choose to import this file from your customization CSS *(page 1985)*.

How to Start Chapters on Odd Pages

A common use case is to arrange the chapters of the publication to start on an odd page number.

In your customization CSS *(page 1985)*, add the following:

```
@page chapter {
 -oxy-initial-page-number: auto-odd;
}
@page table-of-contents {
 -oxy-initial-page-number: auto-odd;
}
```

Supported values for `-oxy-initial-page-number` include: **auto**, **auto-even**, **auto-odd**, or a number.

How to Style the Empty (Blank) Pages

By making the chapters start on an odd page, the CSS processor might add blank pages to the previous page sequence as padding.

To style those blank pages add the following code in your customization CSS *(page 1985)*:

```
@page chapter:blank, table-of-contents:blank {
     @top-left      { content: none; }
     @top-center    { content: none; }
     @top-right     { content: none; }
     @bottom-left   { content: none; }
     @bottom-center { content: none; }
     @bottom-right  { content: none; }
}
```

Note: This just removes the headers and footers, but you can use a background image or a header with "Intentionally left blank" text.

Related Information:

How to Add a Background Image for the Cover *(page 2000)*

How to Force an Odd or Even Number of Pages in a Chapter

Another use case is to specify a number of pages for a section. Suppose that you have a table of contents that follows the cover page and you need to have an even number of pages. Hence, the next chapter would start on an even page.

In your customization CSS *(page 1985)*, use the `-oxy-force-page-count` property with an even value:

```
@page table-of-contents {
 -oxy-force-page-count: even;
}
```

Supported values for `-oxy-force-page-count` include: **even**, **odd**, **end-on-even**, **end-on-odd**, **auto**, **no-force**.

How to Style the First page of a Chapter

You can use the `:first` page rule selector to control how the first page of a chapter looks. Suppose that you have defined the following layout for your default page and you want to put the publication title (the `maptile` string) on the header of the first page (instead of the chapter name that is displayed on this page):

In your customization CSS *(page 1985)*, add the following:

```
@page chapter:first {
 @top-right-corner { content: string(maptitle); }
 @top-left { content: none; }
}
```

Table of Contents

The table of contents is a hierarchy of topic titles with links to the topic content.

Table of contents - Input XML fragment

In the merged DITA map, the `<opentopic:map>` contains a hierarchy of `<topicref>` elements, or other elements (such as `<chapter>` or `<part>`) that are specializations of `<topicref>` .

Each of the `<topicref>` elements include a *metadata* section that includes the topic title.

```
<bookmap ...>

<oxy:front-page> ... </oxy:front-page>
<oxy:front-matter> ... </oxy:front-matter>

<opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">

  <oxy:toc-title xmlns:oxy="http://www.oxygenxml.com/extensions/author" empty="true"/>

  <booktitle class="- topic/title bookmap/booktitle ">
      <booklibrary class="- topic/ph bookmap/booklibrary ">Retro Tools</booklibrary>
      <mainbooktitle class="- topic/ph bookmap/mainbooktitle ">Tasks</mainbooktitle>
      <booktitlealt class="- topic/ph bookmap/booktitlealt ">Product Tasks</
booktitlealt>
  </booktitle>

  <chapter is-chapter="true"
```

```
      class="- map/topicref bookmap/chapter " href="#unique_5" type="topic">
      <topicmeta class="- map/topicmeta " data-topic-id="installing">
          <navtitle href="#unique_5" class="- topic/navtitle ">Installing</navtitle>
          ...
      </topicmeta>

      <topicref class="- map/topicref " href="#unique_6" type="task">
          <topicmeta class="- map/topicmeta " data-topic-id="installstorage">
              <navtitle href="#unique_6" class="- topic/navtitle ">Installing</
navtitle>
                  ...
          </topicmeta>
               ...
      </topicref>
           ...
  </chapter>
```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<div class="- bookmap/bookmap map/map map bookmap" ...>

<div class="- front-page/front-page front-page"> ... </div>
<div class="- bookmap/frontmatter frontmatter"> ... </div>

<div class=" toc/toc toc">

 <div class="toc/toc-title toc-title" empty="true"/>

 <div class="- topic/title bookmap/booktitle booktitle">
      <div class="- topic/ph bookmap/booklibrary booklibrary">Retro Tools</div>
      <div class="- topic/ph bookmap/mainbooktitle mainbooktitle">Tasks</div>
      <div class="- topic/ph bookmap/booktitlealt booktitlealt">Product Tasks</div>
 </div>

 <div is-chapter="true"
  class="- map/topicref bookmap/chapter topicref chapter " href="#unique_5"
type="topic">
  <div class="- map/topicmeta topicmeta" data-topic-id="installing">
```

```
      <div href="#unique_5" class="- topic/navtitle navtitle">Installing</div>
      ...
  </div>

  <div class="- map/topicref  topicref chapter " href="#unique_6" type="task">
      <div class="- map/topicmeta topicmeta" data-topic-id="installstorage">
          <div href="#unique_6" class="- topic/navtitle navtitle">Installing</div>
              ...
  </div>

              ...
 </div>

           ...
</div>
```

Note: The `<oxy:toc-title>` element is used as a placeholder for the name of the TOC. For instance, you can use the string "Contents", specified on a pseudo element, in the CSS.

Table of contents - Built-in CSS

The built-in CSS rules are in: `[PLUGIN_DIR]/css/p-toc.css`.

Related Information:

Page Headers and Footers *(page 2029)*

How to Style the Table of Contents Entries

Note: Each of the items from the table of contents is an element that has the `map/topicref` class.

The following example uses the italic font for the label and changes the color and style of the connecting line between the title and the page number.

In your customization CSS *(page 1985)*, add the following two selectors:

```
/* The toc item label - the topic title */
*[class ~= "map/topicref"] *[class ~= "topic/navtitle"] {
    font-style:italic;
    color: navy;
}

/* The dotted line between the topic name and the page number. */
*[class ~= "map/topicref"] *[class ~= "topic/navtitle"]:after {
```

```
    content: leader('-') target-counter(attr(href), page);
    color: navy;
}
```

And if you need to alter the indent of the nested table of content items, use the following selector:

```
*[class ~= "map/topicref"] *[class ~= "map/topicref"] {
    margin-left: 1em;
}
```

The numbers can be styled like this:

```
*[class ~= "map/topicref"] > *[class ~= "map/topicmeta"]:before,
*[class ~= "map/topicref"]
    > *[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before{
  color:blue;
}
```

The following is an example of customizing the font size for the items representing chapters. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute `@is-chapter`.

```
*[class ~= "map/topicref"][is-chapter = "true"]  > *[class ~= "map/topicmeta"] >
 *[class ~= "topic/navtitle"]{
  font-size:2em;
}
```

How to Change the Header of the Table of Contents

In the built-in CSS, there is a page named *table-of-contents*. The default is to have the word 'Contents' in its header (this is localized, using the `toc-header` string defined in the `p-18n.css`) alternating in the left or right side of the header:

```
@page table-of-contents:left {
    @top-left {
        content: string(toc-header) " | " counter(page, lower-roman);
        font-size: 8pt;
    }
}
@page table-of-contents:right {
     @top-right {
         content: string(toc-header) " | " counter(page, lower-roman);
         font-size: 8pt;
```

```
     }
}
```

If you need to change this string, or change the color, you should use the following `@page` selectors as a starting point in your customization CSS *(page 1985)*:

```
@page table-of-contents:left {
    @top-left {
        content: "My publication table of contents | " counter(page, lower-roman);
        color:red;
    }
}
@page table-of-contents:right {
     @top-right {
        content: "My publication table of contents | " counter(page, lower-roman);
        color:red;
     }
}
```

Localization *(page 2050)*

How to Make the Table of Contents Start on an Odd Page

In your customization CSS *(page 1985)*, add the following snippet for the *table-of-contents* page:

```
@page table-of-contents{
    -oxy-initial-page-number: auto-odd;
}
```

Related Information:

Double Side Pagination *(page 2021)*

How to Display a Topic Before the Table of Contents

To display a topic before the *table-of-contents* page, follow these steps:

1. Make sure the topic is referenced on the first level in the DITA map.
2. Set the `@outputclass` to `before-toc` on the `<topicref>`.

```
<topicref href="pathToMyTopic" outputclass="before-toc">
```

Result: When the PDF is processed, the topic will automatically appear before the table of contents.

PDF Bookmarks

The PDF Bookmarks are used to generate a hierarchical structure similar to a table of contents in a specialized view of your PDF Reader.

PDF Bookmarks - Built-in CSS

The PDF bookmarks are generated by matching the titles from the topics in the content. The built-in CSS rules are in: `[PLUGIN_DIR]/css/p-bookmarks.css`.

How to Control the Depth of the Sections From the PDF Bookmarks.

By default, the PDF bookmarks are generated for up to 7 levels. If you need to limit them (for example to 2 levels), you can use the following CSS rules in your customization CSS *(page 1985)*:

```
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] >
 *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"]
 *[class~="topic/topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"]
 *[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"]
 *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] >
 *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"]
 *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"]
 *[class~="topic/topic"] > *[class~="topic/title"] {
  bookmark-label:none;
}
```

These rules clear the labels generated by the titles starting with the depth 3 (the topic nesting level is given by the selectors `*[class~="topic/topic"]`).

How to Remove the Numbering From the PDF Bookmarks

By default, the PDF bookmark labels are generated while taking the text set before the chapters titles into account. Since this usually contains the part, chapter, or section numbers, the PDF Bookmarks will make use of them.

The solution is to remove the `content(before)` from the `bookmark-label`, leaving just the `content(text)`.

In your customization CSS *(page 1985)*, add the following CSS rules:

```
*[class~="topic/topic"] > *[class~="topic/title"] {
  bookmark-label: content(text);
  -ah-bookmark-label: content();
}
```

Related Information:

Numbering *(page 2007)*

Page Headers and Footers

The page headers and footers use the string sets defined for publication, chapter, and section titles. These string-sets are defined in the numbering css *(page 2011)*. This section contains information about how they are used in the page definitions.

Page Headers and Footers - Built-in CSS

All page definitions are found in: `[PLUGIN_DIR]css/print/p-pages-and-headers.css`.

Note: This is listed solely for illustration purposes, as the plugin might use something different.

There are pages for:

Default Page

The default page imposes a header that contains the publication title, chapter, and section title. They alternate on the left or right side of the page:

```
   @page :left {
       @top-left {
           content: string(maptitle) string(parttitle) string(chaptertitle)
string(sectiontitle) " | " counter(page);
           font-size:8pt;
       }
   }

   @page :right{
       @top-right {
```

```
            content: string(maptitle) string(parttitle) string(chaptertitle)
string(sectiontitle) " | " counter(page);
            font-size:8pt;
        }
    }
```

Note: To override the default rules defined for named pages such as chapter or table of contents, you need to use more specific page rules, ones that contain the page name:

```
  @page :left, table-of-contents:left, chapter:left {
        @top-left {
            content: "...";
        }
  }

  @page :right, table-of-contents:right, chapter:right{
        @top-right {
            content: "...";
        }
  }
```

Chapter Page

This is inherited from the default page. The chapter page is associated to the topics marked as chapters, usually the ones that are direct children of the map. It clears the header from the first page of each chapter.

```
  @page chapter{
   /* Currently inherit from the default page.*/
  }

  /* No headers on the chapter first page. */
  @page chapter:first:left{
   @top-left {
    content: none;
   }
  }
  @page chapter:first:right{
   @top-right {
    content: none;
   }
```

```
}
```

Front Matter and Back Matter page

The bookmap front matter and back matter page. It clears the headers.

```
@page matter-page {
     @top-left-corner    {          content:none }
     @top-left           {          content:none }
     @top-center         {          content:none }
     @top-right          {          content:none }
     @top-right-corner   {          content:none }
     @bottom-left-corner {          content:none }
     @bottom-left        {          content:none }
     @bottom-center      {          content:none }
     @bottom-right       {          content:none }
     @bottom-right-corner{          content:none }
}
```

Blank Pages

Clears the header for the blank pages that may be created by a `page-break-before`, `page-break-after`, or by using double side pagination *(page 2021)*:

```
@page :blank{
 @top-left {
  content: none;
 }
 @top-right {
  content: none;
 }
}
```

Index Page

The page that contains the index terms (appears only if there are such items in your topics). It uses a lower roman page number in the footer:

```
@page index {
     @top-left-corner    {          content:none }
     @top-left           {          content:none }
```

```
        @top-center         {          content:none }
        @top-right          {          content:none }
        @top-right-corner   {          content:none }
        @bottom-left-corner {          content:none }
        @bottom-left        {          content:none }
        @bottom-center      {          content: counter(page, lower-alpha) }
        @bottom-right       {          content:none }
        @bottom-right-corner{          content:none }
}
@media oxygen-chemistry {
        @page index {
            column-count: 2;
            column-fill: auto;
        }
 }
```

When transformed with Chemistry, the page layout is spread on two columns.

Large Tables Page

The big tables are placed on a rotated page, with orientation landscape:

```
@page landscape-page :right {
    size: landscape;

    @top-left {
        content: none
    }
    @top-center {
        content: none
    }
    @top-right {
        content: none
    }

    @right-bottom {
        content: string(maptitle) string(parttitle) string(chaptertitle)
string(sectiontitle) " | " counter(page);
        font-size: 8pt;
        transform: rotate(90);
        vertical-align: middle;
        text-align: right;
```

```
    }
}

@page landscape-page :left {
    size: landscape;

    @top-left {
        content: none
    }
    @top-center {
        content: none
    }
    @top-right {
        content: none
    }

    @right-top {
        content: string(maptitle) string(parttitle) string(chaptertitle)
 string(sectiontitle) " | " counter(page);
        font-size: 8pt;
        transform: rotate(90);
        vertical-align: middle;
        text-align: left;
    }
}
```

How to Add a Multi-line Copyright Notice to the Footer

Suppose you want to add a footer with the following two lines of text at the end of each page that is shown on the right side:

```
© 2017 - My Company Ltd
All rights reserved
```

For this, you need to specify a rule that matches all the right pages and adds that content in the `bottom-center`. In your customization CSS *(page 1985)*, add the following CSS rule:

```
@page :right{
    @bottom-center {
        content: "© 2017 - My Company Ltd \A All rights reserved";
        font-size: 0.5em;
```

```
        color: silver;
    }
}
```

Note: Other page rules (such as the *table-of-contents*) override the contents of the `@bottom-center` because they are more specific. If you need to also print the copyright in the TOC pages, then use this as the selector:

```
@page :right, table-of-contents:right {
  ...
}
```

Note: To use new lines (`\n` characters) in your headers or footers, use the `\A` notation, as in the example above.

How to Add a Background Image to the Header

A common use-case is to add a background image to one of the page corners.

```
@page :left {
    @bottom-left-corner{
        content: " ";
        background-image: url('https://www.oxygenxml.com/resellers/resources/
OxygenXMLEditor_icon.svg');
        background-repeat:no-repeat;
        background-position:50% 50%;
    }
}
```

Important: Always specify a `content` property. If not, the page margin box will not be generated.

Note: You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Related Information:

Images *(page 2054)*

How to Add a Background Image for the Cover *(page 2000)*

How to Style a Part of the Text from the Header

If you need to style a text (let say a company slogan) with different colors or font styles, you have two options:

1. Use an SVG image as background for a page margin box. See: How to Add a Background Image to the Header *(page 2034)*. This is the recommended approach.
2. Use two page margin boxes, and style them differently:

   ```
   @top-center {
     content: "First part";
     color: red;
     text-align:right;
   }
   @top-left {
     content: "- Second part";
     color: blue;
     text-align:left;
   }
   ```

   With this approach you are constrained to a fix number of styles, dictated by the page margin boxes.

How to Simplify the Header (Only Keep the Chapter Title)

The headers display information such as *map title*, *part title*, *chapter title*, and *section title*, ending in the page number.

```
content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) "
 | " counter(page);
```

This might be too much if you have long titles. The solution is to override the default header content.

In your customization CSS *(page 1985)*, add the following CSS rule:

```
@page :left {
    @top-left {
        content: string(chaptertitle) " | " counter(page);
    }
}
@page :right{
    @top-right {
        content: string(chaptertitle) " | " counter(page);
```

```
    }
}
```

Important: Some of the CSS default page rules are more important. If you see that the content does not change, you should try to specify also the name of the page:

```
@page :left, table-of-contents:left, chapter:left{
  ...
}
@page :right, table-of-contents:right, chapter:right{
  ...
}
```

How to Change the Header Separators (Between Sections and Chapter Titles)

There are a number of `strings` defined for part, chapter, and sections. Each of these strings start with the " | " character as a separator. For example, in the header of a page, you may find a sequence of strings:

```
My Publication | Introduction | Getting Started
```

1. "My Publication" is the value of the `maptitle` string.
2. "Introduction" is the value of the `chaptertitle` string.
3. "Getting Started" is the value of the `sectiontitle` string.

There might be cases where you want to change this separator. You will need to recompose the header content using the above string sets. Suppose you want to use " - " as a separator. In your customization CSS *(page 1985)*, add the following CSS rule:

```
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"] {
    string-set: parttitle " - " counter(part, upper-roman) " - " content(),
 chaptertitle  ""; /* Avoid propagating a past chapter title on a new part */
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"] {
    string-set: chaptertitle " - " counter(chapter) " - " content();
}
```

If you enabled the CSS for Deep Numbering *(page 2014)*, then use:

```
/*
 * Alter the string sets that are shown in the header of the page.
 */
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"] {
```

```
    string-set: parttitle " - " counter(part, upper-roman) " - " content(),
 chaptertitle  ""; /* Avoid propagating a past chapter title on a new part */
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"] {
    string-set: chaptertitle " - " counter(chapter) " - " content(), sectiontitle "";
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/topic"] >
 *[class ~= "topic/title"] {
    string-set: sectiontitle " - " counter(chapter) "." counter(section1) " -
 " content();
}
```

How to Change the Header Styling Depending on Page Side

To modify the styling of the default page headers, add the following CSS rule in your customization CSS *(page 1985)*:

```
@page :left {
    @top-left {
        color:navy;
        font-style:italic;
    }
    @top-right {
        color:red;
    }
}
```

If you intend to modify **just the headers of the table of contents**, use the `table-of-contents` page rule selector:

```
@page table-of-contents:left {
    @top-left {
        color:navy;
        font-style:italic;
    }
    @top-right {
        color:red;
    }
}
```

Index

The index section collects all the index terms from the publication and shows them in a sorted tree.

Index - Input XML fragment

In the merged DITA map, the structure that holds the index tree is the `<opentopic-index:index.groups>` element.

```
<map class="- map/map " >
    <oxy:front-page>
        ...
    </oxy:front-page>
    <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">
        ...
    </opentopic:map>
    <topic class="- topic/topic ">
        <title class="- topic/title ">Request Support</title>
       ...
    </topic>
    <opentopic-index:index.groups id="d16e5548">
      ...
    </opentopic-index:index.groups>
</map>
```

Each of the groups contain:

- A label, the starting letter ("T" in the following example).
- A tree of `<opentopic-index:index.entry>` elements.

```
<opentopic-index:index.group>

 <opentopic-index:label>T</opentopic-index:label>

  <opentopic-index:index.entry value="table of contents">
    <opentopic-index:formatted-value>table of contents</opentopic-index:formatted-
value>
    <opentopic-index:refID value="table of contents:">
        <oxy:index-link xmlns:oxy="http://www.oxygenxml.com/extensions/author"
               href="#d16e3988"> [d16e3988]
        </oxy:index-link>
    </opentopic-index:refID>
```

```
    <opentopic-index:index.entry value="change header">
        <opentopic-index:formatted-value>change header</opentopic-index:formatted-
value>
        <opentopic-index:refID value="table of contents:change header:">
           <oxy:index-link xmlns:oxy="http://www.oxygenxml.com/extensions/author"
                href="#d16e4176">
                [d16e4176] </oxy:index-link>
        </opentopic-index:refID>
    </opentopic-index:index.entry>
    <opentopic-index:index.entry value="style">
        <opentopic-index:formatted-value>style</opentopic-index:formatted-value>
        <opentopic-index:refID value="table of contents:style:">
            <oxy:index-link xmlns:oxy="http://www.oxygenxml.com/extensions/author"
                href="#d16e4120">
                [d16e4120] </oxy:index-link>
        </opentopic-index:refID>
  </opentopic-index:index.entry>
 </opentopic-index:index.entry>
</opentopic-index:index.group>
```

Each of the entries contain:

- The formatted value (`<opentopic-index:formatted-value>`).
- A link to the publication content (`<opentopic-index:refID>` / `<oxy:index-link>`).
- Possibly other child entries.

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<div class="- map/map map" >
   <div class="front-page/front-page">
       ...
   </div>
   <div class="toc/toc toc">
       ...
   </div>
   <div class="- topic/topic topic">
       <div class="- topic/title title">Request Support</title>
      ...
   </div>
```

```
    <div class=" index/groups groups">
      ...
    </div>
</map>
```

The index group content becomes:

```
<div class=" index/group group">
  <div class=" index/label label">T</div>

  <div class=" index/entry entry">
    <div class=" index/formatted-value formatted-value">table of contents</div>
    <div class=" index/refid refid">
        <div class=" index/link link"
               href="#d16e3988"> [d16e3988]
        </div>
    </div>
    <div class=" index/entry entry">
        <div class=" index/formatted-value formatted-value">change header</div>
         <div class=" index/refid refid">
            <div class=" index/link link"
               href="#d16e4176"> [d16e4176] </div>
        </div>
    </div>
    <div class=" index/entry entry">
        <div class=" index/formatted-value formatted-value">style</div>
        <div class=" index/refid refid">
            <div class=" index/link link"
               href="#d16e4120"> [d16e4120] </div>
        </div>
    </div>
  </div>
</div>
```

Index - Built-in CSS

All index styling is found in: `[PLUGIN_DIR]css/print/p-index.css`.

How to Style the Index Page Title and the Grouping Letters

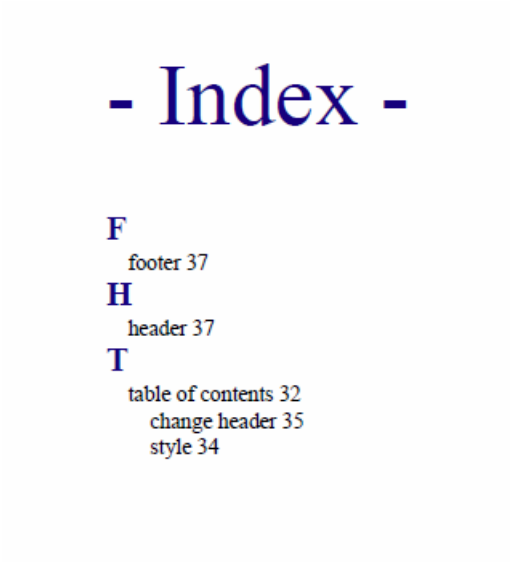
In your customization CSS *(page 1985)*, add the following CSS rules:

```
*[class ~= "index/groups"] *[class ~= "index/group"] *[class ~= "index/label"] {
```

```
    font-size:1.5em;
    color:navy;
}

*[class ~= "index/groups"]:before {
    content: "- Index - ";
    color:navy;
    font-size: 4em;
}
```

The result is:

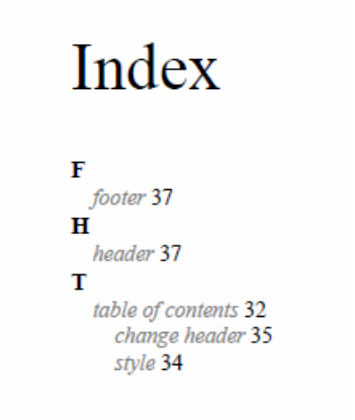


How to Style the Index Terms Labels

In your customization CSS *(page 1985)*, add the following CSS rule:

```
*[class ~= 'index/groups'] *[class ~= 'index/formatted-value'] {
    font-style:oblique;
    color:gray;
}
```

The result is:



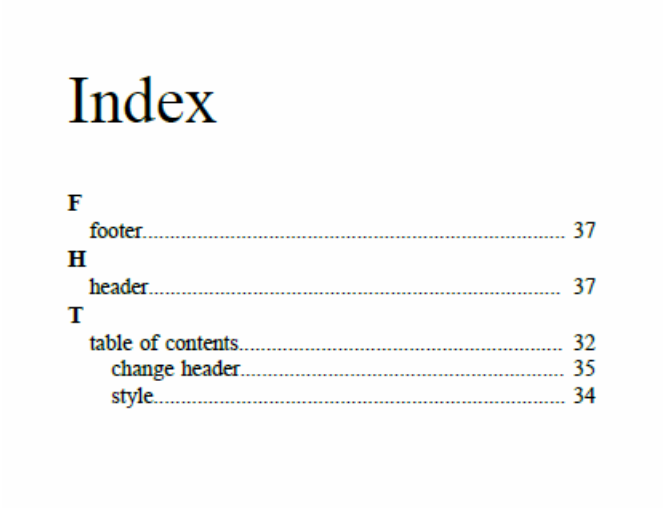
How to Add Filling Dots Between the Index Labels and the Page Numbers

Suppose you want the leader CSS content to generate a row of dots. It is necessary that the parent entry have the text justified.

In your customization CSS *(page 1985)*, add the following CSS rule:

```
index\.entry {
    text-align:justify;
}
index\.entry  formatted-value:after {
    content:leader('.');
}
```

The output now contains the dots:



How to Change the Index Page Number Format

The page number is reset at the beginning of the index page by the built-in CSS rule:

```
*[class ~= "index.groups"] {
        counter-reset: page 1;
}
```

If you want to start the page counter from a different initial number, just change the value of this counter.

If you need to style the page number differently (for example, using decimals), add the following CSS rule in your customization CSS *(page 1985)*:

```
@page index {
        @bottom-center      {          content: counter(page, decimal) }
}
```

Footnotes

Footnotes are pieces of information placed at the bottom of the page. A footnote has a number that is left in the content (the footnote call) and the same value placed before the footnote text (the footnote marker).

Footnotes - Built-in CSS

Footnote properties are defined in `[PLUGIN_DIR]css/print/p-foot-notes.css`.

How to Change Style of the Footnote Markers and Footnote Calls

To bold the footnotes numbers and use some colors, add the following rules to your customization CSS *(page 1985)*:

```
*[class ~= "topic/fn"]:footnote-call {
 font-weight: bold;
       color:red;
}

*[class ~= "topic/fn"]:footnote-marker {
 font-weight: bold;
       color:red;
}
```

Related Information:

https://www.oxygenxml.com/doc/ug-chemistry/topics/ch_footnotes.html

How to Reset the Footnotes Counter

There are cases where you want to reset the footnote counter.

For example, if you need to reset it at the beginning of each chapter, add the following rules to your customization CSS *(page 1985)*:

```
*[class ~= "bookmap/chapter"],
*[class ~= "topic/topic"][is-chapter] {
 counter-reset: footnote 1;
}
```

Or you can mark any element with an `@outputclass` value, match that value, and reset the counter at any point in your counter:

```
<p outputclass="reset-footnotes"/>
```

```
*[outputclass ~= "reset-footnotes"] {
 counter-reset: footnote 1;
}
```

Page Breaks

The page breaks can be controlled in multiple ways:

1. By creating an `@page` and assigning it to an element will create a page break between this element and the sibling elements that have a different page.
2. Using the CSS properties: `page-break-before`, `page-break-after`, or `page-break-avoid`.
3. In your DITA topic, set the `@outputclass` attribute on the topic root (or any element) to contain one of the `page-break-before`, `page-break-after`, or `page-break-avoid` values. If you want to control the page breaking from the DITA map, use the `@outputclass` attribute on the `<topicref>`, with any of the values mentioned above.

Related Information:

Double Side Pagination *(page 2021)*

Oxygen PDF Chemistry: Controlling Page Breaks

Page Breaks - Built-in CSS

Page break properties are used in: `[PLUGIN_DIR]css/print/p-page-breaks.css`.

How to Avoid Page Breaks in Lists and Tables

To avoid splitting elements over two pages, you can use the `page-break-inside` CSS property. For example, if you want to impose this on tables and lists, then add the following rules to your customization CSS *(page 1985)*:

```
*[class ~= "topic/table"] {
    page-break-inside:avoid;
}
*[class ~= "topic/ol"] {
    page-break-inside:avoid;
}
*[class ~= "topic/ul"] {
    page-break-inside:avoid;
}
```

Note: Since the task steps are inherited from `topic/ol`, they will also not be split over two separate pages. However, if you want to allow this, add the following CSS rule:

```
*[class ~= "task/steps"] {
    page-break-inside:auto;
}
```

Note: Another way to do this is to mark the element with an `@outputclass` set to `page-break-avoid`.

How to Force a Page Break Before or After a Topic or Another Element

If you want to force a page break, mark the topic (or any other element you need to control page breaking for) with an `@outputclass` set to one of these values:

page-break-before

Use this for a page break before the marked element.

page-break-after

Use this for a page break after the marked element.

page-break-avoid

Use this to avoid page breaks inside the marked element.

To force a page break before a certain topic, you should write:

```
<topic outputclass="page-break-before" ... >
```

Note: You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. In this way you can reuse the topic in another context where the page breaking is not necessary.

You can also control page breaking for lists, paragraphs, or any other block type elements. The following example avoids page breaks inside an ordered list:

```
<ol outputclass="page-break-avoid" ... >
```

How to Add a Blank Page After a Topic

If you want to add a new blank page after a topic, add the following rules to your customization CSS *(page 1985)*.

Style the separating blank page:

```
@page topic-separating-page{
   @top-left {
     content: "";
   }
   @top-right {
     content: "";
   }
   @top-center {
      content: "This page is blank";
   }
}
```

Associate this page to the `:after` pseudo element of the topic:

```
*[class~="topic/topic"][outputclass~="add-separator-page"]:after {
 content: " ";
 display: block;
 page: topic-separating-page;
}
```

In the XML content, on the `<topic>` element, set the `@outputclass` to the `add-separator-page` value.

```
<topic outputclass="add-separator-page"> ... </topic>
```

The `:after` pseudo element will be created next to the topic content and will be placed on the `topic-separating-page`.

Use the page margin box selectors to override the default content from the headers/footers.

Note: You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. This allows you to reuse the topic in another context where the page breaking is not necessary.

How to Enforce a Number of Lines from Paragraphs that Continue in Next Page

In typography, an *orphan* is the first line of a paragraph that appears alone at the bottom of a page (the paragraph continues on a following page), while a *widow* is the last line of a paragraph that appears alone at the top of a page. The default is 2 for each of them. You can control this number by adding the following to your customization CSS *(page 1985)*:

```
:root {
    widows:4;
    orphans:4;
}
```

Hyphenation

Hyphenation specifies how words should be hyphenated when text wraps across multiple lines.

How to Enable Hyphenation for Entire Map

To enable hyphenation for your entire map:

1. Make sure you set an `@xml:lang` attribute on the root of your map.
2. In your customization CSS *(page 1985)*, add:

   ```
   :root {
       hyphens: auto;
   }
   ```

3. To except certain elements from being hyphenated, use `hyphens:none`. The following example excludes the `<keyword>` elements from being hyphenated:

   ```
   *[class ~= "topic/keyword"] {
       hyphens: none;
   }
   ```

How to Enable/Disable Hyphenation for Tables

To enable hyphenation for your entire map:

1. Make sure you set an `@xml:lang` attribute on the root of your map or your table elements.
2. In your customization CSS *(page 1985)*, add:

```
*[class ~= "topic/table"] {
    hyphens: auto;
}
```

3. To except certain elements from being hyphenated, use `hyphens:none`. The following example excludes the `<keyword>` elements from being hyphenated:

```
*[class ~= "topic/keyword"] {
    hyphens: none;
}
```

Accessibility

By default, the PDF documents produced using this plugin are partially accessible in the sense that most of the paragraphs, tables, lists, headers, and footers are tagged automatically so a PDF reader can use this information to present the content.

Related Information:

Oxygen PDF Chemistry: Accessibility

Accessibility - Built-in CSS

Accessibility properties are defined in `[PLUGIN_DIR]css/print/p-accessibility.css`.

How to Create Fully Accessible Documents

To make your documents fully accessible (**PDF/UA1**), do the following:

1. In your customization CSS *(page 1985)*, specify fonts for all elements and for all page margin boxes. There should be no text that falls back to the basic provided fonts (Times, Courier, etc.). For instance, you can use:

```
:root { font-family: Arial }
@page {
    @top-left {font-family: Arial }
```

```
    ...
}
```

2. Specify an `@alt` attribute with a description on any image, or better, use the `<alt>` DITA element.
3. Change the Chemistry invocation from the `build.xml` file, adding the argument `-pdf-ua`. There are two targets to change: `chemistry` and `chemistry.embedded`.

Fonts

Fonts are an important part of the publication. Your font selection should take into consideration both design and the targeted ranges of characters.

To use them in the customization CSS *(page 1985)*:

- You can place the font files in the same folder as your CSS and use a @font-face definition to reference them.
- You can use web fonts (for example, Google Fonts), and import the CSS snippet into your CSS.
- You can use system fonts.

All these techniques are explained in: **Oxygen PDF Chemistry User Manual: Fonts**.

How to Set Fonts to Headers, Titles and Content

Suppose that customization CSS *(page 1985)*, you have defined your font (for example, *Roboto*) using a Google web font:

```
@import url('https://fonts.googleapis.com/css?family=Roboto');
```

To use it in all the header parts:

```
@page {
  @top-left-corner { font-family: "Roboto"; }
  @top-left { font-family: "Roboto"; }
  @top-center { font-family: "Roboto"; }
  @top-right { font-family: "Roboto"; }
  @top-right-corner { font-family: "Roboto"; }
}
```

For the titles, match all the `topic/title` elements:

```
*[class ~= "topic/title"] {
  font-family: "Roboto";
}
```

For the content, you can match the root element of the document and set another font on it (for example, *sans-serif*). All elements will inherit this font.

```
:root {
  font-family: sans-serif;
}
```

As the title selector from the above example is more specific, it will take precedence over the selector that was used for content, thus the titles will preserve the *Roboto* font.

How to Use Fonts for Asian Languages

For Asian languages, you must use a font or a sequence of fonts that cover the needed character ranges. If the characters are not found, the # symbol is used.

When you specify a sequence of fonts, if the glyphs are not found in the first font, the next font is selected until one that includes all the glyphs is found. A common font sequence for Asian languages is used in the following example.

In your customization CSS *(page 1985)* add:

```
:root {
  font-family: Calibri, SimSun, "Malgun Gothic";
}
```

Localization

The default CSS contain rules and localized strings for English, French and German.

Localization - Built-in CSS

The built-in localization strings for editing and printing media are defined in:

- `[PLUGIN_DIR]css/core/-i18n.css`
- `[PLUGIN_DIR]css/core/-i18n-en.css`
- `[PLUGIN_DIR]css/core/-i18n-de.css`
- `[PLUGIN_DIR]css/core/-i18n-fr.css`

There are several strings that are used only in the printed media, such as the table of contents title or the index page title. They can be found in the following CSS files:

- `[PLUGIN_DIR]css/print/p-i18n.css`
- `[PLUGIN_DIR]css/print/p-i18n-en.css`
- `[PLUGIN_DIR]css/print/p-i18n-de.css`

- `[PLUGIN_DIR]css/print/p-i18n-fr.css`

Note: The actual number of localization files may vary.

How to Enable German Localization

Suppose you need to produce your publication for a German audience. In this case, you would want the text from the headers and footers to be translated to German.

To achieve that, set the `@xml:lang` attribute on the root of your DITA map to `de_de`.

Warning: The `default.language` transformation parameter is not taken into account.

How to Create a Localization CSS for Another Language

Suppose you want to localize your publishing for the Dutch language (language code `nl`). To do this, use the following procedure:

1. Copy and paste the contents of the following files in your customization CSS *(page 1985)*:
   - `[PLUGIN_DIR]/css/core/-i18n-de.css`
   - `[PLUGIN_DIR]/css/print/p-i18n-de.css`
2. Search for and replace `:lang(de)` with `:lang(nl)`.
3. In an editor, open the English localization files, side by side with your customization CSS:
   - `[PLUGIN_DIR]/css/core/-i18n-en.css`
   - `[PLUGIN_DIR]css/print/p-i18n-en.css`
4. Translate each of the strings from your customization, using the English localization as reference.

This is a very simple example of localizing just the table of contents, index page title, and the figure and table captions:

```
/* Title in the TOC page */
toc-title[empty]:lang(nl):before {
    content: "Inhoud";
}

/* This string is used in the TOC page header. */
:root:lang(nl) {
    string-set: toc-header "Inhoud";
}

/* Title in the Index page */
*[class ~= "index/groups"]:lang(nl):before {
```

```
    content: "Index";
}

@media print {
    *[class ~= "topic/table"] > *[class ~= "topic/title"]:lang(de):before {
        content: "Tafel " counter(tablecount) ": ";
    }
}
@media print {
    *[class ~= "topic/fig"] > *[class ~= "topic/title"]:lang(de):before {
        content: "Figuur " counter(figcount) ": ";
    }
}
...
```

Styling the Content

If you need to change the styles of the elements from the topic contents, you should create a customization CSS *(page 1985)* and then add CSS rules. To create the CSS rules, you can use the development tools described in Debugging the CSS *(page 1986)*.

Reusing the Styling for WebHelp and PDF Output

If you are using the `pdf-css-html5` transformation type, then the generated HTML5 document that is later converted to PDF is very similar to the generated HTML5 pages from the WebHelp Responsive.

This is an output example from the WebHelp transformation:

```
<h1 class="title topictitle1" id="ariaid-title2">Care and Preparation</h1>
<div class="body">
    <p class="shortdesc">When caring ...</p>
    <p class="p">When caring for your flower garden you want ... </p>
```

And the same example from the PDF transformation (note the additional emphasized class values):

```
<h1 class="- topic/title title topictitle1" id="ariaid-title2">Care andPreparation</
h1>
<div class="- topic/body body">
   <p class="- topic/shortdesc shortdesc">When caring ... </p>
   <p class="- topic/p p">When caring for your flower garden you want ...  </p>
```

It makes sense to reuse the same CSS rules you developed for one transformation type to the other. The main rule is to use the short class names instead of the long ones. For example, to style the short descriptions with italic font, use:

```
.shortdesc {
  font-style: italic;
}
```

The rule of thumb is that if you have a CSS rule that successfully styles an element in WebHelp, it should apply without any modification in the PDF output.

Lists

You can style the list item markers, or other properties.

How to Style the List Markers (Numbers or Bullets)

For the media print, the default CSS rules for the list items use the `:marker` pseudo-class.

```
@media print {
    *[class~="topic/li"]::marker {
      text-align: center;
      font-weight:bold;
    }
    *[class~="topic/li"] {
      margin-left: 0.25in;
    }
}
```

To eliminate the bold font weight for the items form ordered lists then add the following rules to your customization CSS *(page 1985)*:

```
*[class~="topic/ol"] > *[class~="topic/li"]::marker {
      font-weight:normal;
}
```

For the unordered lists:

```
*[class~="topic/ul"] > *[class~="topic/li"]::marker {
      font-weight:normal;
}
```

Links

Links allow the users to navigate through the documentation.

How to Remove 'on page NNN' Link Label

For paper printed materials, it is desirable that the links display a label (similar to "on page 54") after their text content. This gives the user the possibility to identify the target page. However, if the produced PDF is not printed on paper and is intended only for electronic use, this label may create clutter and makes the document harder to read. To eliminate this label, add the following in your customization CSS *(page 1985)*:

```
*[class ~= "topic/xref"][href]:after,
*[class ~= "topic/link"][href]:after {
    content: none;
}
```

How to Change Link Styles

Suppose you want the links to be bold and with an underline. In your customization CSS *(page 1985)*, add this snippet:

```
*[class ~= "topic/xref"][href]:after,
*[class ~= "topic/link"][href]:after {
    font-weight: bold;
    text-decoration: underline;
}
```

Images

Images are an important part of a publication.

Note: You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Images - Built-in CSS

Image properties are defined in `[PLUGIN_DIR]css/print/p-images.css`.

```
*[class ~= "topic/image"] {
      prince-image-resolution: 120dpi;
      -ah-image-resolution: 120dpi;
```

```
        image-resolution: 120dpi;
        /* The US-letter page size minus page margins. See p-page-size.css for the
current page size. */
        max-width: 6.5in;
    }
```

How to Fix Image Bleeding - Control Image Size

Sometimes the images may be too big for the page. The built-in CSS rules specify a maximum size for images, limiting to the width of the parent block. But if the parent block is itself too wide and bleeds out of page, you might consider specifying a length.

In your customization CSS *(page 1985)*, add the following snippet:

```
 *[class ~= "topic/image"] {
    ...
        /* The US-letter page size minus page margins. See p-page-size.css for the
current page size. */
        max-width: 6.5in;
    }
```

How to Change Image Resolution

This is a good technique to change the size of all **raster** images from your documentation. This will not work for vector images, such as PDF or SVG. If the images (PNG, for example) contain the image resolution in their metadata, this will be taken into account. For all other images, the default resolution is 120dpi.

If the default resolution is not good (suppose you need a higher pixel density of 300dpi), you can change it by adding the following in your customization CSS *(page 1985)*:

```
*[class ~= "topic/image"] {
        prince-image-resolution: 300dpi;
        -ah-image-resolution: 300dpi;
        image-resolution: 300dpi;
}
```

How to Place Big Images on Rotated Pages

Very wide images may bleed out of the page. One solution for this is to use landscape pages for these wide images.

In your customization CSS *(page 1985)*, add:

```
*[class~="topic/image"][outputclass='land'] {
    page: landscape-page;
}
```

Setting the attribute `@outputclass` = 'land' on the table element will force the table on a new landscape page.

Another solution is to set an `@outputclass` attribute on the image, then create a rule that matches it, and associate a landscape page for it.

How to Place a Text and Image Side by Side

If you need to align text and an image side by side, you can use the following technique:

1. Organize your text and image under a `<div>` element like this:

```
...
 <div outputclass="side-by-side">
      <p> This will be in the left side, the next figure in the right. </p>
      <fig>
        <image href="cactus.jpeg"/>
      </fig>
 </div>
...
```

   Note: You can use the `@outputclass` attribute to mark the `<div>` elements that have this special layout.

2. In your customization CSS *(page 1985)*, add:

```
*[outputclass ~= "side-by-side"] > *[class ~= "topic/p"] {
  display:inline-block;
  width: 45%;
}

*[outputclass ~= "side-by-side"] > *[class ~= "topic/fig"] {
  display:inline-block;
  width: 45%;
}
```

   The image should fill the entire width of the parent `<fig>` element:

```
*[outputclass ~= "side-by-side"] > *[class ~= "topic/fig"]  > *[class ~= "topic/
image"] {
```

```
  width:100%;
}
```

By default, the bottom of the image is on the same line as the text baseline. If you want the text and the image to be aligned at the top, add these lines:

```
*[outputclass ~= "side-by-side"] > *[class ~= "topic/p"] {
  vertical-align:top;
}

*[outputclass ~= "side-by-side"] > *[class ~= "topic/fig"] {
  vertical-align:top;
  font-size:0pt;
}
```

Note: The `font-size:0pt` is needed to remove the font ascent and descent around the image rectangle.

Tables

Tables are widely used in technical documentation. This section contains information about the CSS rules that are used to style them and how to fix some problems.

Tables - Built-in CSS

There is a combination of CSS files that address tables: `[PLUGIN_DIR]/css/core/-table-html-cals.css`, `[PLUGIN_DIR]/css/core/-table-cals.css`.

How to Deal With Wide Tables - Page Rotation

Some of the tables can have a large number of columns. In this case, the table may bleed out of the page. One solution is to use landscape pages for these tables.

Setting the attribute `@orient` = 'land' on the table element will force the table on a new landscape page.

Another solution is to use automatic detection of wide tables (5 or more columns):

```
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='5'],
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='6'],
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='7'],
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='8'] {
    page: landscape-page;
```

```
    max-width: 100%;
    page-break-before: avoid;
}
```

Note: The `landscape-page` page layout is defined in the `[PLUGIN_DIR]css/print/p-pages-and-headers.css`.

If you want to rotate the entire topic that contains the big table, use:

```
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='5'],
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='6'],
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='7'],
*[class~="topic/table"] > *[class~="topic/tgroup"][cols='8'] {
    max-width: 100%;
    table-layout:auto;
}

*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *[class~="topic/table"] >
 *[class~="topic/tgroup"][cols='5']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *[class~="topic/table"] >
 *[class~="topic/tgroup"][cols='6']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *[class~="topic/table"] >
 *[class~="topic/tgroup"][cols='7']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *[class~="topic/table"] >
 *[class~="topic/tgroup"][cols='8']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/
topic"]) > *[class~="topic/table"] > *[class~="topic/tgroup"][cols='5']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/
topic"]) > *[class~="topic/table"] > *[class~="topic/tgroup"][cols='6']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/
topic"]) > *[class~="topic/table"] > *[class~="topic/tgroup"][cols='7']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/
topic"]) > *[class~="topic/table"] > *[class~="topic/tgroup"][cols='8']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/
topic"]) > *:not([class~="topic/topic"]) > *[class~="topic/table"] > *[class~="topic/
tgroup"][cols='5']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/
topic"]) > *:not([class~="topic/topic"]) > *[class~="topic/table"] > *[class~="topic/
tgroup"][cols='6']),
```

```
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/
topic"]) > *:not([class~="topic/topic"]) > *[class~="topic/table"] > *[class~="topic/
tgroup"][cols='7']),
*[class~="topic/topic"]:has(*:not([class~="topic/topic"]) > *:not([class~="topic/
topic"]) > *:not([class~="topic/topic"]) > *[class~="topic/table"] > *[class~="topic/
tgroup"][cols='8']){
      page: landscape-page;
}
```

How to Fix Text Bleeding From Table Cells

Slim tables or tables that have many columns make the text from the cells to be confined to a small horizontal space. Long words would bleed outside the cell boundaries. To fix this, you should enable hyphenation in your tables, thus making the words spread on multiple lines. In your customization CSS *(page 1985)*, add:

```
*[class~="topic/table"] {
    hyphens: auto;
}
```

Related Information:

Hyphenation *(page 2047)*

How to Enable the Automatic Table Layout

The DITA specification indicates that tables should have a fixed layout. However, you can get a more optimal arrangement of the cells using the automatic layout. In your customization CSS *(page 1985)*, add:

```
*[class~="topic/tgroup"] {
    table-layout:auto !important;
}
```

If you want to control which table you want this layout, you can set the `@outputclass` attribute on the `<table>` element:

```
<table outputclass='auto_tbl'> ... </table>
```

Then, in the CSS, use a rule that matches the `@outputclass`:

```
*[class~="topic/table"][outputclass='auto_tbl'] > *[class~="topic/tgroup"] {
    table-layout:auto !important;
```

```
}
```

⚠ **Important:** Make sure the tables have no column width specified.

Code Blocks

Code blocks are used to render section of programming code.

How to Enable Code Syntax Highlighting

This topic refers only to the `pdf-css-html5` transformation type.

You can use syntax highlighting to make your code snippets more readable. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to one of these values:

- language-bourne
- language-c
- language-cpp
- language-csharp
- language-ini
- language-java
- language-javascript
- language-json
- language-lua
- language-perl
- language-php
- language-python
- language-ruby
- language-sql
- language-xml
- language-css

For example, for a java snippet:

```
<codeblock outputclass="language-java">
   for (int i=0; i &lt;100; i++) {
     // do something
   }
</codeblock>
```

The resulting HTML fragment in the merged HTML5 document is:

```
 <pre class="+ topic/pre pr-d/codeblock pre codeblock language-java"
```

```
    xml:space="preserve">
   <strong class="hl-keyword" style="color:#7f0055">for</strong>
       (<strong class="hl-keyword" style="color:#7f0055">int</strong>
         i=<span class="hl-number">0</span>; i
            &lt;<span class="hl-number">100</span>; i++) {
     <em class="hl-comment" style="color:#006400">// do something</em>
   }
</pre>
```

And in the output, it will be rendered as:

```
for (int i=0; i <100; i++) {
  // do something
}
```

Changing the Colors for the Syntax Highlighting

As you can see in the above example, the HTML elements `<span>` and `<strong>` are used to color the content. Since they have a `@style` attribute set, the overriding properties need to be marked with `!important`.

Suppose you want to color the keywords in red and the comments in blue. To do so, add the following to your customization CSS *(page 1985)*:

```
.hl-keyword {
  color: red !important;
}
.hl-comment {
  color: blue !important;
}
```

How to Disable Line Wrapping in Code Blocks

By default, code blocks have the content wrapped to avoid the bleeding of long lines out of the page. To avoid wrapping, add the following in your customization CSS *(page 1985)*:

```
*[class~="pr-d/codeblock"] {
   white-space: pre;
}
```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the best solution to distinguish between lines is to leave them wrapped, but color each line with a different background (zebra coloring). An example is provided here: XSLT Extensions for PDF Transformations *(page 1979)*.

Notes

Notes contain an additional piece of information that calls attention to particular content. They may have various types (tip, caution, danger, restriction, etc.)

How to Change Note Icons

The recommended icon format is SVG.

For the `pdf-css` transformation type, to change the default icons for notes that do not have a `type` attribute, add the following rule to your customization CSS *(page 1985)* :

```
*[class ~= "topic/note"]:before {
    content: url('../../img/note.svg) " Note: ";
}
```

For a note of type '`attention`' add:

```
*[class ~= "topic/note"][type = "attention"]:before {
    content: url('../../img/important.svg) " Attention: ";
}
```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, to change the default icons for notes that do not have a `type` attribute, add the following rule to your customization CSS *(page 1985)* :

```
div.note > span.note__title{
    background-image:url("../img/note.svg") !important;
}
```

For a note of type '`warning`', '`caution`', or '`trouble`' add the corresponding CSS rule:

```
div.warning > span.note__title{
    background-image:url("../img/warning.svg") !important;
}
div.caution > span.note__title{
    background-image:url("../img/caution.svg") !important;
}
div.trouble > span.note__title{

```

Troubleshooting

This section contains information about fixing various publishing problems.

Error Parsing CSS File - Caused by a Networking Problem

Problem

My custom styles are not applied and in the transformation results console, I get an error containing one of the following: `I/O exception`, `Unknown host`, `Error parsing`.

Cause

One of the CSS files contains references to resources from another website that is currently inaccessible. These resources may include:

- Fonts
- Images
- Other CSS files

Note: If you exported one of the built-in publishing templates from the transformation scenario dialog, it is possible that the associated CSS files use an imported Google Font.

Remedy

1. Check your proxy settings (ask the system administrator for help).
2. If the server is still inaccessible from the transformation process, download the remote resources using a web browser, save them in the customization CSS file folder, and refer them directly from your CSS.

   Note: If the problem is caused by a remote font, see Using Local Fonts.

DITA Map to PDF - base on XSL-FO Customization

Oxygen XML Editor comes bundled with the DITA Open Toolkit that provides a mechanism for converting *DITA maps (page 3228)* to PDF output. Oxygen XML Editor includes a built-in **DITA Map PDF - based on XSL-FO** *(page 1634)* transformation scenario that convert DITA maps to PDF using an *xsl:fo* processor.

There are several methods that can be used to customize DITA to PDF output:

- Create a customization directory that contains your customized files and reference that directory in the PDF transformation scenario (using the `customization.dir` parameter).

- Creating a DITA Open Toolkit plugin that adds extensions to the PDF output. More details can be found in the DITA Open Toolkit Documentation.

  Tip: Some sample plugins are available on GitHub that could help you to get started with creating a plugin:

  # Sample Plugin: DITA-OT PDF Customization Plugin for Oxygen User Manual
  # Sample Plugin: DITA-OT PDF2 - Generate Numbers Before Topic's Title

Using a Customization Directory

One way to customize the PDF output generated by the **DITA Map to PDF - based on XSL-FO** *(page 1634)* transformation scenario is to create a dedicated folder to store customized files. With this approach, you will copy the contents of the built-in customization directory to a new directory where you can customize the files according to your needs and reference the new directory using the `customization.dir` parameter in the transformation scenario. The biggest advantage of this method is that the contents of your customization directory will remain unaffected when the DITA-OT is upgraded.

How to Create a Customization Directory

Follow this procedure to create a customization directory:

1. Copy all the entire *`DITA-OT-DIR`*`\plugins\org.dita.pdf2\Customization` directory to another location where you have write access.
2. Modify any of the files in whatever way necessary to achieve your specific goal. For inspiration, see Embedding a Company Logo *(page 2065)* for a specific example of how you can modify contents of the directory to embed a logo in the output.

   Tip: For other specific examples, see DITA-OT 2.5 Documentation - PDF Customization Plugin.

3. Edit the **DITA Map to PDF - based on XSL-FO** *(page 1634)* transformation scenario, go to the **Parameters** tab, and set the **customization.dir** parameter to point to the location of your customization directory.

DITA-OT 2.5 Documentation - PDF Customization Plugin

Embedding a Company Logo

The following procedure explains how to embed a company logo image in the front matter of the book.

1. Create a customization directory *(page 2064)* (if you haven't already done so).
2. Create a `cfg\common\artwork` directory structure in your customization directory and copy your logo to that directory (for example, `C:\Customization\cfg\common\artwork\logo.png`).

   Important: Make sure that your logo image is named: **logo.png**.

3. Rename `Customization\catalog.xml.orig` to: `Customization\catalog.xml`.
4. Open the `catalog.xml` in Oxygen XML Editor and *uncomment* this line:

   ```
   <!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/-->
   ```

   It now looks like this:

   ```
   <uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
   ```

5. Rename the file `Customization\fo\xsl\custom.xsl.orig` to: `C:\Customization\fo\xsl\custom.xsl`
6. Open the `custom.xsl` file in Oxygen XML Editor and create the template called **createFrontCoverContents** for DITA-OT 2.5.4.

   Tip: You can copy the same template from *`DITA-OT-DIR`*`\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl` and modify it in whatever way necessary to achieve your specific goal. This new template in the `custom.xsl` file will override the same template from *`DITA-OT-DIR`*`\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl`.

   Example:

   For example, the `custom.xsl` could look like this:

   ```
   <?xml version='1.0'?>
   <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
       xmlns:fo="http://www.w3.org/1999/XSL/Format"
       version="2.0">

   <xsl:template name="createFrontCoverContents">
    <!-- set the title -->
    <fo:block xsl:use-attribute-sets="__frontmatter__title">
     <xsl:choose>
   ```

```
  <xsl:when test="$map/*[contains(@class,' topic/title ')][1]">
   <xsl:apply-templates select="$map/*[contains(@class,' topic/title ')][1]"/>
     </xsl:when>
     <xsl:when test="$map//*[contains(@class,' bookmap/mainbooktitle ')][1]">
       <xsl:apply-templates select="$map//*[contains
                                    (@class,' bookmap/mainbooktitle ')][1]"/>
     </xsl:when>
     <xsl:when test="//*[contains(@class, ' map/map ')]/@title">
       <xsl:value-of select="//*[contains(@class, ' map/map ')]/@title"/>
     </xsl:when>
     <xsl:otherwise>
       <xsl:value-of select="/descendant::*[contains
          (@class, ' topic/topic ')][1]/*[contains(@class, ' topic/title ')]"/>
  </xsl:otherwise>
 </xsl:choose>
</fo:block>

<!-- set the subtitle -->
<xsl:apply-templates select="$map//*[contains
                                     (@class,' bookmap/booktitlealt ')]"/>
<fo:block xsl:use-attribute-sets="__frontmatter__owner">
 <xsl:apply-templates select="$map//*[contains(@class,' bookmap/bookmeta ')]"/>
</fo:block>

<!-- Load the image logo -->
 <fo:block text-align="center" width="100%">
  <fo:external-graphic
     src="url({concat($artworkPrefix,
                      'Configuration/OpenTopic/cfg/common/artwork/logo.png')})"
    />
 </fo:block>
</xsl:template>

</xsl:stylesheet>
```

7. Edit the **DITA Map to PDF - based on XSL-FO** *(page 1634)* transformation scenario, go to the **Parameters** tab, and set the **customization.dir** parameter to point to the location of your customization directory.

Tip: For other specific examples, see DITA-OT 3.x Documentation - PDF Customization Plugin.

Related Information:

Using a Customization Directory *(page 2064)*

Customizing the Header and Footer in PDF Output

The XSLT stylesheet *DITA-OT-DIR*`/plugins/org.dita.pdf2/xsl/fo/static-content.xsl` contains templates that output the static header and footers for various parts of the PDF such as the prolog, table of contents, front matter, or body.

The templates for generating a footer for pages in the body are called `insertBodyOddFooter` or `insertBodyEvenFooter`.

These templates get the static content from resource files that depend on the language used for generating the PDF. The default resource file is *DITA-OT-DIR*`/plugins/org.dita.pdf2/cfg/common/vars/en.xml`. These resource files contain variables (such as *Body odd footer*) that can be set to specific user values.

Instead of modifying these resource files directly, they can be overwritten with modified versions of the resources in a PDF customization directory.

1. Create a customization directory *(page 2064)* (if you haven't already done so).
2. Locate the stylesheets and templates listed above in your customization directory and modify them in whatever way necessary to achieve your specific goal.

   Tip: For more information and examples, see the Oxygen PDF Customization Plugin project on GitHub.

3. Edit the **DITA Map to PDF - based on XSL-FO** *(page 1634)* transformation scenario, go to the **Parameters** tab, and set the **customization.dir** parameter to point to the location of your customization directory.

Related Information:

https://github.com/oxygenxml/com.oxygenxml.pdf2.ug/wiki

Using a Customization Directory *(page 2064)*

Adding a Watermark to PDF Output

To add a watermark to the PDF output of a **DITA Map PDF - based on XSL-FO** *(page 1634)* transformation scenario, follow this procedure:

1. Create a customization directory *(page 2064)* (if you haven't already done so).
2. Create a `cfg\common\artwork` directory structure in your customization directory and copy your watermark image to that directory (for example, `C:\Customization\cfg\common\artwork\watermark.png`).
3. Rename the `Customization\catalog.xml.orig` file to: `Customization\catalog.xml`.
4. Open the `catalog.xml` in Oxygen XML Editor and *uncomment* this line:

   ```
   <!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/-->
   ```

   The uncommented line should look like this:

   ```
   <uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
   ```

5. Rename the file: `Customization\fo\xsl\custom.xsl.orig` to: `Customization\fo\xsl\custom.xsl`.
6. Open the `Customization\fo\xsl\custom.xsl` file in Oxygen XML Editor to overwrite two XSLT templates:
   - The first template is located in the XSLT stylesheet *`DITA-OT-DIR`*`\plugins\org.dita.pdf2\xsl\fo\static-content.xsl`. Override by copying the original template content in the `custom.xsl` and specifying a watermark image for every page in the PDF content, using a *block-container* element that references the watermark image file:

     ```
     <fo:static-content flow-name="odd-body-header">
            <fo:block-container absolute-position="absolute"
               top="-2cm" left="-3cm" width="21cm" height="29.7cm"
               background-image="{concat($artworkPrefix,
     'Configuration/OpenTopic/cfg/common/artwork/watermark.png')}">
              <fo:block/>
            </fo:block-container>
           <fo:block xsl:use-attribute-sets="__body__odd__header">
               <xsl:call-template name="insertVariable">
                   <xsl:with-param name="theVariableID" select="'Body odd header'"/>
                   <xsl:with-param name="theParameters">
                      <prodname>
                          <xsl:value-of select="$productName"/>
                      </prodname>
                      <heading>
                    <fo:inline xsl:use-attribute-
     sets="__body__odd__header__heading">
                          <fo:retrieve-marker retrieve-class-name="current-header"/
     >
                    </fo:inline>
     ```

```
                </heading>
               <pagenum>
              <fo:inline xsl:use-attribute-sets="__body__odd__header__pagenum">
                    <fo:page-number/>
              </fo:inline>
            </pagenum>
         </xsl:with-param>
       </xsl:call-template>
    </fo:block>
  </fo:static-content>

</xsl:template>
```

- The second template to override is located in the XSLT stylesheet *DITA-OT-DIR*`\plugins\org.dita.pdf2\xsl\fo\commons.xsl` and is used for styling the first page of the output. Override it by copying the original template content in the `custom.xsl` and adding the `block-container` element that references the watermark image file:

```
<xsl:template name="createFrontMatter_1.0">
      <fo:page-sequence master-reference="front-matter"
xsl:use-attribute-sets="__force__page__count">
          <xsl:call-template name="insertFrontMatterStaticContents"/>
          <fo:flow flow-name="xsl-region-body">
              <fo:block-container absolute-position="absolute"
                  top="-2cm" left="-3cm" width="21cm" height="29.7cm"
                  background-image="{concat($artworkPrefix,
'Configuration/OpenTopic/cfg/common/artwork/watermark.png')}">
                  <fo:block/>
              </fo:block-container>
  <fo:block xsl:use-attribute-sets="__frontmatter">
       <!-- set the title -->
    <fo:block xsl:use-attribute-sets="__frontmatter__title">
     <xsl:choose>
      <xsl:when test="$map/*[contains(@class,' topic/title ')][1]">
    <xsl:apply-templates select="$map/*[contains(@class,' topic/title ')][1]"/>
      </xsl:when>
      <xsl:when test="$map//*[contains(@class,' bookmap/mainbooktitle ')][1]">
    <xsl:apply-templates select="$map//*[contains
(@class,' bookmap/mainbooktitle ')][1]"/>
          </xsl:when>
          <xsl:when test="//*[contains(@class, ' map/map ')]/@title">
```

```
            <xsl:value-of select="//*[contains(@class, ' map/map ')]/@title"/
>
          </xsl:when>
            <xsl:otherwise>
             <xsl:value-of select="/descendant::*[contains
(@class, ' topic/topic ')][1]/*[contains(@class, ' topic/title ')]"/>
            </xsl:otherwise>
      </xsl:choose>
    </fo:block>

   <!-- set the subtitle -->
   <xsl:apply-templates select="$map//*[contains
(@class,' bookmap/booktitlealt ')]"/>

      <fo:block xsl:use-attribute-sets="__frontmatter__owner">
         <xsl:apply-templates select="$map//*[contains
(@class,' bookmap/bookmeta ')]"/>
      </fo:block>

      </fo:block>

   <!--<xsl:call-template name="createPreface"/>-->

      </fo:flow>
        </fo:page-sequence>
        <xsl:if test="not($retain-bookmap-order)">
            <xsl:call-template name="createNotices"/>
        </xsl:if>
    </xsl:template>
```

7. Edit the **DITA Map to PDF - XSL-FO** *(page 1634)* transformation scenario, go to the **Parameters** tab, and set the **customization.dir** parameter to point to the location of your customization directory.

Related Information:

Adding a Watermark in DITA Map to XHTML Output *(page 3160)*

Adding an Edit Link in PDF Output to Launch Oxygen XML Web Author

You can embed *Edit* links in the DITA Map PDF output that will automatically launch a particular document in Oxygen XML Web Author. A reviewer can then simply click the link and they will be redirected to the Oxygen XML Web Author editing page with that particular file open and editable.

To embed an *Edit* link in the DITA Map PDF output, follow these steps:

1. Edit a **DITA Map to PDF - based on XSL-FO** *(page 1634)* transformation scenario and open the **Parameters** tab.
2. Set values for the following parameters:
   - **editlink.remote.ditamap.url** - The URL of the DITA Map suitable for opening in Oxygen XML Web Author.
   - **editlink.web.author.url** - The URL of the Oxygen XML Web Author installation, for example `https://www.oxygenxml.com/oxygen-xml-web-author/`
3. Run the transformation scenario.

Result: In the PDF output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

Force Page Breaks Between Two Block Elements in PDF Output

Suppose that in your DITA content you have two *block elements (page 3226)*, such as two paragraphs:

```
<p>First para</p>
<p>Second para</p>
```

and you want to force a page break between them in the PDF output.

Here is how you can implement a DITA Open Toolkit *plugin (page 3232)* that would achieve this:

1. Define your custom processing instruction that marks the place where a page break should be inserted in the PDF, for example:

   ```
   <p>First para</p>
     <?pagebreak?>
   <p>Second para</p>
   ```

2. Locate the **DITA Open Toolkit** distribution and in the `plugins` directory create a new *plugin* folder (for example, *`DITA-OT-DIR`*`/plugins/pdf-page-break`).
3. In this new folder, create a new `plugin.xml` file with the following content:

   ```
   <plugin id="com.yourpackage.pagebreak">
   ```

```
  <feature extension="package.support.name" value="Force Page Break Plugin"/>
  <feature extension="package.support.email" value="support@youremail.com"/>
  <feature extension="package.version" value="1.0.0"/>
  <feature extension="dita.xsl.xslfo" value="pageBreak.xsl" type="file"/>
</plugin>
```

The most important feature in the *plugin* is that it will add a new XSLT stylesheet to the XSL processing that produces the PDF content.

4. In the same folder, create an XSLT stylesheet named `pageBreak.xsl` with the following content:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                      xmlns:fo="http://www.w3.org/1999/XSL/Format" version="1.0">
  <xsl:template match="processing-instruction('pagebreak')">
    <fo:block break-after="page"/>
  </xsl:template>
</xsl:stylesheet>
```

5. Install your *plugin* in the DITA Open Toolkit. *(page 3185)*

The source code for the plugin can be found on GitHub here: https://github.com/dita-community/org.dita-community.pdf-page-break.

Customizing `note` Images in PDF

To customize the images that appear next to each type of note in the PDF output, use a PDF customization folder *(page 2064)* with the following procedure:

1. Create a customization directory *(page 2064)* (if you haven't already done so).
2. Create a `cfg\common\vars` directory structure in your customization directory and copy the contents of *`DITA-OT-DIR`*`\plugins\org.dita.pdf2\cfg\common\vars` into that created directory.
3. Locate the *`DITA-OT-DIR`*`\plugins\org.dita.pdf2\cfg\cfg\common\vars\en.xml` file in your customization directory (for example, `custom_org.dita.pdf2\cfg\common\vars\en.xml`).
4. Create a `cfg\common\artwork` directory structure in your customization directory and add your custom **notice** image (for example, `Customization\cfg\common\artwork\notice.gif`).
5. Locate and edit the `Customization\cfg\common\vars\en.xml` file and modify the appropriate note element. For example, modify the path to the image for `<note>` element with the `type` attribute set to `notice` from:

```
<variable id="notice Note Image
  Path">Configuration/OpenTopic/cfg/common/artwork/important.png</variable>
```

to:

```
<variable id="notice Note Image
  Path">cfg/common/artwork/notice.gif</variable>
```

6. Edit the **DITA Map to PDF - based on XSL-FO** *(page 1634)* transformation scenario, go to the **Parameters** tab, and set the path for the **customization.dir** property to point to the customization folder. Also, set the **com.oxygenxml.use.custom.note.images** parameter to **no**.

Show Comments and Tracked Changes in PDF Output

To include comments and *tracked changes* (stored within your DITA topics) in the PDF output, follow these steps:

1. Edit a **DITA Map to PDF** transformation scenario.
2. In the **Parameters** tab, set the value of the **show.changes.and.comments** parameter to `yes`.
3. Optionally, you can configure any of these other parameters to adjust the colors of the comments and tracked changes:
   - **ct.insert.color** - Specifies the color for insertion type tracked changes, as a plain color (i.e. red, yellow, blue), or with a hexadecimal equivalent (i.e. #FFFFFF). The default value is 'blue'.
   - **ct.delete.color** - Specifies the color for deletion type tracked changes, as a plain color (i.e. red, yellow, blue), or with a hexadecimal equivalent (i.e. #FFFFFF). The default value is 'red'.
   - **ct.comment.bg.color** - Specifies the background color for comment type tracked changes, as a plain color (i.e. red, yellow, blue), or with a hexadecimal equivalent (i.e. #FFFFFF). The default value is 'yellow'.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

   Result: Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

Set a Font for PDF Output Generated with FO Processor

When a *DITA map (page 3228)* is transformed to PDF using an FO processor and it contains some Unicode characters that cannot be rendered by the default PDF fonts, a font that is capable of rendering these characters must be configured and embedded in the PDF result.

The settings that must be modified for configuring a font for the built-in FO processor are detailed in Add a Font to the Built-in FO Processor - Advanced Version *(page 2077)*.

DITA OT PDF Font Mapping

The DITA OT contains a file *`DITA-OT-DIR`*`/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` that maps logical fonts used in the XSLT stylesheets to physical fonts that will be used by the FO processor to generate the PDF output.

The XSLT stylesheets used to generate the XSL-FO output contain code like this:

```
<xsl:attribute name="font-family">monospace</xsl:attribute>
```

The font-family is defined to be *monospace*, but *monospace* is just an alias. It is not a physical font name. Therefore, another stage in the PDF generation takes this *monospace* alias and looks in the `font-mappings.xml`.

If it finds a mapping like this:

```
<aliases>
      <alias name="monospace">Monospaced</alias>
 </aliases>
```

then it looks to see if the *monospace* has a *logical-font* definition and if so, it will use the *physical-font* specified there:

```
<logical-font name="Monospaced">
      <physical-font char-set="default">
        <font-face>Courier New, Courier</font-face>
      </physical-font>
.............
</logical-font>
```

Important:

If no alias mapping is found for a font-family specified in the XSLT stylesheets, the processing defaults to **Helvetica**.

Related Information:

http://www.elovirta.com/2016/02/18/font-configuration-in-pdf2.html

Adding Libraries to the Built-in FO Processor (DITA-OT)

Starting with Oxygen XML Editor version 20.0, both hyphenation and PDF image support are enabled by default in the built-in DITA-OT FO processor. For older version of Oxygen XML Editor, use the following procedures to enable such support.

Adding Hyphenation Support for DITA-OT Transformation Scenarios

1. Download the pre-compiled *JAR (page 3230)* from OFFO.

2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab. Click the **Libraries** button and add the path to the `fop-hyph.jar` library.

Adding Support for PDF Images

1. Download the *fop-pdf-images JAR* libraries.
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab. Click the **Libraries** button and add the path to the libraries.

Debugging DITA PDF Transformations

To debug a DITA PDF transformation scenario using the XSLT Debugger follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **XML > XML Catalog**, click **Add**, and select the file located at *DITA-OT-DIR*`\plugins\org.dita.pdf2\cfg\catalog.xml`.
2. Open the map in the **DITA Maps Manager** *(page 2943)* and create a **DITA Map PDF - XSL-FO** transformation scenario.
3. Edit the scenario, go to the **Parameters** tab and change the value of the **clean.temp** parameter to **no**.
4. Run the transformation scenario.
5. Open the **stage1.xml** file located in the temporary directory and format and indent *(page 854)* it.
6. Create a transformation scenario for this XML file by associating the `topic2fo_shell_fop.xsl` stylesheet located at *DITA-OT-DIR*`\plugins\org.dita.pdf2\xsl\fo\topic2fo_shell_fop.xsl`. If you are specifically using the RenderX XEP or Antenna House FO processors to build the PDF output, you should use the XSL stylesheets `topic2fo_shell_xep.xsl` or `topic2fo_shell_axf.xsl` located in the same folder.
7. In the transformation scenario edit the XSLT Processor combo box choose the Saxon EE XSLT processor (the same processor used when the DITA OT transformation is executed).
8. In the transformation scenario, edit the **Parameters** list and set the parameter `locale` with the value `en_GB` and the parameter `customizationDir.url` to point either to your customization directory or to the default DITA OT customization directory. Its value should have a URL syntax like this: `file://c:/path/to/`*DITA-OT-DIR*`/plugins/org.dita.pdf2/cfg`.
9. Debug the transformation scenario.

Debugging XSLT Stylesheets and XQuery Documents *(page 2199)*

How to Enable Debugging for FO Processor Transformations *(page 2079)*

Generating PDF Output from XSL-FO (Apache FOP)

The Oxygen XML Editor installation package is distributed with the Apache FOP that is a Formatting Objects processor for rendering your XML documents to PDF. *FOP* is a print and output independent formatter driven by XSL Formatting Objects. *FOP* is implemented as a Java application that reads a formatting object tree and renders the resulting pages to a specified output.

To see the version of the built-in XSL-FO processor for your installation, go to **Help > About > Libraries** and search for *Apache FOP*.

Other FO processors can be configured in the **Preferences** dialog box *(page 212)*.

Add a Font to the Built-in FO Processor - Simple Version

If the font that must be set to Apache FOP is one of the fonts that are installed in the operating system you should follow the next steps for creating and setting a FOP configuration file that looks for the font that it needs in the system fonts. It is a simplified version of the procedure for setting a custom font in Apache FOP *(page 2077)*.

1. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)
   a. Create a FOP configuration file that specifies that FOP should look for fonts in the installed fonts of the operating system.

```
<fop version="1.0">
  <renderers>
    <renderer mime="application/pdf">
      <fonts>
        <auto-detect/>
      </fonts>
    </renderer>
  </renderers>
</fop>
```

b. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **XML > XSLT/FO/XQuery > FO Processors**, and enter the path of the FOP configuration file in the **Configuration file** text field.

2. Set the font on the document content.
   This is done usually with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.
   - For DocBook documents you can start with the built-in scenario called **DocBook PDF**, edit the XSLT parameters *(page 1644)* and set the font name (in our example the font family name is **Arial Unicode MS**) to the parameters `body.font.family` and `title.font.family`.
   - For TEI documents you can start with the built-in scenario called **TEI PDF**, edit the XSLT parameters *(page 1644)* and set the font name (in our example **Arial Unicode MS**) to the parameters `bodyFont` and `sansFont`.
   - For DITA transformations to PDF using DITA-OT you should modify the following two files:
     # *`DITA-OT-DIR`*`/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` - The `font-face` element included in each element `physical-font` having the `attribute char-set="default"` must contain the name of the font (**Arial Unicode MS** in our example)
     # *`DITA-OT-DIR`*`/plugins/org.dita.pdf2/fop/conf/fop.xconf` - An element `auto-detect` must be inserted in the element `fonts`, which is inside the element `renderer` that has the attribute `mime="application/pdf"`:

```
<renderer mime="application/pdf">
  . . .
   <fonts>
       <auto-detect/>
   </fonts>
  . . .
</renderer>
```

Add a Font to the Built-in FO Processor - Advanced Version

If an XML document is transformed to PDF using the built-in Apache FOP processor but it contains some Unicode characters that cannot be rendered by the default PDF fonts, then a special font that is capable to render these characters must be configured and embedded in the PDF result.

Important: On Windows, fonts are located into the `C:\Windows\Fonts` directory. On Mac, they are placed in `/Library/Fonts`. To install a new font on your system, it's enough to copy it in the `Fonts` directory. If a special font is installed in the operating system, there is a simple way of telling FOP to look for it. See the simplified procedure for adding a font to FOP *(page 2076)*.

1. Locate the font.

   First, find out the name of a font that has the glyphs for the special characters you used. One font that covers most characters, including Japanese, Cyrillic, and Greek, is Arial Unicode MS.

2. Register the font in the FOP configuration.

   Note: DITA PDF transformations have their own `fop.xconf` (*`DITA-OT-DIR`*`/plugins/org.dita.pdf2/cfg/fop.xconf`). If the font is not installed in the system, it needs to be referenced in the `fop.xconf`.

   a. For information about registering the font in the FOP Configuration, see: https://xmlgraphics.apache.org/fop/2.2/fonts.html.
   b. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **XML > XSLT/FO/XQuery > FO Processors**, and enter the path of the FOP configuration file in the **Configuration file** text field.

3. Set the font on the document content.
   This is usually done with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

   DocBook Example: For DocBook documents, you can start with the built-in scenario called **DocBook PDF**, edit the XSLT parameters *(page 1644)*, and set the font name (in our example, *Arialuni*) to the parameters `body.font.family` and `title.font.family`.

   TEI Example: For TEI documents, you can start with the built-in scenario called **TEI PDF**, edit the XSLT parameters *(page 1644)*, and set the font name (in our example, *Arialuni*) to the parameters `bodyFont` and `sansFont`.

   DITA Example: For DITA to PDF transformations using DITA-OT modify the following two files:
   - *`DITA-OT-DIR`*`/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` - The `font-face` element included in each element `physical-font` having the `attribute char-set="default"` must contain the name of the font.
   - *`DITA-OT-DIR`*`/plugins/org.dita.pdf2/fop/conf/fop.xconf` - An element `font` must be inserted in the element `fonts`, which is inside the element `renderer` that has the attribute `mime="application/pdf"`.

     For more information, see: https://xmlgraphics.apache.org/fop/2.1/fonts.html.

Adding Libraries to the Built-in FO Processor (XML with XSLT and FO)

Starting with Oxygen XML Editor version 20.0, both hyphenation and PDF image support are enabled by default in the built-in Apache FO processor. For older version of Oxygen XML Editor, use the following procedures to enable such support.

Adding Hyphenation Support for XML with XSLT Transformation Scenarios

If you want to add newer hyphenation libraries or you are using an older version of Oxygen XML Editor, follow this procedure:

1. Create a folder called `fop` in the *`[OXYGEN_INSTALL_DIR]/lib`* folder.
2. Download the compiled *JAR (page 3230)* from OFFO.
3. Copy the `fop-hyph.jar` file into the *`[OXYGEN_INSTALL_DIR]/lib/fop`* folder.
4. Restart Oxygen XML Editor.

Adding Support for PDF Images

To add support for PDF images in an older version of Oxygen XML Editor, follow these steps:

1. Create a folder called `fop` in the *`[OXYGEN_INSTALL_DIR]/lib`* folder.
2. Download the *fop-pdf-images JAR* libraries.
3. Copy the libraries into the *`[OXYGEN_INSTALL_DIR]/lib/fop`* folder.
4. Restart Oxygen XML Editor.

How to Enable Debugging for FO Processor Transformations

If you encounter errors when running PDF transformations that use an FO processor, it is possible to enable debugging/logging to help you identify the problem. To enable debugging/logging for FO processing, follow this procedure:

1. Locate and edit the following configuration file: *`[OXYGEN_INSTALL_DIR]/tools/config/log4j.xml`*.

   Note: You need write access to this folder, so if you do not have administrator permissions, you may first need to copy the file to another location where you have write access.

2. Edit the `priority` element (inside the `root` element) and change its value to **debug**.
3. Save the file in the original location.
4. Restart Oxygen XML Editor and re-run the transformation.

   Tip: It is recommended that you use a small input file when trying to reproduce the problem, to make it easier to analyze the data in the log.

5. Once you are finished with the debugging session, remember to edit the `log4j.xml` file and change the `priority` element back to its original value. Otherwise, performance could be affected.

Generating PDF Output from a Calabash XProc Processor

To generate PDF output from your XProc pipeline (when using the Calabash XProc processor), follow these steps:

1. Open the *[OXYGEN_INSTALL_DIR]*`/lib/xproc/calabash/engine.xml` file.
2. Uncomment the `<system-property name="com.xmlcalabash.fo-processor" value="com.xmlcalabash.util.FoXEP"/>` system property.
3. Uncomment the `<system-property name="com.renderx.xep.CONFIG" file="../../../tools/xep/xep.xml"/>` system property. Edit the `file` attribute to point to the configuration file that is usually located in the XEP installation folder.
4. Uncomment the references to the XEP libraries. Edit them to point to the matching library names from the XEP installation directory.
5. Restart Oxygen XML Editor.

DocBook to PDF Output Customization

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

1. Create a custom version of the DocBook title spec file.

   You should start from a copy of the file `[DocBook XSL directory]/fo/titlepage.templates.xml` and customize it. The instructions for the spec file can be found here.

   An example of spec file:

```
<t:titlepage-content t:side="recto">
    <mediaobject/>
    <title
        t:named-template="book.verso.title"
        font-size="&hsize2;"
        font-weight="bold"
        font-family="{$title.font.family}"/>
    <corpauthor/>
      ...
```

```
</t:titlepage-content>
```

2. Generate a new XSLT stylesheet from the title spec file from the previous step.
   Apply `[DocBook XSL directory]/template/titlepage.xsl` to the title spec file. The result is an XSLT stylesheet (for example, `mytitlepages.xsl`).

3. Import `mytitlepages.xsl` in a DocBook customization layer.
   The customization layer is the stylesheet that will be applied to the XML document. The `mytitlepages.xsl` should be imported with an element like this:

   ```
   <xsl:import href="dir-name/mytitlepages.xsl"/>
   ```

4. Insert a logo image in the XML document.
   The path to the logo image must be inserted in the `book/info/mediaobject` element of the XML document.

5. Apply the customization layer to the XML document.
   A quick way is to duplicate the transformation scenario **DocBook PDF** that is included with Oxygen XML Editor and set the customization layer in the **XSL URL** property of the scenario *(page 1645)*.

Related Information:

The book DocBook XSL: The Complete Guide by Bob Stayton contains more details about customizing the PDF output.

Video demonstration for creating a DocBook customization layer in Oxygen XML Editor.

11.

Working with XPath Expressions

XPath is a language for addressing specific parts of an XML document. XPath, such as the Document Object Model (DOM), models an XML document as a tree of nodes. An XPath expression is a mechanism for navigating through and selecting nodes from the XML document. An XPath expression is, in a way, analogous to an SQL query used to select records from a database.

There are various types of nodes, including element nodes, attribute nodes, and text nodes. XPath defines a way to compute a string-value for each type of node.

XPath defines a library of standard functions for working with strings, numbers and boolean expressions.

Examples:

- **child::*** - Selects all children of the root node.
- **.//name** - Selects all elements having the name "name", descendants of the current node.
- **/catalog/cd[price>10.80]** - Selects all the `cd` elements that have a price element with a value larger than 10.80.

To find out more about XPath, go to http://www.w3.org/TR/xpath.

Related Information:

Content Completion in XPath Expressions *(page 1177)*

Find/Replace in Multiple Files *(page 740)*

Find/Replace Dialog Box *(page 736)*

XPath Toolbar

XPath is a query language for selecting nodes from an XML document. To use XPath expressions effectively, you need a good understanding of the XPath Core Function Library.

XPath Toolbar

Oxygen XML Editor provides an XPath toolbar to let you query XML documents fast and easy using XPath expressions.

Figure: XPath Toolbar

The XPath toolbar includes the following features:

XPath version chooser drop-down menu

You can choose the XPath version from the drop-down menu available in the left side of the toolbar. Available options include **XPath 1.0**, **XPath 2.0**, **XPath 2.0 SA**, **XPath 3.0**, **XPath 3.0 SA**.

Note: The results returned by XPath 2.0 SA and XPath 3.0 SA have a location limited to the line number of the start element (there are no column information and no end specified).

Warning: Oxygen XML Editor uses Saxon to execute XPath 3.0 expressions, but implements a part of the 3.0 functions. When using a function that is not implemented, Oxygen XML Editor can return a compilation error.

XPath scope menu

Oxygen XML Editor allows you to define a scope for which the XPath operation will be executed. You can choose where the XPath expression will be executed:

- **Current file** - Current selected file only.
- **Project** - All the files in the project.
- **Selected project resources** - The files selected in the project.
- **All opened files** - All files opened in the application.
- **Current DITA Map hierarchy** - All resources referenced in the currently selected *DITA map*, opened in the **DITA Maps Manager** view *(page 2943)*.
- **Opened archive** - Files open in the **Archive Browser** view *(page 2091)*.
- **Working sets** - The selected *working sets (page 3235)*.

At the bottom of the scope menu the following scope configuration actions are available:

- **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets (page 3235)*.
- **XPath file filter** - You can filter the files from the selected scope for which the XPath expression will be executed. By default, the XPath expression will be executed only on XML files, but you can also define a set of patterns that will filter out files from the current scope. If you select the **Include archive** option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

History drop-down list

The XPath combo box keeps a history of the last 15 expressions that were used so that you can easily choose them again.

Switch to XPath Builder View

Opens the **XPath Builder** view *(page 2085)*.

Settings menu

The following actions are available in this drop-down menu:

- **Update on cursor move** - When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed.
- **Evaluate as you type** - When you select this option, the XPath expression you are composing is evaluated in real time.

  Note: This option and the automatic validation are disabled when you edit huge documents *(page 774)* or when the scope is other than **Current file**.

- **Options** - Opens the Preferences page of the currently selected processing engine.

Note: During the execution of an XPath expression, the XPath toolbar displays a **Stop** button. Press this button to stop the XPath execution.

When you type expressions longer than 60 characters, a dialog box opens that offers you the possibility to switch to the **XPath Builder** view *(page 2085)*.

Related Information:

XPath Expression Results View *(page 2088)*

XPath Builder View

The **XPath/XQuery Builder** view allows you to compose complex XPath expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.0, you can use the `doc()` function to specify the source file for which the expressions are executed. When you connect to a database, the expressions are executed over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Editor executes the expressions over the XML document in the associated scenario.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. You can also open it simply by pressing the **Switch to XPath Builder View** button that is located on the XPath toolbar *(page 2082)*.

The upper part of the view contains the following actions:

XPath version chooser drop-down menu

A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0SA, XPath 3.0, XPath 3.0SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

Note: The results returned by XPath 2.0 SA and XPath 3.0 SA have a location limited to the line number of the start element (there are no column information and no end specified).

Note: Oxygen XML Editor uses Saxon to execute XPath 3.0 expressions. Since Saxon implements a part of the 3.0 functions, when using a function that is not implemented, Oxygen XML Editor returns a compilation error.

Execute XPath button

Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the **Results** view *(page 354)*.

Favorites button

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, press the star button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Editor automatically groups favorites in folders named after the method of execution.

History drop-down menu

Keeps a list of the last 15 executed XPath expressions. Use the **Clear history** action from the bottom of the list to remove them.

Settings drop-down menu

Contains the following three options:

- **Update on cursor move** - When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed.
- **Evaluate as you type** - When you select this option, the XPath expression you are composing is evaluated in real time.

  Note: This option and the automatic validation are disabled when you edit huge documents *(page 774)* or when the scope is other than **Current file**.

- **Options** - Opens the Preferences page of the currently selected processing engine.

XPath scope menu

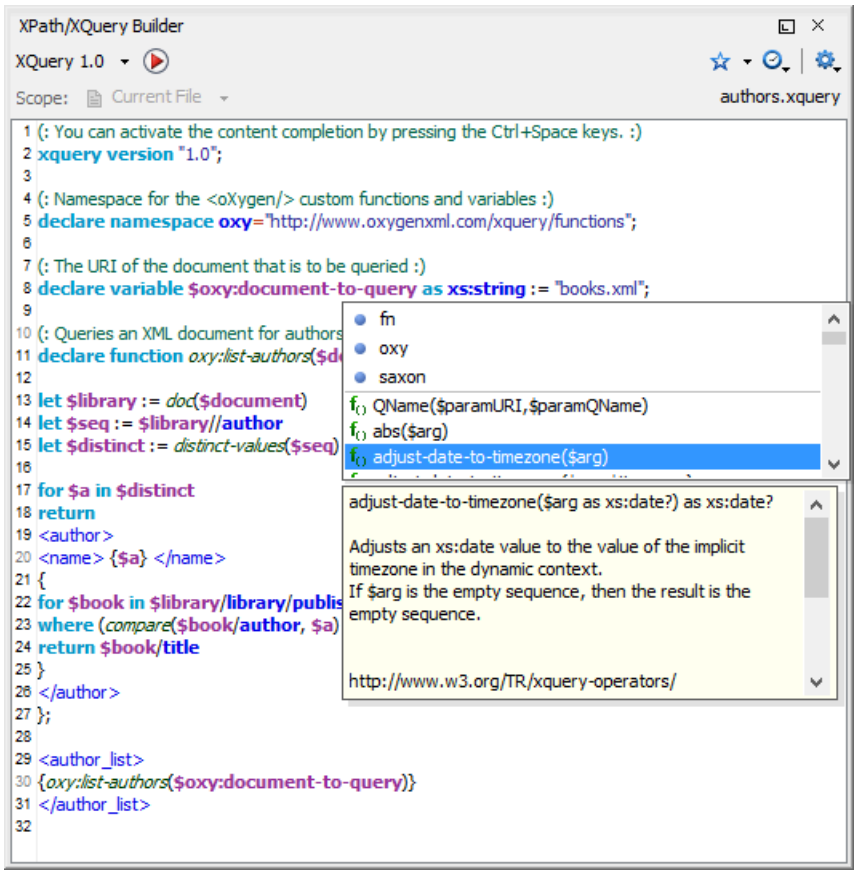
Oxygen XML Editor allows you to define a scope for which the XPath operation will be executed. You can choose where the XPath expression will be executed:

- **Current file** - Current selected file only.
- **Project** - All the files in the project.
- **Selected project resources** - The files selected in the project.
- **All opened files** - All files opened in the application.
- **Current DITA Map hierarchy** - All resources referenced in the currently selected *DITA map*, opened in the **DITA Maps Manager** view *(page 2943)*.
- **Opened archive** - Files open in the **Archive Browser** view *(page 2091)*.
- **Working sets** - The selected *working sets (page 3235)*.

At the bottom of the scope menu the following scope configuration actions are available:

- **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets (page 3235)*.
- **XPath file filter** - You can filter the files from the selected scope for which the XPath expression will be executed. By default, the XPath expression will be executed only on XML files, but you can also define a set of patterns that will filter out files from the current scope. If you select the **Include archive** option, the XPath expression will be also executed on the files in any archive (including EPUB and DocX) found at the current scope.

Figure: XPath/XQuery Builder View



While you edit an XPath or XQuery expression, Oxygen XML Editor assists you with the following features:

- *Content Completion Assistant (page 3227)* - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the

Content Completion Assistant also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.

- Syntax Highlighting - Allows you to identify the components of an expression. To customize the colors of the components of the expression, open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Editor > Syntax Highlight** *(page 171)*.
- Automatic validation of the expression as you type.

Note: When you type invalid syntax a red serrated line underlines the invalid fragments.

- Function signature and documentation balloon, when the cursor is located inside a function.

The usual edit actions (**Cut**, **Copy**, **Paste**, **Select All**, **Undo**, **Redo**) are available in the contextual menu of the top editable part of the view.

Related Information:

XPath Expression Results View *(page 2088)*

XPath Expression Results View

When you run an XPath expression, Oxygen XML Editor displays the results of its execution in the **Results** view *(page 354)*.

This view contains the following columns:

- **Description** - The result thatOxygen XML Editor displays when you run an XPath expression.
- **XPath location** - The path to the matched node.
- **Resource** - The name of the document that you run the XPath expression on.
- **System ID** - The path to the document itself.
- **Location** - The location of the result in the document.

To arrange the results depending on a column, click its header. To group the results by their resource, or by their system ID, right-click the header of any column in the **Results** view and select **Group by "Resource"** or **Group by "System ID"**. If no information regarding location is available, Oxygen XML Editor displays **Not available** in the **Location** column. Oxygen XML Editor displays the results in a valid XPath expression format.

```
- /node[value]/node[value]/node[value] -
```

The **Results** view also includes various toolbar and contextual menu actions. For more information, see Results View *(page 354)*.

Example:

The following snippets are taken from a DocBook book based on the DocBook XML DTD. The book contains a number of chapters. To return all the chapter nodes of the book, enter `//chapter` in the XPath expression field and press **(Enter)**. This action returns all the `chapter` nodes of the DocBook book in the **Results View**. Click a record in the **Results View** to locate and highlight its corresponding chapter element and all its children nodes in the document you are editing.

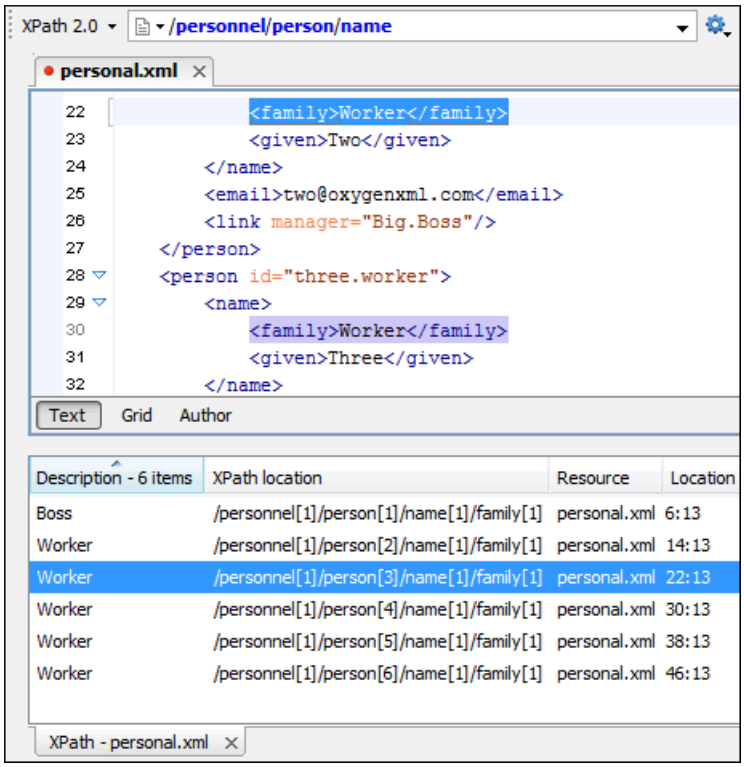
To find all `example` nodes contained in the `sect2` nodes of a DocBook XML document, use the following XPath expression: `//chapter/sect1/sect2/example`. Oxygen XML Editor adds a result in the **Results View** for each `example` node found in any `sect2` node.

For example, if the result of the above XPath expression is:

```
- /chapter[1]/sect1[3]/sect2[7]/example[1]
```

it means that in the edited file, the `example` node is located in the first chapter, third section level one, seventh section level 2.

Figure: XPath Results Highlighted in Editor Panel with Character Precision



XPath and XML Catalogs

The evaluation of the XPath expression tries to resolve the locations of documents referenced in the expression through *XML Catalogs (page 3235)*. These catalogs are configured in the **XML Catalog** preferences *(page 186)* pages and the **XML Parser** preferences *(page 189)*.

Example:

As an example, consider the evaluation of the `collection(URIofCollection)` function (XPath 2.0). To resolve the references from the files returned by the `collection()` function with an *XML catalog*, specify the class name of the catalog-enabled parser for parsing these collection files. The class name is *ro.sync.xml.parser.CatalogEnabledXMLReader*. Specify it as it follows:

```
let $docs := collection(iri-to-uri(
   "file:///D:/temp/test/XQuery-catalog/mydocsdir?recurse=yes;select=*.xml;
   parser=ro.sync.xml.parser.CatalogEnabledXMLReader"))
```

XPath Prefix Mapping

To define default mappings between prefixes (that you can use in the XPath toolbar *(page 2082)*) and namespace URIs go to the **XPath** preferences page *(page 216)* and enter the mappings in the **Default prefix-namespace mappings** table. The same preferences panel allows you to configure the default namespace used in XPath 2.0 expressions.

Important: If you define a default namespace, Oxygen XML Editor binds this namespace to the first free prefix from the list: `default`, `default1`, `default2`, and so on. For example, if you define the default namespace `xmlns="something"` and the prefix `default` is not associated with another namespace, you can match tags without prefix in an XPath expression typed in the XPath toolbar by using the prefix `default`. To find all the `level` elements when you define a default namespace in the root element, use this expression: `//default:level` in the XPath toolbar.

12.

Working with Archives

Oxygen XML Editor includes a useful **Archive Browser** view *(page 2091)* that offers the means to work with files directly from various types of archives (for example, opening and saving files directly in archives, or browsing and modifying archive structures). The archive support is available for all ZIP-type archives, including:

- ZIP archives
- EPUB books
- *JAR archives (page 3230)*
- Office Open XML (OOXML) files
- Open Document Format (ODF) files
- *IDML files (page 3230)*

You can transform, validate, and perform many other operations on files directly from an archive. For instance, you can transform, or validate files directly from OOXML or ODF packages, and the structure and content of the ZIP archives can be opened, edited, and saved, similar to any other ZIP archive browsing tool. Also, when browsing for a URL in various dialog boxes, you can use the **Browse for archived file** action to browse and select files from a particular archive.

For more information about working with an EPUB archive in Oxygen XML Editor, watch our video demonstration:

Browsing Archives

Oxygen XML Editor includes a helper view called the **Archive Browser** that allows you to view the contents and structure of an archive, and it offers a variety of toolbar and contextual menu actions. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

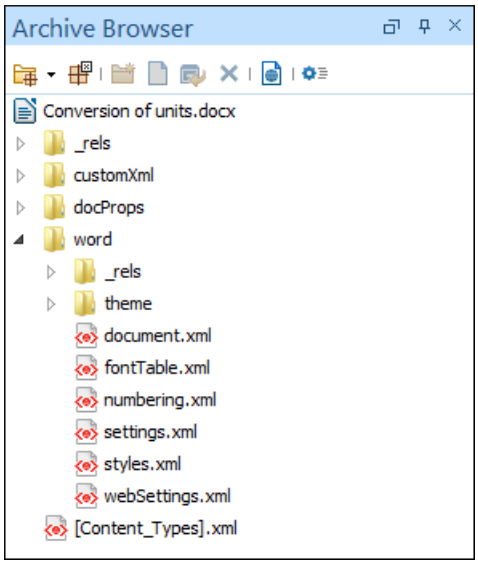
To open an archive in the **Archive Browser** view, use one of the following methods:

- Open an archive from the **Project** view *(page 332)*.
- Select an archive in one of the file chooser dialog boxes in Oxygen XML Editor (such as the **Open** dialog box).
- Drag an archive from a system file explorer and drop it in the **Archives Browser** view.

When displaying an archive, the **Archive Browser** view locks the archive file. It is then automatically unlocked when the **Archive Browser** view is closed.

Tip: If a file is not recognized by Oxygen XML Editor as a supported archive type, you can add it from the **Archive** preferences page *(page 243)*.

Figure: Archive Browser



Archive Browser Toolbar Actions

The following actions are available on the **Archive Browser** toolbar:

Open Archive menu

Provides access to the **Open Archive** action that opens a new archive in the browser. If the extension is not known as an archive extension, you will be directed to the **Archive** preferences page *(page 243)* to add a new extension. The sub-menu keeps a list of recently open archive files and a **Clear history** action that allows you to delete the list.

Close

Closes the browsed archive and unlocks the archive file.

Validate (available for EPUB archives only)

Checks the EPUB archive to see if its content and structure is valid.

New folder

Creates a folder as child of the selected folder in the browsed archive.

New file

Creates a file as child of the selected folder in the browsed archive.

Add files

Adds existing files as children of the selected folder in the browsed archive.

Note: You can also add files in the archive by dragging them from the file browser or the **Project** view *(page 332)* and dropping them in the **Archive Browser** view.

Delete

Deletes the selected resource in the browsed archive.

Open in System Application

Opens the selected resource in the default system application that is associated with that type of file.

Archive Options

Opens the **Archive** preferences page *(page 243)*.

Archive Browser Contextual Menu Actions

The following additional actions are available from the contextual menu for resources in the **Archive Browser** view:

Open

Opens a resource from the archive in the editor.

Extract

Extracts a resource from the archive in a specified folder.

New folder

Creates a folder as child of the selected folder in the browsed archive.

New file

Creates a file as child of the selected folder in the browsed archive.

Add files

Adds existing files as children of the selected folder in the browsed archive.

Note: On OS X, the **Add file** action is also available and it allows you to add one file at a time.

Rename

Renames a resource in the archive.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to search for and replace specific pieces of text inside the archive.

Cut

Cuts the selected archive resource.

Copy

Copies the selected archive resource.

Paste

Pastes a file or folder into the archive.

Delete

Removes a file or folder from archive.

Preview

Previews an image contained in the archive. See the Image Preview *(page 716)* topic for more details.

Copy location

Copies the URL location of the selected resource.

Refresh

Refreshes the selected resource.

Properties

Shows the properties of the selected resource.

For more information, watch our video demonstration about working with an EPUB in the **Archive Browser** view:

Working with Archive Files

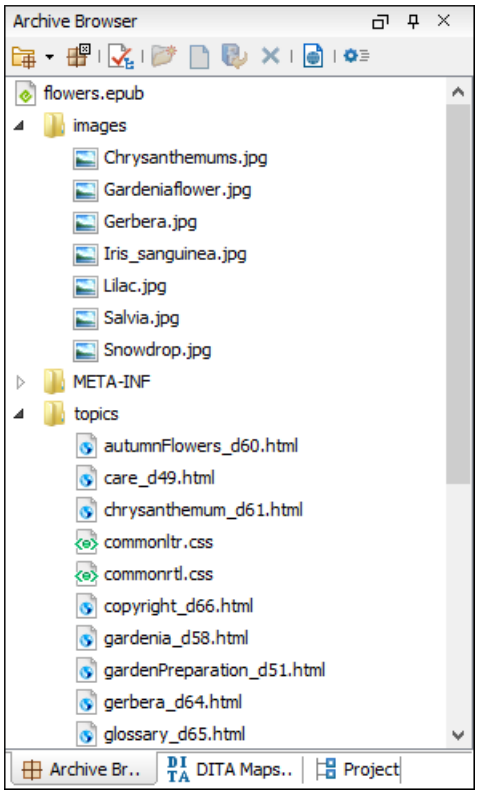
Oxygen XML Editor includes support for working with various types of archives, including the following:

- **EPUB** - An e-book file format that can be used on many types of devices, such as smart phones, tablets, e-readers, or computers.
- **OOXML** - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
- **ODF** - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.

When these types of files are opened in the **Archive Browser** view *(page 2091)*, their internal components are expanded:

- Document content (XHTML and image files).
- Packaging files.
- Container files.

Figure: EPUB File Displayed in the Archive Browser View



When an archive is expanded in the **Archive Browser** view *(page 2091)*, you can add or delete files that compose the archive structure. All changes made to the structure of an archive are saved immediately. You can open files from within the archive to edit them in the main editing pane and save changes *(page 2096)* back to the archive. You can also use the **Open in System Application** action to open the archive in the default system application that is associated with that type of file.

EPUB-Specific Validation

When working with EPUB archives, the **Archive Browser** *(page 2091)* includes a **Validate** action on the toolbar that checks the EPUB archive to make sure the structure and content are valid. Oxygen XML Editor uses the open-source *EpubCheck* validator to perform the validation. This validator detects many types of errors, including OCF container structure, OPF and OPS mark-up, as well as internal reference consistency.

For more information about working with an EPUB archive in Oxygen XML Editor, watch our video demonstration:

Related Information:

The Archive Browser View *(page 2091)*

EPUB Document Type (Framework) *(page 1608)*

Creating an Archive

To create an archive from scratch, follow these steps:

1. Go to **File > New** or click **New** on the main toolbar.
2. Choose your particular type of archive template. For example, select one of the **ODF**, **OOXML**, or **EPUB** templates.
3. Click **Create** and choose the name and location of the file.
4. Click **Save**.
   A skeleton archive is saved on disk and opened in the **Archive Browser** view *(page 2091)*.

   Tip: Use toolbar and contextual menu actions to edit, add, and remove resources from the archive. For EPUB archives, you can use the **Validate** action to verify the integrity of the EPUB archive.

Editing and Saving Files Inside an Archive

You can open files directly from an archive in the **Archive Browser** view *(page 2091)* and then edit them in the main editor pane. To open a file, simply double-click it or select **Open** from the contextual menu.

When saving the file back to the archive, you are prompted to choose if you want the application to make a backup copy of the archive before saving the new content. If you choose **Never ask me again**, you will not be asked again to make backup copies. You can re-enable the pop-up message from the Messages preferences page *(page 258)*.

Migrating Archives to DITA or TEI

Certain types of archives can be converted to DITA or TEI. For example, OOXML (Office Open XML) archive files with the DOCX file extension can be migrated to DITA or TEI.

To migrate DOCX files to DITA or TEI, follow these steps:

1. Open and expand the archive in the **Archive Browser** *(page 2091)*.
2. Open the **document.xml** file contained in the archive.
3. Run one of the following built-in transformation scenarios:
   a. **DOCX DITA** to migrate to DITA.
   b. **DOCX TEI P5** to migrate to TEI.
4. You may need to do some manual reconfiguring to map DOCX styles to DITA or TEI content.

   Tip: Oxygen XML Editor also includes a built-in transformation scenario called **ODT TEI P5** for converting ODF archive files with the ODT file extension to TEI and a similar process can be used to migrate ODT files to TEI.

13.

Databases and SharePoint

Oxygen XML Editor provides support for connecting and integrating with various databases and Microsoft SharePoint. This section includes information about the database-related features in Oxygen XML Editor. It explains how to connect with the supported databases, presents the actions that are available for each type, and includes information about SharePoint integration.

Working with Databases

XML is a storage and interchange format for structured data and is supported by all major database systems. Oxygen XML Editor offers the means for managing the interaction with some of the most commonly used databases (both *Relational* and *Native XML* databases). Through this interaction, Oxygen XML Editor helps users with browsing, content editing, importing from databases, using XQuery with databases, SQL execution, and generating XML Schema from a database structure.

The types of connections that are supported in Oxygen XML Editor include:

- IBM DB2 *(page 2104)*
- Microsoft SQL Server *(page 2109)*
- Oracle Database *(page 2113)*
- PostgreSQL *(page 2119)*
- Berkeley DB XML *(page 2122)*
- eXist *(page 2129)*
- MarkLogic *(page 2135)*
- Documentum xDB (X-Hive/DB) *(page 2144)*
- MySQL *(page 2152)*
- Generic JDBC *(page 2154)*
- JDBC-ODBC *(page 2156)*
- BaseX *(page 2157)*
- WebDAV *(page 2162)*
- Microsoft SharePoint *(page 2176)*

Related Information:

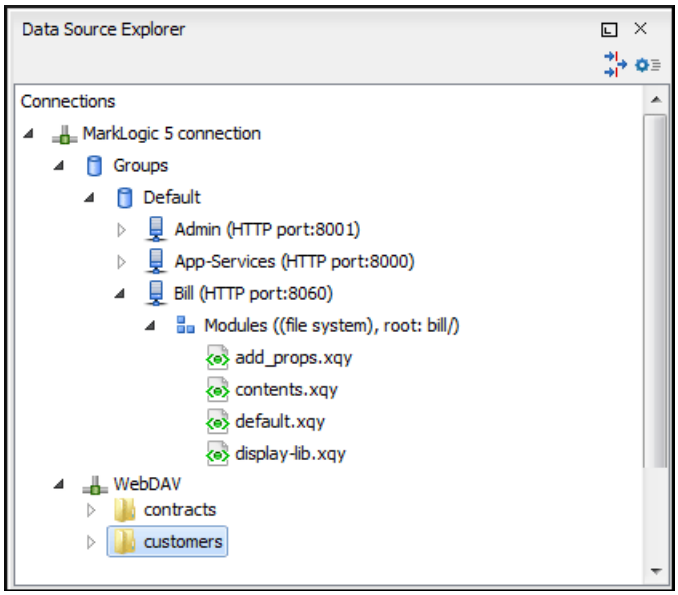
Integration with Microsoft SharePoint *(page 2176)*

Data Source Explorer View

The **Data Source Explorer** view displays your database connections. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

You can connect to a database simply by expanding the connection node (click the connection) . The database structure can be expanded to resource level, or even all the way to column level for tables inside relational databases. Oxygen XML Editor supports multiple simultaneous database connections and the connection tree in the **Data Source Explorer** view provides an easy method for browsing them.

Figure: Data Source Explorer View



The objects (nodes) that are displayed in the **Data Source Explorer** view depend on the connection type and structure of the database. Various contextual menu actions are available for each hierarchical level and for some connections you can add or move resources in a container by simply dragging them from the **Project** view *(page 332)*, a file browsing application, or another database.

Toolbar Actions

The following actions are available in the toolbar of this view:

Filters

Opens the **Data Sources / Table Filters** preferences page *(page 231)*, allowing you to decide which table types are displayed in the **Data Source Explorer** view.

Configure Database Sources

Opens the **Data Sources** preferences page *(page 227)* where you can configure both data sources and connections.

Database-Specific Contextual Menu Actions

Each specific type of database will also include its own specific contextual menu actions in the **Data Source Explorer** view. The actions depend on the type of database, the type of node, or the hierarchical level of the node in which the contextual menu is invoked.

For more information on the specific actions that are available, see the topics in this section for each specific type of database.

Related Information:

Data Sources Preferences *(page 227)*

Table Explorer View

Relational databases tables in the **Data Source Explorer** view *(page 2098)* can be displayed and edited in the **Table Explorer** view by selecting the **Edit** action from the contextual menu of a **Table** node or by double-clicking one of its fields. To modify the content of a cell, double-click it and start typing. When editing is complete, Oxygen XML Editor attempts to update the database with the new cell content.

Figure: Table Explorer View

	ID [SMALLINT]	NAME [VARCHAR]	DEPT [SMALLINT]	JOB [CHAR]	YEARS [SMALLINT]	SALARY [DECIMAL]	COMM [DECIMAL]
0	10	Sanders	20	Mgr	7	98357.50	*(null)*
1	20	Pernal	20	Sales	8	78171.25	612.45
2	30	Marenghi	38	Mgr	5	77506.75	*(null)*
3	40	O'Brien	38	Sales	6	78006.00	846.55
4	50	Hanes	15	Mgr	10	80659.80	*(null)*
5	60	Quigley	38	Sales	*(null)*	66808.30	650.25
6	70	Rothman	15	Sales	7	76502.83	1152.00
7	80	James	20	Clerk	*(null)*	43504.60	128.20
8	90	Koonitz	42	Sales	6	38001.75	1386.70
9	100	Plotz	42	Mgr	7	78352.80	*(null)*

You can sort the content of a table by one of its columns by clicking its column header.

Note the following:

- The first column is an index (not part of the table structure).

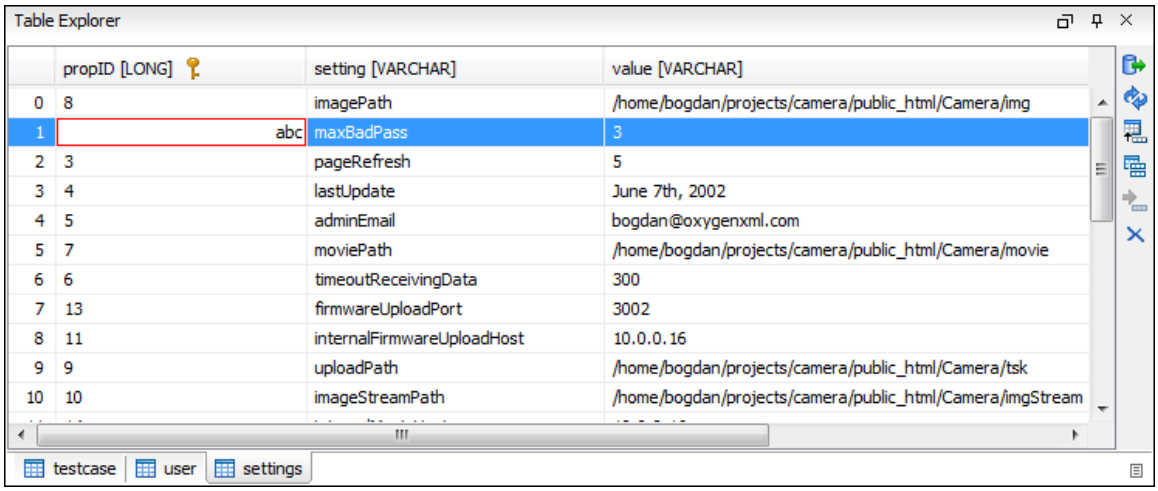
- Every column header contains the field name and its data type.
- The primary key columns are marked with this symbol: .
- Multiple tables are presented in a tabbed manner.

For performance issues, you can set the maximum number of cells that are displayed in the **Table Explorer** view (using the **Limit the number of cells** option in the **Data Sources** Preferences page *(page 231)*). If a table that has more cells than the value set in the options is displayed in the **Table Explorer** view, a warning dialog box informs you that the table is only partially shown.

You are notified if the value you have entered in a cell is not valid (and thus cannot be updated).

- If the content of the edited cell does not belong to the data type of the column, the cell is marked by a red square and remains in an editing state until a correct value is inserted. For example, in the following figure `propID` contains `LONG` values. If a character or string is inserted, the cell will look like this:

  Figure: Cell Containing an Invalid Value



- If the constraints of the database are not met (for instance, primary key constraints), an information dialog box will appear, notifying you of the reason the database has not been updated. For example, in the table below, trying to set the second record in the primary key `propID` column to 8, results in a duplicate entry error since that value has already been used in the first record:

Figure: Duplicate Entry for Primary Key

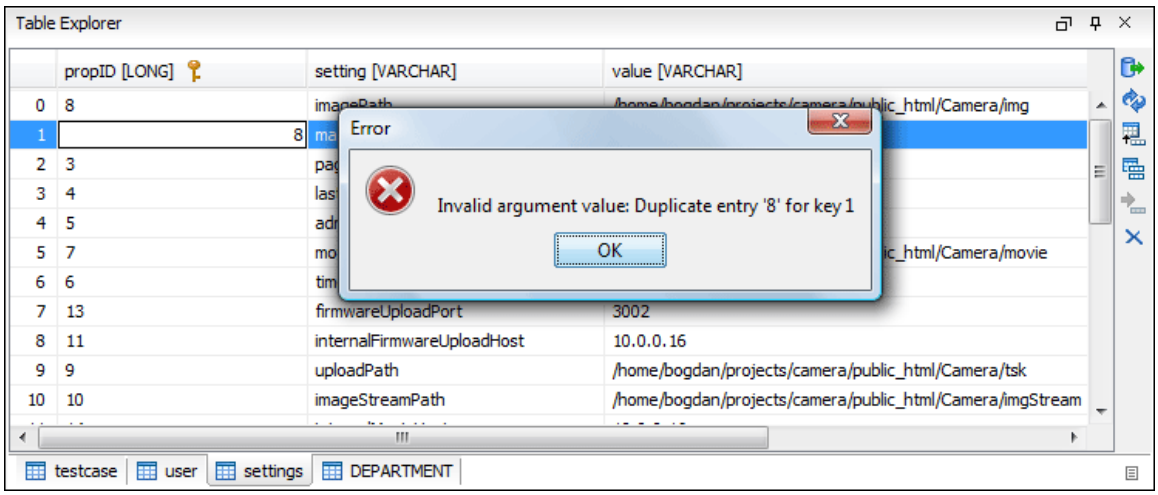


Table Explorer Contextual Menu Actions

Common editing actions (**Cut**, **Copy**, **Paste**, **Select All**, **Undo**, **Redo**) are available in the contextual menu of an edited cell.

The contextual menu, available on every cell in the **Table Explorer** view, also includes the following actions:

Set NULL

Sets the content of the cell to **null**. This action is not available for columns that cannot have a value of **null**.

Insert row

Inserts an empty row in the table.

Duplicate row

Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

Commit row

Commits the selected row.

Delete row

Deletes the selected row.

Copy

Copies the content of the cell.

Paste

Pastes copied content into the selected cell.

Table Explorer Toolbar Actions

The toolbar of the **Table Explorer** view also includes the following actions:

Export to XML

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the Import from database *(page 2191)* chapter) .

Refresh

Performs a refresh for the sub-tree of the selected node.

Insert row

Inserts an empty row in the table.

Duplicate row

Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

Commit row

Commits the selected row.

Delete row

Deletes the selected row.

Data Source Explorer View *(page 2098)*

Database Connection Support

Oxygen XML Editor offers support for a variety of *Relational* and *Native XML* database connections. The database drivers and connections for various types of database are configured in the **Data Sources** preferences page *(page 227)* and once configured, the database connections can be viewed and managed in the **Data Source Explorer** view *(page 2098)*. Oxygen XML Editor also includes a **Database** *perspective (page 299)* that helps you to manage databases.

The database support in Oxygen XML Editor offers a variety of capabilities, including:

- Browsing the structure of databases in the **Data Source Explorer** view *(page 2098)*.

- Viewing relational tables in the **Table Explorer** view *(page 2100)*.
- Executing SQL queries against databases.
- Calling stored procedures with input and output parameters.
- XQuery execution with databases.
- Exporting data from databases to XML.

Relational Database Support

Relational databases use a relational model and are based on tables linked by a common key. Oxygen XML Editor offers support for the most commonly used relational databases, including:

- IBM DB2
- Oracle 11g
- Microsoft SQL Server
- PostgreSQL
- MySQL

Oxygen XML Editor also offers generic support (table browsing and execution of SQL queries) for any JDBC-compliant database (for example, *MariaDB*).

Native XML Database Support

Native XML databases have an XML-based internal model and their fundamental unit of storage is XML. They use XML as an interface to specify documents as tree structured data that may contain unstructured text, but on disk the data is stored as optimized binary files. This makes query and retrieval processes faster. Oxygen XML Editor offers support for the most commonly used native XML databases, including:

- Berkeley DB XML
- eXist
- MarkLogic
- Documentum xDB (X-Hive/DB) 10
- Oracle XML DB
- Base X

Related Information:

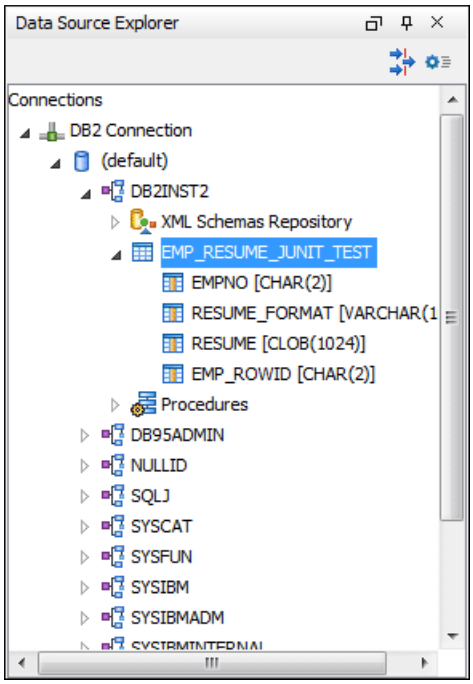
WebDAV Connections *(page 2162)*

Integration with Microsoft SharePoint *(page 2176)*

IBM DB2 Database Connections

Oxygen XML Editor includes support for IBM DB2 database connections. Oxygen XML Editor allows you to browse the structure of an IBM DB2 database in the **Data Source Explorer** view *(page 2098)*, open tables in the **Table Explorer** view *(page 2100)*, and perform various operations on the resources in the repository.

Figure: IBM DB2 Database Connection



Configuring an IBM DB2 Database Connection

To configure the support for the IBM DB2 database, follow this procedure:

1. Go to the IBM website and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file. Unzip the zip file and use the `db2jcc.jar` and `db2jcc_license_cu.jar` files in Oxygen XML Editor for configuring a DB2 data source *(page 2105)*.
2. Configure IBM DB2 *Data Source* drivers *(page 2105)*.
3. Configure an IBM DB2 Server *Connection (page 2107)*.
4. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

How to Configure IBM DB2 Data Source Drivers

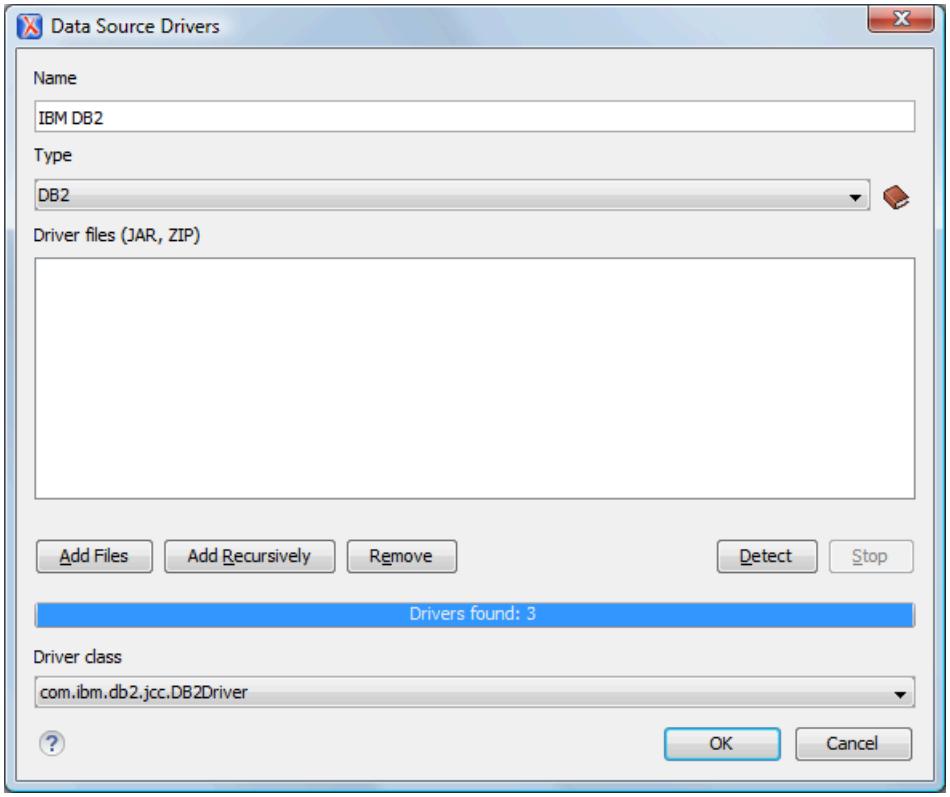
Available in the Enterprise edition only.

To configure a data source for connecting to an IBM DB2 server, follow these steps:

1. Go to the IBM website and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file.
2. Unzip the downloaded archive.
3. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
4. Click the **New** button in the **Data Sources** panel.

   The dialog box for configuring a data source is opened.

   Figure: Data Source Drivers Configuration Dialog Box

5. Enter a unique name for the data source.
6. Select *DB2* in the driver **Type** drop-down menu.
7. Click the **Add Files** button and select the IBM DB2 driver files from the archive that you downloaded and unzipped.

   The IBM DB2 driver files are:

   - `db2jcc.jar`

- `db2jcc_license_cisuz.jar`
- `db2jcc_license_cu.jar`

8. Select the most appropriate **Driver class**.
9. Click the **OK** button to finish the data source configuration.
10. Continue on to configure your IBM DB2 connection *(page 2107)*.

How to Configure an IBM DB2 Connection

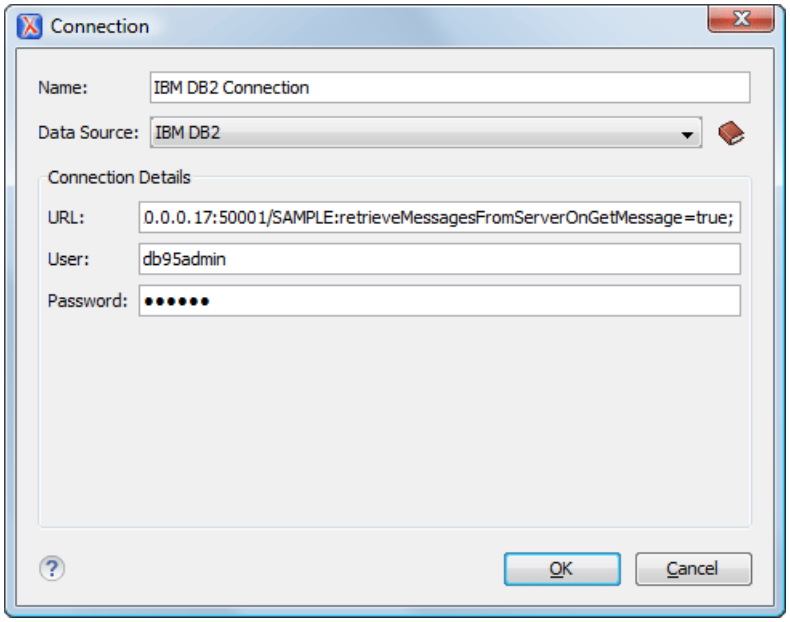
The support to create an IBM DB2 connection is available in the Enterprise edition only.

To configure a connection to an IBM DB2 server, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the + **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

   Figure: Connection Configuration Dialog Box



3. Enter a unique name for the connection.
4. Select an *IBM DB2* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
   a. Enter the URL to the installed IBM DB2 engine.
   b. Enter the user name to access the IBM DB2 engine.

c. Enter the password to access the IBM DB2 engine.

6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

IBM DB2 Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view *(page 2098)*, depending on the node in which it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on Connection nodes)

Opens the **Data Sources** preferences page *(page 227)* where you can configure both data sources and connections.

Edit (available on Table nodes)

Opens the selected table in the **Table Explorer** view *(page 2100)*.

Export to XML (available on Table nodes)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the Import from Database *(page 2191)* chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view *(page 2098)*, the various nodes in IBM DB2 connections include the following additional contextual menu actions:

XML Schema Repository Level Nodes

Register

Opens a dialog box for adding a new schema file in the DB XML repository.
In this dialog box, you enter a collection name and the necessary schema

files. Schema dependencies management can be done by using the **Add** and **Remove** buttons.

Schema Level Nodes

Unregister

Removes the selected schema from the XML Schema Repository.

View

Opens the selected schema in Oxygen XML Editor.

Microsoft SQL Server Database Connections

Oxygen XML Editor includes support for Microsoft SQL Server database connections. Oxygen XML Editor allows you to browse the structure of a SQL Server database in the **Data Source Explorer** view *(page 2098)*, open tables in the **Table Explorer** view *(page 2100)*, and perform various operations on the resources in the repository.

Configuring a Microsoft SQL Server Connection

To configure the support for a Microsoft SQL Server database, follow this procedure:

1. Download the appropriate MS SQL JDBC driver from the Microsoft website. For SQL Server 2008 R2 and older go to http://www.microsoft.com/en-us/download/details.aspx?id=21599. For SQL Server 2012 and 2014 go to http://www.microsoft.com/en-us/download/details.aspx?id=11774.
2. Configure MS SQL Server *Data Source* drivers *(page 2109)*.
3. Configure a MS SQL Server *Connection (page 2110)*.
4. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

How to Configure Microsoft SQL Server Data Source Drivers

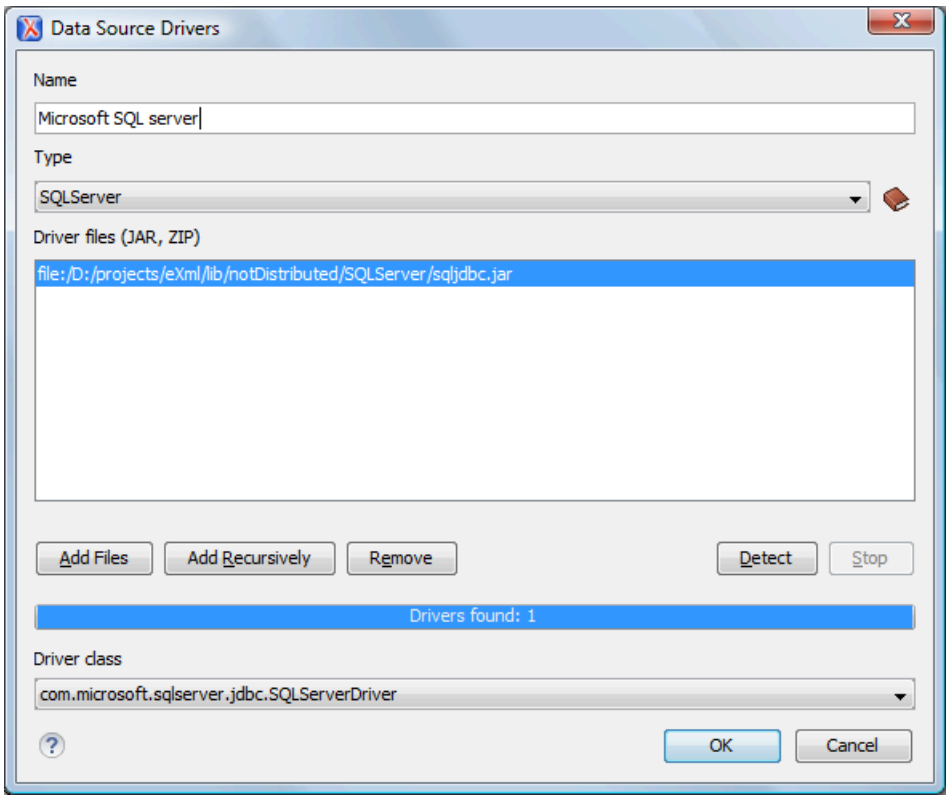
Available in the Enterprise edition only.

To configure a data source for connecting to a Microsoft SQL server, follow these steps:

1. Download the appropriate MS SQL JDBC driver from the Microsoft website. For SQL Server 2008 R2 and older, go to http://www.microsoft.com/en-us/download/details.aspx?id=21599. For SQL Server 2012 and 2014, go to http://www.microsoft.com/en-us/download/details.aspx?id=11774.
2. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
3. Click the **New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

Figure: Data Source Drivers Configuration Dialog Box



4. Enter a unique name for the data source.
5. Select *SQLServer* in the driver **Type** drop-down menu.
6. Click the **Add Files** button and select the Microsoft SQL Server driver file that you downloaded. The SQL Server driver file is called `sqljdbc.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure your Microsoft SQL Server connection *(page 2110)*.

How to Configure a Microsoft SQL Server Connection

The support to configure a Microsoft SQL Server connection is available in the Enterprise edition only.

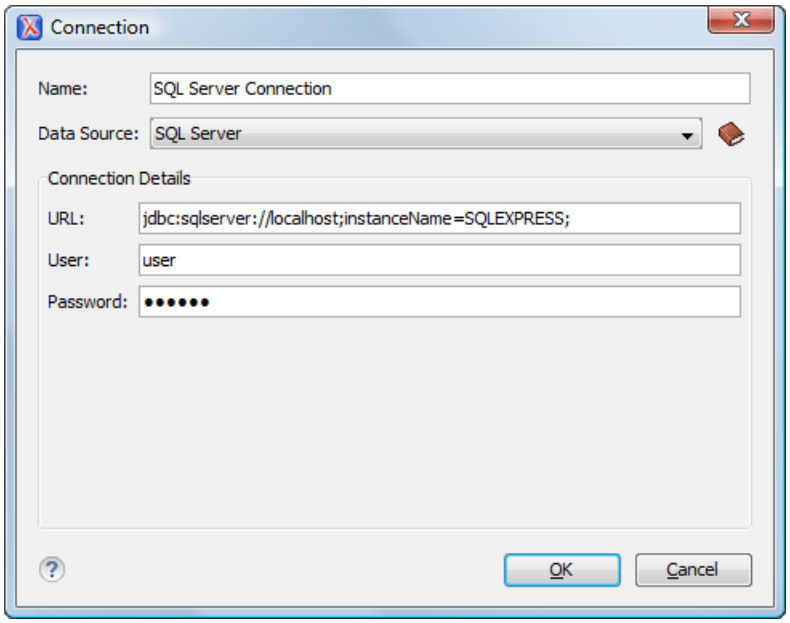
To configure a connection to a Microsoft SQL Server, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.

2. Click the + **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

   Figure: Connection Configuration Dialog Box



3. Enter a unique name for the connection.
4. Select the *SQL Server* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the SQL Server server.
      If you want to connect to the server using Windows integrated authentication, you must add **;integratedSecurity=true** to the end of the URL. The URL will look like this:

      ```
      jdbc:sqlserver://localhost;instanceName=SQLEXPRESS;integratedSecurity=true;
      ```

      Note: For integrated authentication, leave the **User** and **Password** fields empty.

   b. Enter the user name for the connection to the SQL Server.
   c. Enter the password for the connection to the SQL Server.
6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

Microsoft SQL Server Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view *(page 2098)*, depending on the node in which it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on Connection nodes)

Opens the **Data Sources** preferences page *(page 227)* where you can configure both data sources and connections.

Edit (available on Table nodes)

Opens the selected table in the **Table Explorer** view *(page 2100)*.

Export to XML (available on Table nodes)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the Import from Database *(page 2191)* chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view *(page 2098)*, the resource level nodes in Microsoft SQL Server connections include the following additional contextual menu action:

XML Schema Repository Level Nodes

Register

Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the **Add** and **Remove** buttons.

Schema Level Nodes

Add

Adds a new schema to the XML Schema files.

Unregister

Removes the selected schema from the XML Schema Repository.

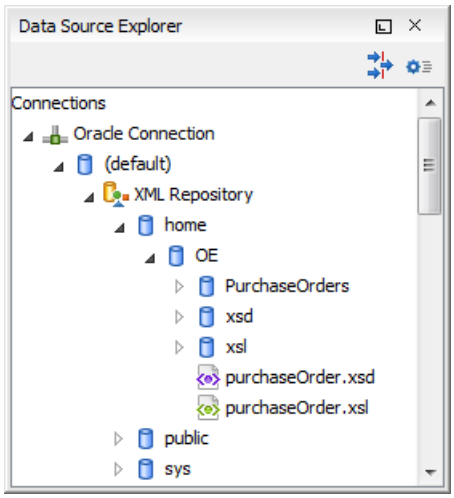
View

Opens the selected schema in Oxygen XML Editor.

Oracle Database Connections

The Oracle database is a common relational type of database system. Oxygen XML Editor comes with built-in support for the 11g version of the database system. The Oracle database also includes a Oracle XML DB component that adds native XML support. Oxygen XML Editor allows you to browse Oracle repositories in the **Data Source Explorer** view *(page 2098)*, open tables in the **Table Explorer** view *(page 2100)*, and perform various operations on the resources in the repository.

Figure: Oracle Database Connection



Related Information:

Using XQuery with Oracle XML DB

Configuring an Oracle 11g Database Connection

To configure the support for a Oracle 11g database, follow this procedure:

1. Go to http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html and download the Oracle 11g JDBC driver called `ojdbc6.jar`.
2. Configure Oracle 11g *Data Source* drivers *(page 2114)*.
3. Configure an Oracle 11g *Connection (page 2115)*.
4. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

How to Configure Oracle 11g Data Source Drivers

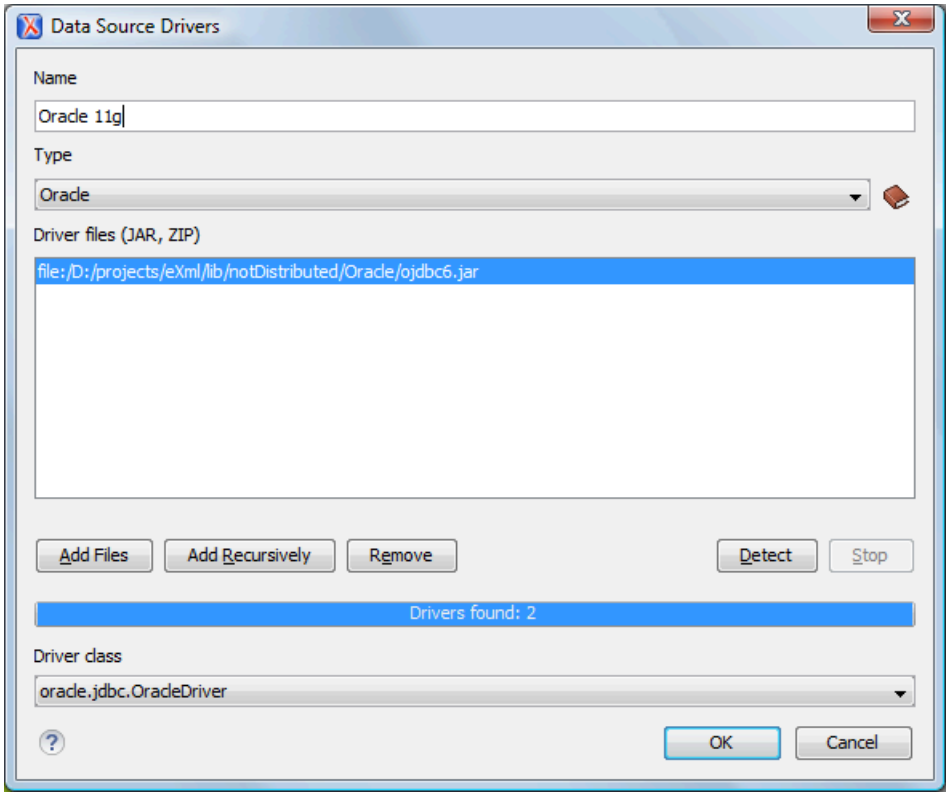
Available in the Enterprise edition only.

To configure a data source for connecting to an Oracle 11g server, follow these steps:

1. Go to http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html and download the Oracle 11g JDBC driver called `ojdbc6.jar`.
2. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
3. Click the + **New** button in the **Data Sources** panel.

   The dialog box for configuring a data source is opened.

   Figure: Data Source Drivers Configuration Dialog Box



4. Enter a unique name for the data source.
5. Select *Oracle* in the driver **Type** drop-down menu.
6. Click the **Add Files** button and select the Oracle driver file that you downloaded.
   The Oracle driver file is called `ojdbc5.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure your Oracle connection *(page 2115)*.

How to Configure an Oracle 11g Connection

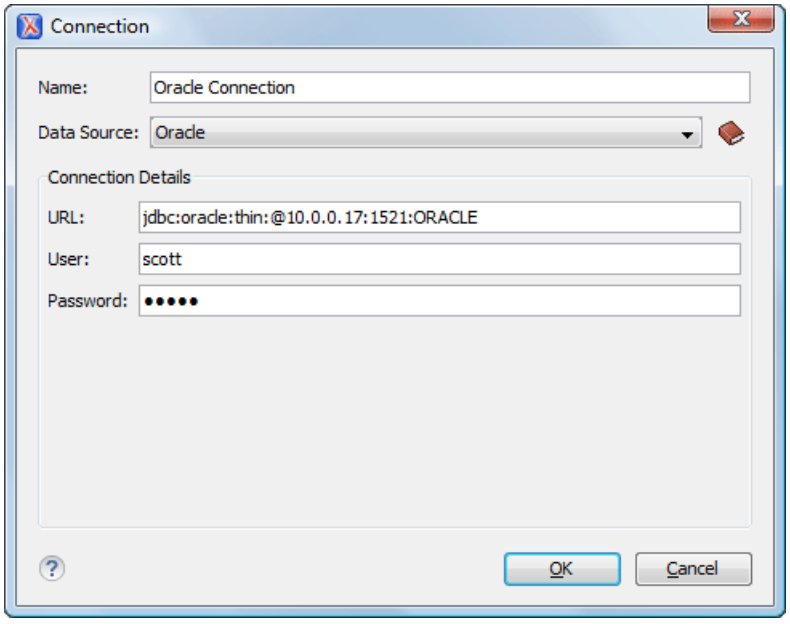
Available in the Enterprise edition only.

To configure a connection to an Oracle 11g server, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the + **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

   Figure: Connection Configuration Dialog Box



3. Enter a unique name for the connection.

4. Select the *Oracle 11g* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the Oracle server.
   b. Enter the user name for the connection to the Oracle server.
   c. Enter the password for the connection to the Oracle server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

Oracle Database Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view *(page 2098)*, depending on the node in which it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on Connection nodes)

Opens the **Data Sources** preferences page *(page 227)* where you can configure both data sources and connections.

Edit (available on Table nodes)

Opens the selected table in the **Table Explorer** view *(page 2100)*.

Export to XML (available on Table nodes)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the Import from Database *(page 2191)* chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view *(page 2098)*, the various nodes in Oracle database connections include the following additional contextual menu actions:

XML Schema Repository Level Nodes

Register

Opens a dialog box for adding a new schema file in the XML repository. To add an XML Schema, enter the schema URI and location on your file system. *Local* scope means that the schema is visible only to the user who registers it. *Global* scope means that the schema is public.

Note: Registering a schema may involve dropping/creating types. Hence you need type-related privileges such as DROP TYPE, CREATE TYPE, and ALTER TYPE. You need privileges to delete and register the XML schemas involved in the registering process. You need all privileges on XMLType tables that conform to the registered schemas. For XMLType columns, the ALTER TABLE privilege is needed on corresponding tables. If there are schema-based XMLType tables or columns in other database schemas, you need privileges such as the following:

- `CREATE ANY TABLE`
- `CREATE ANY INDEX`
- `SELECT ANY TABLE`
- `UPDATE ANY TABLE`
- `INSERT ANY TABLE`
- `DELETE ANY TABLE`
- `DROP ANY TABLE`
- `ALTER ANY TABLE`
- `DROP ANY INDEX`

To avoid having to grant all these privileges to the schema owner, Oracle recommends that the registration be performed by a DBA if there are XML schema-based XMLType table or columns in other user database schemas.

XML Repository Level Nodes

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

Container Level Nodes

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

Delete

Deletes the current container.

Properties

Shows various properties of the current container.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor will detect that there was a change and will ask if you want to upload the edited resource to the server.

Rename

Renames the current resource

Move

Moves the current resource to a new container (also available through drag and drop).

Delete

Deletes the current container.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Properties

Shows various properties of the current container.

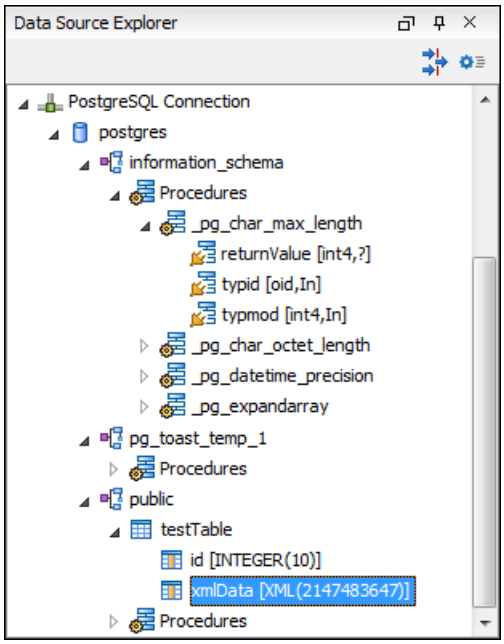
Compare

Compares two selected resources using the **Compare Files** tool *(page 2728)*.

PostgreSQL Database Connections

Oxygen XML Editor includes support for PostgreSQL database connections. Oxygen XML Editor allows you to browse the structure of a PostgreSQL database in the **Data Source Explorer** view *(page 2098)*, open tables in the **Table Explorer** view *(page 2100)*, and perform various operations on the resources in the repository.

Figure: PostgreSQL Database Connection



Configuring a PostgreSQL Database Connection

To configure the support for a PostgreSQL database, follow this procedure:

1. Go to http://jdbc.postgresql.org/download.html and download the PostgreSQL 8.3 JDBC3 driver.
2. Configure PostgreSQL *Data Source* drivers *(page 2119)*.
3. Configure a PostgreSQL *Connection (page 2120)*.
4. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

How to Configure PostgreSQL 8.3 Data Source Drivers

To configure a data source for connecting to a PostgreSQL server, follow these steps:

1. Go to http://jdbc.postgresql.org/download.html and download the PostgreSQL 8.3 JDBC3 driver.
2. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
3. Click the **+ New** button in the **Data Sources** panel.

   The dialog box for configuring a data source is opened.

4. Enter a unique name for the data source.
5. Select *PostgreSQL* in the driver **Type** drop-down list.
6. Click the **Add Files** button and select the PostgreSQL driver file that you downloaded.
   The PostgreSQL driver file is called `postgresql-8.3-603.jdbc3.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure your PostgreSQL connection *(page 2120)*.

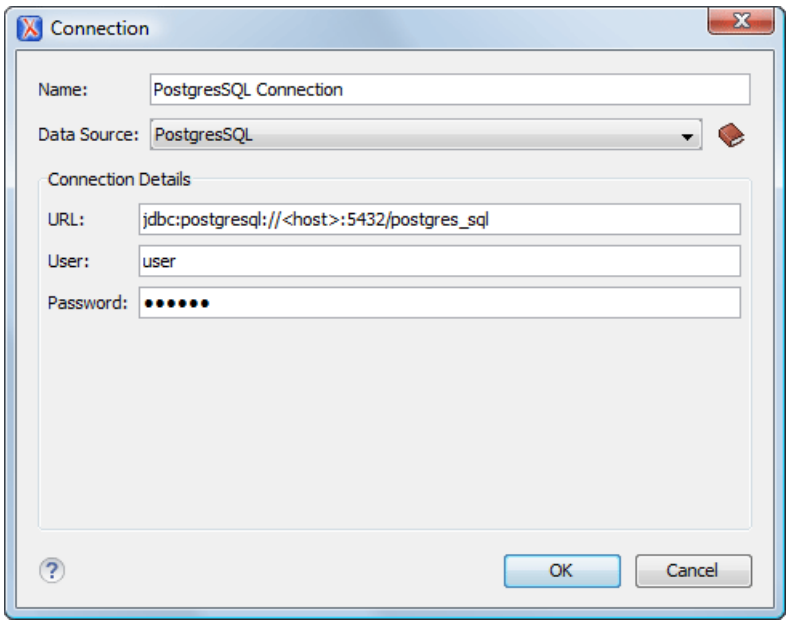
How to Configure a PostgreSQL 8.3 Connection

To configure a connection to a PostgreSQL 8.3 server, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

Figure: Connection Configuration Dialog Box



3. Enter a unique name for the connection.
4. Select the *PostgreSQL 8.3* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the PostgreSQL 8.3 server.
   b. Enter the user name for the connection to the PostgreSQL 8.3 server.
   c. Enter the password for the connection to the PostgreSQL 8.3 server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

PostgreSQL Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view *(page 2098)*, depending on the node in which it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on Connection nodes)

Opens the **Data Sources** preferences page *(page 227)* where you can configure both data sources and connections.

Edit (available on Table nodes)

Opens the selected table in the **Table Explorer** view *(page 2100)*.

Export to XML (available on Table nodes)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the Import from Database *(page 2191)* chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view *(page 2098)*, the resource level nodes in PostgreSQL connections include the following additional contextual menu action:

Resource Level Nodes

Compare

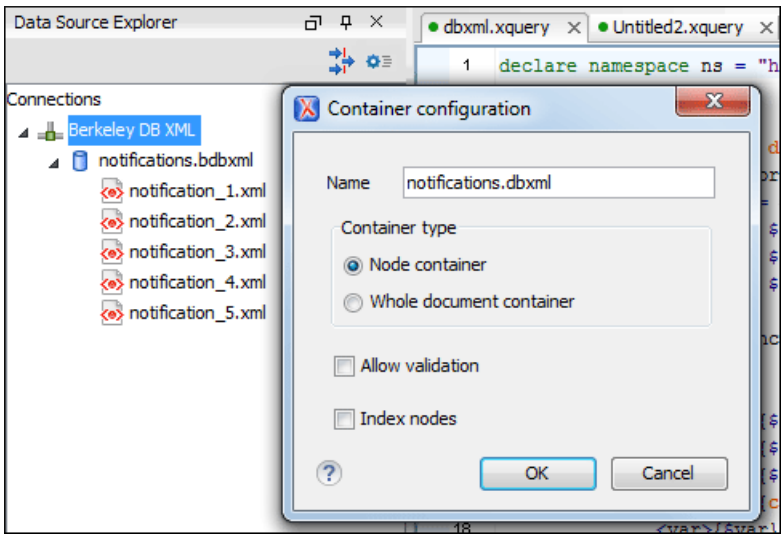
Compares two selected resources using the **Compare Files** tool *(page 2728)*.

Berkeley DB XML Database Connections

Oxygen XML Editor includes support for Berkeley DB XML database connections. Oxygen XML Editor allows you to browse the structure of a Berkeley DB XML database in the **Data Source Explorer** view *(page 2098)* and perform various operations on the resources in the repository.

Oracle Berkeley DB XML is an open source, embeddable XML database with XQuery-based access to documents stored in containers and indexed based on their content. It is built on top of the Oracle Berkeley DB and inherits its features and attributes, along with native XML support. A detailed description can be found at: http://www.oracle.com/us/products/database/berkeley-db/xml/overview/index.html.

Figure: Berkeley DB XML Connection



Configuring a Berkeley DB XML Database Connection

Follow this procedure to configure the support for a Berkeley DB XML database:

1. Configure Berkeley DB XML *Data Source* drivers *(page 2123)*.
2. Configure a Berkeley DB XML *Connection (page 2124)*.
3. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

How to Configure Berkeley DB XML Data Source Drivers

For this procedure, you need to already have a Berkeley DB XML database installed on your system.

Oxygen XML Editor supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a data source for a Berkeley DB XML database, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the **New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *Berkeley DBXML* from the driver **Type** drop-down menu.
5. Click the **Add Files** button to add the Berkeley DB driver files.

   The driver files for the Berkeley DB database (and their locations) are as follows:

   - `db.jar` (check for it in `[DBXML_DIR]/lib` or `[DBXML_DIR]/jar`)

- `dbxml.jar` (check for it in `[DBXML_DIR]/lib` or `[DBXML_DIR]/jar`)

Where `[DBXML_DIR]` is the Berkeley DB XML database root directory. For example, in Windows it is: `C:\Program Files\Oracle\Berkeley DB XML <version>`.

6. Click the **OK** button to finish the data source configuration.
7. Continue on to configure your Berkeley DB XML connection *(page 2124)*.

How to Configure a Berkeley DB XML Connection

Oxygen XML Editor supports Berkeley DB XML versions 2.3.10, 2.4.13, 2.4.16 & 2.5.16. To configure a connection to a Berkeley DB XML database, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select a previously configured Berkeley data source from the **Data Source** drop-down menu.
5. Enter the connection details.
   a. Set the path to the Berkeley DB XML `database` directory in the **Environment home directory field**. Use a directory with write access. DO NOT use the installation directory where Berkeley DB XML is installed if you do not have write access to that directory.
   b. Select the **Verbosity** level: *DEBUG*, *INFO*, *WARNING*, or *ERROR*.
   c. Optionally, you can select the **Join existing environment** checkbox.
   If selected, an attempt is made to join an existing environment in the specified home directory and all the original environment settings are preserved. If that fails, try reconfiguring the connection with this option unchecked.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

Berkeley DB XML Contextual Menu Actions

While browsing Berkeley DB XML connections in the **Data Source Explorer** view *(page 2098)*, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources** preferences page *(page 227)* where you can configure both data sources and connections.

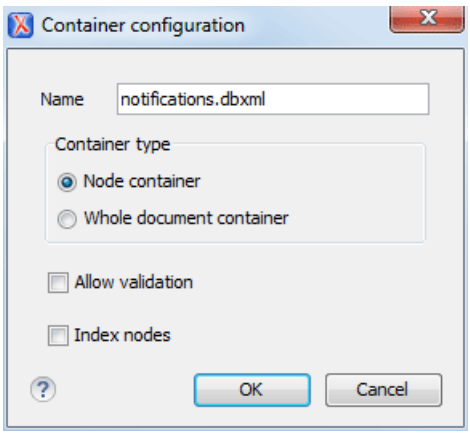
Disconnect

Stops the connection.

New Collection

Opens a **Container configuration** dialog box that allows you to adds a new container in the repository.

Figure: Container Configuration Dialog Box



This dialog box allows you to configure the following:

- **Name** - The name of the new container.
- **Container type** - At creation time, every container must have a type defined for it. This container type identifies how XML documents are stored in the container. As such, the container type can only be determined at container creation time. You cannot change it when subsequent container opens. You can select one of the following types:
  # **Node container** - XML documents are stored as individual nodes in the container. Each record in the underlying database contains a single leaf node, its attributes and attribute values (if any), and its text nodes (if any). Berkeley DB XML also keeps the information it requires to reassemble the document from the individual nodes stored in the underlying databases. This is the default selection and is the preferred container type.
  # **Whole document container** - The container contains entire documents. The documents are stored without any manipulation of line breaks or whitespace.

- **Allow validation** - If selected, documents will be validated when they are loaded into the container. The default behavior is to not validate documents.
- **Index nodes** - If selected, indices for the container will return nodes rather than documents. The default is to index at the document level. This property has no meaning if the container type is **Whole document container**.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Container Level Nodes

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

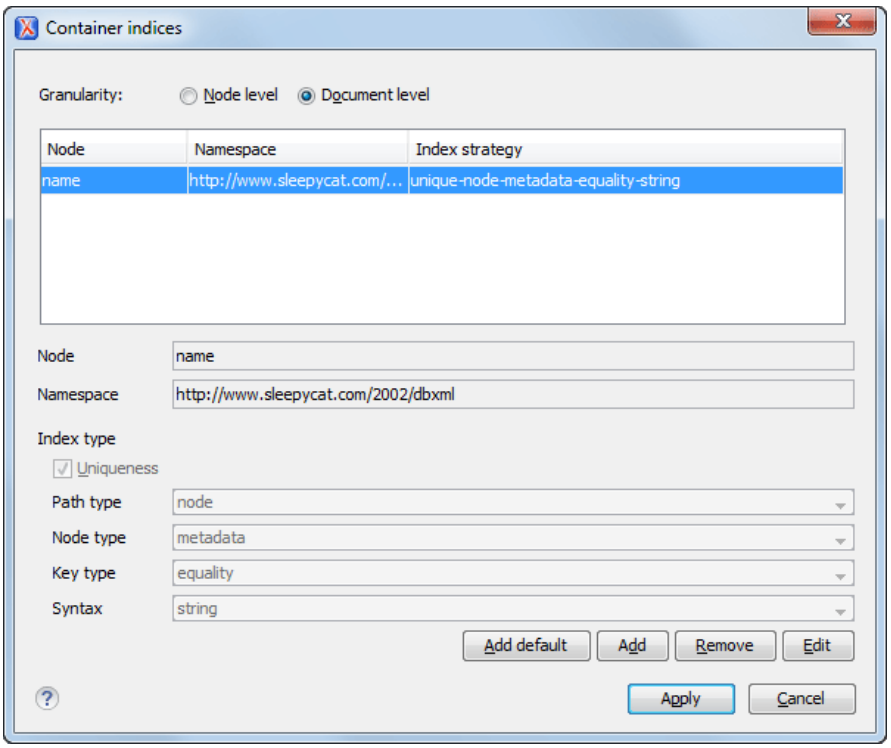
Delete

Deletes the current container.

Edit indices

Opens a **Container Indices** dialog box that allows you to configure indices properties for the selected Berkeley container.

Figure: Container Indices Dialog Box



This dialog box allows you to configure the following properties:

- **Granularity** - A measure of the level of details of your data in the database. You can select one of the following:
  # **Document level** - Good option for retrieving large documents.
  # **Node level** - Good option for retrieving nodes from within documents.
- **Node** - The name of the node.
- **Namespace** - The index namespace.
- **Index type**:
  # **Uniqueness** - Indicates whether or not the indexed value must be unique within the container.
  # **Path type** - Drop-down menu that allows you to select from the following:
    # **node** - Indicates that you want to index a single node in the path.
    # **edge** - Indicates that you want to index the portion of the path where two nodes meet.
  # **Node type** - Drop-down menu that allows you to select from the following:
    # **element** - An element node in the document content.

        # **attribute** - An attribute node in the document content.
        # **metadata** - A node found only in the metadata content of a document.
    # **Key type** - Drop-down menu that allows you to select from the following:
        # **equality** - Improves the performances of tests that look for nodes with a specific value.
        # **presence** - Improves the performances of tests that look for the existence of a node regardless of its value.
        # **substring** - Improves the performance of tests that look for a node whose value contains a given sub-string.
    # **Syntax** - The syntax describes the type of data the index contains and is mostly used to determine how indexed values are compared. The default value is `string`.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Compare

Compares two selected resources using the **Compare Files** tool *(page 2728)*.

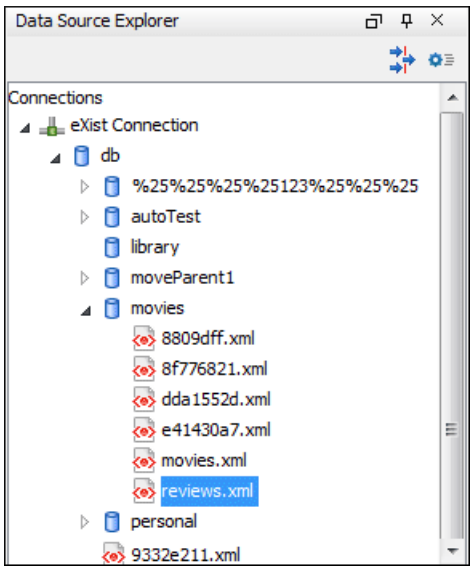
Debugging with Berkeley DB XML

The Berkeley DB XML database added a debugging interface starting with version 2.5. The current version is supported in the Oxygen XML Editor XQuery Debugger. The same restrictions and peculiarities *(page 2142)* apply for the Berkeley debugger as for the MarkLogic debugger.

eXist Database Connections

Oxygen XML Editor includes support for eXist database connections. Oxygen XML Editor allows you to browse the structure of a eXist database in the **Data Source Explorer** view *(page 2098)* and perform various operations on the resources in the repository.

Figure: eXist Database Connection



Configuring an eXist Database Connection

There are two ways to configure the support for an eXist database:

- Use the dedicated **Create eXist-db XML connection** wizard.
  1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)*, go to **Data Sources** and click the **Create eXist-db XML connection** link.
  2. Enter your connection details in the connection wizard and click **OK**.

     Important: To create an eXist connection using this wizard, Oxygen XML Editor expects the `exist/webstart/exist.jnlp` path to be accessible at the provided **Host** and **Port**.

  3. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.
- Use the **Data Sources** preferences page to configure your connection.
  1. Configure eXist *Data Source* drivers *(page 2130)*.
  2. Configure an eXist *Connection (page 2132)*.
  3. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

How to Configure eXist Data Source Drivers

For this procedure, you need to already have an eXist database server installed.

Oxygen XML Editor supports eXist database server versions up to and including version 3.0. To configure a data source for an eXist database, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the **+ New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *eXist* from the driver **Type** drop-down menu.
5. Click the **Add Files** button to add the eXist driver files.
   The following driver files should be added and they are found in the installation directory of the eXist database server. Make sure you copy the files from the installation of the eXist server where you want to connect from Oxygen XML Editor.

   eXist 3.x
   - `exist.jar`
   - `lib/core/xmldb.jar`
   - `lib/core/xmlrpc-client-3.1.x.jar`
   - `lib/core/xmlrpc-common-3.1.x.jar`
   - `lib/core/ws-commons-util-1.0.x.jar`
   - `lib/core/slf4j-api-1.x.x.jar` (if available)
   - `lib/core/slf4j-log4j12-1.x.x.jar` (if available)

   eXist 4.x
   - `exist.jar`
   - `lib/core/log4j-api-*.jar`
   - `lib/core/log4j-jul-*.jar`
   - `lib/core/log4j-slf4j-impl-*.jar`
   - `lib/core/slf4j-api-*.jar`
   - `lib/core/ws-commons-util-*.jar`
   - `lib/core/xmldb.jar`
   - `lib/core/xmlrpc-client-*.jar`
   - `lib/core/xmlrpc-common-*.jar`

   The `*` represents the version number.
6. Click the **OK** button to finish the data source configuration.
7. Continue on to configure your eXist connection *(page 2132)*.
   For more information about running XQuery against an eXist XML database, watch our video demonstration:

How to Configure an eXist Connection

To configure a connection to an eXist database, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select a previously configured eXist data source from the **Data Source** drop-down menu.
5. Enter the connection details.
   a. Set the URI to the installed eXist engine in the **XML DB URI** field.
   b. Set the user name in the **User** field.
   c. Set the password in the **Password** field.
   d. Enter the start collection in the **Collection** field.
   eXist organizes all documents in hierarchical collections. Collections are like directories. They are used to group related documents together. This text field allows the user to set the default collection name.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.
   For more information about running XQuery against an eXist XML database, watch our video demonstration:

eXist Contextual Menu Actions

While browsing eXist database connections in the **Data Source Explorer** view *(page 2098)*, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources** preferences page *(page 227)* where you can configure both data sources and connections.

Disconnect

Stops the connection.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Container Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Collection

Creates a new collection on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Paste

Pastes the copied selection.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor will detect that there was a change and will ask if you want to upload the edited resource to the server.

Save As

Allows you to save the selected resource as a file on disk.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Compare

Compares two selected resources using the **Compare Files** tool *(page 2728)*.

MarkLogic Database Connections

Oxygen XML Editor Enterprise edition includes support for MarkLogic database connections. Once you configure a MarkLogic connection *(page 2136)*, you can use the **Data Source Explorer** view *(page 2098)* to display all the application servers that are configured on the MarkLogic server. You can expand each application server and view all of its configured modules, and the **Data Source Explorer** view *(page 2098)* allows you to open and edit these modules.

Note: To browse modules located in a database, directory properties must be associated with them. These directory properties are generated automatically if the *directory creation* property of the database is set to automatic. If this property is set to **manual** or **manual-enforced**, add the directory properties of the modules manually, using the XQuery function `xdmp:directory-create()`. For example, for two documents with the `/code/modules/main.xqy` and `/code/modules/imports/import.xqy` IDs, run the following query:

```
(xdmp:directory-create('/code/modules/'), xdmp:directory-create('/code/modules/
imports/'))
```

For more information about directory properties, go to: http://blakeley.com/blogofile/2012/03/19/directory-assistance/.

MarkLogic and XQuery

MarkLogic connections can be used in conjunction with XQuery scripts to debug and solve problems with XQuery transformations. XQuery modules can also be validated using a MarkLogic server to allow to you to spot possible issues without the need of actually executing the XQuery script.

When debugging XQuery files with MarkLogic *(page 2140)*, you can use the **Data Source Explorer** view *(page 2098)* to open the files from the application server that is involved in the debugging process. By using the **Data Source Explorer** view *(page 2098)*, any imported modules are better identified by the MarkLogic server. You can also use step actions and breakpoints *(page 2141)* in the modules to help identify problems.

Modules Container

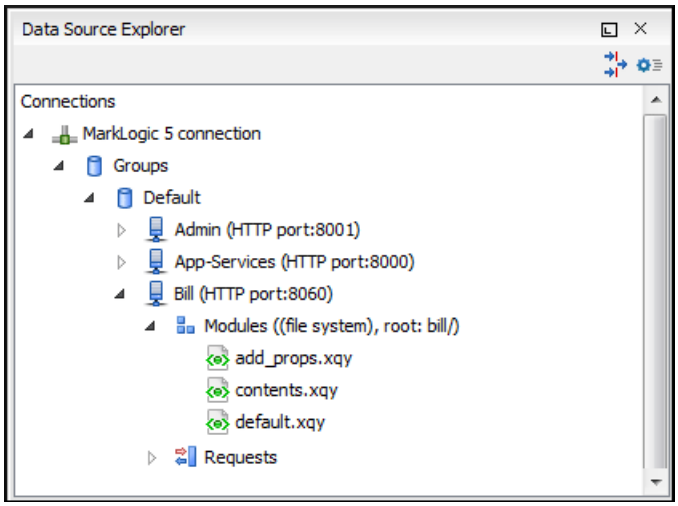
For each Application server (for example: *Bill (HTTP port:8060)*), you have access to the XQuery modules that are visible to that server. When editing, executing, or debugging XQuery it is recommended to open the XQuery files from this **Modules** container.

Note: You can also manage resources for a MarkLogic database through a WebDAV connection, although it is not recommended if you work with XQuery files since imported modules may not be resolved correctly.

Requests Container

Each MarkLogic application server includes a **Requests** container. In this container, Oxygen XML Editor displays both queries that are stopped for debugging purposes and queries that are still running. To clean up the entire **Requests** container at the end of your session, right-click it and use the **Cancel all requests** action *(page 2144)*.

Figure: MarkLogic Connection in Data Source Explorer



Configuring a MarkLogic Database Connection

Note that this feature is available in Oxygen XML Editor Enterprise edition only.

Follow this procedure to configure the support for a MarkLogic database connection:

1. Download the MarkLogic driver from MarkLogic Community site.
2. Configure MarkLogic *Data Source* drivers *(page 2137)*.
3. Configure a MarkLogic *Connection (page 2137)*.

4. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

Related Information:

MarkLogic Development in Oxygen XML Editor *(page 2138)*

How to Configure MarkLogic Data Source Drivers

Available in the Enterprise edition only.

Note: Oxygen XML Editor supports MarkLogic version 4.0 or later.

To configure a data source for MarkLogic, follow this procedure:

1. Download the **XCC Java distribution** zip file from: http://developer.marklogic.com/products/xcc.
2. Unzip the downloaded archive.
3. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
4. Click the **+ New** button in the **Data Sources** panel.
5. Enter a unique name for the data source.
6. Select *MarkLogic* from the driver **Type** drop-down list.
7. Click the **Add Files** button and select the MarkLogic driver file from the `lib` folder of the archive that you downloaded and unzipped. The driver file name is `marklogic-xcc-{server_version}.jar`, where *{server_version}* is the MarkLogic server version.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure your MarkLogic Connection *(page 2137)*.

How to Configure a MarkLogic Connection

Available in the Enterprise edition only.

Note: Oxygen XML Editor supports MarkLogic version 4.0 or later.

To configure a connection to a MarkLogic database, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select a previously configured MarkLogic data source from the **Data Source** drop-down menu.
5. Enter the connection details.

    a. The host name or IP address of the installed MarkLogic engine in the **XDBC Host** field.

Oxygen XML Editor uses XCC connector to interact with MarkLogic XDBC server and requires the basic authentication schema to be set. Starting with version MarkLogic 4.0 the default authentication method when you create an HTTP or WebDAV Server is *digest*, so make sure to change it to *basic*.

b. Set the port number of the MarkLogic engine in the **Port** field. A MarkLogic XDBC application server must be configured on the server on this port. This XDBC server will be used to process XQuery expressions against the server. Later, if you want to change the XDBC server, instead of editing the configuration just use the **Use it to execute queries** action *(page 2143)* from Data Source Explorer.

c. Set the user name to access the MarkLogic engine in the **User** field.

d. Set the password to access the MarkLogic engine in the **Password** field.

e. Optionally, in the **WebDAV URL** field, set the URL used for browsing the MarkLogic database in the **Data Source Explorer** view *(page 2098)*.
The **Database** field specifies the database for which the XQuery expressions are executed. If you set this option to default, the database associated to the application server of the configured port is used.

6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

MarkLogic Development in Oxygen XML Editor

The Oxygen XML Editor support for MarkLogic includes features designed for developers, such as debugging XQuery transformations, remote and collaborative debugging, XQuery editing and validation, and an XQuery builder *(page 1332)* that helps to improve productivity.

Working with XQuery Files

MarkLogic supports working with XQuery files to create queries over stored XML content. You can open an XQuery file, configure a transformation scenario to match your MarkLogic connection, write the XQuery, and then execute it.

When editing XQuery modules stored on the MarkLogic server, the **Outline** view *(page 1330)* collects and displays all the functions from all imported modules. The *Content Completion Assistant (page 3227)* also presents all of these functions along with the latest built-in XQuery functions in accordance with the server version.

When developing queries for MarkLogic, it is best to open the resources from the **Data Source Explorer** view *(page 2098)*. When you execute or debug XQuery files opened from this view, imported modules can be resolved better by the MarkLogic server. Another advantage is that validation is automatically performed on the MarkLogic server, including any imported modules.

XQuery Debugging

Oxygen XML Editor allows you to use MarkLogic connections to debug real applications that use XQuery (for example, web applications that trigger XQuery executions). By setting the server in debug mode, you can intercept all the XQuery scripts that run on that server. Oxygen XML Editor connects to the MarkLogic server, shows you the running XQuery scripts, and allows you to debug them. The remote debugging support also allows you to debug collaboratively. Multiple users can participate in the same debugging session. You can start a debugging session and another user can continue it, and vice versa.

Working with Modules

MarkLogic has a concept of two types of XQuery modules, *library* and *main* modules. A *library* module is used to define functions. Library modules cannot be evaluated directly. They are imported, either from other library modules or from main modules. A *main* module is used as an entry point that can be executed as an XQuery program. For more information on these types of modules, see XQuery Library Modules and Main Modules.

When working with *library* modules, you need to create a validation scenario and associate it with the module. In the validation scenario you need to specify a main module as the entry point for validation. The modules need to be deployed on a MarkLogic server because Oxygen XML Editor will request the server to validate the modules.

To validate *library* modules stored on a MarkLogic server, follow these steps:

1. Configure a MarkLogic database connection *(page 2136)*.
2. Expand the MarkLogic connection in the **Data Source Explorer** view *(page 2098)* and open the *library* modules. The *main* module must also be opened from the **Data Source Explorer** view *(page 2098)*.
3. Configure a validation scenario *(page 1082)* for each *library* module. Specify the *main* module in the **URL of the file to validate** field.

   Result: Validation is done on the server that contains the *main* module. The *main* module and all other *library* modules involved in the validation must be saved. Otherwise, the server will validate what was saved on the server, without the uncommitted changes. Also, the *Content Completion*

Assistant (page 3227) and the **Outline** view *(page 1330)* should now present the functions from all the modules.

Related Information:

Debugging with MarkLogic *(page 2140)*

Configuring a MarkLogic Database Connection *(page 2136)*

Debugging with MarkLogic

Oxygen XML Editor includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a MarkLogic data source *(page 2137)* and a MarkLogic connection *(page 2137)*.
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Editor accesses. On the server side, debugging must be activated in the XDBC server and in the *Task Server* section of the server control console (the switch *debug allow*). If the debugging is not activated, the MarkLogic server reports a **DBG-TASKDEBUGALLOW** error.

   Note: An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Editor uses to process XQuery expressions by selecting the **Use it to execute queries** action *(page 2143)* from the contextual menu in the **Data Source Explorer** view *(page 2098)*.

3. Open the XQuery file and start the debugging process.
   - If you want to debug an XQuery file stored on the MarkLogic server, we recommend you to use the **Data Source Explorer** view *(page 2098)* and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.
   - The MarkLogic XQuery debugger integrates seamlessly into the XQuery Debugger *perspective (page 297)*. If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to debug the scenario *(page 2218)* directly.
   - Otherwise, switch to the **XQuery Debugger** *perspective (page 3232)*, open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the debug control toolbar *(page 2202)*.

For general information about how a debugging session is started and controlled, see the Working with the Debugger *(page 2218)* section.

In a MarkLogic debugging session, you can use step actions and *breakpoints (page 2222)* to help identify problems. When you add a *breakpoint (page 2223)* on a line where the debugger never stops, Oxygen XML Editor displays a warning message. These warnings are displayed for *breakpoints* you add either in the main XQuery (which you can open locally or from the server) or for *breakpoints* you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see Using Breakpoints for Debugging Queries that Import Modules with MarkLogic *(page 2141)*.

Remote Debugging with MarkLogic

Oxygen XML Editor allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Editor connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.

Oxygen XML Editor also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

Important: When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

For more information about the XQuery debugger for MarkLogic, watch our video demonstration:

Configuring a MarkLogic Database Connection *(page 2136)*

Using Breakpoints for Debugging Queries that Import Modules with MarkLogic

When debugging queries that imports modules stored in the database, it is recommended to place *breakpoints (page 2222)* in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the *breakpoints* in all the modules will be considered. Also, make sure that there are no other opened modules that are not involved in the current debugging session.

To place *breakpoints* in the modules, use the following procedure:

1. In the **Data Source Explorer** view *(page 2098)*, open all the modules from the **Modules** container of the XDBC application server *(page 2137)* that performs the debugging.
2. Set *breakpoints (page 2223)* in the module as needed.
3. Continue debugging *(page 2218)* the query.

If you get a warning that the *breakpoints* failed to initialize, try the following solutions:

- Check the **Breakpoints** view *(page 2206)* and make sure there are no older *breakpoints* (set on resources that are not part of the current debugging context).
- Make sure you open the modules from the context of the application server that does the debugging and place *breakpoints* there.

MarkLogic Database Connections *(page 2135)*

MarkLogic Development in Oxygen XML Editor *(page 2138)*

Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

- Debugging support is only available for MarkLogic server versions 4.0 or newer.
- For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: *'0.9-ml' (inherited from MarkLogic 3.2)*, *'1.0-ml'*, and *'1.0'*.
- All declared variables are presented as strings. The **Value** column of the **Variables** view contains the expression from the variable declaration. It can be evaluated by copying the expression with the **Copy value** action from the contextual menu of the **Variables** view *(page 2216)* and pasting it in the **XWatch** view *(page 2208)*.
- There is no support for output to source mapping *(page 2219)*.
- There is no support for showing the trace *(page 2213)*.
- You can only set breakpoints *(page 2206)* in imported modules in one of the following cases:
  # When you open the module from the context of the application server involved in the debugging, using the **Data Source Explorer** view *(page 2098)*.
  # When the debugger automatically opens the modules in the Editor.
- No *breakpoints (page 2222)* are set in modules from the same server that are not involved in the current debugging session.

- No support for profiling *(page 2223)* when an XQuery transformation is executed in the debugger.

MarkLogic Contextual Menu Actions

While browsing MarkLogic connections in the **Data Source Explorer** view *(page 2098)*, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources** preferences page *(page 227)* where you can configure both data sources and connections.

Disconnect

Stops the connection.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Container Level Nodes

Enable Debug Mode

Switches the server to a debugging mode. For more information, see MarkLogic debugging sessions *(page 2140)*.

Use it to Execute Queries

The server will be used to process XQuery expressions against it.

Refresh

Performs a refresh on the selected node.

Module or Folder Level Nodes

Export

Allows you to export the folder on the remote connection to a local folder.

Refresh

Performs a refresh on the selected node.

Requests Level Nodes

Refresh

Performs a refresh on the selected node.

Cancel all requests

Cancels all queries that are either running or stopped on the application server. You can use this action to clean up the entire **Requests** container at the end of your sessions.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor will detect that there was a change and will ask if you want to upload the edited resource to the server.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Refresh

Performs a refresh on the selected node.

Compare

Compares two selected resources using the **Compare Files** tool *(page 2728)*.

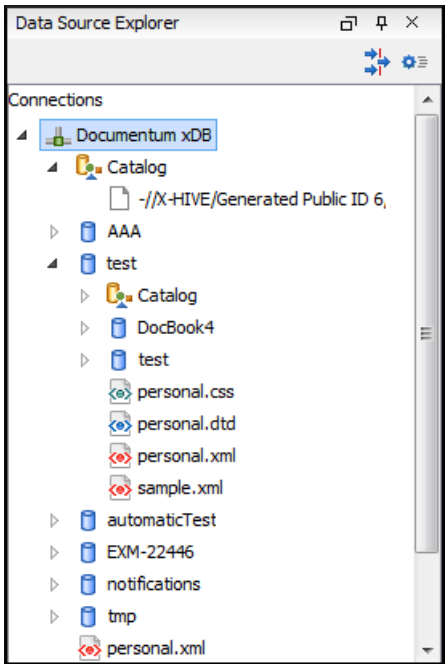
Debugging with MarkLogic *(page 2140)*

Documentum xDB (X-Hive/DB) 10 Database Connections [Deprecated]

Oxygen XML Editor includes support for Documentum xDB (X-Hive/DB) 10 database connections. Oxygen XML Editor allows you to browse the structure of a Documentum xDB (X-Hive/DB) 10 database in the **Data Source Explorer** view *(page 2098)* and perform various operations on the resources in the repository.

Figure: Documentum xDB (X-Hive/DB) 10 Connection



Configuring a Documentum xDB (X-Hive/DB) 10 Database Connection [Deprecated]

Follow this procedure to configure the support for a Documentum xDB (X-Hive/DB) 10 database:

1. Configure Documentum xDB *Data Source* drivers *(page 2145)*.
2. Configure a Documentum xDB *Connection (page 2146)*.
3. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

How to Configure Documentum xDB (X-Hive/DB) 10 Data Source Drivers [Deprecated]

Available in the Enterprise edition only. For this procedure, you need to already have a Documentum xDB server installed.

To configure a data source for Documentum xDB (X-Hive/DB) 10, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.

2. Click the + **New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *Documentum xDB* from the driver **Type** drop-down menu.
5. Click the **Add** button to add the driver files.

   The driver files for the Documentum xDB (X-Hive/DB) 10 database are found in the Documentum xDB (X-Hive/DB) 10 lib directory from the server installation folder:

   - `antlr-runtime.jar`
   - `aspectjrt.jar`
   - `icu4j.jar`
   - `xhive.jar`
   - `google-collect.jar`
6. Click the **OK** button to finish the data source configuration.
7. Continue on to configure your Documentum xDB (X-Hive/DB) 10 connection *(page 2146)*.

How to Configure an Documentum xDB (X-Hive/DB) 10 Connection [Deprecated]

To configure a connection to a Documentum xDB (X-Hive/DB) 10 database, follow these steps:

Note: The bootstrap type of X-Hive/DB connections is not supported in Oxygen XML Editor. The following procedure explains the `xhive://` protocol connection type.

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the + **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select a previously configured data source from the **Data Source** drop-down menu.
5. Enter the connection details.

   a. Set the URL property of the connection in the **URL** field.
   If the property is a URL of the form *xhive://host:port*, the Documentum xDB (X-Hive/DB) 10 connection will attempt to connect to a Documentum xDB (X-Hive/DB) 10 server running behind the specified TCP/IP port.

   b. Set the user name to access the Documentum xDB (X-Hive/DB) 10 engine in the **User** field.

   c. Set the password to access the Documentum xDB (X-Hive/DB) 10 engine in the **Password** field.

d. Set the name of the database to access from the Documentum xDB (X-Hive/DB) 10 engine in the **Database** field.

e. Select the **Run XQuery in read / write session (with committing)** checkbox if you want to end the session with a commit. Otherwise, the session ends with a rollback.

6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

Documentum xDB (X-Hive/DB) 10 Contextual Menu Actions [Deprecated]

While browsing Documentum xDB (X-Hive/DB) 10 connections in the **Data Source Explorer** view *(page 2098)*, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources** preferences page *(page 227)* where you can configure both data sources and connections.

Disconnect

Stops the connection.

Add Library

Allows you to add a new library.

Insert XML Instance

Allows you to add a new XML resource directly into the database root. See Documentum xDB (X-Hive/DB) 10 Parser Configuration *(page 2151)* for more details.

Insert non-XML Instance

Allows you to add a new non-XML resource directly in the database root.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Catalog Level Nodes

Add AS Models

Allows you to add a new abstract schema model to the selected catalog.

Export

Allows you to export the folder on the remote connection to a local folder.

Set Default Schema

Allows you to set a default DTD to be used for parsing. It is not possible to set a default XML Schema.

Clear Default Schema

Allows you to clear the default DTD. The action is available only if there is a DTD set as default.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Container (Library) Level Nodes

New File

Creates a new file on the connection, in the current folder.

Add Library

Allows you to add a new library.

Import Folders

Imports folders on the server.

Add Local Catalog

Adds a catalog to the selected library. By default, only the root-library has a catalog, and all models are stored there.

Insert XML Instance

Allows you to add a new XML resource directly into the database root. See Documentum xDB (X-Hive/DB) 10 Parser Configuration *(page 2151)* for more details.

Insert non-XML Instance

Allows you to add a new non-XML resource directly in the database root.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view,

Oxygen XML Editor will detect that there was a change and will ask if you want to upload the edited resource to the server.

Save As

Allows you to save the selected resource as a file on disk.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Add AS model

Allows you to add an XML schema to the selected XML resource.

Set AS model

Allows you to set an active AS model for the selected XML resource.

Clear AS model

Allows you to clear the active AS model of the selected XML resource.

Properties

Displays the resource properties. Available only for XML resources.

Set Default Schema

Allows you to set the selected DTD to be used as default for parsing. The action is available only for DTD.

Clear Default Schema

Allows you to unset the selected DTD. The action is available only if the selected DTD is the current default to be used for parsing.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Compare

Compares two selected resources using the **Compare Files** tool *(page 2728)*.

Documentum xDB (X-Hive/DB) 10 Parser Configuration for Adding XML Instances [Deprecated]

When an XML instance document is added to a Documentum xDB (X-Hive/DB) 10 connection or library, it is parsed with an internal XML parser of the database server. The following options are available for configuring this parser:

- DOM Level 3 parser configuration parameters. More about each parameter can be found here: DOM Level 3 Configuration.
- Documentum xDB (X-Hive/DB) 10 specific parser parameters (for more information, consult the Documentum xDB (X-Hive/DB) 10 manual):
  # **xhive-store-schema** - If selected, the corresponding DTD or XML schemas are stored in the catalog during validated parsing.
  # **xhive-store-schema-only-internal-subset** - Stores only the internal sub-set of the document (not an external sub-set). This option modifies the **xhive-store-schema** (only has a function when that parameter is set to true, and when a DTD is involved). Select this option if you only want to store the internal sub-set of the document (not the external sub-set).
  # **xhive-ignore-catalog** - Ignores the corresponding DTD and XML schemas in the catalog during validated parsing.
  # **xhive-psvi** - Stores **psvi** information about elements and attributes. Documents parsed with this feature turned on give access to **psvi** information and enable support of data types by XQuery queries.
  # **xhive-sync-features** - With this convenience setting turned on, parameter settings of **XhiveDocumentIf** are synchronized with the parameter settings of **LSParser**. Note that parameter settings **xhive-psvi** and **schema-location** are always synchronized.

Troubleshooting Documentum xDB [Deprecated]

Question:

I am able to access my XML Database in the **Data Source Explorer** *(page 2098)* and open files for reading but when I try to save changes to a file back into the database, I receive the following error:

"Cannot save the file. DTD factory class org.apache.xerces.impl.dv.dtd.DTDDVFactoryImpl does not extend from DTDDVFactory". How can I fix this?

Answer:

`xhive.jar` contains a MANIFEST.MF with a classpath:

```
Class-Path: core/antlr-runtime.jar core/aspectjrt.jar core/fastutil-shrinked.jar
    core/google-collect.jar core/icu4j.jar core/lucene-regex.jar core/lucene.jar
    core/serializer.jar core/xalan.jar core/xercesImpl.jar
```

Since the driver was configured to use `xhive.jar` directly from the *xDB* installation (where many other *JARS* are located), `core/xercesImpl.jar` from the *xDB* installation directory is loaded even though it is not specified in the list of *JARS* from the data source driver configuration (it is in the classpath from `xhive.jar` - `MANIFEST.MF`). A simple workaround for this issue is to copy **ONLY** the *JAR* files used in the driver configuration to a separate folder and configure the data source driver to use them from there.

MySQL Database Connections

Oxygen XML Editor includes support for MySQL database connections. Oxygen XML Editor allows you to browse the structure of a SQL Server database in the **Data Source Explorer** view *(page 2098)*, open tables in the **Table Explorer** view *(page 2100)*, and perform various operations on the resources in the repository.

Configuring a MySQL Database Connection

To configure the support for a MySQL database, follow this procedure:

1. Configure MySQL *Data Source* drivers *(page 2152)*.
2. Configure a MySQL *Connection*. *(page 2153)*
3. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

How to Configure MySQL Data Source Drivers

To connect to a MySQL server, you need to create a generic JDBC type data source based on the MySQL JDBC driver available on the MySQL website.

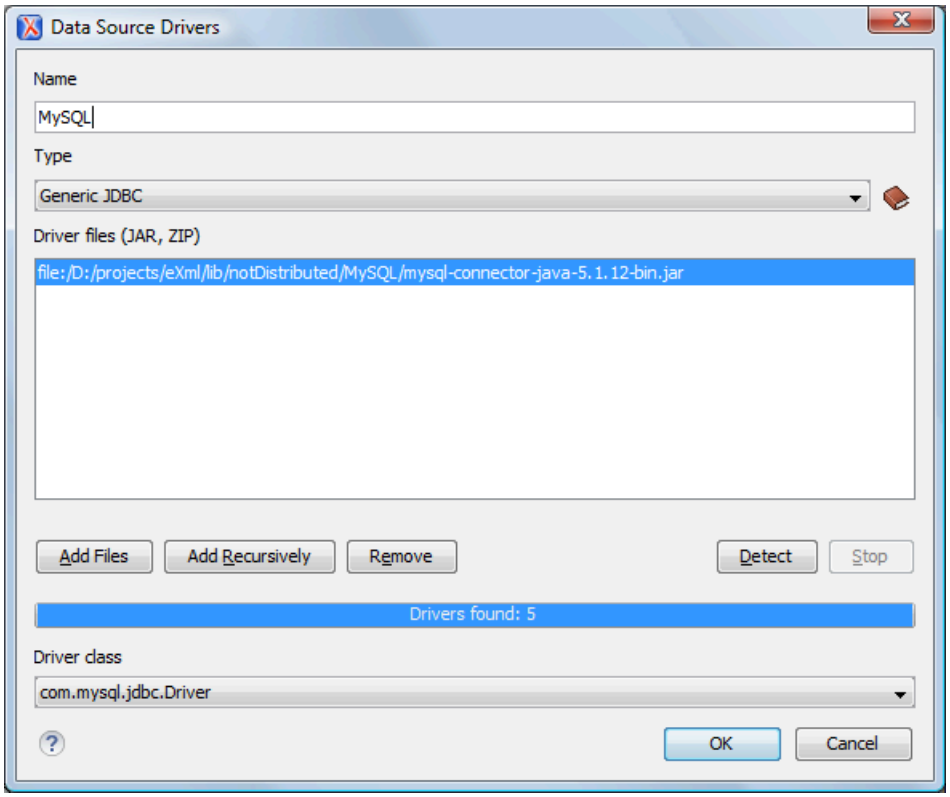
To configure this data source, follow these steps:

1. Go to https://www.oxygenxml.com/database_drivers.html and download the appropriate MySQL driver.

2. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
3. Click the **+ New** button in the **Data Sources** panel.

   The dialog box for configuring a data source is opened.

   Figure: Data Source Drivers Configuration Dialog Box



4. Enter a unique name for the data source.
5. Select *Generic JDBC* in the driver **Type** drop-down list.
6. Click the **Add Files** button and select the MySQL driver file that you downloaded.
   The driver file for the MySQL server is called `mysql-com.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure your MySQL connection *(page 2153)*.

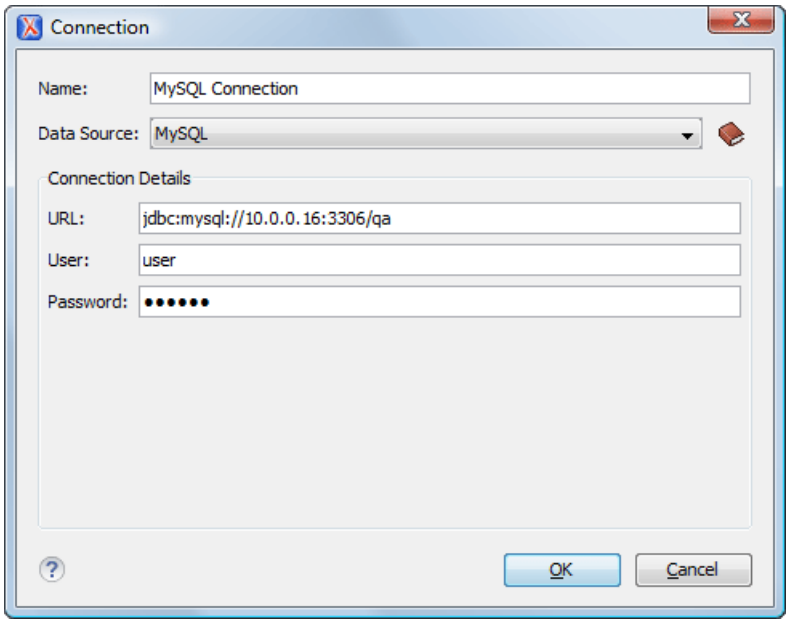
How to Configure a MySQL Connection

To configure a connection to a MySQL server, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the + **New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

   Figure: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *MySQL* data source in the **Data Source** drop-down list.
5. Enter the connection details.
   a. Enter the URL of the MySQL server.
   b. Enter the user name for the connection to the MySQL server.
   c. Enter the password for the connection to the MySQL server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

Generic JDBC Database Connections

Oxygen XML Editor includes support for Generic JDBC database connections.

Configuring a Generic JDBC Database Connection

To configure the support for a generic JDBC database, follow this procedure:

1. Configure Generic JDBC *Data Source* drivers *(page 2155)*.
2. Configure a Generic JDBC *Connection (page 2155)*.
3. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

How to Configure Generic JDBC Data Source Drivers

Starting with version 17, Oxygen XML Editor comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Editor along with a Java VM version 7 or 6.

To configure a generic JDBC data source, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the **+ New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *Generic JDBC* in the driver **Type** drop-down list.
5. Add the driver file(s) using the **Add Files** button.
6. Select the most appropriate **Driver class**.
7. Click the **OK** button to finish the data source configuration.
8. Continue on to configure a generic JDBC connection *(page 2155)*.

How to Configure a Generic JDBC Connection

To configure a connection to a generic JDBC database, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select the *Generic JDBC* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
   a. Enter the URL of the generic JDBC database, with the following format: `jdbc: <subprotocol>: <subname>`.
   b. Enter the user name for the connection to the generic JDBC database.
   c. Enter the password for the connection to the generic JDBC database.
6. Click the **OK** button to finish the connection configuration.

7. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

JDBC-ODBC Database Connections

Oxygen XML Editor includes support for JDBC-ODBC database connections.

How to Configure a JDBC-ODBC Connection

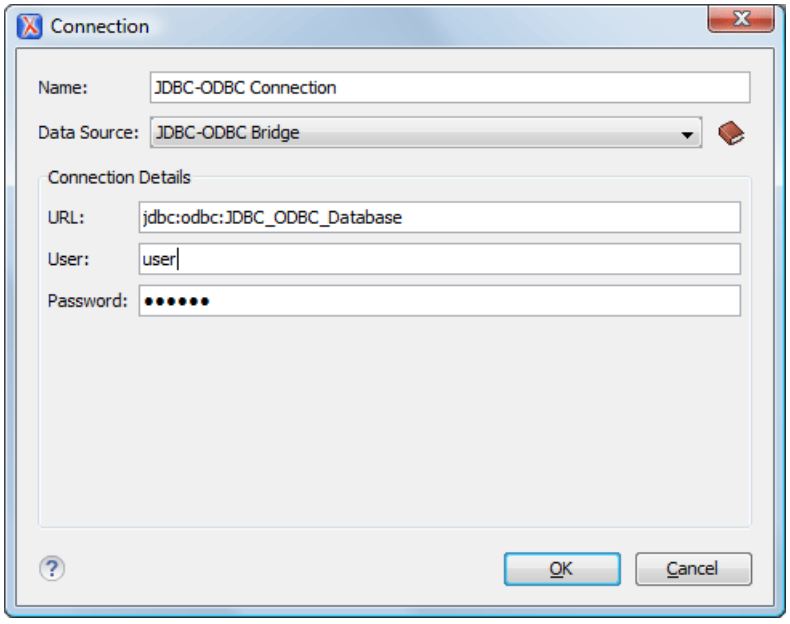
Starting with version 17, Oxygen XML Editor comes bundled with Java 8, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Editor along with a Java VM version 7 or 6.

To configure a connection to an ODBC data source, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.

   The dialog box for configuring a database connection is displayed.

   Figure: Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select *JDBC-ODBC Bridge* in the **Data Source** drop-down list.

5. Enter the connection details.
   a. Enter the URL of the ODBC source.
   b. Enter the user name of the ODBC source.
   c. Enter the password of the ODBC source.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

BaseX Database Connections

Oxygen XML Editor includes support for BaseX database connections using a WebDAV connection. BaseX is a light-weight XML database engine and XQuery processor. Oxygen XML Editor allows you to browse the structure of a BaseX database in the **Data Source Explorer** view *(page 2098)* and perform XQuery executions.

How to Configure a BaseX Connection

To configure a BaseX connection, follow these steps:

1. First of all, make sure the BaseX HTTP Server is started. For details about starting the BaseX HTTP server, go to http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server. The configuration file for the HTTP server is named `.basex` and is located in the BaseX installation directory. This file helps you to find out which port the HTTP server using. The default port for BaseX WebDAV is 8984.
2. To ensure that everything is functioning, open a WebDAV URL inside a browser and check to see if it works. For example, the following URL retrieves a document from a database named TEST: `http://localhost:8984/webdav/TEST/etc/factbook.xml`.
3. Once you are sure that the BaseX WebDAV service is working, you can configure the WebDAV connection in Oxygen XML Editor as described in How to Configure a WebDAV Connection *(page 2162)*. The WebDAV URL should resemble this: `http://{hostname }:{port}/webdav/`. If the BaseX server is running on your own machine and it has the default configuration, the data required by the WebDAV connection is:
   - WebDAV URL: `http://localhost:8984/webdav`
   - User: `admin`
   - Password: `admin`
4. Once the WebDAV connection is created, to view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

BaseX Contextual Menu Actions

While browsing BaseX connections in the **Data Source Explorer** view *(page 2098)*, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources** preferences page *(page 227)* where you can configure both data sources and connections.

Disconnect

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Folder Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Compare

Compares two selected resources using the **Compare Files** tool *(page 2728)*.

Base X XQJ Connection

XQuery execution is possible in a BaseX connection through an XQJ connection.

Important: The XQJ connector is only capable of running XQuery 1.0 scrips, therefore XQuery 3.0 and 3.1 scripts are not supported.

BaseX XQJ Data Source

First of all, create an XQJ data source as described in How to Configure an XQJ Data Source *(page 2161)*. The BaseX XQJ API-specific files that must be added in the configuration dialog box are `xqj-api-1.0.jar`, `xqj2-0.1.0.jar` and `basex-xqj-1.2.3.jar` (the version names of the *JAR* file may differ). These libraries can be downloaded from *xqj.net/basex/basex-xqj-1.2.3.zip*. As an alternative, you can also find the libraries in the BaseX installation directory, in the **lib** sub-directory.

BaseX XQJ Connection

The next step is to create an XQJ connection *(page 2162)*.

For a default BaseX configuration, the following connection details apply (you can modify them when necessary):

- **Port**: 1984
- **serverName**: localhost
- **user**: admin
- **password**: admin

XQuery Execution

Now that the XQJ connection is configured, open the XQuery file you want to execute in Oxygen XML Editor and create an XQuery Transformation *(page 1709)*. In the **Transformer** drop-down menu, select the name of the XQJ connection you created. Apply the transformation scenario and the XQuery will be executed.

How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is Zorba.

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to **PATH** - on Windows, to **LD_LIBRARY_PATH** - on Linux, or to **DYLD_LIBRARY_PATH** - on OS X. Restart Oxygen XML Editor after configuring the environment variables.
2. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
3. Click the + **New** button in the **Data Sources** panel.
4. Enter a unique name for the data source.
5. Select **XQuery API for Java (XQJ)** in the **Type** combo box.
6. Press the **Add** button to add XQJ API-specific files.
   You can manage the driver files using the **Add**, **Remove**, **Detect**, and **Stop** buttons.
   Oxygen XML Editor detects any implementation of *javax.xml.xquery.XQDataSource* and presents it in **Driver class** field.
7. Select the most suited driver in the **Driver class** combo box.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure the XQJ connection *(page 2162)*.

How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the + **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured XQJ data sources *(page 2161)* in the **Data Source** combo box.
5. Fill-in the connection details.
   The properties presented in the connection details table are automatically detected depending on the selected data source.
6. Click the **OK** button to finish the connection configuration.

WebDAV Connections

Oxygen XML Editor includes support for WebDAV server connections. Oxygen XML Editor allows you to browse the structure of a WebDAV connection in the **Data Source Explorer** view *(page 2098)* and perform various operations on the resources in the repository.

How to Configure a WebDAV Connection

By default, Oxygen XML Editor contains built-in data source drivers for **WebDAV** connections. Based on this data source, you can create a WebDAV connection for browsing and editing data from a database that provides a WebDAV interface. The connection is available in the **Data Source Explorer** view *(page 2098)*.

To configure a WebDAV connection, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the + **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the WebDAV data sources in the **Data Source** drop-down menu.
5. Enter the connection details:
   a. Set the URL to the WebDAV repository in the field **WebDAV URL**.
   b. Set the user name that is used to access the WebDAV repository in the **User** field.

c. Set the password that is used to access the WebDAV repository in the **Password** field.

6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.
   For more information about the WebDAV support in Oxygen XML Editor, watch our video demonstration:

WebDAV Contextual Menu Actions

While browsing WebDAV connections in the **Data Source Explorer** view *(page 2098)*, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources** preferences page *(page 227)* where you can configure both data sources and connections.

Disconnect

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Folder Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view,

Oxygen XML Editor will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Compare

Compares two selected resources using the **Compare Files** tool *(page 2728)*.

SQL Execution Support

The database support in Oxygen XML Editor includes support for writing SQL statements, syntax highlighting, *folding (page 3229)*, and dragging and dropping from the **Data Source Explorer** view *(page 2098)*. It also includes transformation scenarios for executing the statements, and the results are displayed in the **Table Explorer** view *(page 2100)*.

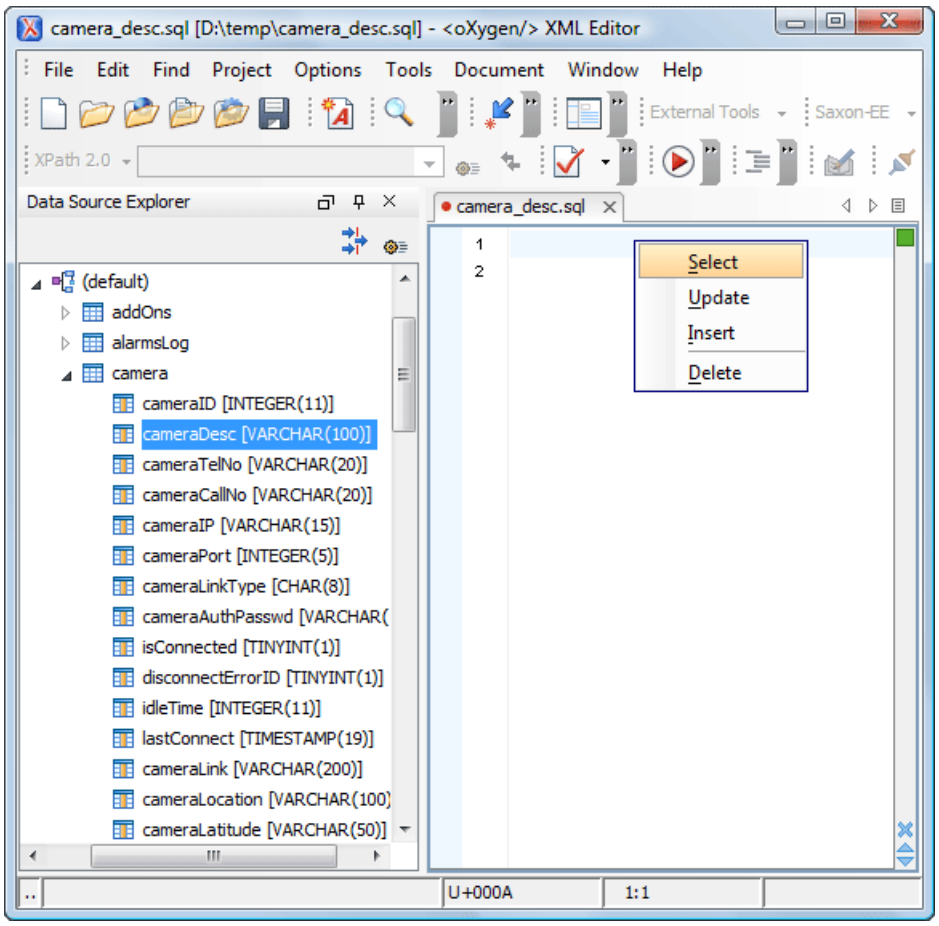
Drag and Drop from Data Source Explorer View

Dragging operations from the **Data Source Explorer** view *(page 2098)* and dropping them in the SQL Editor allows you to create SQL statements quickly by inserting the names of tables and columns in the SQL statements.

1. Configure a database connection (see the specific procedure for your database server in the Database Connection Support *(page 2103)* section).
2. Browse to the table you will use in your statement.
3. Drag the table or a column of the table into the editor where a SQL file is open.

   Drag and drop actions are available both on the table and on its fields. A pop-up menu is displayed in the SQL editor.

   Figure: SQL Statement Editing with Drag and Drop



4. Select the type of statement from the pop-up menu.

Depending on your choice, dragging a table results in one of the following statements being inserted into the document:

- **SELECT `*field1*`,`*field2*`, ... FROM `*catalog*`. `*table*`** (for example: `SELECT `DEPT`,`DEPTNAME`,`LOCATION` FROM `camera`.`cameraDesc``)
- **UPDATE `*catalog*`. `*table*` SET `*field1*`=, `*field2*`=,....** (for example: `UPDATE `camera`.`cameraDesc` SET `DEPT`=, `DEPTNAME`=, `LOCATION`=`)
- **INSERT INTO `*catalog*`. `*table*` (`*field1*`,`*field2*`, ...) VALUES (, ,)** (for example: `INSERT INTO `camera`.`cameraDesc` (`DEPT`,`DEPTNAME`,`LOCATION`) VALUES (, , )`)
- **DELETE FROM `*catalog*`. `*table*`** (for example: `DELETE FROM `camera`.`cameraDesc``)

Depending on your choice, dragging a column results in one of the following statements being inserted into the document:

- **SELECT `*field*` FROM `*catalog*`. `*table*`** (for example: `SELECT `DEPT` FROM `camera`.`cameraDesc``)
- **UPDATE `*catalog*`. `*table*` SET `*field*`=** (for example: `UPDATE `camera`.`cameraDesc` SET `DEPT`=`)
- **INSERT INTO `*catalog*`. `*table*` (`*field1*`) VALUES ()** (for example: `INSERT INTO `camera`.`cameraDesc` (`DEPT`) VALUES ()`)
- **DELETE FROM `*catalog*`. `*table*`** (for example: `DELETE FROM `camera`.`cameraDesc` WHERE `DEPT`=`)

SQL Validation

SQL validation support is offered for IBM DB2. Note that if you choose a connection that does not support SQL validation, you will receive a warning when trying to validate. The SQL document is validated using the connection from the associated transformation scenario.

Executing SQL Statements

The steps for executing an SQL statement on a relational database are as follows:

1. Configure a transformation scenario *(page 1612)* using the **Configure Transformation Scenario(s)** action from the toolbar or the **Document > Transformation** menu.
   A SQL transformation scenario needs a database connection. You can configure a connection using the **Preferences** button from the SQL transformation dialog box.
   The dialog box contains the list of existing scenarios that apply to SQL documents.
2. Set parameter values for SQL placeholders using the **Parameters** button from the SQL transformation dialog box.
   For example, in `SELECT * FROM `test`.`department` where DEPT = ? or DEPTNAME = ?` the two parameters can be configured for the place holders (?) in the transformation scenario.

When the SQL statement is executed, the first placeholder is replaced with the value set for the first parameter in the scenario, the second placeholder is replaced by the second parameter value, and so on.

Restriction: When a stored procedure is called in an SQL statement executed on an SQL Server database, mixing inline parameter values with values specified using the **Parameters** button of the scenario dialog box is not recommended. This is due to a limitation of the SQL Server driver for Java applications. An example of stored procedure that is not recommended: `call dbo.Test(22, ?)`.

3. Execute the SQL scenario by clicking the **OK** or **Apply associated** button.

   The result of a SQL transformation is displayed in a view *(page 354)* at the bottom of the Oxygen XML Editor window.

4. View more complex return values of the SQL transformation in a separate editor panel.
   A more complex value returned by the SQL query (for example, an *XMLTYPE* or *CLOB* value) cannot be displayed entirely in the result table.

   a. Right-click the cell containing the complex value.

   b. Select the action **Copy cell** from the contextual menu.
      The action copies the value in the clipboard.

   c. Paste the value into an appropriate editor.
      For example, you can paste the value in an opened XQuery editor panel of Oxygen XML Editor.

XQuery and Databases

XQuery is a native XML query language that is useful for querying XML views of relational data to create XML results. It also provides the mechanism to efficiently and easily extract information from Native XML Databases (NXD) and relational data. The following database systems supported in Oxygen XML Editor offer XQuery support:

- *Native XML Databases:*
  # Berkeley DB XML
  # eXist
  # MarkLogic (validation support available starting with version 5)
  # Documentum xDB (X-Hive/DB) 10
- *Relational Databases:*

IBM DB2
Microsoft SQL Server (validation support not available)
Oracle (validation support not available)

Related Information:

Editing XQuery Documents *(page 1326)*

Build Queries with Drag and Drop from the Data Source Explorer View

When a query is edited in the XQuery editor, the XPath expressions can be composed quickly by dragging them from the **Data Source Explorer** view *(page 2098)* and dropping them into the editor panel.

1. Configure the data source drivers *(page 2103)* for the particular relational database in the **Data Sources** preferences page *(page 227)*.
2. Configure the connection *(page 2103)* for the particular relational database in the **Data Sources** preferences page *(page 227)*.
3. Browse the connection in the **Data Source Explorer** view *(page 2098)*, expanded to the table or column that you want to insert in the query.
4. Drag the table or column name to the XQuery editor panel.
5. Drop the table or column name where the XPath expression is needed.

An XPath expression that selects the dragged name is inserted in the XQuery document at the cursor position.

XQuery Validation When Connected to a Database

With Oxygen XML Editor, you can validate your XQuery documents when connected to a database. When you open an XQuery document from a connection that supports validation (for example, MarkLogic, or eXist), by default Oxygen XML Editor uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation resolves imports better.

Related Information:

XQuery Validation *(page 1326)*

XQuery Transformation for Databases

XQuery is designed to retrieve and interpret XML data from any source, whether it is a database or document. Data is stored in relational databases but it is often required that the data be extracted and transformed as XML when interfacing to other components and services. Also, it is an XPath-based querying language supported by most NXD vendors. To perform a query, you need an XQuery transformation scenario.

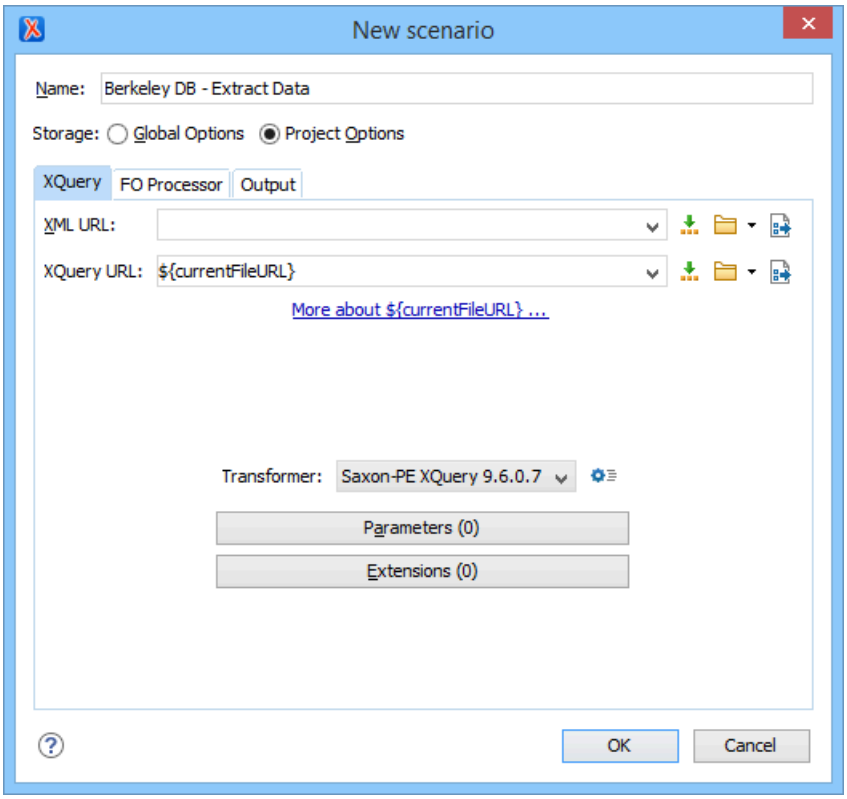
1. Configure the data source drivers and the connection *(page 2103)* for the particular database.
2. Configure an XQuery transformation scenario.
   a. Click the **Configure Transformation Scenario** toolbar button or go to menu **Document > Transformation > Configure Transformation Scenario**.

      The **Configure Transformation Scenario** dialog box *(page 1722)* is opened.

   b. Click the **New** button toward the bottom of the dialog box.
   c. Select **XML Transformation with XQUERY** *(page 1659)*.

      The **New Scenario** dialog box for configuring an XQuery scenario is opened.

      Figure: New Scenario Dialog Box



d. Insert the scenario name in the dialog box for editing the scenario.

e. Choose the database connection in the **Transformer** drop-down list.

f. Configure any other parameters as needed.
For an XQuery transformation, the output tab has an option called **Sequence** that allows you to run an XQuery in lazy mode. The amount of data extracted from the database is controlled from the **Size limit on Sequence view** option *(page 206)* in the **XQuery** preferences page. If you choose **Perform FO Processing** in the **FO Processor** tab, the **Sequence** option is ignored.

g. Click the **OK** button to finish editing the scenario.

Once the scenario is associated with the XQuery file, the query can include calls to specific XQuery functions that are implemented by that engine. The available functions depend on the target database engine selected in the scenario. For example, for eXist and Berkeley DB XML, the *Content Completion Assistant (page 3227)* lists the functions supported by that database engine. This is useful for only inserting calls to the supported functions (standard XQuery functions or extension ones) into the query .

Note: An XQuery transformation is executed against a Berkeley DB XML server as a transaction using the query transaction support of the server.

3. Run the transformation scenario.
To view a more complex value returned by the query that cannot be entirely displayed in the XQuery query result table at the bottom of the Oxygen XML Editor window (for example, an XMLTYPE or CLOB value), do the following:
   - Right-click that table cell.
   - Select the **Copy cell** action from the contextual menu to copy the value into the clipboard.
   - Paste the value wherever you need it (for example, in an opened XQuery editor panel of Oxygen XML Editor).

Related Information:

XML Transformation with XQuery *(page 1659)*

XQuery XQJ Transformation *(page 2171)*

XQuery XQJ Transformation

XQuery API for Java (XQJ) refers to the common Java API for the XQuery 1.0 specification. The XQJ API enables you to execute XQuery against an XML data source.

Important: The XQJ connector is only capable of running XQuery 1.0 scrips, therefore XQuery 3.0 and 3.1 scripts are not supported.

Oxygen XML Editor supports any transformer that offers an XQJ API implementation and it be used for validating XQuery or transforming XML documents.

To configure the support for XQJ, do the following:

1. Configure an XQJ *Data Source (page 2161)*.
2. Configure an XQJ *Connection (page 2162)*.
3. To view your connection, go to the **Data Source Explorer** view *(page 2098)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective (page 3232)*.

How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is Zorba.

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to **PATH** - on Windows, to **LD_LIBRARY_PATH** - on Linux, or to **DYLD_LIBRARY_PATH** - on OS X. Restart Oxygen XML Editor after configuring the environment variables.
2. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
3. Click the + **New** button in the **Data Sources** panel.
4. Enter a unique name for the data source.
5. Select **XQuery API for Java (XQJ)** in the **Type** combo box.
6. Press the **Add** button to add XQJ API-specific files.
   You can manage the driver files using the **Add**, **Remove**, **Detect**, and **Stop** buttons.
   Oxygen XML Editor detects any implementation of *javax.xml.xquery.XQDataSource* and presents it in **Driver class** field.
7. Select the most suited driver in the **Driver class** combo box.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to configure the XQJ connection *(page 2162)*.

How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. Click the **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured XQJ data sources *(page 2161)* in the **Data Source** combo box.
5. Fill-in the connection details.
   The properties presented in the connection details table are automatically detected depending on the selected data source.
6. Click the **OK** button to finish the connection configuration.

XQuery Database Debugging

Oxygen XML Editor includes a debugging interface that helps you to detect and solve problems with XQuery transformations that are executed against MarkLogic and Berkeley DB XML databases.

For more information about the debugging support in Oxygen XML Editor, see Debugging XSLT Stylesheets and XQuery Documents *(page 2199)*.

Debugging with MarkLogic

Oxygen XML Editor includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a MarkLogic data source *(page 2137)* and a MarkLogic connection *(page 2137)*.
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Editor accesses. On the server side, debugging must be activated in the XDBC server and in the *Task Server* section of the server control console (the switch *debug allow*). If the debugging is not activated, the MarkLogic server reports a **DBG-TASKDEBUGALLOW** error.

   Note: An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Editor uses to process XQuery expressions by

selecting the **Use it to execute queries** action *(page 2143)* from the contextual menu in the **Data Source Explorer** view *(page 2098)*.

3. Open the XQuery file and start the debugging process.
   - If you want to debug an XQuery file stored on the MarkLogic server, we recommend you to use the **Data Source Explorer** view *(page 2098)* and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.
   - The MarkLogic XQuery debugger integrates seamlessly into the XQuery Debugger *perspective (page 297)*. If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to debug the scenario *(page 2218)* directly.
   - Otherwise, switch to the **XQuery Debugger** *perspective (page 3232)*, open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the debug control toolbar *(page 2202)*.

     For general information about how a debugging session is started and controlled, see the Working with the Debugger *(page 2218)* section.

In a MarkLogic debugging session, you can use step actions and *breakpoints (page 2222)* to help identify problems. When you add a *breakpoint (page 2223)* on a line where the debugger never stops, Oxygen XML Editor displays a warning message. These warnings are displayed for *breakpoints* you add either in the main XQuery (which you can open locally or from the server) or for *breakpoints* you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see Using Breakpoints for Debugging Queries that Import Modules with MarkLogic *(page 2141)*.

Remote Debugging with MarkLogic

Oxygen XML Editor allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Editor connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.

Oxygen XML Editor also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

Important: When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

For more information about the XQuery debugger for MarkLogic, watch our video demonstration:

Related Information:

MarkLogic Development in Oxygen XML Editor *(page 2138)*

Configuring a MarkLogic Database Connection *(page 2136)*

Using Breakpoints for Debugging Queries that Import Modules with MarkLogic

When debugging queries that imports modules stored in the database, it is recommended to place *breakpoints (page 2222)* in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the *breakpoints* in all the modules will be considered. Also, make sure that there are no other opened modules that are not involved in the current debugging session.

To place *breakpoints* in the modules, use the following procedure:

1. In the **Data Source Explorer** view *(page 2098)*, open all the modules from the **Modules** container of the XDBC application server *(page 2137)* that performs the debugging.
2. Set *breakpoints (page 2223)* in the module as needed.
3. Continue debugging *(page 2218)* the query.

If you get a warning that the *breakpoints* failed to initialize, try the following solutions:

- Check the **Breakpoints** view *(page 2206)* and make sure there are no older *breakpoints* (set on resources that are not part of the current debugging context).
- Make sure you open the modules from the context of the application server that does the debugging and place *breakpoints* there.

Related Information:

MarkLogic Database Connections *(page 2135)*

MarkLogic Development in Oxygen XML Editor *(page 2138)*

Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

- Debugging support is only available for MarkLogic server versions 4.0 or newer.
- For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: *'0.9-ml' (inherited from MarkLogic 3.2)*, *'1.0-ml'*, and *'1.0'*.

- All declared variables are presented as strings. The **Value** column of the **Variables** view contains the expression from the variable declaration. It can be evaluated by copying the expression with the **Copy value** action from the contextual menu of the **Variables** view *(page 2216)* and pasting it in the **XWatch** view *(page 2208)*.
- There is no support for output to source mapping *(page 2219)*.
- There is no support for showing the trace *(page 2213)*.
- You can only set breakpoints *(page 2206)* in imported modules in one of the following cases:
  # When you open the module from the context of the application server involved in the debugging, using the **Data Source Explorer** view *(page 2098)*.
  # When the debugger automatically opens the modules in the Editor.
- No *breakpoints (page 2222)* are set in modules from the same server that are not involved in the current debugging session.
- No support for profiling *(page 2223)* when an XQuery transformation is executed in the debugger.

Debugging with Berkeley DB XML

The Berkeley DB XML database added a debugging interface starting with version 2.5. The current version is supported in the Oxygen XML Editor XQuery Debugger. The same restrictions and peculiarities *(page 2142)* apply for the Berkeley debugger as for the MarkLogic debugger.

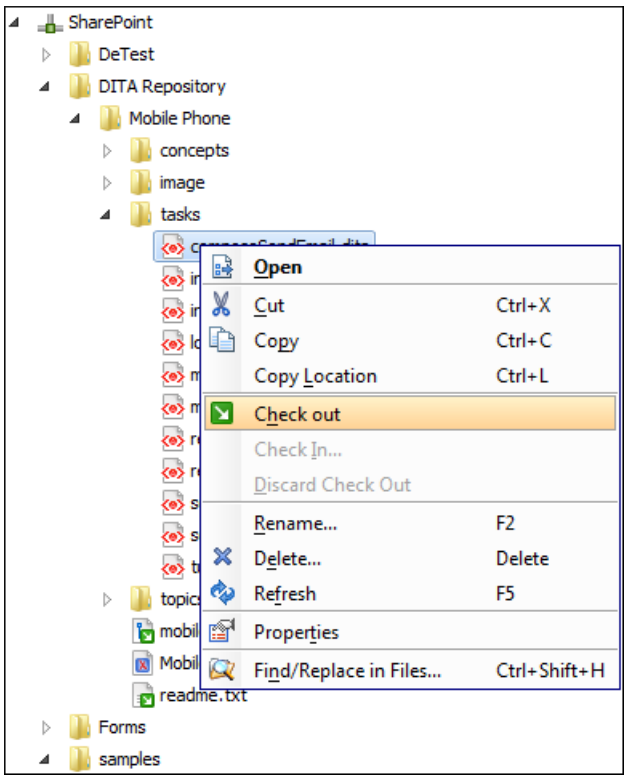
Integration with Microsoft SharePoint

Oxygen XML Editor provides support for browsing and managing SharePoint connections in the **Data Source Explorer** view *(page 2098)*. You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, or edit and transform the documents in the editor.

Note: You can access documents stored on SharePoint Online for Office 365 sites that use either **Cloud identity (default)** or **Federated identity (ADFS)** as the authentication method.

Restriction: The SharePoint connection is only available in the Enterprise edition of Oxygen XML Editor.

Figure: SharePoint Connection



Related Information:

Working with Databases *(page 2098)*

How to Configure a SharePoint Connection

By default, Oxygen XML Editor contains built-in data source drivers for **SharePoint**. Use this data source to create a connection to a SharePoint server that will be available in the **Data Source Explorer** view *(page 2098)*.

To configure a SharePoint connection, follow these steps:

1. Open the **Preferences** dialog box **(Options > Preferences)** *(page 80)* and go to **Data Sources**.
2. In the **Connections** panel click the **+ New** button.
3. Enter a unique name for the connection.
4. Select SharePoint in the **Data Source** combo box.
5. Fill-in the connection details:
    a. Set the URL to the SharePoint repository in the field **SharePoint URL**.

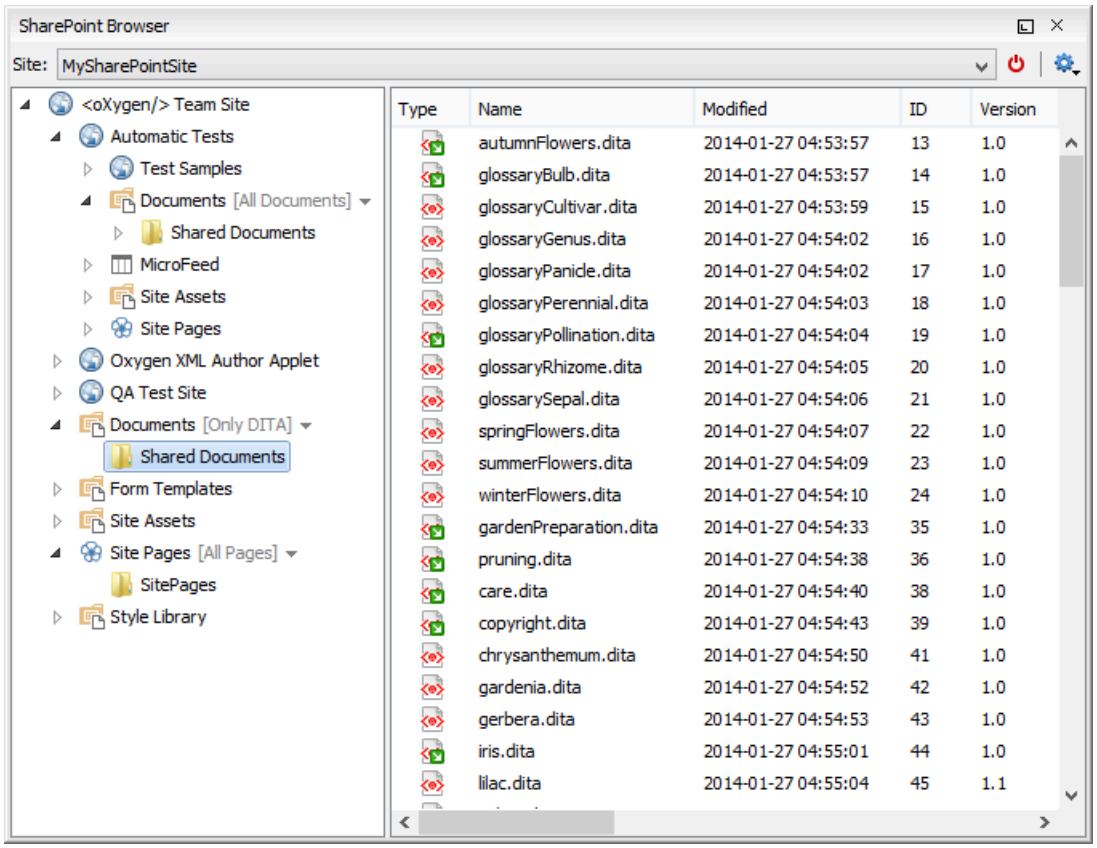
b. Set the server domain in the **Domain** field. If you are using a SharePoint 365 account, leave this field empty.
c. Set the user name to access the SharePoint repository in the **User** field.
d. Set the password to access the SharePoint repository in the **Password** field.

6. To view your connection, go to the **SharePoint Browser** view *(page 2178)* (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu).
   For more information about connecting to repository located on a SharePoint server, watch our video demonstration:

SharePoint Browser View

The **SharePoint Browser** view allows you to connect to a SharePoint repository and perform SharePoint-specific actions on the available resources. To display this view, go to **Window > Show View > SharePoint Browser**.

Figure: SharePoint Browser View



The view is split in several functional areas:

Connection Area

The following controls are available:

- The **Site** combo box allows you to select and connect to an already defined SharePoint connection *(page 2177)*.
- The **Disconnect** action terminates the current connection.
- The **Settings** drop-down menu contains actions that help you to quickly define a new connection or manage the existing ones from the **Data Source** options page: **New SharePoint Connection** and **Configure Database Sources**. Also, here you can choose one of the predefined view layouts.

SharePoint Site Navigation Area

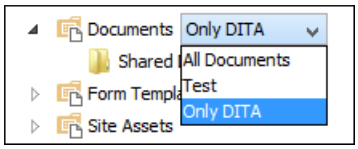
If there is no connection selected in the **Site** combo box, this area is left blank and promotes the actions that allow you to quickly add SharePoint connections. Otherwise, the navigation area presents the SharePoint site structure in a tree-like fashion with various node types (such as *sites*, *libraries*, and *folders*).

Depending on the type of node, a contextual menu offers customized actions that can be performed on that node. The contextual menu of a folder allows you to create new folders and documents, import folders and files, and to rename and delete the folder.

Note: The rename and delete actions are not available for library root folders (folders located at first level in a SharePoint library).

Each library node displays a drop-down menu next to its name where you can select what you want to display for the current library node. This functionality is also available on the contextual menu of the node.

Figure: Drop-Down Menu to Select Which Items to Display



Folder Content Area

The content of a folder is displayed in a tabular form, where each row represents the properties of a folder or document. The list of columns and the way the documents and folders are organized depends on the currently selected view of the parent library.

Table 75. Contextual Menu Actions for the Folder Area

Action	Description	Available for	
		folders	documents
Open	Displays the content of the currently selected folder. Opens the current document for editing.	✔	✔
Rename	Renames the current node on server.	✔	✔
Import	Import files or folders into the currently selected folder.	✔	✔
Delete	Deletes the current node from the server.	✔	✔
Copy Location	Copies to clipboard the URL of the current node.	✔	✔
Check Out	Reserves the current document for your use so that other users cannot change it while you are editing it.		✔
Check In	Commits on the server the changes you made to the document, so that other users can see them. It also makes the document available for editing to other users.		✔
Discard Check Out	Discards the previous checkout operation, making the file available for editing to other users.		✔
Refresh	Queries the server to refresh the available properties of the current node.	✔	✔
Drag and Drop	You can drag documents from the **SharePoint Browser** view and drop them in the main editor area to open them with ease.		✔

You can filter and sort the displayed items. To display the available filters of a column, click the filter widget located on the column header. You can apply multiple filters at the same time.

Note: A column can be filtered or sorted only if it was configured this way on the server side.

Figure: Column Filter

How to Configure a SharePoint Connection *(page 2177)*

SharePoint Contextual Menu Actions

While browsing SharePoint connections in the **Data Source Explorer** view *(page 2098)*, the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources** preferences page *(page 227)* where you can configure both data sources and connections.

Disconnect

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Folder Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor will detect that there was a change and will ask if you want to upload the edited resource to the server.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Check Out

Checks out the selected document on the server.

Check In

Checks in the selected document on the server. This action opens the **Check In** dialog box. In this dialog box, the following options are available:

- **Minor Version** - Increments the minor version of the file on the server.
- **Major Version** - Increments the major version of the file on the server.
- **Overwrite** - Overwrites the latest version of the file on the server.
- **Comment** - Allows you to comment on a file that you check in.

Discard Check Out

Discards the previous checkout operation, making the file available for editing to other users.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Find/Replace in Files

Opens the **Find/Replace in Files** dialog box *(page 740)* that allows you to find and replace text in multiple files from the connection.

Compare

Compares two selected resources using the **Compare Files** tool *(page 2728)*.

14.

Importing Data

Computer systems and databases contain data in incompatible formats and exchanging data between these systems can be very time consuming. Converting the data to XML can greatly reduce the complexity and create data that can be read by various types of applications.

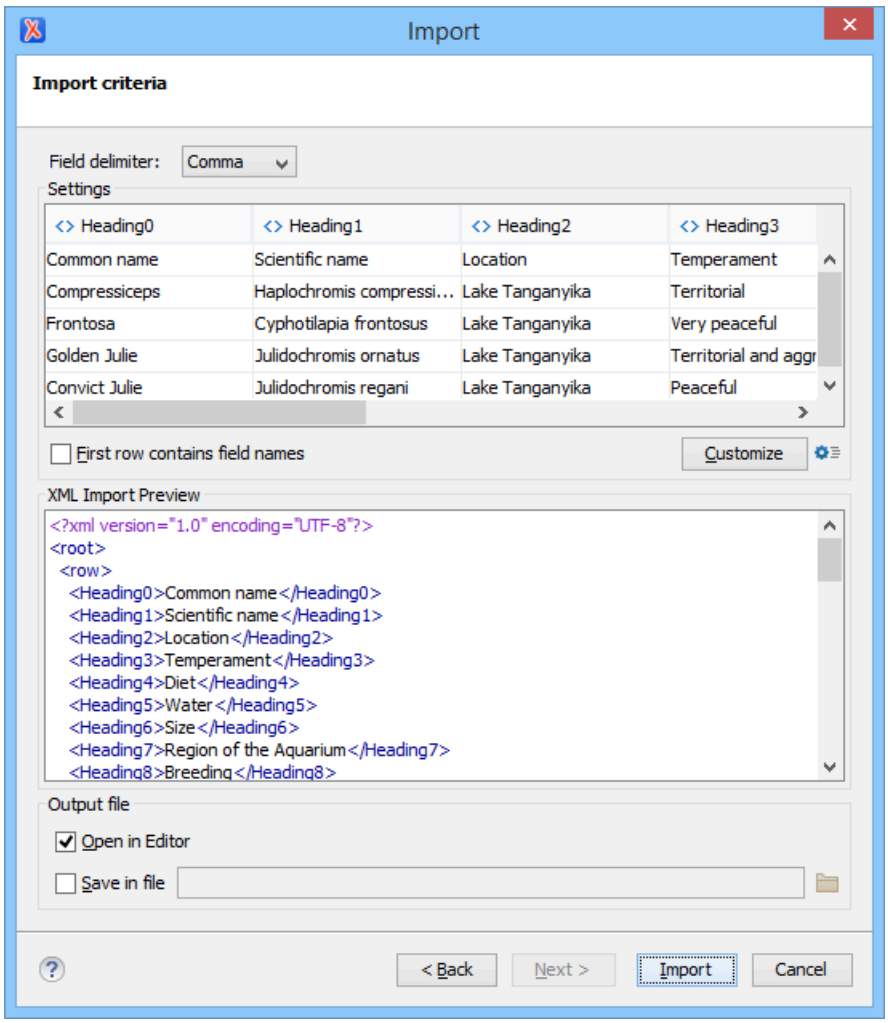
Oxygen XML Editor offers support for importing text files, MS Excel files, Database Data, and HTML files into XML documents. The XML documents can be further converted into other formats using the Transform features *(page 1612)*.

Import from Text Files

To import a text file into an XML file, follow these steps:

1. Go to **File > Import > Text File**.
   A **Select text file** dialog box is displayed.
2. Select the URL of the text file.
3. Select the encoding of the text file.
4. Click the **Next** button.
   The **Import Criteria** dialog box is displayed.

Figure: Import Criteria Dialog Box



5. Configure the settings for the conversion.
   a. Select the **Field delimiter** for the import settings. You can choose between the following: `Comma`, `Semicolon`, `Tab`, `Space`, or `Pipe`.
   b. The **Import settings** section presents the input data in a tabular form. By default, all data items are converted to element content (<> symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (× symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
   c. **First row contains field names** - If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.

d. **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: `ELEMENT`, `ATTRIBUTE`, or `SKIPPED`.
e. **Import Settings** - Clicking this button opens the **Import** preferences page *(page 219)* that allows you to configure more import options.
f. The **XML Import Preview** panel contains an example of what the generated XML document looks like.
g. **Open in editor** - If selected, the new XML document created from the imported text file is opened in the editor.
h. **Save in file** - If selected, the new XML document is saved in the specified path.

6. Click **Import** to generate the XML document.

Import from MS Excel Files

Oxygen XML Editor provides several methods for importing MS Excel files into an XML file. The first method is to use the Oxygen XML Editor **Smart Paste** mechanism *(page 911)* by simply copying data from Excel and pasting it into a document in **Author** mode (note that this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents). You can also copy data from Excel and paste it into inserted cells in **Grid** mode, but this is a more manual process. If you want to import an entire Excel file, Oxygen XML Editor also offers a configurable import wizard that works with any type of XML document.

Smart Paste Method in Author Mode

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the Excel spreadsheet in your office application, copy its content, and simply paste it into your document in **Author** mode.

The Oxygen XML Editor **Smart Paste** mechanism *(page 911)* will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

Grid Mode Method

The **Grid** mode in Oxygen XML Editor displays all content in an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. When importing Excel data into **Grid** mode, you first need to insert new cells

in the particular nested table and then you can paste data from Excel the same as you would in any table or spreadsheet.

1. Copy the particular cells from your Excel spreadsheet that you want to import into an XML file.
2. Switch to **Grid** mode in Oxygen XML Editor.
3. Expand the particular nodes and locate the nested table where you want to insert the copied cells.
4. Right-click a particular row or column where you want to insert the data and select **Insert row** or **Insert column**, depending on the structure of the copied cells.
5. Paste the copied cells from the clipboard into the newly inserted cells in **Grid** mode.
6. You may need to make some manual adjustments. For example, if the selection of copied cells contained an empty cell, Oxygen XML Editor might ignore that cell.

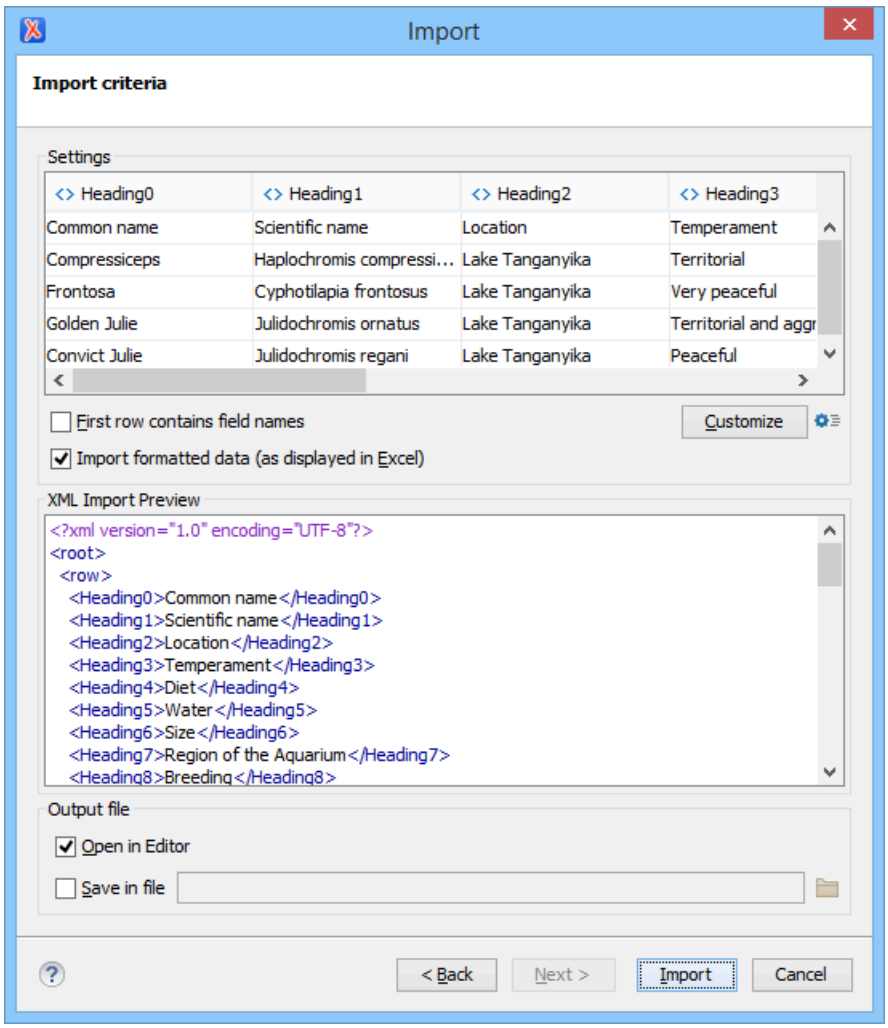
Import Wizard Method

By default, this method supports importing Excel 97/2000/XP/2003 formats out-of-the-box. To import spreadsheet data from Excel 2007 or newer, additional libraries are needed before using this procedure. See Import Data from MS Excel 2007 or Newer *(page 2190)* for instructions on adding more libraries.

To use the **Import** wizard to import an Excel file into an XML file, follow these steps:

1. Go to **File > Import > MS Excel file**.
2. Select the URL of the Excel file. The sheets of the document you are importing are presented in the **Available Sheets** section of this dialog box.
3. Click the **Next** button to proceed to the next stage of the wizard.

Figure: Import Wizard



4. Configure the settings for the conversion. This stage of the wizard offers the following options:

Import settings section

Presents the input data in a tabular form. By default, all data items are converted to element content (<> symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (× symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

First row contains field names

If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.

Customize

This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: `ELEMENT`, `ATTRIBUTE`, or `SKIPPED`.

Import Settings

Clicking this button opens the **Import** preferences page *(page 219)* that allows you to configure more import options.

Import formatted data (as displayed in Excel)

If this option is selected, the imported data retains the Excel data formatting (such as the representation of numeric values or dates). If deselected, the data formatting is not imported.

XML Import Preview panel

Contains an example of what the generated XML document will look like.

Open in editor

If selected, the new XML document created from the imported file is opened in the editor.

Save in file

If selected, the new XML document is saved in the specified path.

5. Click **Import** to generate the XML document.

For more information about exchanging data between Oxygen XML Editor and spreadsheet applications, watch our video demonstration:

Related Information:

Exporting XML Content to Excel *(page 884)*

Import Data from MS Excel 2007 or Newer

To import spreadsheet data from Excel 2007 or newer (`.xlsx`), Oxygen XML Editor needs additional libraries from the release 3.10 of the Apache POI project.

To add this support, follow this procedure:

1. Go to **Help > Install new add-ons** to open an add-on selection dialog box.

2. Enter or paste **http://www.oxygenxml.com/InstData/Addons/default/updateSite.xml** in the **Show add-ons from** field or select it from the drop-down menu.
3. Select **Excel XLSX libraries** plugin and click **Next**.
4. Restart the application.

   Result: You can now use the **Import** wizard *(page 2188)* to import data from Excel 2007 or newer.

Alternate Method to Manually Add the Libraries

To manually add the libraries, follow these steps:

1. Download version 3.10 of the Apache POI project from http://archive.apache.org/dist/poi/release/bin/. The specific ZIP file that you need is: `poi-bin-3.10-FINAL-20140208.zip`.
2. Unpack `poi-bin-3.10-FINAL-20140208.zip`.
3. Copy the following `.jar` files in the `lib` directory of the installation folder of Oxygen XML Editor :
   - `dom4j-1.6.1.jar`
   - `poi-ooxml-3.10-FINAL-20140208.jar`
   - `poi-ooxml-schemas-3.10-FINAL-20140208.jar`
   - `xmlbeans-2.3.0.jar`

Result: You can now use the **Import** wizard *(page 2188)* to import data from Excel 2007 or newer.

Related Information:

Exporting XML Content to Excel *(page 884)*

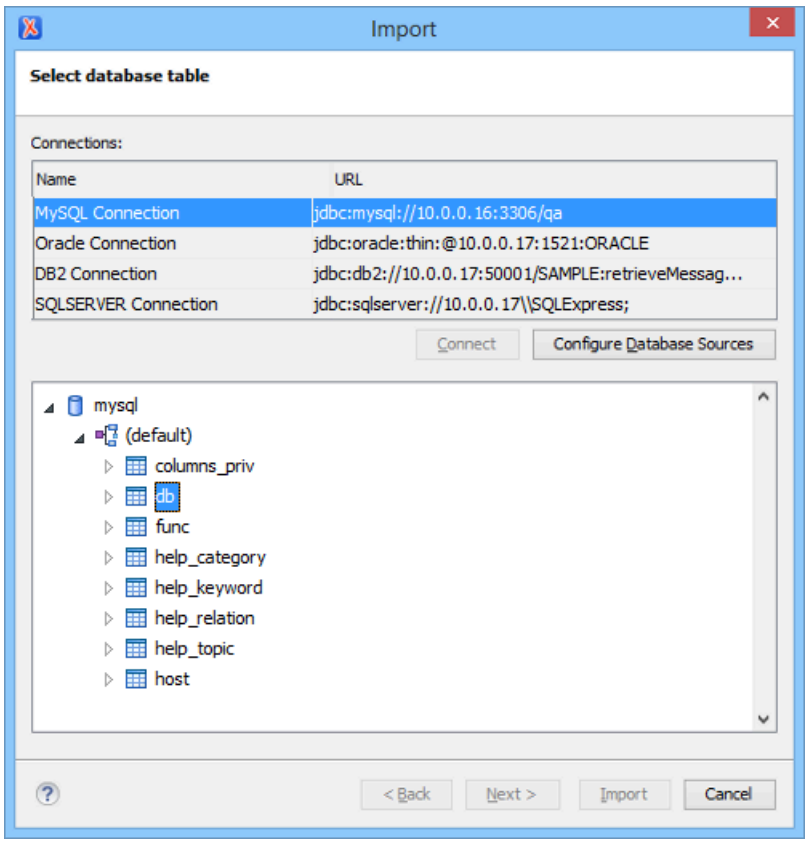
Import Database Data as an XML Document

To import the data from a relational database table as an XML document, follow these steps:

1. Go to **File > Import > Database Data** to start the **Import** wizard.

   This opens a **Select database table** dialog box that lists all the defined database connections:

Figure: Select Database Table Dialog Box



2. Select the connection to the database that contains the appropriate data.
   Only connections configured in relational data sources can be used to import data.

3. If you want to edit, delete, or add a data source or connection, click the **Configure Database Sources** button.
   The **Preferences**/**Data Sources** option page is opened.

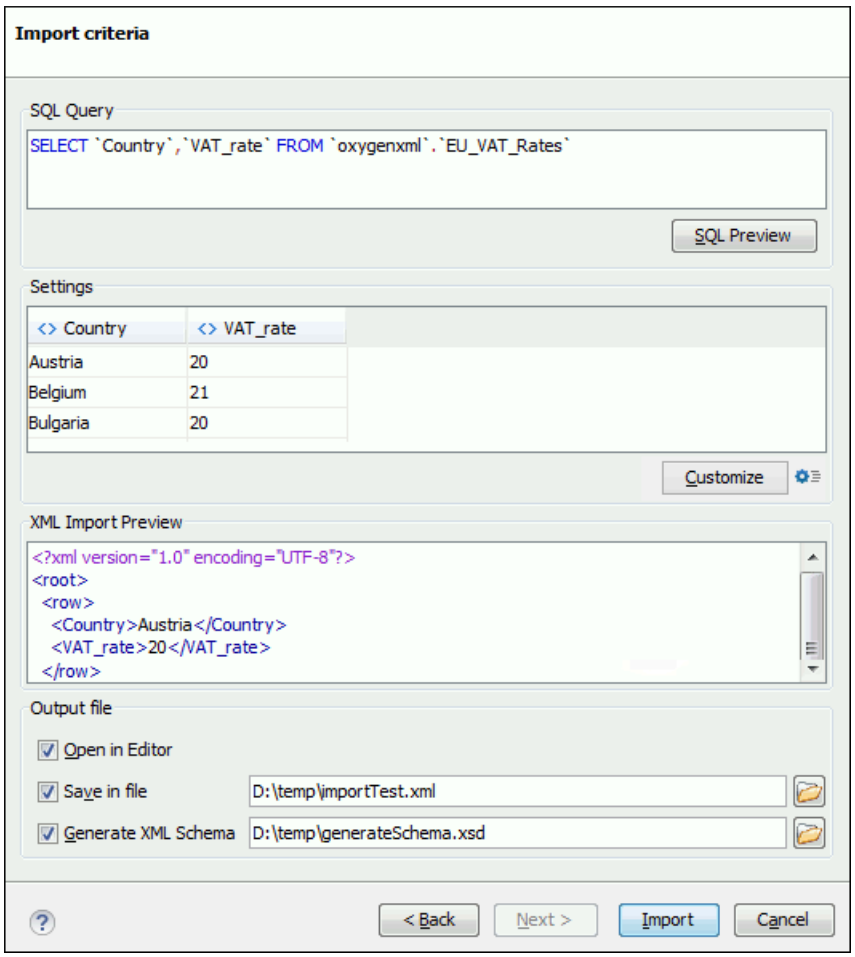
4. Click **Connect**.

5. In the list of sources, expand a schema and choose the required table.

6. Click the **Next** button.

   The **Import Criteria** dialog box is opened with a default query string in the **SQL Query** pane.

Figure: Import from Database Criteria Dialog Box



7. Configure the settings for the conversion.
   a. **SQL Preview** - If this button is pressed, the **Settings** pane displays the labels that are used in the XML document and the first five lines from the database. By default, all data items are converted to element content (<> symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (× symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
   b. **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: `ELEMENT`, `ATTRIBUTE`, or `SKIPPED`.
   c. **Import Settings** - Clicking this button opens the **Import** preferences page *(page 219)* that allows you to configure more import options.

d. The **XML Import Preview** panel contains an example of what the generated XML document looks like.
e. **Open in editor** - If selected, the new XML document created from the imported file is opened in the editor.
f. **Save in file** - If selected, the new XML document is saved in the specified path.
g. **Generate XML Schema** - Allows you to specify the path of the generated XML Schema file.

8. Click **Import** to generate the XML document.

Import from HTML Files

Oxygen XML Editor offers two methods for importing HTML files into an XML document. The first method is to simply copy data from an HTML document and paste it into a document in **Author** mode, but this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents. Oxygen XML Editor also offers a configurable import wizard that works with any type of XML document.

Smart Paste Method

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the HTML document in your web browser, copy its content, and paste it into your document in **Author** mode.

The Oxygen XML Editor **Smart Paste** mechanism *(page 911)* will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

Import Wizard Method

To use the **Import** wizard to import from HTML files, follow these steps:

1. Go to **File > Import > HTML File**. The **Import HTML** wizard is displayed.
2. Enter the URL of the HTML document.
3. Select the type of the resulting XHTML document:
   - XHTML5
   - XHTML 1.0 Transitional
   - XHTML 1.0 Strict
4. Click the **OK** button.

Result: The resulting document is an XHTML file containing a DOCTYPE declaration that references the XHTML DTD definition on the Web. The parsed content of the imported file is transformed to XHTML5, XHTML Transitional, or XHTML Strict depending on the option you chose.

Import Content Dynamically

Along with the built-in support for various useful URL protocols (such as HTTP or FTP), Oxygen XML Editor also provides special support for a *convert* protocol that can be used to chain predefined processors to dynamically import content from various sources.

A *dynamic conversion URL* chains various processors that can be applied, in sequence, on a target resource and has the following general syntax:

```
convert:/processor=xslt;ss=urn:processors:excel2d.xsl/processor=excel!/urn:files:my.xls
```

The previous example first applies a processor (`excel`) on a target identified by the identifier (`urn:files:sample.xls`) and converts the Excel™ resource to XML. The second applied processor (`xslt`) applies an XSLT stylesheet identified using the identifier (`urn:processors:excel2d.xsl`) over the resulting content from the first applied processor. These identifiers are all mapped to real resources on disk via an *XML catalog* that is configured in the application, as in the following example:

```
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <rewriteURI uriStartString="urn:files:" rewritePrefix="./resources/"/>
  <rewriteURI uriStartString="urn:processors:" rewritePrefix="./processors/"/>
</catalog>
```

The target resource part of the conversion URL must always follow the `!/` pattern. It can be any of the following:

- An absolute URL that points to a resource.
- An identifier that will be resolved to an actual resource via the *XML Catalog (page 3235)* support in the application. In the example above, the **urn:files:sample.xls** target resource is resolved via the *XML catalog*.
- A relative location. This location can only be resolved to an actual resource URL when the application has enough information about the location where the URL is referenced.

  For example, for a *DITA map (page 3228)* with a `topicref` such as:

  ```
  <topicref href="convert:/.../processor=excel!/resources/sample.xls"/>
  ```

  the `resources/sample.xls` path will be resolved relative to the *DITA map* location.

This type of URL can be opened in the application by using the **Open URL** action from the **File** menu. It can also be referenced from existing XML resources via `xi:include` or as a topic reference from a *DITA map*.

A *GitHub* project that contains various dynamic conversion samples for producing DITA content from various sources (and then publishing it) can be found here: https://github.com/oxygenxml/dita-glass.

Conversion Processors

A set of predefined conversion processors is provided in Oxygen XML Editor. Each processor has its own parameters that can be set to control the behavior of the conversion process. All parameters that are resolved to resources are passed through the *XML catalog* mapping.

The following predefined conversion processors are included:

- `xslt` **Processor** - Converts an XML input using the Saxon EE XSLT processor. The `ss` parameter indicates the stylesheet resource to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

  ```
  convert:/processor=xslt;ss=urn:processors:convert.xsl;p1=v1!/urn:files:sample.xml
  ```

- `xquery` **Processor** - Converts an XML input using the Saxon EE XQuery processor. The `ss` parameter indicates the XQuery script to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

  ```
  convert:/processor=xquery;ss=urn:processors:convert.xquery;p1=v1!/
  urn:files:sample.xml
  ```

- `excel` **Processor** - Converts an Excel™ input to an XML format that can later be converted by other piped processors. It has a single parameter `sn`, which indicates the name of the sheet that needs to be converted. If this parameter is missing, the XML will contain the combined content of all sheets included in the Excel™ document.

  ```
  convert:/processor=excel;sn=test!/urn:files:sample.xls
  ```

- `java` **Processor** - Converts an input to another format by applying a specific Java method. The `jars` parameter is a comma-separated list of *JAR (page 3230)* libraries, or folders that libraries will be loaded from. The `ccn` parameter is the fully qualified name of the conversion class that will be instantiated. The conversion class needs to have a method with the following signature:

  ```
   public void convert(String systemID, String originalSourceSystemID,
  InputStream is, OutputStream os, LinkedHashMap<String, String> properties)
  throws IOException
  ```

  ```
  convert:/processor=java;jars=libs;ccn=test.JavaToXML!/
  urn:files:java/WSEditorBase.java
  ```

- `js` **Processor** - Converts an input to another format by applying a JavaScript method. The `js` parameter indicates the script that will be used. The `fn` parameter is the name of the method

that will be called from the script. The method must take a string as an argument and return a string. If any of the parameters are missing, an error is thrown and the conversion stops.

```
convert:/processor=js;js=urn:processors:md.js;fn=convertExternal!/
urn:files:sample.md
```

- `json` **Processor** - Converts a JSON input to XML. It has no parameters.

```
convert:/processor=json!/urn:files:personal.json
```

- `xhtml` **Processor** - Converts HTML content to well-formed XHTML. It has no parameters.

```
convert:/processor=xhtml!/urn:files:test.html
```

- `wrap` **Processor** - Wraps content in a tag name making it well-formed XML. The `rn` parameter indicates the name of the root tag to use. By default, it is `wrapper`. The `encoding` parameter specifies the encoding that should be used to read the content. By default, it is `UTF8`. As an example, this processor can be used if you want to process a comma-separated values file with an XSLT stylesheet to produce XML content. The CSV file is first wrapped as well-formed XML, which is then processed with an `xslt` processor.

```
convert:/processor=wrap!/urn:files:test.csv
```

- `cache` **Processor** - Caches the converted content obtained from the original document to a temporary file. The cache will be used on subsequent uses of the same URL, thus increasing the speed for the application returning the converted content. If the original URL points to the local disk, the cache will be automatically invalidated when the original file content gets modified. Otherwise, if the original URL points to a remote resource, the cache will need to be invalidated by reloading (**File >** **Reload (F5)**) the URL content that is opened in the editor.

```
convert:/processor=cache/processor=xslt;…..!/urn:files:test.csv
```

Reverse Conversion Processors

All processors defined above can also be used for saving content back to the target resource if they are defined in the URL as reverse processors. Reverse processors are evaluated right to left. These reverse processors allow *round-tripping* content to and from the target resource.

As an example, the following URL converts HTML to DITA when the URL is opened using the `h2d.xsl` stylesheet and converts DITA to HTML when the content is saved in the application using the `d2h.xsl` stylesheet.

```
convert:/processor=xslt;ss=h2d.xsl/rprocessor=xslt;ss=d2h.xsl!/urn:files:sample.html
```

Important: If you are publishing a *DITA map* that has such conversion URL references inside, you need to edit the transformation scenario and set the value of the parameter

fix.external.refs.com.oxygenxml to **true**. This will instruct Oxygen XML Editor to resolve such references during a special pre-processing stage. Depending on the conversion, you may also require additional libraries to be added using the **Libaries** button in the **Advanced** tab of the transformation scenario.

15.

Debugging XSLT Stylesheets and XQuery Documents

Oxygen XML Editor includes a powerful debugging interface that helps you to detect and solve problems with XSLT and XQuery transformations.

XSLT Debugger Perspective

The **XSLT Debugger** *perspective (page 3232)* allows you to detect problems in an XSLT transformation by executing the process step by step. To switch the focus to this *perspective*, select the **XSLT Debugger** button in the top-right corner of the interface or **Window > Open perspective > XSLT Debugger**.

XQuery Debugger Perspective

The **XQuery Debugger** *perspective (page 3232)* allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this *perspective*, select the **XQuery Debugger** button in the top-right corner of the interface or **Window > Open perspective > XQuery Debugger**.

XSLT/XQuery Debugging Overview

The **XSLT Debugger** and **XQuery Debugger** *perspectives (page 3232)* allows you to test and debug XSLT 1.0 / 2.0 / 3.0 stylesheets and XQuery 1.0 / 3.0 documents including complex XPath 2.0 / 3.0 expressions. The interface presents simultaneous views of the source XML document, the XSLT/XQuery document and the result document. As you go step by step through the XSLT/XQuery document the corresponding output is generated step by step, and the corresponding position in the XML file is highlighted. At the same time, special views provide various types of debugging information and events useful to understand the transformation process.

The following set of features allow you to test and solve XSLT/XQuery problems:

- Support for XSLT 1.0 stylesheets (using Saxon 6.5.5 and Xalan XSLT engines), XSLT 2.0 / 3.0 stylesheets and XPath 2.0 / 3.0 expressions that are included in the stylesheets (using Saxon 9.8.0.12 XSLT engine) and XQuery 1.0 / 3.0 (using Saxon 9.8.0.12 XQuery engine).
- Stepping capabilities: step in, step over, step out, run, run to cursor, run to end, pause, stop.

- Output to source mapping between every line of output and the instruction element / source context that generated it.
- *Breakpoints (page 2222)* on both source and XSLT/XQuery documents.
- Call stack on both source and XSLT/XQuery documents.
- Trace history on both source and XSLT/XQuery documents.
- Support for XPath expression evaluation during debugging.
- Step into imported/included stylesheets as well as included source entities.
- Available templates and hits count.
- Variables view.
- Dynamic output generation.

For even more information, watch our video demonstration:

Debugger Layout

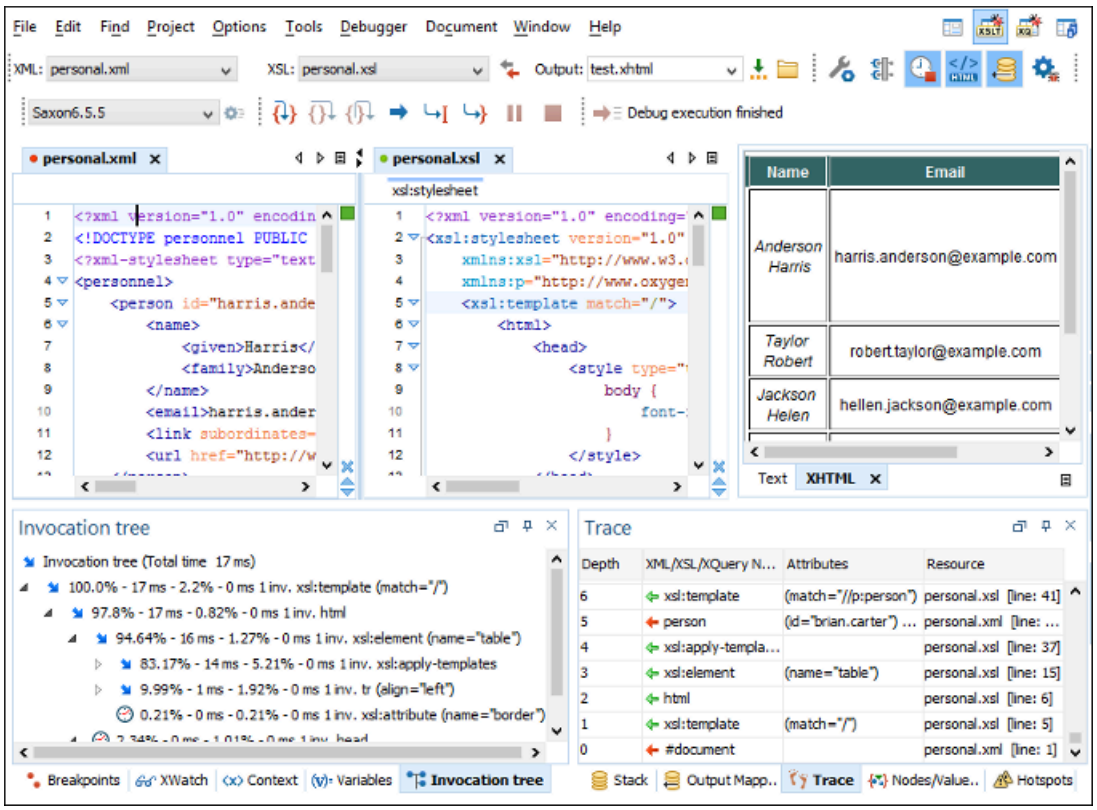
The XML and XSL files are displayed in **Text** mode *(page 819)*. The other modes (**Author** mode *(page 400)*, **Grid** mode *(page 390)*) are available only in the **Editor** *perspective (page 294)*.

The **XSLT/XQuery Debugger** *perspective (page 3232)* contains the following components:

- **Source Document View (XML)** - Displays and allows the editing of XML files (documents).
- **XSLT/XQuery Document View (XSLT/XQuery)** - Displays and allows the editing of XSL files (stylesheets) or XQuery documents.
- **Output View** - Displays the output that results from inputting a document (XML) and a stylesheet (XSL) or XQuery document in the transformer. The transformation result is written dynamically while the transformation is processed (using the **Run** button on the Control toolbar *(page 2204)*). Several actions are available in the contextual menu for this view, including **Find/Replace**, **Copy**, and **Format and Indent**. There are two types of output views: a **Text** view (with XML syntax highlights) and **XHTML** view. For large outputs, the XHTML view can be disabled (see Debugger Settings *(page 210)*).
- **Control Toolbar** *(page 2202)* - Contains a variety of actions to help you configure and control the debugging process.
- **Information Views** *(page 2205)* - The information views at the bottom of the editor display various types of information to help you understand the transformation process.

Tip: The **Output** view and the various other information views are dockable *(page 3228)* so that you can configure the workspace according to your preferences.

Figure: Debugger Interface



XML documents and XSL stylesheets or XQuery documents that were opened in the **Editor** *perspective (page 3232)* are automatically sorted into the first two panes. When multiple files of each type are opened, the individual documents and stylesheets are separated using the familiar tab management system that you are used to in the **Editor** *perspective*. Selecting a tab brings the document or stylesheet into focus and enables editing without the need to go back to the **Editor** *perspective*.

In Debugger mode, the normal editor toolbar is not available. However, functions are still accessible from the **Document** menu and the contextual menus.

Bookmarks (page 304) are replaced in the **Debugger** *perspective* by breakpoints *(page 2222)*.

During debugging, the current execution node is highlighted in both document (XML) and XSLT/XQuery views.

Related Information:

Steps in a Typical Debugging Process *(page 2218)*

Identify the XSLT / XQuery Expression that Generated Particular Output *(page 2219)*

Supported Processors for XSLT / XQuery Debugging *(page 2229)*

Performance Profiling of XSLT Stylesheets and XQuery Documents *(page 2223)*

Control Toolbar

The **Control** toolbar contains all the actions that you need to configure and control the debugging process. The following actions are described as they appear in the toolbar from left to right.

Figure: Control Toolbar

XML source selector

The current selection represents the source document used as input by the transformation engine. The selection list contains all opened files (XML files being emphasized). This option allows you to use other file types also as source documents. In an XQuery debugging session this selection field can be set to the default value `NONE`, because usually XQuery documents do not require an input source.

XSL / XQuery selector

The current selection represents the stylesheet or XQuery document to be used by the transformation engine. The selection list contains all opened files (XSLT / XQuery files being emphasized).

Link with editor

When selected, the XML and XSLT/XQuery selectors display the names of the files opened in the central editor panels. This button is toggled off by default.

Output selector

The selection represents the output file specified in the associated transformation scenario. You can specify the path by using the text field, the **Insert Editor Variables** *(page 275)* button, or the **Browse** button.

Configure parameters

Opens a dialog box that allows you to configure the XSLT / XQuery parameters to be used by the transformation.

Edit extensions

Allows you to add and remove the Java classes and *JARS (page 3230)* used as XSLT extensions.

/ Turn on/off profiling

Enables / Disables current transformation profiling.

Enable XHTML output

Enables the rendering of the output in the **XHTML** output view *(page 2200)* during the transformation process. For performance issues, disable XHTML output when working with very large files. Note that only XHTML conformant documents can be rendered by this view. To view the output result of other formats, such as HTML, save the **Text output** area to a file and use an external browser for viewing.

When starting a debug session from the **Editor** *perspective (page 3232)* by using the **Debug Scenario** action, the state of this toolbar button reflects the state of the **Show as XHTML** output option from the scenario.

Turn on/off output to source mapping

Enables or disables the output to source mapping between every line of output and the instruction element / source context that generated it.

Debugger preferences

Quick link to Debugger preferences page *(page 210)*.

XSLT / XQuery engine selector

Lists the processors available for debugging XSLT and XQuery transformations *(page 2229)*.

XSLT / XQuery engine advanced options

Advanced options available for Saxon 9.8.0.12.

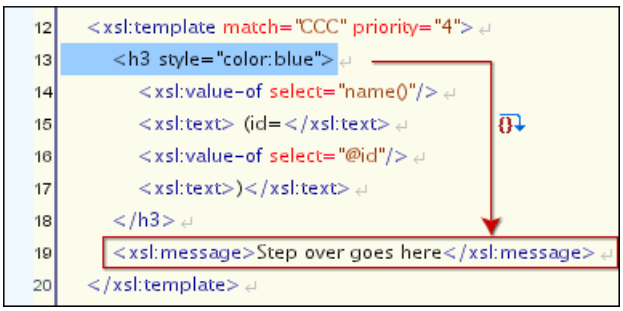
Step into

Starts the debugging process and runs until the next instruction is encountered.

Step over

Run until the current instruction and its sub-instructions are over. Usually this will advance to the next sibling instruction.

Figure: Step over



Step out

Run until the parent of the current instruction is over. Usually this will advance to the next sibling of the parent instruction.

Figure: Step out

Run Shift + F5

Starts the debugging process. The execution of the process is paused when a breakpoint *(page 2206)* is encountered or the transformation ends.

Run to cursor

Starts the debugging process and runs until one of the following conditions occur: the line of cursor is reached, a valid *breakpoint (page 2222)* is reached or the execution ends.

Run to end

Runs the transformation until the end, without taking into account enabled *breakpoints (page 2222)*, if any.

Pause

Request to pause the current transformation as soon as possible.

Stop

Request to stop the current transformation without completing its execution.

Show current execution nodes

Reveals the current debugger context showing both the current instruction and the current node in the XML source. Possible displayed states:

- Entering ( ) or leaving () an XML execution node.
- Entering ( ) or leaving () an XSL execution node.
- Entering ( ) or leaving () an XPath execution node.

Note: When you set a MarkLogic server as a processor, the **Show current execution nodes** button is named **Refresh current session context from server**. Click this button to refresh the information in all the views.

Note: For some of the XSLT processors (Saxon-HE/PE/EE) the debugger could be configured to step into the XPath expressions affecting the behavior of the following debugger actions: **Step into**, **Step over** or **Step Out**.

Related Information:

Advanced Saxon HE/PE/EE XQuery Transformation Options *(page 1663)*

Debugging Information Views

The information views at the bottom of the editor is comprised of two panes that are used to display various types of information used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This enables the developer to obtain a clear view of the transformation progress. By using the debug controls, developers can easily isolate parts of stylesheet. Therefore, they may be more easily understood and modified.

The information types include the following:

Left side information views

- **Breakpoints** view *(page 2206)*
- **XWatch** view *(page 2208)*
- **Context** view *(page 2207)*
- **Messages** view *(page 2209)* (XSLT only)
- **Variables** view *(page 2216)*
- **Invocation Tree** view *(page 2225)*

Right side information views

- **Stack** view *(page 2210)*
- **Output Mapping Stack** view *(page 2211)*
- **Trace** view *(page 2213)*
- **Templates** view *(page 2214)* (XSLT only)
- **Nodes/Values Set** view *(page 2215)*
- **Hotspots** view *(page 2227)*

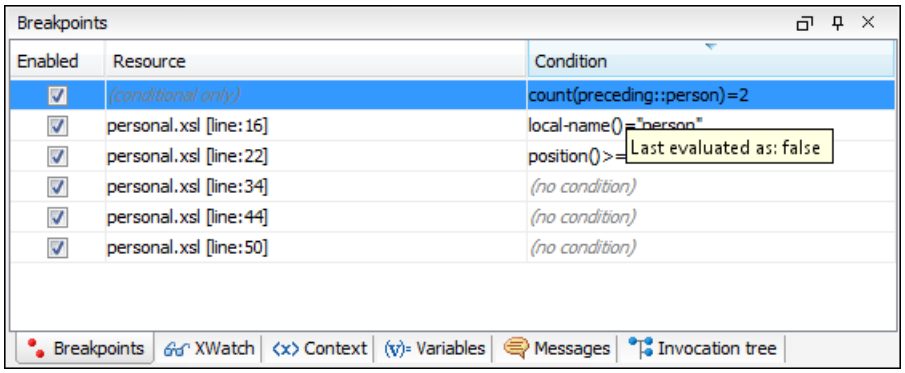
Tip: The information views are dockable *(page 3228)* so that you can configure the workspace according to your preferences.

Breakpoints View

The **Breakpoints** view lists all *breakpoints (page 2222)* that are set on opened documents. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. *Breakpoints* can be inserted *(page 2223)* in the XML source document or the XSLT/XQuery document in debugging sessions.

Once you insert a *breakpoint*, it is automatically added to the list in the **Breakpoints** view and you can edit its associated *condition*. A *breakpoint* can have an associated break condition that represents an XPath expression evaluated in the current debugger context. In order to be processed, their evaluation result should be a boolean value. A *breakpoint* with an associated condition only stops the execution of the Debugger if the *breakpoint condition* is evaluated as **true**.

Figure: Breakpoints View



The **Breakpoints** view contains the following columns:

- **Enabled** - If selected, the current condition is evaluated and taken into account.
- **Resource** - Resource file and number of the line where the *breakpoint* is set. The Entire path of resource file is available as tooltip.

- **Condition** - XSLT/XQuery expression to be evaluated during debugging. The expression will be evaluated at every debug step.

Clicking a record highlights the *breakpoint* line in the document.

Note: The *breakpoints* list is not deleted at the end of a transformation (it is preserved between debugging sessions).

The following actions are available in the contextual menu of the table:

Go to

Moves the cursor to the source of the *breakpoint*.

Run to Breakpoint

Runs the debugger up to the point of this particular *breakpoint* and ignores the others (regardless of whether they were previously enabled or disabled).

Enable

Enables the *breakpoint*.

Disable

Disables the *breakpoint*. A disabled *breakpoint* will not be evaluated by the Debugger.

Add

Allows you to add a new *breakpoint* and *breakpoint condition*.

Edit

Allows you to edit an existing *breakpoint*.

Remove

Deletes the selected *breakpoint*.

Enable all

Enables all *breakpoints*.

Disable all

Disables all *breakpoints*.

Remove all

Removes all *breakpoints*.

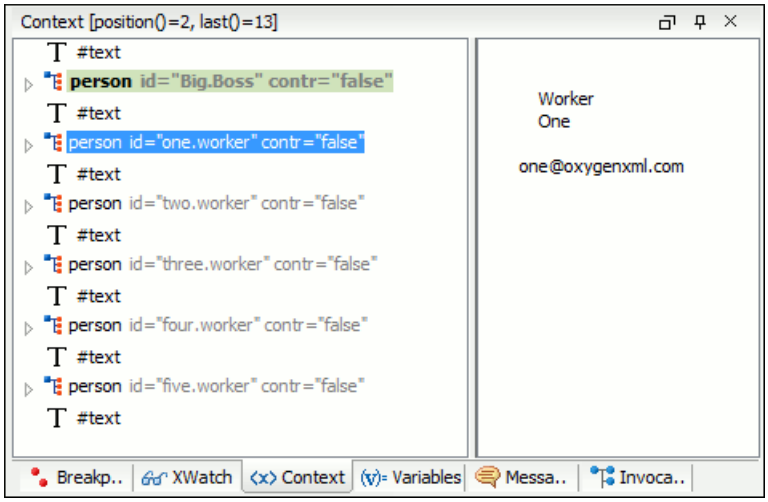
Related Information:

Using Breakpoints *(page 2222)*

Context View

The context node is valid only for XSLT debugging sessions and is a source node corresponding to the XSL expression that is evaluated. It is also called the context of execution. The context node implicitly changes as the processor hits various steps (at the point where XPath expressions are evaluated). This node has the same value as evaluating '.' (dot) XPath expression in **XWatch** view *(page 2208)*. The value of the context node is presented as a tree in the **Context** view. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: Context node view



The context nodes are presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel. The **Context** view also presents the current mode of the XSLT processor if this mode differs from the default one.

The title bar displays the current element index and the number of elements that compose the current context (this information is not available if you choose Xalan or Saxon 6 as processing engine).

XPath Watch (XWatch) View

The **XWatch** view shows XPath expressions evaluated during the debugging process. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Expressions are evaluated dynamically as the processor changes its source context. When you type an XPath expression in the **Expression** column, Oxygen XML Editor supports you with syntax highlight and content completion assistance *(page 1177)*.

Figure: XPath Watch View

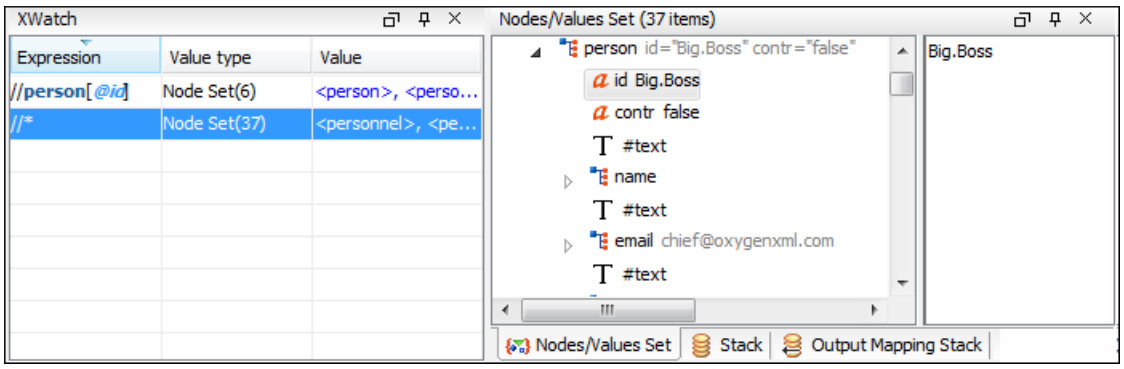


Table 76. XWatch columns

Column	Description
Expression	XPath expression to be evaluated (XPath 1.0 or 2.0 / 3.0 compliant).
Value	Result of XPath expression evaluation. Value has a type (see the possible values *(page 2216)* in the section Variables View *(page 2216)*). For *Node Set* results, the number of nodes in the set is shown in parenthesis.

Important: Notes about working with the **XWatch** view:

- Expressions that reference variable names are not evaluated.
- The expression list is not deleted at the end of the transformation (it is preserved between debugging sessions).
- To insert a new expression, click the first empty line of the **Expression** column and start typing. As an alternative, right-click and select the **Add** action. Press **(Enter)** on the cell to add and evaluate.
- To delete an expression, click its **Expression** column and delete its content. As an alternative, right-click and select the **Remove** action. Press **(Enter)** on the cell to commit changes.
- If the expression result type is a *Node Set*, click it (**Value** column) and its value is displayed in the **Nodes/Values Set** view *(page 2215)*.
- The **Copy**, **Add**, **Remove** and **Remove All** actions are available in every row's contextual menu.

Messages View

Using **xsl:message** instructions is one way to signal special situations encountered during transformation as well as a raw way of doing the debugging. The **Messages** view is available only for XSLT debugging sessions and shows all `xsl:message` calls executed by the XSLT processor during transformation. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: Messages View

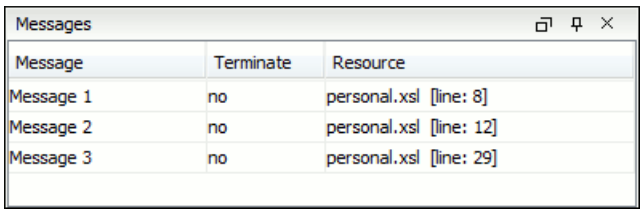

Table 77. Messages columns

Column	Description
Message	Message content.
Terminate	Signals if processor terminates the transformation or not once it encounters the message (yes/no respectively).
Resource	Resource file where *xsl:message* instruction is defined and the message line number. The complete path of the resource is available as tooltip.

The following actions are available in the contextual menu:

Go to

Highlight the XSL fragment that generated the message.

Copy

Copies to clipboard message details (system ID, severity info, description, start location, terminate state).

Clear all

Removes all messages from the view.

Important:

- Clicking a record from the table highlights the `xsl:message` declaration line.
- Message table values can be sorted by clicking the corresponding column header. Clicking the column header switches the sorting order between: ascending, descending, no sort.

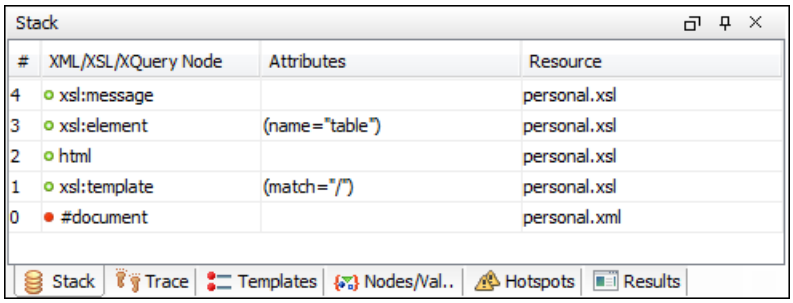
Stack View

The **Stack** view shows the current execution stack of both source and XSLT/XQuery nodes. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

During the transformation, two stacks are managed. One for source nodes being processed and the other for XSLT/XQuery nodes being processed. Oxygen XML Editor shows both node types in one common stack. The source (XML) nodes are preceded by a red color icon while XSLT/XQuery nodes

are preceded by a green color icon. The advantage of this approach is that you can always see the source scope on which an XSLT/XQuery instruction is executed (the last red color node on the stack). The stack is oriented upside down.

Figure: Stack View



The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line containing the XSLT element that is displayed on the selected line from the view.

Table 78. Stack Columns

Column	Description
#	Order number, represents the depth of the node (0 is the stack base).
XML/XSLT/XQuery Node	Node from source or stylesheet document currently being processed. One particular stack node is the document root, noted as **#document**.
Attributes	Attributes of the node (a list of *id="value"* pairs).
Resource	Resource file where the node is located. The entire path is available as tooltip.

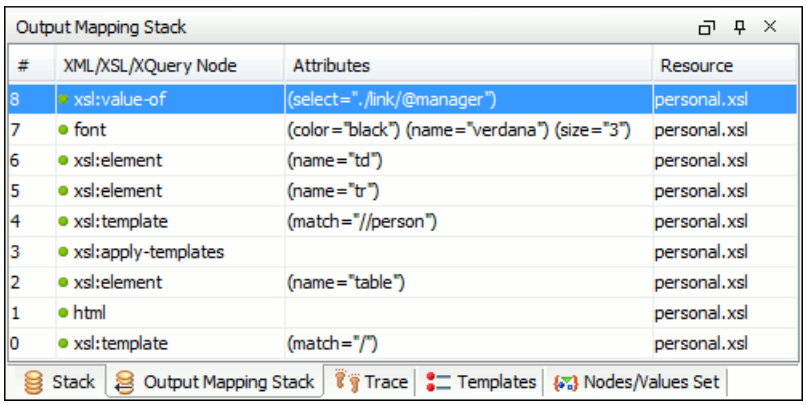
Important: Remarks:

- Clicking a record from the stack highlights that node's location inside resource.
- Using Saxon, the stylesheet elements are qualified with XSL proxy, while using Xalan you only see their names. (example: `xsl:template` using Saxon and `template` using Xalan).
- Only the Saxon processor shows element attributes.
- The Xalan processor shows also the built-in rules.

Output Mapping Stack View

The **Output Mapping Stack** view displays context data *(page 2219)* and presents the XSLT templates/ XQuery elements that generated specific areas of the output. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: Output Mapping Stack view



The **Go to** action of the contextual menu takes you to the line that contains the XSLT element displayed in the **Output Mapping Stack** view.

Table 79. Output Mapping Stack Columns

Column	Description
#	The order number in the stack of XSLT templates/XQuery elements. Number 0 corresponds to the bottom of the stack in the status of the XSLT/XQuery processor. The highest number corresponds to the top of the stack.
XSL/XQuery Node	The name of an XSLT template/XQuery element that participated in the generation of the selected output area.
Attributes	The attributes of the XSLT template/XQuery node.
Resource	The name of the file containing the XSLT template/XQuery element.

Important: Remarks:

- Clicking a record highlights that XSLT template definition/XQuery element inside the resource (XSLT stylesheet file/XQuery file).
- Saxon only shows the applied XSLT templates having at least one hit from the processor. Xalan shows all defined XSLT templates, with or without hits.
- The table can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in XSLT rules.

Related Information:

Identify the XSLT / XQuery Expression that Generated Particular Output *(page 2219)*

Stack View *(page 2210)*

Trace View *(page 2213)*

Templates View *(page 2214)*

Trace View

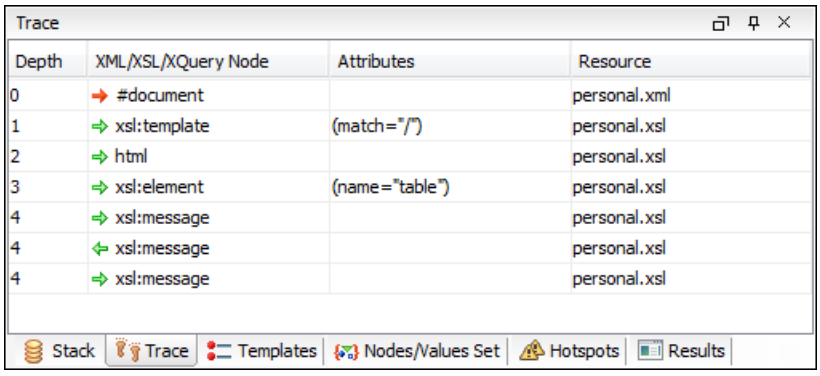
Usually, the XSLT/XQuery processors signal the following events during transformation:

- - Entering a source (XML) node.
- - Leaving a source (XML) node.
- - Entering an XSLT/XQuery node.
- - Leaving an XSLT/XQuery node.

The **Trace** view catches all of these events, so you can see how the process evolved. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The red icon lines denote source nodes while the green icon lines denote XSLT/XQuery nodes. It is possible to save the element trace in a structured XML document (using the **Export to XML** action in the contextual menu). Thus, you have the possibility of comparing the trace results from multiple debug sessions.

Figure: Trace History View



The contextual menu contains the following actions:

Go to

Moves the selection in the editor panel to the line containing the XSLT element or XML element that is displayed on the selected line from the view;

Export to XML

Saves the entire trace list in XML format.

Table 80. Trace History Columns

Column	Description
Depth	Shows you how deep the node is nested in the XML or stylesheet structure. The bigger the number, the more nested the node is. A depth 0 node is the document root.
XML/XSLT/XQuery Node	Represents the node from the processed source or stylesheet document. One particular node is the document root, noted as *#document*. Every node is preceded by an arrow that represents what action was performed on it (entering or leaving the node).
Attributes	Attributes of the node (a list of *id="value"* pairs).
Resource	Resource file where the node is located. The complete path of the resource file is provided as tooltip.

Important: Remarks:

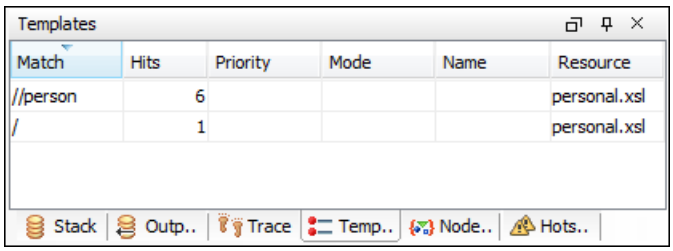
- Clicking a record highlights that node's location inside the resource.
- Only the Saxon processor shows the element attributes.
- The Xalan processor shows also the built-in rules.

Templates View

The **xsl:template** is the basic element for stylesheets transformation. The **Templates** view is only available during XSLT debugging sessions and shows all *xsl:template* instructions used by the transformation. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Being able to see the number of *hits* for each of the templates allows you to get an idea of the stylesheet coverage by template rules with respect to the input source.

Figure: Templates view



The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line that contains the XSLT template displayed on the selected line from the view.

Table 81. Templates columns

Column	Description
Match	The *match* attribute of the *xsl:template*.
Hits	The number of hits for the *xsl:template*. Shows how many times the XSLT processor used this particular template.
Priority	The template priority as established by XSLT processor.
Mode	The *mode* attribute of the *xsl:template*.
Name	The *name* attribute of the *xsl:template*.
Resource	The resource file where the template is located. The complete path of the resource file is available as tooltip.

Important: Remarks:

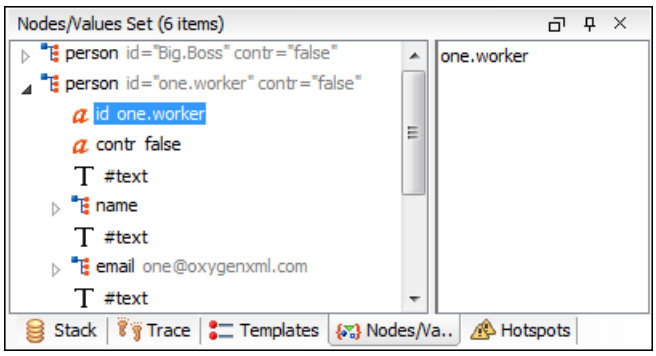
- Clicking a record highlights that template definition inside the resource.
- Saxon only shows the applied templates having at least one hit from the processor. Xalan shows all defined templates, with or without hits.
- Template table values can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in rules.

Nodes/Values Set View

The **Nodes/Values Set** view is always used in relation with the **Variables** view *(page 2216)* and **XWatch** view *(page 2208)*. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. It shows an XSLT node set value in a tree form. This view is updated as a response to the following events:

- You click a variable that has a node set value in the **Variables** *(page 2216)* or **XWatch** view *(page 2208)*.
- You click a tree fragment in the **Variables** *(page 2216)* or **XWatch** view *(page 2208)*.
- You click an XPath expression evaluated to a node set in the **Variables** *(page 2216)* or **XWatch** view *(page 2208)*.

Figure: Node Set view



The nodes / values set is presented in a tree-like fashion. The total number of items is presented in the title bar. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel.

Important: Remarks:

- For longer values in the right side panel, the interface displays it with an ellipsis (...) at the end. A more detailed value is available as a tooltip when hovering over it.
- Clicking a record highlights the location of that node in the source or stylesheet view.

Variables View

The **Variables** view displays variables and parameters (local and global), along with their values. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Variables and parameters play an important role during an XSLT/XQuery transformation. Oxygen XML Editor uses the following icons to differentiate variables and parameters:

- V - Global variable.
- {V} - Local variable.
- P - Global parameter.
- {P} - Local parameter.

The following value types are available:

- **Boolean**
- **String**
- **Date** - XSLT 2.0 / 3.0 only.
- **Number**
- **Set**

- **Object**
- **Fragment** - Tree fragment.
- **Any**
- **Undefined** - The value was not yet set, or it is not accessible.

Note:

When Saxon 6.5 is used, if the value is unavailable, then the following message is displayed in the **Value** field: "The variable value is unavailable".

When Saxon 9 is used:

If the variable is not used, the **Value** field displays "The variable is declared but never used".
If the variable value cannot be evaluated, the **Value** field displays "The variable value is unavailable".

- **Document**
- **Element**
- **Attribute**
- **ProcessingInstruction**
- **Comment**
- **Text**
- **Namespace**
- **Evaluating** - Value under evaluation.
- **Not Known** - Unknown types.

Figure: Variables View

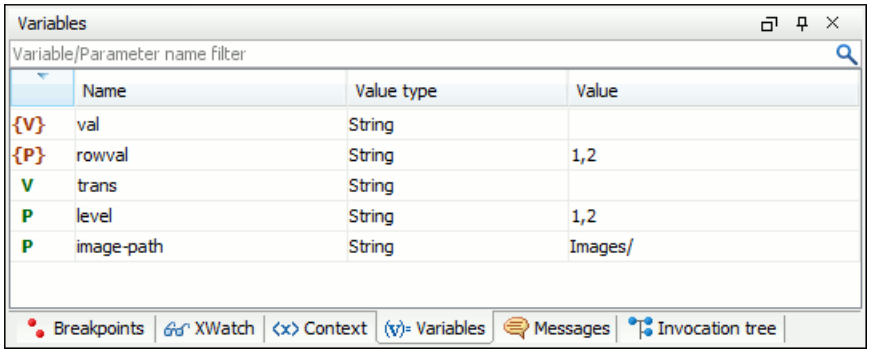


Table 82. Variables Columns

Column	Description
Name	Name of variable / parameter.
Value Type	Type of variable/parameter.
Value	Current value of variable / parameter.

The value of a variable (the **Value** column) can be copied to the clipboard for pasting it to other editor areas with the **Copy value** action from the contextual menu. This is useful if you have long and complex values that cannot be easily remembered just by looking at them once.

Important: Remarks:

- Local variables and parameters are the first entries presented in the table.
- Clicking a record highlights the variable definition line.
- Variable values could differ depending on the transformation engine used or stylesheet version set.
- If the value of the variable is a node set or a tree fragment, clicking it causes the **Node Set** view *(page 2215)* to be shown with the corresponding set of values.
- Variable table values can be sorted by clicking the corresponding column header. Clicking the column header switches between the orders: ascending, descending, no sort.

Multiple Output Documents in XSLT 2.0 and XSLT 3.0

For XSLT 2.0 and XSLT 3.0 stylesheets that store the output in multiple files by using the `xsl:result-document` instruction, the content of the file created in this way is displayed dynamically while the transformation is running in an output view. There is one view for each `xsl:result-document` instruction so that the output is not mixed while still being presented in multiple views.

Steps in a Typical Debugging Process

Depending on your situation and needs, the debugging process might be more complex, but the following procedure is an example of a typical debugging process:

1. Open the source XML document *(page 684)* and the XSLT/XQuery document. *(page 684)*
2. If you are in the **Editor** *perspective (page 3232)*, switch to the **XSLT Debugger** or **XQuery Debugger** *perspective (page 3232)* with one of the following actions:
   - Select **Window > Open perspective > XSLT Debugger/XQuery Debugger** or the **XSLT Debugger**/**XQuery Debugger** button in the top-right corner of the interface.
   - Select **Document > XML Document > Debug scenario** or use the **Debug scenario** action on the toolbar.. This action initializes the Debugger *perspective (page 3232)* with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger *perspective*.

3. Select the source XML document in the XML source selector of the Control toolbar *(page 2202)*. In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to **NONE**.
4. Select the XSLT/XQuery document in the XSL/XQuery selector of the Control toolbar *(page 2202)*.
5. Set XSLT/XQuery parameters using the **Configure parameters** button on the Control toolbar *(page 2202)*.
6. Set one or more breakpoints *(page 2222)*.
7. Step through the stylesheet using the following buttons available on the Control toolbar *(page 2203)*:
   - **Step into**
   - **Step over**
   - **Step out**
   - **Run**
   - **Run to cursor**
   - **Run to end**
   - **Pause**
   - **Stop**
8. Examine the data in the information views to find the bug in the transformation process.
   For more information about fixing bugs in the transformation, see: Identify the XSLT / XQuery Expression that Generated Particular Output *(page 2219)*.

Related Information:

Identify the XSLT / XQuery Expression that Generated Particular Output *(page 2219)*

Identify the XSLT / XQuery Expression that Generated Particular Output

To quickly spot the XSLT templates or XQuery expressions with problems, it is important to know what XSLT template in the XSLT stylesheet (or XQuery expression in the XQuery document) and what element in the source XML document generated a specified area in the output.

Some of the debugging capabilities (for example, **Step in**) can be used for this purpose. Using **Step in**, you can see how output is generated and link it with the XSLT/XQuery element being executed in the

current source context. However, this can become difficult on complex XSLT stylesheets or XQuery documents that generate a large output.

You can click particular text in the **Output** view or **XHTML** output view and the editor will select the XML source context and the XSLT template/XQuery element that generated that text. Also, inspecting the whole stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the specified output area speeds up the debugging process.

This is an example of a typical procedure for identifying an expression that generated particular output:

1. Switch to the **XSLT Debugger** or **XQuery Debugger** *perspective (page 3232)* with one of the following actions:
   - Select **Window > Open perspective > XSLT Debugger/XQuery Debugger** or the **XSLT Debugger**/**XQuery Debugger** button in the top-right corner of the interface.
   - Select **Document > XML Document > Debug scenario** or use the **Debug scenario** action on the toolbar.. This action initializes the Debugger *perspective (page 3232)* with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger *perspective*.
2. Select the source XML document in the XML source selector of the Control toolbar *(page 2202)*. In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to **NONE**.
3. Select the XSLT/XQuery document in the XSL/XQuery selector of the Control toolbar *(page 2202)*.
4. Select the appropriate engine in the XSLT/XQuery engine selector of the Control toolbar *(page 2203)*.
5. Set XSLT/XQuery parameters using the **Configure parameters** button on the Control toolbar *(page 2202)*.
6. Apply the XSLT stylesheet or XQuery transformation using the **Run to end** button that is available on the Control toolbar *(page 2204)*.
7. Inspect the mapping by clicking a section of the output in either the **Text** tab or **XHTML** tab of the Output view *(page 297)*.

Figure: XHTML Output to Source Mapping

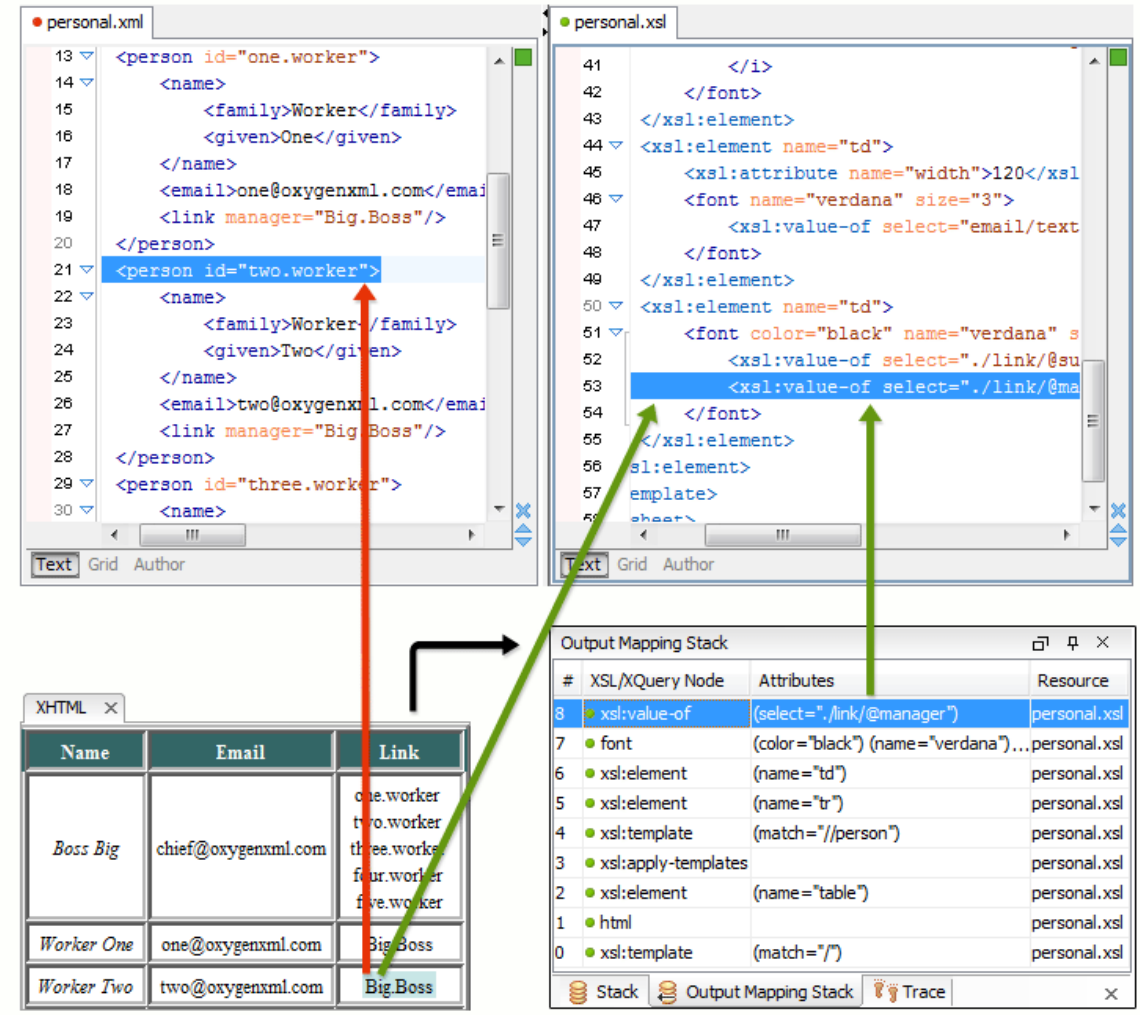

Figure: Text Output to Source Mapping

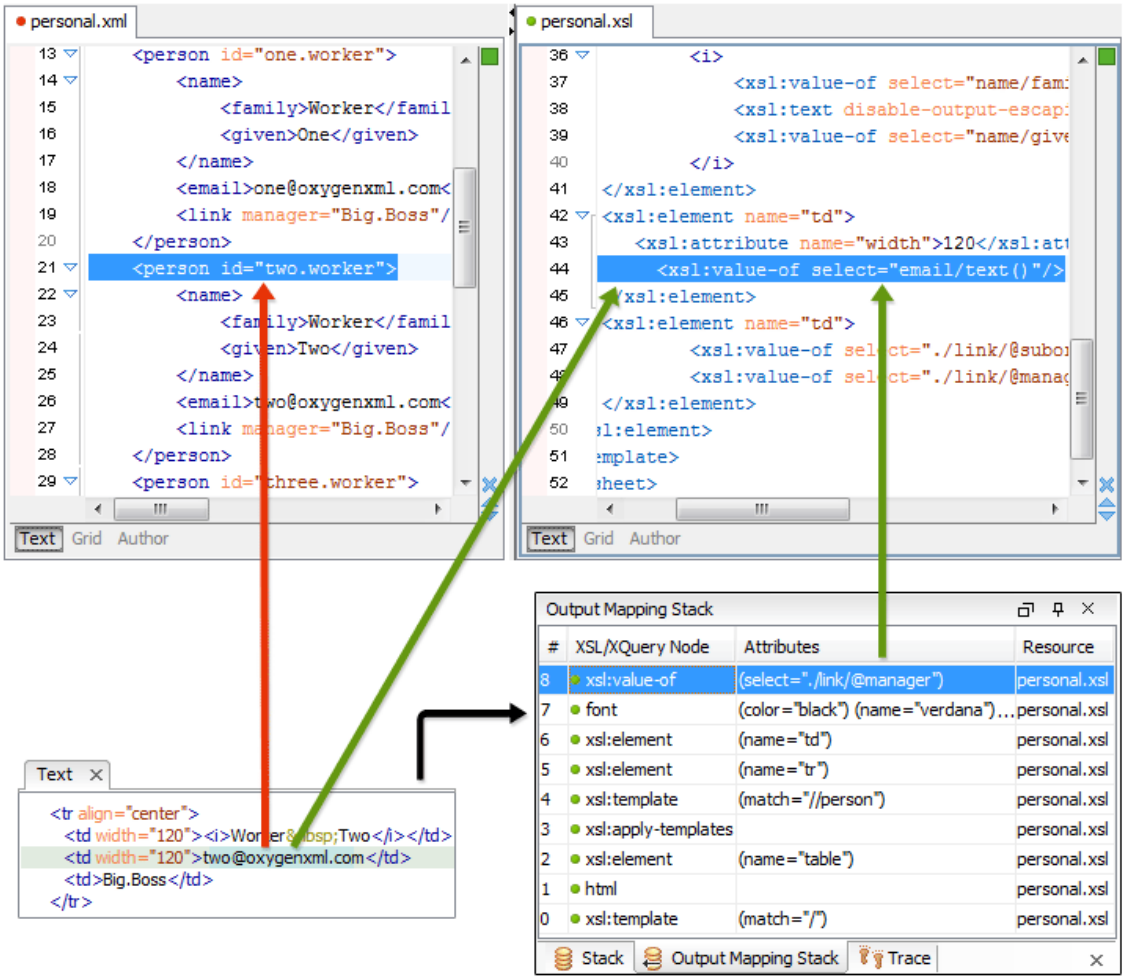


This action will highlight the XSLT / XQuery element and the XML source context. This XSLT template/XQuery element that is highlighted in the XSLT/XQuery editor represents only the top of the stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the clicked output section. In the case of complex transformations, inspecting the whole stack of XSLT templates/XQuery elements speeds up the debugging process. This stack is available in the **Output Mapping Stack** view *(page 2211)*.

Related Information:

Output Mapping Stack View *(page 2211)*

Trace View *(page 2213)*

Templates View *(page 2214)*

Using Breakpoints

The Oxygen XML Editor XSLT/XQuery Debugger allows you to interrupt XSLT/XQuery processing to gather information about variables and processor execution at particular points. To ensure *breakpoints* are persistent between work sessions, they are saved at project level. You can set a maximum of 100 *breakpoints* per project.

Inserting Breakpoints

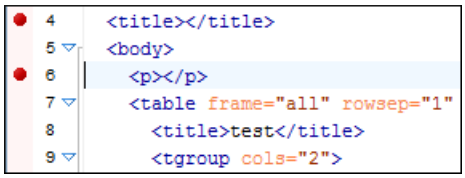
To insert a *breakpoint*, follow these steps:

1. Click the line where you want to insert the *breakpoint* in the XML source document or the XSLT/XQuery document. *Breakpoints* are automatically created on the ending line of a start tag, even if you click a different line.
2. Click the vertical stripe on the left side of the editor panel or use **Shift+F7**.

Result:

Once you insert a *breakpoint*, it is automatically added to the list in the **Breakpoints** view and you can edit its associated *condition*. A *breakpoint* can have an associated break condition that represents an XPath expression evaluated in the current debugger context. In order to be processed, their evaluation result should be a boolean value. A *breakpoint* with an associated condition only stops the execution of the Debugger if the *breakpoint condition* is evaluated as **true**.

Figure: Example: Breakpoints



Removing Breakpoints

To remove a *breakpoint*, click its icon (●) in the vertical stripe on the left side of the editor panel or right-click the *breakpoint* and select **Renove** or **Remove all**.

Related Information:

Breakpoints View *(page 2206)*

Performance Profiling of XSLT Stylesheets and XQuery Documents

Whether you are trying to identify a performance issue that is causing your production XSLT/XQuery transformation to not meet customer expectations or you are trying to proactively identify issues prior to deploying your XSLT/XQuery transformation, using the XSLT/XQuery profiler feature is essential to helping you save time and ultimately ensure a better performing, more scalable XSLT/XQuery transformation.

The XSLT/XQuery profiling feature can use any available XSLT/XQuery processor that can be used for debugging and it is available from the debugging *perspective (page 3232)*.

Enabling the Profiler

Enabling and disabling the profiler is controlled by the / **Profiler** button from the debugger Control toolbar *(page 2203)*. The XSLT/XQuery profiler is off by default. This option is not available during a debugger session so you need to set it before starting the transformation. For information about a common debugging procedure, see Steps in a Typical Debugging Process *(page 2218)*.

Profiling Information Views

Immediately after enabling the profiler, two new information views are added to the current debugger information views *(page 2205)*:

- **Invocation tree** view *(page 2225)* on left side
- **Hotspots** view *(page 2227)* on right side

Profiling data is available only after the transformation ends successfully.

On the left side (**Invocation tree** view *(page 2225)*), you can examine how style instructions are processed. This result view is also named call-tree, as it represents the order of style processing. The profiling result shows the duration time for each of the style-instruction including the time needed for its called children.

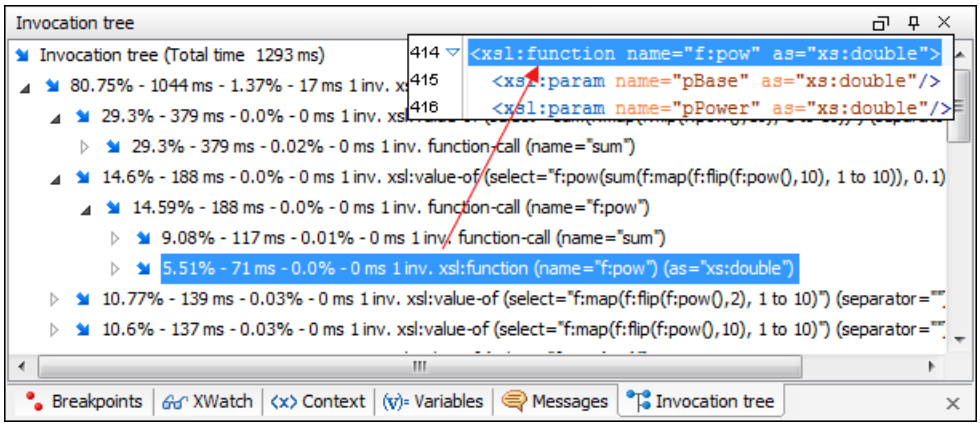
On the right side (**Hotspots** view *(page 2227)*), you can immediately spot the time the processor spent in each instruction. As an instruction usually calls other instructions, the used time of the called instruction is extracted from the duration time of the caller (the hotspot only presents the inherent time of the instruction).

Source Backmapping

In either the **Invocation tree** *(page 2225)* or **Hotspots** view *(page 2227)*, you can use the backmapping feature to find the XSLT stylesheet or XQuery expression definition. Clicking the

selected item causes Oxygen XML Editor to highlight the XSLT stylesheet or XQuery expression source line where the instruction is defined.

Figure: Source Backmapping



Saving and Customizing Profiling Data

The profiling data can be saved (exported) into XML and HTML format. In either the **Invocation tree** *(page 2225)* or **Hotspots** view *(page 2227)*, right-click anywhere in the view and select **Export to XML** or **Export to HTML**. The HTML report can be customized based upon the profiling raw data. When you select **Export to HTML**, Oxygen XML Editor will save it as XML and apply an XSLT stylesheet to render the report as XML. You can customize these stylesheets to suit your needs. By default, they are located in: *[OXYGEN_INSTALL_DIR]*`/frameworks/profiler/`.

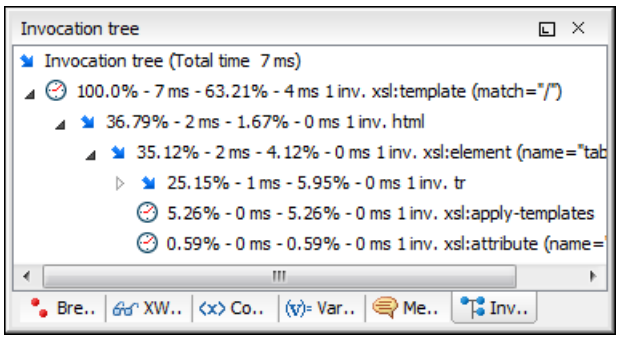
Other Profiling Notes

- If you want to change the XSLT/XQuery profiler settings *(page 211)*, use the contextual menu and choose the corresponding **View settings** entry.
- Profiling exhaustive transformations may run into an **OutOfMemory** error due to the large amount of information being collected. If this is the case, you can close unused projects when running the profiling or use high values for Java VM options `-Xms` and `-Xmx`. If this does not help you can shorten your source XML file and try again.
- For more information about the XSLT/XQuery Profiler, watch our video demonstration:

Invocation Tree View

The **Invocation Tree** view shows a top-down call tree that represents how XSLT instructions or XQuery expressions are processed. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: Invocation Tree View



The entries in the invocation tree include a few possible icons that indicate the following:

- - Points to a call whose inherent time is insignificant compared to its total time.
- - Points to a call whose inherent time is significant compared to its total time (greater than 1/3rd of its total time).

Every entry in the invocation tree includes textual information that depends on the **XSLT/XQuery profiler settings** *(page 211)*:

- A percentage number of the total time that is calculated with respect to either the root of the tree or the calling instruction.
- A total time measurement in milliseconds or microseconds. This is the total execution time that includes calls into other instructions.
- A percentage number of the inherent time that is calculated with respect to either the root of the tree or the calling instruction.
- An inherent time measurement in milliseconds or microseconds. This is the inherent execution time of the instruction.
- An invocation count that shows how often the instruction has been invoked on this call-path.
- An instruction name that contains also the attributes description.

The **Invocation Tree** view also includes the following contextual menu actions:

Export to HTML

Selecting this option will save the profiling data as XML and then apply an XSLT stylesheet to render the report as HTML. These stylesheets are included in the subfolder: `[OXYGEN_INSTALL_DIR]/frameworks/profiler/`. You can use them to customize your own report based on the profiling raw data.

Export to XML

Use this option to save the profiling data as an XML file in a specified location.

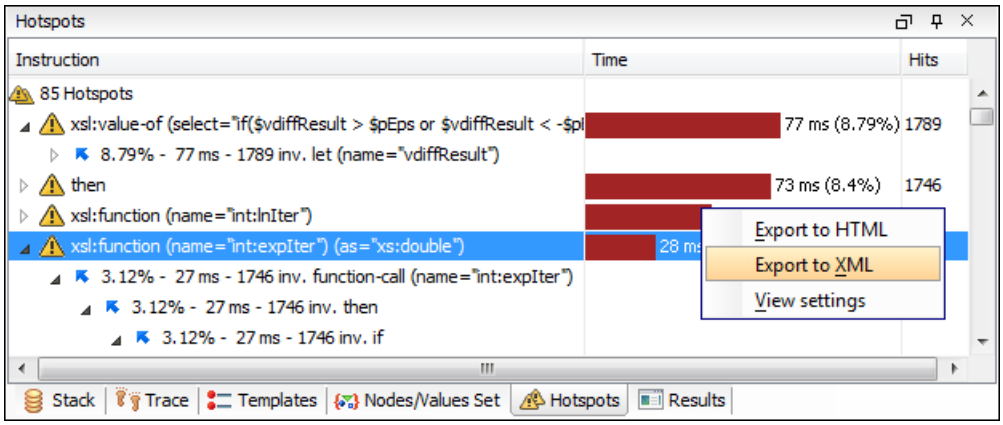
View settings

Opens the XSLT/XQuery Profiler preferences page *(page 211)* that allows you to configure various profiling settings.

Hotspots View

The **Hotspots** view displays a list of all instruction calls that lie above the threshold defined in the **XSLT/XQuery profiler settings** *(page 211)*. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure: Hotspots View



By opening a hotspot instruction entry, the tree of back-traces leading to that instruction call are calculated and shown.

Every hotspot is described by the values from the following columns:

- **Instruction** - The name of the instruction.
- **Time** - The inherent time in milliseconds or microseconds of how much time has been spent in the hotspot, along with a bar whose length is proportional to this value. All calls into this instruction are summed up regardless of the particular call sequence.
- **Hits** - The invocation count of the hotspot entry.

If you click the ⚠ handle on the left side of a hotspot, a tree of back-traces will be shown.

Every entry in the backtrace tree has textual information attached to it that depends on the **XSLT/XQuery profiler settings** *(page 211)*:

- A percentage number that is calculated with respect to either the total time or the called instruction.
- A time measured in milliseconds or microseconds of how much time has been contributed to the parent hotspot on this call-path.
- An invocation count that shows how often the hotspot has been invoked on this call-path.

Note: This is not the number of invocations of this instruction.

- An instruction name that also contains its attributes.

The **Hotspots** view also includes the following contextual menu actions:

Export to HTML

Selecting this option will save the profiling data as XML and then apply an XSLT stylesheet to render the report as HTML. These stylesheets are included in the subfolder: *[OXYGEN_INSTALL_DIR]*`/frameworks/profiler/`. You can use them to customize your own report based on the profiling raw data.

Export to XML

Use this option to save the profiling data as an XML file in a specified location.

View settings

Opens the XSLT/XQuery Profiler preferences page *(page 211)* that allows you to configure various profiling settings.

Debugging XSLT that Call Java Extensions

It is possible to debug XSLT that call Java extensions. This is achieved through a transformation scenario in which the Java extensions are specified, and the debugging can be done based upon the same scenario.

To debug XSLT with Java extensions, follow this procedure:

1. Create an XSLT transformation scenario *(page 1688)* for your XSLT document (select **Configure Transformation Scenario(s)** action from the toolbar, then click **New**, and select **XSLT transformation**).
2. In the **New scenario** dialog box, click the **Extensions** button (in the **XSLT** tab), specify the Java extensions (JAR libraries) that are needed, and click **OK**.
3. Once you are finished configuring the transformation scenario, click **OK**, then select **Save and close**.
4. Use the **Debug scenario** action on the toolbar and the debugging will be based upon the same transformation scenario you just configured and saved.

Tip: You could achieve this during a typical debugging process *(page 2218)* by specifying the Java extensions using the **Edit extensions** button on the debugger control toolbar *(page 2203)*.

Related Information:

Validating XSLT Stylesheets that Call Java Extensions *(page 1172)*

Debugging Java Extensions

The XSLT/XQuery debugger does not step into Java classes that are configured as XSLT/XQuery extensions of the transformation. To step into Java classes, inspect variable values, and set *breakpoints (page 2222)* in Java methods, you can set up a Java debug configuration in an IDE (such as the Eclipse SDK) as described in the following steps:

1. Create a debug configuration.
   a. Set at least 256 MB as heap memory for the Java virtual machine (recommended 1024 MB) by setting the `-Xmx` parameter in the debug configuration (for example, "-Xmx1024m").
   b. Make sure the *[OXYGEN_INSTALL_DIR]*`/lib/oxygen.jar` file and your Java extension classes are on the Java classpath.
   The Java extension classes should be the same classes that were set as an extension *(page 2203)* of the XSLT/XQuery transformation in the debugging *perspective (page 3232)*.
   c. Set the class *ro.sync.exml.Oxygen* as the main Java class of the configuration.
   The main Java class *ro.sync.exml.Oxygen* is located in the `oxygen.jar` file.
2. Start the debug configuration.
   Now you can set *breakpoints* and inspect Java variables as in any Java debugging process executed in the selected IDE (Eclipse SDK, and so on.).

Supported Processors for XSLT / XQuery Debugging

The following built-in XSLT processors are integrated in the debugger and can be selected in the Control Toolbar *(page 2202)*:

- **Saxon 9.8.0.12 HE (Home Edition)** - a limited version of the Saxon 9 processor, capable of running XSLT 1.0, XSLT 2.0 / 3.0 basic and XQuery 1.0 transformations, available in both the XSLT debugger and the XQuery one,
- **Saxon 9.8.0.12 PE (Professional Edition)** - capable of running XSLT 1.0 transformations, XSLT 2.0 basic ones and XQuery 1.0 ones, available in both the XSLT debugger and the XQuery one,

- **Saxon 9.8.0.12 EE (Enterprise Edition)** - a schema aware processor, capable of running XSLT 1.0 transformations, XSLT 2.0 /3.0 basic ones, XSLT 2.0 / 3.0 schema aware ones and XQuery 1.0 / 3.0 ones, available in both the XSLT debugger and the XQuery debugger,
- **Saxon 6.5.5** - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger,
- **Xalan 2.7.2** - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger.

Author Mode Customization

This section contains an Author Mode Customization Guide *(page 2231)*, CSS Support in Author Mode *(page 2391)*, a collection of Frequently Asked Questions regarding the Oxygen XML Editor API *(page 2493)*, and other topics in regards to customizing the **Author** mode.

Author Mode Customization Guide

The **Author** mode editor of Oxygen XML Editor was designed to provide a user-friendly interface for editing XML documents. **Author** combines the power of source editing with the intuitive interface of a word processor. You can customize the **Author** mode editor to support new custom XML formats or to change how standard XML formats are edited.

Although Oxygen XML Editor includes built-in, configured *frameworks (page 3229)* for DocBook, DITA, TEI, and XHTML you might need to create a customization of the editor to handle other types of documents. A common use case is when your organization holds a collection of XML document types used to define the structure of internal documents and they need to be visually edited by people with no experience working with XML files.

There are several ways to customize the editor:

1. Create a CSS file defining styles for the XML elements you will work with, and create XML files that reference the CSS through an `xml-stylesheet` processing instruction.
